TO BE SOLD, THOULOUSE and WHITE SWAN or CHINESE GEESE, WHITE PERUVIAN MUSK, AYLESBURY and WILD DUCKS, all quite pure bred.—Apply to P. DUTTON, Delamere Rectory, Northwich.

WANTED to PURCHASE, a small secondhand GREENHOUSE about 10 feet square. Particulars, size, and price, to be addressed, post paid, to T. W., Messrs. Harwar's, Furnival's Inn.

TO GARDENERS, NURSERYMEN, SEEDSMEN, AND FLORISTS.

TO BE SOLD, in consequence of the ill-health of proprietor, a capital BUSINESS in the above line, with a first-rate connexion, and of 17 years' standing. The Premises, which are convenient and well situated, will be sold together with the Business. One-half of the purchase money may remain on security of the premises.—For particulars apply to Mr. LENDON, Nurseryman, &c., Wellington, Somerset.

TO FRUIT GROWERS, NURSERYMEN, & OTHERS.

TO BE SOLD, by Public Tender, a highly eligible FREEHOLD PROPERTY, situate at Broom Hill, in the parish of Orpington, Kent, 14 miles from London and 6 miles from the proposed Bromley Station of the Crystal Palace Extension. This valuable property comprises a brick-built nine-roomed Dwelling-house pleasantly situated, in good tenantable repair, together with Garden, detached Shed, Fruit Plantation and Paddock, containing 4 acres more or less, subject to an apportioned amount of tithes. The above property is well adapted for a Nursery or Fruit Ground, being a suitable soil (sandy loam), and many years noted for its great productiveness.

Terms and all particulars as to tender, &c., may be obtained by applying to Mr. GEORGE ELKINGTON, Architect and Surveyor, 20, Cannon Street, London.

FLORIST'S BUSINESS.

TO BE SOLD, the NURSERY GROUND, GREENHOUSES, &c., of the late Mr. HENRY GROOM, at Clapham Rise, Surrey, in consequence of his death, and the GOODWILL of the well-established BUSINESS to be disposed of. The Premises (exclusive of a strip of land held rent free, subject to six months' notice) comprise 3¼ acres, and are held at the low yearly rent of 80*l.* for an unexpired term of 36 years from Michaelmas, 1855. The House adjoining, late in the occupation of Mr. Groom, is not comprised in the lease, but may be rented.—The Premises may be viewed on application, and further information obtained of Messrs. PROTHEROE & MORRIS, American Nursery, Leytonstone, Essex; and of Messrs. BARNES & BERNARD, Solicitors, 2, Great Winchester Street, London.

TO GENTLEMEN'S GARDENERS, FLORISTS, ETC.

AN eligible opportunity presents itself to those who wish to commence business in an increasing neighbourhood near London, an excellent Garden, with Greenhouses, a Propagating House, &c., all walled in, attached to which is a good House and Shop, suitable for Fruiterer, Greengrocer, and Seedsman. Possession may be had immediately; the occupier is about leaving on account of a death in the family.—For particulars apply to F. SANGSTER, Seedsman, 252, Whitechapel Road, London.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The stock is light, and the quantity of land may be made to suit the convenience of the Tenant.—For further particulars apply to JOHN YOUNG, Elm Cottage, Taunton.

TO AMATEUR FARMERS.—BELMORE HOUSE.

TO BE LET, unfurnished, for a term of years, containing three best living rooms and eight bed rooms, with offices, &c., convenient and complete stable for seven horses, with good garden and orchard. Forty acres in a ring fence to be let with it or without. Belmore is six miles from Bishopstoke Station on the South-Western Railway, in the centre of the Hambledon Hunt, and within easy distance of the H. H. and Horsley hounds.—For particulars, apply to Messrs. ATTWOOD and BIGDEN, the Close, Salisbury.

TO BE LET, CHEVINGTON WOODSIDE FARM, in the parish of Warkworth, Northumberland; tithe free, and entered to at May-day, 1856, containing about 566 acres, of which 90 acres are in old Grass. The tillage land is of sound good quality, and the old Grass is very valuable fattening pasture. A large portion of the farm has been thorough drained under Government grant. The Farm is within two miles of the Addington Station. Mr. Thos. Brown, of Whitefield House, near Acklington, will show the farm with a plan.—Further particulars may be had by application to GEORGE A. GREY, Esq., Millfield, Northumberland, by whom offers will be received till 12th Nov.

Sales by Auction.

CAMELLIAS, AZALEAS, ETC.,

THAMES BANK, PIMLICO.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Joseph Robinson to submit to public competition, on the above premises, on WEDNESDAY, Oct. 31, at 11 for 12 o'clock, without the least reserve, a very choice and select Collection of Fancy and other varieties of Pelargoniums, also a collection of Pompone Chrysanthemums, about sixty neat specimens, a few Azaleas, also a fine collection of Dahlias, three Greenhouses, and a light Spring Van. J. R. assures purchasers that every plant will be correctly named and labelled.—Catalogues had 6*d.* each, returnable to purchasers, of the Auctioneers, American Nursery, Leytonstone, Essex, and of Mr. J. ROBINSON, 2, Glasgow Terrace, Thames Bank, Pimlico.

CLAPHAM RISE.
To NOBLEMEN, GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, on the Premises, Clapham Rise, near London, on MONDAY, October 29, and following day, at 11 o'clock each day (by order of the executors of the late Mr. Henry Groom) the whole of the extensive, costly, and unrivalled collection of TULIPS, Offsets, and Breeders, which include the most rare and approved varieties in cultivation, and choice Seedlings not in the possession of any other grower, being the study of 40 years of the deceased's life, whose judgment and taste was universally admitted. Also Dutch and other Bulbs, consisting of the finest Double and Single Hyacinths, Narcissus, Crocus, Early Double and Single Tulips, Jonquils, a rich assortment of Ranunculuses, Gladiolus, Anemones, &c., with 1500 Lilium lancifolium in great variety, Japonicum, &c. May be viewed prior to the sale.—Catalogues may be obtained 1*s.* each, returnable to purchasers, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

NURSERY STOCK.
To NOBLEMEN, GENTLEMEN, CONTRACTORS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, on the Premises, Albion Road, Stoke Newington, on MONDAY, October 22d, and following day, at 11 o'clock each day, fine Ornamental Trees, Evergreens, and Shrubs, consisting of Aucubas, Hollies, Box, Laurels, Arborvitæs, Limes, Poplars, Lilacs, Weeping Ash, Purple Beech, Scarlet Chesnuts, Evergreen Privets; Rhododendrons, Azaleas, and other American Plants; choice Fruit Trees, including Apples, Pears, Plums, Cherries, Peaches, Apricots, Grape Vines, &c.; Standard Dwarf and Climbing Roses, and a large assortment of Hardy Climbers in Pots; choice Cinerarias, Chrysanthemums, &c.—Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY, Oct. 24, at 12 o'clock, a first-class collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemones, Crocus, Tulips, Snowdrops, Ranunculuses, Gladiolus, &c.; also a selected assortment of fine Standard and Dwarf Roses, including Hybrids, Bourbons, Chinas, Noisettes, &c., and American Plants, comprising Hybrid Rhododendrons, Ghent and other Azaleas, Kalmias, Andromeda floribunda, beautifully furnished with bloom buds, &c.—May be viewed the morning of Sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

WANDSWORTH ROAD.

MESSRS. PROTHEROE AND MORRIS have been instructed by Messrs. Chandler & Sons to Sell by Auction, on the premises in the Wandsworth Road, early next month, a collection of the following ORNAMENTAL TREES, EVERGREENS, and SHRUBS, comprising Laburnums, Almonds, Poplars, Lilacs, Evergreen Privets, Variegated and Green Hollies, from 2 to 8 feet high; Arbor-vitæ, from 2 to 8 feet; Laurels, large Box, Scarlet Arbutus, very handsome; crimson and other Rhododendrons, well set with flower buds; yellow Azaleas, Kalmias, Daphne hybrida, Escallonia, Veronicas, &c., &c.; also dwarf Apples and Pears well adapted for potting, Gooseberries, Currants, and Vines, Chrysanthemums, Passion flowers, Myrtles, &c., &c. This Sale is worthy the attention of Planters, as everything is in fine condition and will move well. An announcement of the days of sale will shortly be made, and Catalogues prepared.

UPPER GRANGE ROAD, BERMONDSEY.
To NOBLEMEN, GENTLEMEN, NURSERYMEN, AND PINE GROWERS.

MR. WILLIAM T. ATWOOD will Sell by Auction, on the Premises without reserve, by direction of B. Drew, Esq., on FRIDAY, the 26th October, at 11 o'clock, the extensive STOCK of PINE PLANTS, the various Ranges of Graperies and Forcing Pits; the Hot-water Apparatus, comprising about 1500 feet of pipe, and three large Boilers. The above property is in good condition, and offers a valuable opportunity to persons requiring Pine Plants and Forcing Houses.—Catalogues to be had of B. DREW, Esq., Bermondsey Street; W. T. ATWOOD, Auctioneer and Land Agent, Mortlake, Surrey; and the Inns in Covent Garden.

NURSERY STOCK.—WHALLEY RANGE, MANCHESTER.

MR. CAPES begs to state that he has received instructions from Messrs. H. Bigland & Co., in consequence of the expiration of their lease, and the grounds having to be given up, to Sell by Auction, on WEDNESDAY and THURSDAY, November 7th and 8th, at 10 o'clock each morning, the entire of the remainder of their STOCK of Evergreens, Fruit and Forest Trees, two Greenhouses, Dutch Pit, and other Effects, at the Britannia Nursery, Whalley Range, near Manchester, further particulars of which will appear in future announcements and in Catalogues, which will be ready a week prior to the sale.—22, Princess Street, Manchester.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c.

Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, and FREDERICK MULLETT EVANS, of No. 20, Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, October 20, 1855.

HORTICULTURAL SOCIETY OF LONDON.—The AUTUMN MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, November 20th, from 12 to 4, P.M. The Chair will be taken at 2 P.M.

BRITISH POMOLOGICAL SOCIETY.—An Extraordinary Meeting of the British Pomological Society will be held at the Rooms, 20, Bedford Street, Covent Garden, on MONDAY, the 5th of November, to compare and determine the merits and qualities of Fruits, for the election of Members, and for general business.

It is hoped that all who take an interest in the cultivation of FRUITS and FRUIT TREES will forward to the meeting specimens of such varieties as they can obtain, correctly named, and otherwise assist in promoting the objects of the Society.

Persons desirous of becoming Members are requested to make application to the Secretary on or before the day of meeting. Members are elected at all the Meetings of the Society; and 10s. entrance fee, with 10s. annual subscription, constitute membership.—ROBERT HOGG, Secretary.

CAMELLIAS.

CHANDLER AND SONS, NURSERYMEN, Wandsworth Road, beg to inform their friends and customers that their CAMELLIAS are finely set with flower buds this season. They are sending out bushy plants from 30s. and upwards per dozen.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Wandsworth Road, have a large collection of the above now coming into flower. Good flowering Plants from 6s. to 12s. per dozen.

CHRYSANTHEMUMS.

F. AND A. SMITH have a large Stock of Pompone and large flowered varieties of the above now in bloom, which they offer on moderate terms. The plants are in 48-inch pots, bushy and dwarf, and well flowered, and will be found well adapted for purposes of decoration. Prices on application.—Dulwich, Surrey.

CHRYSANTHEMUMS.

WOOD AND INGRAM beg to offer fine flowering plants, covered with healthy foliage to the bottom, of good sorts, both Pompone and large flowering varieties, at from 6s. to 9s. per dozen.—Nurseries, Huntingdon.

AZALEA INDICA LEEANA.

JOHN AND CHARLES LEE are now prepared to send out this fine Seedling, which for habit of growth and substance of petal, combined with perfect shape and purity, is decidedly the best white Azalea yet out. It has gained Certificates wherever exhibited. Price 21s.; a few extra strong plants at 42s.—Nursery and Seed Establishment, Hammersmith.

NEW VARIEGATED GERANIUM—MRS. LENNOX.

JOHN AND CHARLES LEE are now sending out this novelty, which is a decided improvement on The Mountain of Light. It is of much more vigorous growth than that variety, the margin of the foliage is of a purer white, and in other respects it possesses the same good qualities. Price 7s. 6d.
Nursery and Seed Establishment, Hammersmith.

RASPBERRY CANES.

TO BE SOLD, about 900 (more or less) of Fine CANES, at a low figure.—Address to G. P. E., care of Mr. Brown, Bootmaker, near the Railway, Shoreditch.

SPANISH CHESNUTS.

TO BE SOLD, about 200,000 Strong SPANISH CHESNUTS, from 2 to 4 feet. Price sent on application to WATERER and GODFREY, Knap Hill, Woking, Surrey.

TO FLORICULTURISTS.

TO BE SOLD, 13 first-rate CAMELLIA PLANTS, in excellent condition, and covered with buds. They are to be sold on account of being too large for the Proprietor's present accommodation. They stand from 4 to 6 feet high. Price for the whole, 15l.

To the above may be added 12 beautiful AZALEA PLANTS, all superior varieties; price seven guineas. Decidedly bargains. Also nine fine DAPHNE PLANTS.—For particulars apply to MR. JOHN KEYNES, Florist, &c., Castle Street Nursery, Salisbury.

TO SEEDSMEN AND OTHERS.

TO BE SOLD, for cash on delivery, 200 Bushels of SKIRVING'S SWEDE, raised from selected and Transplanted Bulbs, warranted neat and genuine, and of the growth of 1855. Also for sale on the same terms, a few cwts. of MANGOLD WURZEL and CARROT SEED, of sorts, just harvested.—For price, &c., apply to Mr. WILLIAM TAYLOR, Nashenden Farm, Rochester, Kent.

RHUBARB.

TO BE SOLD, 3000 Roots of VICTORIA ALBERT AND LINNÆUS RHUBARB in splendid condition, price 50s. per 100, or 20l. per 1000, including package.—Address, Mr. WILLIAM HARNETT, The Cottage, New Cross, Kent: adjoining the Brighton and Croydon Railway Station. Post-office orders to be made payable at London.

ROSE CATALOGUE.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to announce that their New CATALOGUE of ROSES for 1855 and 1856 is now ready, and may be had on application.

ROSE CATALOGUE.

JAMES MITCHELL begs to announce that his New CATALOGUE of ROSES is now ready, and will be forwarded on application.
Piltdown Nurseries, Maresfield, Sussex.—Oct. 27.

E. P. FRANCIS' New DESCRIPTIVE CATALOGUE of ROSES is now ready for distribution, and will be forwarded gratis on application.—Rose Nurseries, Hertford.

ROSES.

T. RIVERS'S ANNUAL DESCRIPTIVE CATALOGUE OF ROSES is now ready for delivery, and will be sent post-free on application; it is so arranged as to be a complete guide for the Amateur.

The DESCRIPTIVE CATALOGUE OF FRUITS is now at Press.—Nurseries, Sawbridgeworth, Herts.

FRUIT TREES.

T. RIVERS'S DESCRIPTIVE CATALOGUE of FRUITS is now Ready for delivery, and will be sent post free. Applications enclosing six stamps (which will be returned to those who order Trees) will be promptly attended to; it contains 28 pages, has been compiled with much care, and is so arranged as to be a useful guide to the purchaser of Fruit Trees.
Nurseries, Sawbridgeworth, Herts.

ROSES, HOLLYHOCKS, ETC.

A. PAUL AND SON'S PRICED DESCRIPTIVE CATALOGUES of ROSES and HOLLYHOCKS are now ready, and may be had post free on application.

A fine stock of CONIFERÆ, ORNAMENTAL TREES and SHRUBS, FRUIT TREES, &c. Prices furnished on application.
Nurseries, Cheshunt, Herts, Oct. 27.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had by enclosing two postage stamps.

WALNUT—Juglans regia	17s.
PEACH—Amygdalus Persica	17s.
PEAR—Pyrus communis	12s.
APPLE—Malus vulgare	11s.
PLUM—Prunus St. Julien (good for grafting Peaches)	20s.
MAHALEB—Prunus	7s.
" " 2 years' old	9s.

All these Plants are very fine.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park: it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 Acres may be cleared for a few shillings.—GILBERT DYSON, Hoo, Rochester.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

LANDSCAPE GARDENING, combining all the modern improvements in the CONSTRUCTION, BUILDING, HEATING, and VENTILATING HOT HOUSES, CONSERVATORIES, PINE PITS, and every other kind of Garden structure, by a practical Gardener and Horticultural Builder of 25 years' experience as Head Gardener to his Grace the late Duke of Northumberland, at Syon House, and her Majesty's Royal Gardens, Windsor, Kew, &c.—Designs and Estimates furnished for Garden embellishments on application to J. W. THOMSON, F.L.H.S., Garden Architect, Exotic Nursery, King Street, Hammersmith.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the frame work, but covered with Galvanised Iron Sashes, with excellent strong glass, and all completed for 1s. 3d. per foot super. Hundreds of references can be given, and Printed Price Lists sent.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30l. was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

TRANSPARENT SHEETING, a Substitute for Garden Mats, 1s. per yard, nearly 2 yards wide strong Canvas do., 1s. per square yard. Waterproof Capes (to protect a Man from wet while stooping down), 3s. each. Second-hand Policemens' Capes, 18s. and 24s. per dozen. Horses' Loin Cloths, Waterdecks for Crimea Horses—viz., a Tarpauling Body Suit lined with stout Woollen Rug, 16s. each Waggon and Cart Covers, &c.—R. RICHARDSON, 21, Tonbridge Place, New Road.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1d. per square foot. CROGGON'S Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to CROGGON & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

GALVANISED WIRE GAME NETTING,
6d. PER YARD, 2 FEET WIDE.

BARNARD AND BISHOP, Market Place, Norwich, in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

	Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	6d. per yd.	4½d. per yd.
2-inch " strong, do.	8 "	6 "
2-inch " intermediate, do.	9½ "	7½ "
2-inch " extra strong, do.	11 "	9 "
1⅝-inch " 24 inches wide	7 "	5½ "
1⅝-inch " strong, do.	9 "	7 "
1⅝-inch " intermediate, do.	11 "	9 "
1⅝-inch " extra strong, do.	13 "	11 "

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10d. per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

NEW ROSES.

WILLIAM WOOD AND SON have again much pleasure in recommending their beautiful Seedling Rose, the Perpetual DUCHESS OF NORFOLK; the colour is a very rich vivid crimson, the underside of the petals shaded with lively pink, giving the flowers an exquisite shell-like appearance.

Price for Standards, or Dwarfs, 3*s.* 6*d.* each.

Williams' Evergreen Climbing Rose, 1*s.* 6*d.* each—This Rose is a seedling from the Ayrshire Splendens fertilised with the Yellow Tea Rose; its flowers are creamy white, deliciously sweet-scented.

N.B. The New Rose Catalogue and Supplement may be had on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

TRAINED FRUIT TREES.

WILLIAM WOOD AND SON have much pleasure in recommending their very extensive and superior stock of Dwarf two-years-trained PEACHES, NECTARINES, and APRICOTS, which they feel assured cannot be excelled. The trees are remarkably healthy, and furnished with well ripened shoots; they will be supplied at 60*s.* per dozen.

Pyramidal Pears on Quince stocks, per doz.	...	24*s.* 0*d.*
Pyramidal Plums, extra fine do.	...	20 0
Pyramidal Apples, do. do.	...	16 0

Catalogues forwarded on application. Extra plants presented with each order, to compensate for distant carriage.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

NEW STRAWBERRIES AT REDUCED PRICES,
GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—The following splendid varieties have been well proved this season and given complete satisfaction, viz., Sir Harry (Underhill's), 100 plants, 4*l.*; 40, 1*l.* 18*s.*; and 20, 1*l.*; or 12*s.* 6*d.* per dozen. Omar Pacha (Ward's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Scarlet Nonpareil (Patterson's), 2*l.* per 100; 1*l.* per 50; 12*s.* per 25. Sir Charles Napier (Smith's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Admiral Dundas (Myatt's), 1*l.* per 100; 12*s.* per 50*s.*; 7*s.* per 25. Nicholson's Ajax, Ruby, Captain Cook and Fill-Basket, 6*s.* per 100; Ingram's Prince of Wales, Nimrod, Eliza (Rivers's), Surprise (Myatt's), and Bicton Pine, a large white one, 6*s.* per 100; British Queen, Black Prince, Eleanor (Myatt's), Old Pine, Trollope's Victoria. Goliah (Kitley's), Keens' Seedling, Old Roseberry, all at 4*s.* per 100; Crystal Palace, a very large and late variety, 10*s.* per 100. Post-office Orders payable at Yarm are expected with all orders. The plants will be securely packed and forwarded to any part of the kingdom.

Plants kept in frames for spring planting.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

PLANTING SEASON.

JOHN CATTELL respectfully invites an inspection of his extensive Stock of Fruit, Forest, and Ornamental Trees and Shrubs, American Plants, &c., &c., consisting of the most esteemed varieties of each kind of Fruit Trees in standards and dwarfs, trained and untrained. Also the best varieties of Gooseberries, Currants, Raspberries, Strawberries, Filberts, Spanish or Kentish Cob Nuts, &c. A general collection of Evergreen and Deciduous Trees and Shrubs, Coniferæ, &c.

The American Plants are particularly well grown, containing selections of the richest and most distinct varieties of Ghent and other Azaleas, Sikkim, Hybrid Scarlet, and other Rhododendrons. The Andromeda floribunda and Kalmia latifolia are remarkably fine. Roses are also extensively and well grown; the collection contains all the newest and most select of the older varieties. Priced Catalogues of the various descriptions of stock are now ready, and may be had on application.

NEW PORTUGAL LAUREL.
CERASUS LUSITANICUS MYRTIFOLIUS.

JOHN CATTELL has much pleasure in informing his patrons and the public that after the 1st of November he will be prepared to send out plants of this very desirable new hardy Evergreen; the habit of growth is quite upright, like a Bay, and the whole plant is densely covered with beautiful shining leaves. As a single specimen it is quite distinct from any other hardy evergreen.

Strong Plants, 3 years old, 7*s.* 6*l.* each	80*s.* per doz.
Do. do., 2 years do., 5*s.* each	50*s.* per doz.
A few extra strong Plants	10*s.* 6*d.* each.

Nurseries, Westerham, Kent, Oct. 27.

TO PLANTERS.

J. SCOTT, Merriott, Crewkerne, Somerset, offers the following:—Deodara Cedars, from 3 to 8 feet, by 6 to 16 round, at 3*s.* 6*d.* to 30*s.* each; Cedar of Lebanon, same size and price; African Cedar, 2 to 3 feet, 3*s.* 6*d.* each; Red Cedar, 3 to 6 feet, 18*s.* to 30*s.* per dozen; Cedar of Goa, 18 inches, 1*s.* 6*d.* each; White Cedar, 5 feet, 3*s.* 6*d.* each; Cryptomeria japonica, 4 to 10 feet, very fine, 2*s.* 6*d.* to 15*s.* each; Taxodium sempervirens, 4 to 10 feet, 2*s* 6*d.* to 10*s.* 6*d.* each; Cupressus macrocarpa, 2½ to 5 feet, 2*s.* 6*l.* to 5*s.* each; C. Govineana, 2 to 3 feet, 3*s.* 6*d.* each; C. funebris, 1 to 3 feet, 1*s.* 6*d.* to 3*s.* 6*d.* each; Thuja pendula, 3 feet, 5*s.* to 7*s.* 6*d.* each; T. aurea, 1 foot high, 3 feet round, 3*s.* 6*d.* each; Juniperus chinensis, 4 feet, fine, 5*s.* each; J. squamata, 5 feet, 5*s.* each; J. excelsa, 3 feet, 7*s.* 6*d.* each; J. tetragona, 18 inches, 2*s.* 6*d.* each; Irish Yews, 4 to 7 feet, fine, 3*s.* 6*d.* to 10*s.* 6*d.* each; Taxus adpressa, 2 to 3 feet, 5*s.* to 7*s.* 6*d.* each; Siberian Arbor-vitæ, 3 to 6 feet, 1*s.* 6*d.* to 3*s.* 6*d.* each; Pinus excelsa, 2 to 7 feet, 1*s.* 6*d* to 7*s.* 6*l.* each; P. insignis, 2 to 5 feet; 2*s.* 6*l.* to 7*s.* 6*d.* each; Standard Portugal Laurels, 4 to 6 feet stems, 3*s.* 6*d.* to 7*s.* 6*d.* each. Apricots, Peaches, and Nectarines, drop trained, 42*s.* per dozen; Pears and Plums, do., 24*s* per dozen; Pears, Plums, and Cherries, dwarf Pyramids, 18*s.* per dozen. These Fruit Trees are all healthy and young, including every Fruit worth growing. 150 sorts, large and Pompone Chrysanthemums, in 6-inch pots, at 6*s.* per dozen.—Oct. 27.

HARDY FERNS.

WILLIAM HUSSEY begs to offer the undernamed Collection of FERNS for 14*s.*, package included, viz.:—

Adiantum capillus Veneris	Ceterach officinarum	Polystichum aculeatum
Allosorus crispus	Cystopteris fragilis	Do. angulare
Asplenium viride	Hymenophyllum Wilsoni	Osmunda regalis
„ trichomanes	Do. Tunbridgense	Polypodium vulgare
„ adiantum nigrum	Lastrea cristata	„ dryopteris
Athyrium filix-femina	„ spinulosa	„ phagopteris
Blechnum boreale	„ dilatata	„ calcareum
Botrichium lunaria	„ Thelypteris	Scolopendrum officinarum

Horticultural Gardens, Norwich.

MYATT'S ADMIRAL DUNDAS STRAWBERRY.—Strong plants packed and delivered free in London, 25*s.* per 100. Also MYATT'S British Queen, Cinquefolia, Globe, Eliza, Mammoth, 3*s.* 6*d.* per 100; Keens' Seedling, Hooper's Seedling, Black Prince, Bicton Pine, 3*s.* 6*d.* per 100.

MYATT'S BRITISH QUEEN.—In reply to several correspondents, and in confirmation of the private answers I gave last summer, I beg leave to state that the only Strawberry bearing the name of "British Queen" is MYATT'S, and when Mr. Beach, in his advertisement says "his true British Queen," he is obviously in error, and arrogates to himself the credit due to my late father, Mr. JOSEPH MYATT, who was the originator of the variety in question.—W. MYATT, Manor Farm, Deptford.—Oct. 27.

THE HEAVIEST LANCASHIRE SHOW GOOSEBERRIES
(NAMED).

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, is now prepared to supply strong three and four years old Plants of the above at 6*s.* per dozen, package, &c., included.

THE FLUKE KIDNEY POTATO (TRUE).

Catalogues containing Lists of Gooseberries, Carnations, Picotees, Pinks, Pansies, &c., on application, enclosing a postage stamp. Post-office Orders to be made payable at Middleton, Lancashire.

A NEW SEEDLING APPLE FROM THE RIBSTON PIPPIN.

STEPHEN SHILLING begs to offer to gentlemen and the trade Trees of his entirely new Apple named OMER PACHA, it being a first-rate hardy grower, strong compact habit, early and productive bearer. Fruit excellent flavour (dessert), ripe in November, keeps until May. Respectable testimonials given from those who have tasted the fruit. Strong plants supplied at 5*s.* 6*d.* each, or 60*s.* per dozen. The usual discount to the trade where one dozen or more are taken. Early application is requested as the stock is limited; all orders carefully and promptly attended to. Fruit of the above can be seen at the office of the *Gardeners' Chronicle*, the British Pomological Societies' Rooms, 20, Bedford Street, Covent Garden, Messrs. Nutting & Son, 46, Cheapside, Messrs. Sutton & Sons, Reading, Mr. C. Turner, Royal Nursery, Slough, and at the North Warnborough Nursery, near Odiham, Hants.

MESSRS. E. G. HENDERSON AND SON beg to announce that they have now received their noted collection of HYACINTHS in excellent condition, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with, Catalogues of which, together with their Plant and Seed Lists, will be forwarded post free on application.

CUCUMBER HENDERSON'S NAPOLEON III., in packets, 3*s.* and 5*s.* 6*d* each.

CALCEOLARIA, CINERARIA, and PRIMULA SEED of first quality, 2*s.* 6*d.* and 5*s.* per packet.

FUCHSIAS.—Banks' Favourite, 10*s.* 6*d.*; Prince of Wales, 10*s.* 6*d.*

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (PAMPAS GRASS).—E. G. H. & SON having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2*s.* 6*d.* each, 25*s.* per dozen, or 7*l.* 10*s.* per 100.

Wellington Nursery, St. John's Wood.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, which they will forward to any part.

	s.	*d.*
25 Azaleas, new hardy Belgian varieties, one of a sort, by name, on their own roots	20	0
25 Azaleas, American varieties, do. do.	16	0
Hardy Heaths, Ledums, and Kalmias, per dozen ...	6	0
25 Hardy American Plants, one of a sort, by name ...	10	6
12 Rhododendrons, including scarlet, white, and rose ...	12	0
Fine hardy scarlet Rhododendrons, 1 to 2 feet, per dozen	15	0
New yellow Rhododendrons, in pots, each .. 3*s.* 6*d.* to	5	6
Cedar of Lebanon, 2 to 3 feet, well grown, per doz., 12*s.* to	18	0
Cedrus Deodara, and other choice Coniferæ (see List).		
6 Fine hardy Magnolias, one of a sort	10	6
50 Dwarf Roses, two of a sort, on own roots	15	0
Standard and half Standard Roses, superb sorts, per dozen ... ... 15*s.* to	18	0
Fine Climbing Roses, per dozen	6	0
Greenhouse Azaleas, best new vars., per dozen .. 12*s.* to	18	0
Camellias, fine double white, &c., with five to eight buds, per dozen .. .. 30*s.* to	40	0
50 Choice Greenhouse Plants, one of a sort	45	0
12 Orchidea Plants, one of a sort, fine species	40	0
Fine Pampas Grass, each, 3*s.* 6*d.*; or, per dozen ...	30	0
Hyacinths, Crocus, Tulips, and Dutch Bulbs of all kinds.		

FRUIT TREES.

Fine standard and dwarf-trained Apricots, Peaches, Nectarines, Pears, Plums, and Cherries, 3*s.* each, or, per dozen	30	0
Fine Apples, Figs, Medlars, Quinces, and Walnuts, each	2	0
Fine Gooseberries, Currants, and Raspberries, per doz.	3	0
Filberts, new, thin shelled, and red skinned, per dozen	4	0
Strong Vines from eyes, and layers in pots, per dozen...	18	0
Peaches, Nectarines, Apricots, and Cherries, grown for pot culture, per dozen	18	0

A large stock of fine Transplanted Scotch, Larch, and Spruce Firs, also Evergreen Shrubs of all kinds.

Albion Nursery, Stoke Newington, London, Oct. 27.

THE EXETER NURSERY, EXETER.

LUCOMBE, PINCE, AND CO. respectfully beg leave to inform the Public that their Nursery is this season abundantly furnished with a fine healthy Stock of all the best varieties of

HARDY ORNAMENTAL TREES AND SHRUBS,
HARDY EVERGREENS, CONIFERÆ,
FRUIT TREES, FOREST TREES,
RHODODENDRONS,
&c., &c., &c.

Their stock of every description of Nursery produce is so good as well as extensive that they are enabled to offer advantageous terms to Purchasers, for particulars of which apply as above.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 27, 1855.

In the Revue Horticole for October we find an interesting account of the VEGETATION of ASIA MINOR, by M. BALANSA, a botanical traveller, already advantageously known by his excellent collections made in Spain. It appears that this gentleman has been dispatched from Paris for the purpose of exploring the range of Mount Taurus, and collecting there whatever may be valuable in horticulture or botany.

His letter is dated from Mersina, or Mersyn, a place a little to the west of the Bay of Skanderoon, which, although having only an open roadstead, has a good anchorage, and is rising into importance as the chief port of Karamania. The place is said to derive its name from the Myrtle bushes which abound in its neighbourhood; but is not of much botanical interest. It was after a residence of some weeks at a Turkish village called Bouloukli, on the side of some limestone hills not rising above 1200 feet high, that M. BALANSA found himself in a condition to give some account of the finer vegetation of the country. In the neighbourhood of this place he for the first time met with a grove of wild Cypresses, and to his surprise found them all of the spreading sort; not an upright one among them. Whence he concludes that the upright Cypress is a mere variety, bearing the same relation to the spreading Cypress as the Black Italian Poplar to common black Poplar (*Populus nigra*); and we would add as the Irish Yew bears to the common Yew, the Swedish Juniper to the common Juniper, or the fastigiate Oak to the common pedunculate species. M. BALANSA describes the wild Cypresses as looking at a distance like Spruce Firs.

Among other plants forming the vegetation of this district are the wild Grape vine, which occurs on the borders of every stream. The Fig tree is also common in the damp mountain villages; and in a forest of *Abies cilicica*, three thousand three hundred feet above the sea, pell-mell with *Arbutus Andrachne* and other woody plants of the hot region, he met with magnificent specimens of the Sweet Bay. "How does it happen," asks M. BALANSA, "that this tree which is sometimes frozen on the plains of the south of France is produced in this place in so alpine a station? Perhaps it is owing to the dryness of the atmosphere, the absence of violent winds from this part of Cilicia, and the shelter afforded by the gigantic trunks of *Abies cilicica*, among which it grows."

It is at the distance of five leagues north of Mersyn that *Abies cilicica* first appears. Its lower limit would seem to be 700 or 800 yards, though specimens are found 300 or 400 yards lower down at the bottom of a land-locked valley running east and west. The middle-sized specimens were about as tall as the *Pinus Laricio* growing in the Jardin des Plantes of Paris.

Another Mersyn plant is *Juniperus drupacea*. It occurs near the top of a chain of mountains 800 yards high on the north-west of the town, where it grows in company with *Pistacia Terebinthus*, *Pinus Halepensis*, Phillyreas, Phœnician Junipers, and Judas trees, all species belonging to the warm littoral range. This *Juniperus drupacea* grows however much higher up the mountains along with *Abies cilicica*. Upon this subject M. BALANSA remarks that since the Cypress which is hardy in the north of France is naturally associated with *Juniperus drupacea* it is probable that the latter, which is a more mountainous plant, would prove equally suitable to our climate. The plant itself is described as a very pretty little diœcious tree with the habit of a Spruce Fir. The pulpy fruit is not eaten raw by the Turks, but they make a preserve of it, of which they are very fond.

In addition to *Abies cilicica* and *Juniperus drupacea*, these Caramanian mountains produce a Pine which, although possibly a variety of *P. halepensis* is nevertheless very distinct in habit, colour, and magnitude. It forms forests all over the slaty slopes of Alla-Dagh, to the exclusion of every other tree. What is very curious, these trees seem to be all of the same age, and are separated at such regular distances "that one would say they

SUTTON AND SONS, SEED-GROWERS, READING.

A Reference (or Remittance) is requested from unknown Correspondents.

had started up some day at the touch of an enchanter's wand."

Cyclamen cilicium of Boissier also grows here in plenty, and a good store of roots is announced as having been collected. This is a charming little Alpine plant, with flowers resembling those of *Cöum*, but not much bigger than Violets. Its leaves are at present unknown.

M. Balansa in conclusion announces that he is about to start for the village of Gulet-Boghaz, the summer residence of the merchants of Tarsus and Adana, where he expects a rich harvest of Alpine plants. We heartily wish him good speed.

In the last number of the Edinburgh New Philosophical Journal, a scientific periodical conducted with great ability, there is a very interesting paper by Professor Goodsir, on the present state of our knowledge of the Electrical Phenomena observable in Plants. A subject of this kind is too remote from practical application, as far as has yet been ascertained, to be allowed much space in our columns; nevertheless it is so curious that we venture to draw up from Mr. Goodsir's narrative a slight sketch of what has been hitherto done, which will we doubt not prove interesting to many of our readers. It is now, we believe, more than 20 years since Donné, a skilful French experimentalist, directed his attention to the water plants called *Charads*, the movements observable in which had been supposed to be caused by electrical action. Dutrochet and Becquerel examined the same phenomena, and from time to time a variety of other desultory inquiries have been prosecuted. Among others our countryman, Mr. Thwaites, now in charge of the Government Botanic Garden in Ceylon, satisfied himself that the very fabric of a plant, its cells, and tubes, and vessels, was due to the action of electrical currents among mucous matter.

The facts collected by Mr. Goodsir present something more tangible than speculation. For although, as he remarks, the researches themselves are not yet sufficiently advanced to admit of a satisfactory analysis, and electrical effects are so complex that it is unsafe to draw any conclusion regarding the part which electricity takes in the organic functions, nevertheless certain facts have now been positively ascertained, although there remains much difficulty in determining whether certain currents, indicated by the instrument, are primary or derived; and also in ascertaining how far the observed currents are produced by unavoidable injury of texture, and consequent mixture of fluids.

The general arrangement of the parts of a plant, and the functions they perform, indicate the probable direction of the resulting electrical disturbances. The differences in the constitution of the ascending and descending portions of the axis, and of their transverse segments, naturally indicate the existence of longitudinal currents; while the structural and functional differences between the central and superficial portions of the axis point to transverse or radiating lines of force. Accordingly, all observations indicate currents in the longitudinal and transverse direction, in roots, tubers, stems, leaves, flowers, and fruits.

In considering *the electrical reactions of the plant, soil, and atmosphere*, it is found that the soil is in a constant negative, while the air when calm and free from clouds is in a positive electric condition.

According to Pouillet, plants in the later stages of germination, after they have protruded from the soil, exhibit by the condenser an excess of negative electricity. The explanation he gives is that the action of the oxygen of the air on the starch of the seed, during its conversion, gives an excess of positive electricity to the air, and of negative electricity to the plant and soil.

But according to M. Becquerel the electrical relations of the plant to the soil and air are reversed after germination is completed. If the electrodes of the galvanometer are inserted, the one into the stem or branch, or passed through a number of leaves laid together, but still adherent—the other into the soil—the former will exhibit an excess of negative, the latter of positive electricity, in proportion to the humidity of the soil and the succulence of the plant.

It may, therefore, be presumed that in the act of vegetation, after germination is accomplished, the ascending sap, which communicates by means of the root with the soil, conveys to it continuously the excess of positive electricity which it has acquired during its course upwards in its reactions more particularly with the descending sap; while the latter furnishes to the air, by exhalation, its excess of negative electricity.

As regards *longitudinal electrical currents in the Dicotyledons* Becquerel states that if the electrodes of the galvanometer be inserted transversely into the parenchyma of the bark, the one a certain distance above the other, or if one be inserted between the bark and wood, and the other be passed through a number of leaves, superimposed and still adherent, the needle will indicate a current passing from below upwards through the parenchyma, the upper electrode indicating positive, the lower negative electricity. The same observer also finds a descending current passing from the stem through the roots into the earth, which therefore becomes positive around the plant. Wartmann states that in the roots, the stem, the branches, the petioles, and peduncles, there exist a central descending current, and a peripheral ascending one, which he denominates axial currents; and that the galvanometer indicates currents from every part of the plant, aerial or subterranean, to the soil, which is thus positive in relation to the plant.

A variety of experiments show that electrical *currents pass from within outwards, and from without inwards in the horizontal section of Dicotyledons.* According to Becquerel, if one electrode be inserted into the pith of a young Poplar and the other into one of the woody layers, or into the bark, a current from without inwards is indicated, the electrode in the pith being positive, that in the wood or bark negative. On removing a piece of bark, and applying the electrodes to its opposite surfaces, the current becomes very intense. The piece of bark thus forms a voltaic couple, of which the exterior is positive, and the interior, covered by cambium, negative.

It would appear then that from the pith to the cambium the woody layers are less and less positive in relation to the pith; whilst from the cambium to the cuticle, the parenchymatous layers are more positive, or at least comport themselves as such in the production of derived currents. This inversion of the electrical effects corresponds with the relative position of the cellular texture in the bark and wood. In the bark it is on the exterior; in the wood, in the interior; in both it is positive.

Wartmann states that "in uniting by the galvanometer the layers of the stem where the liber and cambium touch one another (and where many botanists admit a passage of descending juices), either with the most central parts (the pith or the perfect wood), or with the parts more exterior (the young bark), a lateral current will be found tending from these layers to the neighbouring organs."

It would appear, therefore, that currents pass from the contiguous surfaces of the bark and wood of the dicotyledonous plant outwards towards the cuticle, and inwards to the pith.

As to *currents in leaves* the observations of both Becquerel and Wartmann lead to the conclusion that currents set from the cambium to the parenchyma of the leaf; while at the same time it is negative in relation to the pith and wood of the branch and stem, the leaves behaving as the green part of the parenchyma of the bark; that is to say, the sap which circulates in their tissues is negative in relation to the wood, pith, and soil, and positive in relation to the cambium.

This centripetal current is referable to the central or descending axial current of the plant; while the centrifugal belongs to the superficial transverse system, or that between the inner and outer aspects of the bark.

That *the electrical condition of the flower* must be energetic is to be inferred from its rapid growth. The remarkable elevation of temperature which occurs during the development of this organ, and the important chemico-vital actions which take place in it, should certainly excite corresponding electrical phenomena. Nevertheless, almost nothing is known on the subject. The only observations are by the Italian observer Zantedeschi, who found that at the period of flowering in the Tulip, Jonquil, and Anemone a descending current occurs, and in an Azalea, an Amaryllis, a Lily, and various species of Opuntia, a current passing from the stamen to the pistil.

The *electrical condition of the fruit* has been as little investigated. Donné found that in the Apple and Pear a current would appear to pass from the stalk towards the eye; whilst in the Peach and Apricot the current passes in the contrary direction. Mr. Goodsir remarks that it might be well to determine how far these opposite directions may be referable to structural differences in the two fruits examined: whether in the monocarpous form, the Peach, the current be not referable to the centripetal current of the leaf; and whether in the Apple form (the fleshy mass of which is not a development of the carpellary leaf, but of the cortical layer of the receptacle, and of the end of the peduncle) it is not due to the same causes which produce the general superficial, or cortical axial current in the plant.

An important question connected with these observations is whether *the currents are derived from currents which actually exist in the plant, or are produced by the insertion of the electrodes?* M. Becquerel expresses himself very cautiously on this point. He, however, admits that the two necessary conditions for the production of primary currents exist in the plant. The first is, that two liquids capable of acting chemically on one another should be arranged so as to do so gradually and continuously. The other is the intervention of a conducting substance to complete the circuit. Upon the whole this observer seems inclined to admit the two axial currents, and the horizontal system in the stem and branches of dicotyledons.

Wartmann admits that the tearing of the tissues during the insertion of the electrodes produces at first a considerable deflection of the needle, but adds that this action speedily ceases, when there remains a more feeble current, which must be due to the normal electrical action of the parts. He thinks that vegetable currents probably form closed circuits; that the extremities of the root fibres on the one hand, and the terminations of the leaves on the other, establish a continuity between the ascending peripheral and descending central current; while the similarity in the electrical condition of the exterior of the bark and the interior of the wood probably depends on the medullary rays.

As a general conclusion to be drawn from such facts as have been now described, Mr. Goodsir thinks it can only be stated generally that the disturbance of electric equilibrium in the textures and organs of the plant is due to the chemical action which plays so important a part in the organic processes — at its surface, as during transpiration, respiration proper, and the fixation of carbon—and in its interior, during the reaction of its ascending and descending sap, with the substances contained in the cells of its various structures. No precise statement can be made at present regarding the arrangements by means of which electrical currents are produced in the plant. The researches of Becquerel have proved indeed that a current is produced when two liquids of acid and alkaline reactions respectively, and separated from one another by a porous substance, are connected either by a fluid or solid conductor, and it is evident that similar physical and chemical conditions exist in innumerable forms in the organisation of vegetables. "It is, however, impossible in the present phase of the subject to define them with greater precision."

NEW GARDEN FERNS.—No. VI.

15. Lastrea recedens, J. Smith, MS. Polypodium recedens, J. Sm., En. Fil. Phil., Hook. Journ. Bot. iii. 394. Lastrea elegans, of gardens.

Fronds pentangular, densely pubescent, glandulose, tripinnate; pinnules linear-oblong, acute, decurrent, deeply pinnatifid, with short dentate segments; sori submarginal; stipes adherent to a creeping rhizome.

This very elegant Fern is a native of Ceylon and the Philippine Isles; the cultivated plant was sent from the former place, by the late Dr. Gardner, to Kew. Its fronds which have a longish stipes, scaly at the base, grow a foot and a half or two feet high, and are of a light green colour, densely covered with short hairs intermixed with glands. The outline is pentangular, the two

posterior basal pinnules being considerably enlarged; the secondary pinnules are oblong, or linear oblong acute; they are pinnatifid, with short toothed segments. The sori form a line around the margin of these segments, where they are produced abundantly. The rhizome is creeping, and the fronds are lateral and adherent to it, and grow up erect, with the leafy portion spreading. It is a free-growing evergreen stove Fern.

16. Drynaria Fortuni, T. Moore, Genera and Species of Cultivated Ferns, ined.

Fronds simple, lanceolate attenuate, subcoriaceous, somewhat undulated, smooth, punctulate with transparent dots; sori on the upper part of the frond, uniserial near the costa; stipes articulated with a creeping scaly rhizome.

An elegant simple-fronded evergreen species, with the appearance of a slightly undulated narrow Scolopendrium. The fronds are a foot or more in length, narrow strap-shaped lanceolate, attenuated both at the base and

apex, bright green, entire or subsinuate and slightly wavy, smooth, punctulate with transparent dots which indicate the apices of the free included veinlets. The fronds taper below into the sparingly scaly stipes, which is lateral and articulated on a slender creeping rhizome. The sori form a single row of round dots near the costa on the upper part of the frond. This Fern was sent to us some years since by Mr. Henderson, of Wentworth. It is, no doubt, a native of China, agreeing as it does with specimens (No. 18) collected by Mr. Fortune during his second journey in that country. It succeeds very well in a greenhouse, and equally well in the stove.

17. Davallia tenuifolia, Swartz, Synopsis Filicum, — 133, 350; Hooker, Sp. Fil. i., 186.

Fronds erect or arching, ovate-lanceolate, elongate, smooth, subcoriaceous, bi- or tripinnate, with the rachis compressed or winged; ultimate segments crowded, linear, wedge-shaped, truncate, bifid or slightly erose; sori terminal across the truncated apices of the segments, short oblong, single or in pairs.

This plant, common in all dried collections, and there rather remarkable for its stiffness combined with elegant cutting, is in the cultivated state one of the most graceful of Ferns, its long finely divided fronds assuming the pendent position which best displays the elegant manner in which it is divided. The colour is a bright cheerful green, and the fronds grow 2 feet long; their pinnæ are ovate-lanceolate, twice cut into distinct divisions, and the second of these

again deeply separated into wedge-shaped segments; the entire frond is made up of a multitude of these narrow wedge-shaped segments, which have a truncated apex, across which, at the back, the short transversely oblong sori are borne; these apices are in general slightly notched. When present the sori are seated within little hollow cup-shaped involucres at the points of the segments. This very ornamental Fern was introduced from Java by the Messrs. Rollissons in 1851, and is still rare in gardens. It is an evergreen species requiring stove heat. *T. M.*

HORTICULTURAL SOCIETY OF LONDON.

The following circular has just been issued by the Council:—

21, Regent Street, *October* 23.

In the annual report made by the Council at the last anniversary, the attention of the Fellows was directed to the very serious fact that, during the previous three years, the income of the Society had been unequal to its expenditure, and that as much as 1250*l.* had been added to the debt during the year 1854-5. At the same time a hope was expressed that the causes which brought about so large a deficiency would prove temporary.

The Council have now, however, with very great regret, to report that this hope has proved fallacious, and that the debt will have been found to be again considerably increased before the close of the present year, if the present establishments of the Society are maintained in their integrity.

It has been annually shown by the printed reports that the principal source of income, since the year 1833, from which the garden has been maintained, was the Exhibitions there, the net produce of which was as much as 3024*l.* in the year 1844. This fund has been gradually diminishing. In 1853 it was 1715*l.*, in 1854 only 455*l.*, and in the present year, instead of yielding any increase, the exhibitions have been productive of a loss estimated at about 300*l.*

After giving this subject the best consideration in their power, and consulting Fellows upon whose judgment they are disposed to rely, the Council have arrived at the conclusion that the garden exhibitions will not be profitable in future. The distance of the situation from the metropolis deters visitors from repairing to Chiswick as formerly, when no similar meetings were held in places of more ready access. Nor can it be doubted, that the proximity of the great Government garden at Kew, accessible as it is by railway and water, and with whose attractions it is hopeless to contend, annually renders the Society's garden of greatly diminished interest. Under these circumstances the Council have no alternative but to reduce the latter establishment within very narrow limits, if not to relinquish it altogether; and, at the same time, to realise some at least of the valuable property accumulated there towards liquidating the debts of the Corporation.

The history of the Society clearly shows that it was in its most flourishing state in the year 1821, at which time its operations were confined to the encouragement of horticulture by rewards, and the publication of its transactions, to exhibitions in London, to the distribution of seeds, &c., obtained from its correspondents, and to the maintenance of a small and unexpensive garden. The subsequent enlargement of the Society's undertakings, successful as they have been for a time, have ultimately proved beyond its resources; but the Council hope, and confidently expect, that by reverting to the system of 1821 the Society may be restored to its former prosperity; and by restricting themselves to the encouragement of its original objects, its utility and popularity may be maintained undiminished.

The Council are now engaged in a careful consideration of the manner in which these great changes can be best effected, as well as of the alterations which may be consequently necessary in the rate of subscription of the Fellows. Immediately after their plans shall have been matured, they will be submitted to the sanction of a general meeting. In the meantime, in order not to lose the present season, the Council have ordered an immediate sale of stove plants—the continued cultivation of which even through the ensuing winter would cause a needless increase to the Society's debt—and of some other portions of the Corporation property, such as herbaria, &c., which can be disposed of without detriment to the efficiency of the Society.

Signed by order of the Council,

John Lindley, *Vice Secretary.*

It will be seen by an announcement in another column that this decision is about to be carried into immediate effect, and that the 7th of November will witness the sale of some of the finest plants in Europe.

VEGETABLE PATHOLOGY.—No. XCIII.

374. Caries (*Decay*).—Though the vascular tissue is peculiarly subject to that incipient decomposition of its lining membrane, or even of the walls themselves, which under aggravating conditions leads to general decay, the cellular tissue is sometimes affected in a similar manner, while the vessels are wholly or nearly intact. One of the most curious instances is that affection of Apples, especially of Ribstone Pippins, though not confined to that variety, for I have observed and studied it in the Golden Reinette, Golden Harvey, and some other kinds, which is commonly attributed to the attack of worms, insomuch that they are called worm eaten, and in some cases present on a section an appearance not unlike that of an Oak Apple. I have, however, frequently hunted, with high and low microscopic powers, for some insect growth without ever being able to find a trace of any parasite; nor is there the slightest indication of mycelium. The affected fruit is generally slightly mottled in the first stages of the disease with pale brown, depressed, irregular, uneven spots; but these are not always very manifest, and many of the diseased specks are quite independent of the cuticle. In a later stage the surface assumes a darker hue, and exhibits evident symptoms of approaching decay, and the affection is then scarcely distinguishable externally from that form of common rottenness to which the name of tacked is vulgarly given. A section exhibits a multitude of little reddish brown patches, some of them penetrating deeply into the substance of the fruit, and of a paler or deeper tint, according to the degree in which the individual cells are detached from each other. A common lens exhibits little masses of loose discoloured tissue with darker lines, which are due to the commissures of diseased cells, and are not, as might at first be supposed, minute vessels. Higher powers bring no marked phenomena to light. The cells, in consequence of their shrunk and withered condition, are traversed by abundant folds, which must be carefully distinguished from fungal threads; the walls themselves are here and there deeply discoloured, the endochrome partakes of the same brown ulmic tinge, but there are still numerous starch globes which betray no discoloration, and assume a beautiful violet tinge on the application of iodine. The cells which border on the patches are on the contrary as healthy as if not a single cell were affected. The resemblance of such a section to that of a Potato under the influence of the Potato-murrain is very striking, but I can vouch for the fact that the disease was known long before that of the Potatoes ever made its appearance in England. The malady seems to be essentially constitutional, being much more common in some varieties than others, but it is certainly more frequent in ungenial seasons, characterised by much wet and little sunshine.

375. This affection it should be observed is totally distinct from ordinary cases of decay, which depend upon a variety of causes, as external injuries and the consequent admission of the spores of parasitic fungi, or from the attacks of such fungi as Spilocæa, which lift up the cuticle and admit the weather to the exposed tissues beneath. It is distinct too from all cases of bletting, which takes place occasionally in Apples and other fruits which are not in general subject to the affection. Like so many other similar maladies it commences simultaneously at a number of points, without, however, our being able to ascertain why those should be more unable to resist disease than others. It is, too, perfectly distinct from a peculiar form of decay in which the fruit becomes gradually hard and of a deep brown or black tint, without any lesion of the outward surface. In such cases I have sometimes found a minute black parasite, and an extensive deposit of dark-coloured fungal cells beneath the cuticle. I do not, however, consider the fungus as necessarily connected with the decay, but rather as an aftergrowth when decomposition has already taken place. *M. J. B.*

SUBTERRANEAN IRRIGATION.

Permit me to furnish you with a short account of a lecture which was delivered on Monday last in the Town Hall of Reading, by Mr. Wilkins, relative to his peculiar system of subsoil irrigation, which promises, or rather has already produced, such astonishing results.

A part of the produce of his experimental garden at Caversham was exhibited. The lecturer, apparently a confident and energetic man, elucidated in an able manner the many advantages to be derived from his peculiar system of cultivation; and indeed his discourse was not based on theory alone, for a comparison between his crops and others grown in the ordinary manner was most surprising and conclusive. I need not however enumerate the many and extraordinary examples (as there exhibited) of the superiority of his productions compared with those cultivated in the usual manner, as this will no doubt be more fully dwelt upon by more competent men, suffice it to say that all the articles exhibited (which had been previously taken from the garden in the presence of both scientific and practical men) were doubly and in several cases trebly superior to those produced by the ordinary system of cultivation.

I cannot omit mentioning, however, one example in the shape of a single Potato which had been grown the previous year on this system, and which being planted this season on the same plan produced the astonishing number of 101 Potatoes weighing 24 lbs., all of them perfectly free from disease or the slightest symptom of deterioration. Now this is a truly interesting fact, for if we reflect on the subject, as the lecturer stated, we will find that seven such roots of Potatoes would fill an ordinary sack. Mr. Wilkins dwelt at some length on this circumstance, it being his opinion that Potatoes grown on this system are not only doubly productive, but that they contain a far greater proportion of vegetable and reproductive matter than those cultivated in the ordinary manner, and the theory is certainly borne out in the case of the single Potato grown in the experimental garden above alluded to.

This solitary instance of extraordinary fecundity is, however, scarcely sufficient to convince us that we may rely with confidence upon a repetition of the like abundance (although Mr. Wilkins is very sanguine in the matter) from a crop of these Potatoes in the coming year. I hope however that his anticipations on this important subject may be realised. His explanations were attentively listened to by a very respectable audience, and the lecturer, together with his productions, met with frequent and well merited rounds of applause.

He also exhibited some elegant patterns of candelabra and vases for the cultivation of choice plants either in the parlour or drawing-room, adapted for holding liquid manure, without the slightest smell or inconvenience arising therefrom.

The lecturer also purposed to form a fund with the proceeds of his system to educate orphans of soldiers killed in the present war! Altogether he seems actuated by no pecuniary consideration, but appears to be prompted solely by a spirit of philanthropy to interest himself in the welfare of his countrymen.

That immense advantages may be derived from his particular mode of culture no one who has seen his produce can possibly doubt; let me therefore conclude by wishing him success, and in the hope that he may live to see the full realisation of his projects, let me bid him "Go on and prosper." *J. H. C., Strathfieldsaye.*

Home Correspondence.

Management of Roses in Beds.—Mr. Rivers in his new catalogue now before me recommends dwarf Roses forming beds or groups to be transplanted and highly manured annually, and after some experience I am convinced that this is the only method by which free growth and an abundant bloom can be maintained. It is deplorable to observe how soon and how certainly Roses (unless under very favourable circumstances) deteriorate when left to themselves or to the culture generally bestowed on them, and to remark how unlike the beauteous objects first planted a few years of neglect makes them. Now the remedy for this great evil being so simple and within the reach of all, surely we may expect to see it generally adopted, and for the guidance of those about to adopt such treatment, I may repeat that no renewal of the soil or change of site is necessary, but that careful taking up, well manuring, and careful replanting at this the proper season is all that is requisite. Plants neglected and that have been stationary for a number of years may experience some check on such transplanting, but when it becomes annual the very reverse is the case, and increased luxuriance the invariable result. Where pegging down the shoots, so as to cover the entire bed or borders, is practised (and an admirable practice it is) this treatment will not apply, but 2 or 3 inches of good rotten manure over the entire bed in autumn will answer the same purpose for many years. *J. M., Folkestone.*

Dioscorea Batatas.—Our gardener has managed to grow larger specimens of this Yam than either of your correspondents, who detailed their experiences in your Paper of Saturday last; but now he does not know

whether to take them up or leave them through the winter where they are, giving them the protection of a frame. Will you kindly inform him how to proceed? *A Novice.* [Take them up and keep them in dry river sand.]

Transplanting Machines.—Your paper of the 8th ult. contained an article on this subject from "T. C., Tadcaster." From a perusal of this article as well as of that from Mr. Barron (see p. 646), I am induced to offer a few remarks, omitting at the same time the statements of both which do not bear directly upon the question at issue. Mr. Barron says "Mr. Cowlishaw, who built the Kingston machine, adopted some trifling alteration in trussing the beams," &c. Here there is evidently some little mystery which a discerning public will infer to be the improvements alluded to by "T. C." Some other machines have since been built by Mr. Barron; two of these are quite different from any of the former ones; but the last, No. 6, is the best. Hence it appears that in the early experiments Mr. Barron, though he fully established the excellence of his invention, by no means hit upon the best mode of applying it. This fact alone serves to prove that there were defects in the original machine; and, in my view of the matter, on these defects the alleged improvements must have been founded. It is, however, evident that Mr. B.'s machine, with its recent improvements, is of equal merit with any other now in use; but, at the same time, permit me to remark that (his) Mr. Barron's manner of bearing since this subject came under notice is that of one who would seem to say—"I am here alone, and besides me there is none other." The effect of this manner of expression will be to shake people's confidence in his better judgment. *J. R., Berkshire.*

Australian Passiflora.—Pray inform me whether the fruit of this plant is eatable. In Portugal they preserve the fruit of a species of Passion flower, which is much liked; in the language of the country they call it maracuja. *A Novice.* [We do not think it is eatable, although it does smell like Melons. It is however very handsome.]

The Papaw (see p. 679).—I am glad to see in your Paper an account of experiments respecting the supposed influence of the Papaw on meat. I used often to hear it asserted in the West Indies that meat hung up in the tree became tender in a shorter time than it otherwise would have done, but do not remember having met any one who had tried it sufficiently carefully. I think that there is evidence to induce one to suppose that the mere process of decomposition of animal or vegetable matter has a tendency to promote the growth of adjoining plants independently of the influence of their component parts as manures. May not the growth of a vigorous vegetable, on the other hand, have a tendency to promote decomposition in the dead animal or vegetable matter near it? I wish also to ask for some information respecting a very ornamental plant, which I have not lately seen, and should be glad to procure. I used to know it by the name of Fumaria scandens, but I do not know where the name came from. It was a biennial climber, in habit not much unlike the British Corydalis claviculata, but the leaves and whole plant larger, and the flowers very much larger and of a very pale fawn colour. *C. W. Strickland, Hildenley.* [This plant is now called Adlumia cirrhosa; and is a native of the United States.]

Large Gourds.—Has any correspondent seen a Gourd of the following dimensions—viz., 5 feet 10 inches round, weight 124 lbs., as grown at the gardens of H. S. Thompson, Esq., Kirby Hall, near York? *J. M.* [This is not at all remarkable. On the 6th Nov., 1827, a specimen was exhibited by Mr. Cresswell weighing 136 lbs.; on the 6th Dec., 1831, another was produced by the Rev. H. Wise, of Leamington, weighing 153 lbs.; and on the 21st Oct., 1834, the then gardener of Lord Rodney showed one weighing 212 lbs., and measuring 8 feet in circumference.]

Shell Rain in the Isle of Wight.—Will you kindly favour me with some information respecting the history of the inclosed, which fell in countless numbers during a thunderstorm which passed over Osborne a few days ago. *C. Winchester, Osborne.* [It is a little landshell, called Zua lubrica, common under stones and among Moss all over the north of Europe. The shower which fell at Osborne must have been carried by some violent storm. Can any correspondent suggest where the Zua can have been found by the storm in sufficient quantity?]

The Mis-called Cholera Flies.—It may be remembered that this time last year I took occasion to combat the prevalent opinion that swarms of Aphides, which had been observed in various places in the early part of the autumn were the precursors and even the originators of the cholera. I find that during the present autumn—although it has pleased the Almighty to avert from us this dreadful scourge—yet the Aphides have been pursuing their ordinary habits, immense swarms of them having been recorded in the local journals as having appeared in various parts of Gloucestershire. This I trust will be considered as completely justifying and confirming my previous remarks, so that we shall hear no more of cholera flies. *J. O. Westwood.*

Trenching and Grubbing up an Old Shrubbery.—An old shrubbery here having been much neglected from want of timely thinning, weeding, &c., it is proposed to root out all except a tree or shrub here and there, and to trench the ground in order to prepare it for planting again with a selection of the recently introduced trees and shrubs. It will therefore oblige me if any of your correspondents would kindly instruct me as to the depth the ground should be trenched, and at how much per square yard the work should be done, including of course the stubbing up of the old shrubs, chiefly Lilacs and common Laurels. *Colo.*

Seedlings from the Fluke Potatoes.—I have sent you leaves and flowers of seedling Fluke Potatoes, more as a novelty at this season, than that any good inferences may be drawn from them, but as you may not have seen anything like them so late from the open air for these last 10 years, it may serve to encourage the hope that the period is not far distant when the Potato will grow and ripen as it was wont to do. Seed having been saved from the above-named sort last autumn, the haulm of which remained green upwards of three months after the disease was first seen in the gardens here, the seed was sown in heat early in spring, and the young plants were turned out early in May on a wall border. They are still growing, having withstood the disease with the exception of a few spots, which made their appearance on the 9th of August; but for the last six weeks the plants have been growing clean and healthy, and have every appearance of yielding a large crop, as some of the stems exceed 5 feet in length. I have some hope that the seedlings may prove even hardier than their parent, and better adapted for resisting the evil. Besides the other good qualities the Fluke possesses, I think it the best to raise seedlings from. *J. Webster, Gordon Castle, Fochabers.* [The leaves and flowers in question, though a little bruised from travelling, exhibited every appearance of freshness and vigorous health.]

Cucumber growing.—At p. 693 of last week's Paper, "T. P." says that he has cut from one plant of Sutton's Berkshire Champion Cucumber, 112 feet of fine fruit. Allow me to state that from four plants of Massey's Hybrid Cucumber there have been cut this season 300 fine fruit, measuring on an average 14 inches in length each. The above is the earliest and most prolific Cucumber I have seen in cultivation. *J. M., Kirby Hall, near York.*

Vine Mildew.—Having a late Vinery (with a flower garden in front of it) which is used for storing plants in during winter and late in spring, I was much troubled for five years with mildew, but this I kept under by means of constant applications of sulphur. I then gave air by the front sashes, as well as by the top ones. For the last three seasons I have never given any air by the front sashes till the Grapes were colouring, and I have not seen a spot of mildew. I have a good crop of well coloured fruit at the present time. It occurred to me that by giving front air, the wind passing over the flowers, such as Verbenas, &c., and then entering the house by the front sashes, spread destruction on every side, for since I have not given front air from the time the Vines are in leaf till the Grapes are colouring, I have not, as I have stated, seen a spot of mildew. *James Shrimpton, Gardener to A. J. Doxat, Esq., Putney Heath, Surrey.*

People's Park, Sunderland.—Permit me to furnish you with a plan of this so-called park, which has been stated to be unsurpassed by any in England. It lies about half a mile from Sunderland; and the road to Stockton-on-Tees, which passes through it, divides it into nearly equal parts. On the west side, which comprises about 6 acres, no trees or shrubs have been planted, nor yet walks formed, but it has been partly levelled and grassed over preparatory to Mr. Smith's operations in laying it out. The east side contains 6½ acres (the back and front of quarry), of which 4½ acres only are laid out; and in front of the quarry they were planted with Poplars of sorts, Elm, Ash, Alder, a few Scarlet Thorns, Ribes, and Lilacs, &c. Now, where are the 15 acres laid out? and let me ask, What is there about this park to make it rank with any public grounds in England? The errors committed in laying it out, and the bad judgment exhibited in planting it are so glaring, that I leave it to you to say whether "J. S." or "Medicus" are nearest akin to the long-eared gentleman which was tethered in the park. When it is known that this park has cost upwards of 2000*l.* in its formation, it will at once be evident to a discerning public that more money than judgment has been displayed in the grounds. With respect to Mr. Smith, I know him not; and in justice to Mr. Lawson, a gardener in Sunderland, who has been set down as the writer of my former statement, allow me to assert that he is perfectly innocent of the charge. *J. S.* [We have received the plan alluded to in this communication. The ground seems to be extremely irregular and uneven, which renders it impossible to form a correct opinion of the taste or want of taste displayed by the landscape gardener of the corporation, especially as the plan itself is not accompanied by any scale, nor drawn so as to give sections of the surface. Judging from the slight evidence before us, we should suppose that the walks are very well traced, that the clumps are ugly, and that the plants selected might have been better chosen].——"Fortunatus" says this is not a park, nor yet a garden, because in June it only contained one bed of Dahlias. An economical old lady might equally object that it was not a garden because it did not contain Cabbages. We are told the walks are carried along the lowest levels. Some of them are, but I wonder what sort of a level that is from which the town, harbour, and miles of sea and country can be seen. Already there is more than one such walk, and when the south side of the hill is laid out a finer and more extended sea and land view cannot be had in the north. With regard to the laying out of the walks, the formation of the mounds, &c., it is sufficient in reply to state that the Government inspector, — Ranger, Esq., on officially surveying the grounds, highly approved of all that had been done, and complimented the parties concerned upon their judgment and taste. If "Fortunatus," or "J. S.," instead of a hasty evening visit would spend some hours in it daily as I did, they would find that the "Poplars" include Arbutus, Evergreen Oaks, Laurustinus, Hollies, common Laurel, Portugal Laurel, Yews, Rhododendrons, Azaleas, &c., &c. In conclusion I would remind "J. S." and "Fortunatus" that shrubberies and parks are not like market gardens, which may be laid out and perfected in a season; years are sometimes required to perfect and bring out their beauties. How improper then from a mere flying visit to a place only in process of formation to speak of it in the manner they have done. I know not who your correspondents are, but I strongly suspect that their legitimate sphere is the kitchen garden; here they might be much more at home and much better able to criticise than on a piece of landscape gardening. *Medicus.*

Notices of Books.

Eight Years' Wanderings in Ceylon. By S. W. Baker, Esq. Longman. 8vo, pp. 423, with lithotints and woodcuts.

It appears that Mr. Baker is resident in Ceylon, and that his remarks express the opinions of one capable of forming a correct judgment both of what that fine island is able to produce, and of the wisdom of the measures of the British Government in developing its resources. On neither does he pronounce a favourable judgment. The acts of the government are represented to be feeble and injudicious, and the land is said to be anything rather than the mine of riches which some have reported it to be.

"The appearance of the latter," says the author, "has deceived everyone, especially the black soil of the patina, which my bailiff on his first arrival declared to be excellent. Lord Torrington, who is well known as an agriculturist, was equally deceived. He was very confident in the opinion that 'it only required draining to enable it to produce anything.' The real fact is that it is far inferior to the forest land, and will not pay for the working. Nevertheless, it is my decided opinion that the generality of the forest land at Newera Ellia and the vicinity is superior to that in other parts of Ceylon. There are necessarily rich lots every now and then in such a large extent as the surface of the low country; but these lots usually lie on the banks of rivers which have been subjected to inundations, and they are not fair samples of Ceylon soil. A river's bank or a valley's bottom must be tolerably good even in the poorest country. The great proof of the general poverty of Ceylon is shown in the failure of every agricultural experiment in which a rich soil is required. Cinnamon thrives; but why? It delights in a soil of quartz sand, in which nothing else will grow. Cocoa-nut trees flourish for the same reason; sea air, a sandy soil, and a dry subsoil are all that the Cocoa-nut requires. On the other hand, those tropical productions which require a strong soil invariably prove failures, and Sugar, Cotton, Indigo, Hemp, and Tobacco, cannot possibly be cultivated with success. Even on the alluvial soil upon the banks of rivers, sugar does not pay the proprietor. The only sugar estate in the island that can keep its head above water, is the Peredenia estate, within four miles of Kandy. This, again, lies upon the bank of the Mahawelli river, and it has also the advantage of a home market for its produce, as it supplies the interior of Ceylon at the rate of 23*s.* per cwt. upon the spot. Any person who thoroughly understands the practical cultivation of the Sugar-cane can tell the quality of sugar that will be produced by an examination of the soil. I am thoroughly convinced that no soil in Ceylon will produce a sample of fine straw-coloured, dry, bright, large crystallised sugar. The finest sample ever produced of Ceylon sugar is a dull grey, and always moist; requiring a very large proportion of lime in the manufacture, without which it could neither be cleansed nor crystallised. The Sugar-cane, to produce fine sugar, requires a rich, stiff, and very dry soil. In Ceylon there is no such thing as a stiff soil existing. The alluvial soil upon the banks of rivers is adapted for the growth of Cotton and Tobacco, but not for the Sugar-cane. In such light and moist alluvial soil the latter will grow to a great size, and will yield a large quantity of juice in which the saccharometer may stand well; but the degree of strength indicated will proceed from an immense proportion of mucilage, which will give much trouble in the cleansing during boiling; and the sugar produced must be wanting in dryness and fine colour. There are several rivers in Ceylon whose banks would produce good Cotton and Tobacco, especially those in the districts of Hambantotte and Batticaloa; such as the 'Wallawé,' the 'Yallé river,' the 'Koombookanaar,' &c.; but even here the good soil is very limited, lying on either bank for only a quarter of a mile in width. In addition to this, the unhealthiness of the climate is so great that I am convinced that no European constitution could withstand it. Even the natives are decimated at certain seasons by the most virulent fevers and dysentery."

"In fact, nothing will permanently succeed in Ceylon soil without abundance of manure, with the exception of Cinnamon and Cocoa-nuts. Even the native gardens will not produce a tolerable sample of the common sweet Potato without manure, a positive proof of the general poverty of the soil."

"Can any man, when describing the 'fertility' of Ceylon, be aware that newly cleared forest-land will only produce one crop of the miserable grain called korrakan? Can he understand why the greater portion of Ceylon is covered by dense thorny jungles? It is simply this, that the land is so desperately poor, that it will only produce one crop, and thus an immense acreage is required for the support of a few inhabitants; thus, from ages past up to the present time, the natives have been continually felling fresh forest and deserting the last clearing, which has accordingly grown into a dense thorny jungle, forming what are termed the 'Chénars' of Ceylon. So fully aware are the natives of the impossibility of getting more than one crop out of the land, that they plant all that they require at the same time. Thus may be seen in a field of korrakan (a small grain), Indian Corn, Millet, and Pumpkins, all growing together, and harvested as they respectively become ripe."

This is by no means encouraging to an emigrant. And then Mr. Baker goes on to say that the attention of the Colonial Government is wholly absorbed by Coffee cultivation, to the total neglect of Rice, the great staple of the island.

"Nevertheless, the great capabilities of Ceylon for the cultivation of this all important 'staff of life' are entirely neglected by the government. The tanks which afforded a supply of water for millions in former ages now lie idle and out of repair; the pelican sails in solitude upon their waters, and the crocodile basks upon their shores; the thousands of acres which formerly produced Rice for a dense population, are now matted over by a thorny and impenetrable jungle. The wild buffalo descendant from the ancient stock which tilled the ground of a great nation, now roams through barren forests, which in olden times was a soil glistening with fertility. The ruins of the mighty cities tower high above the trees, sad monuments of desolation, where all was once flourishing, and where thousands dwelt within their walls. All are passed away; and in the wreck of past ages we trace the great resources of the country which produced sufficient food to support millions; while for the present comparatively small population, Ceylon is dependant upon imports."

"These tanks are of various extent, and extremely numerous throughout Ceylon. The largest are those of Minneria, Kandellai, Padavellkiellom, and the Giant's Tank. These are from 15 to 25 miles in circumference; but in former times, when the sluices were in repair and the volume of water at its full height, they must have been much larger."

"In this manner was the greater portion of Ceylon kept in the highest state of cultivation. From the north to the south, the island was thickly peopled, and the only portions which then remained in the hands of nature were those which are now seen in the state of primeval forest. Well may Ceylon in those times have deserved the name of the 'Paradise of the East.' The beauties which nature has showered upon the land were heightened by cultivation; the forest-capped mountains rose from a waving sea of green; the valleys teemed with wealth; no thorny jungles gave a barren cast to the interminable prospect, but the golden tints of ripening crops spread to the horizon. Temples stood upon the hill-tops; cities were studded over the land, their lofty Dagobas and palaces reflected on the glassy surface of the lakes, from which their millions of inhabitants derived their food, their wealth, and their very life. The remains of these cities sufficiently attest the former amount of population, and the comparative civilisation which existed at that remote era among the progenitors of the present degraded race of barbarians. The ruins of 'Anaradupoora,' which cover 256 square miles of ground, are all that remain of the noble city which stood within its walls in a square of sixteen miles. Some idea of the amount of population may be arrived at, when we consider the present density of inhabitants in all Indian houses and towns. Millions must, therefore, have streamed from the gates of a city, to which our modern London was comparatively a village."

To the Coffee cultivation a chapter is devoted which will well repay perusal. It is, however, by no means the easy pursuit which some have imagined it to be, and which many have found terribly the reverse, as the ruin which some years since spread like a pestilence among the planters too plainly evinced. Nevertheless Mr. Baker reports that—

"There is no longer any doubt that a Coffee estate in a good situation in Ceylon will pay a large interest for the capital invested, and will ultimately enrich the proprietor, provided that he has his own capital to work his estate, that he gives his own personal superintendence, and that he understands the management. These are the usual conditions of success in most affairs; but a Coffee estate is not unfrequently abused for not paying—when it is worked with borrowed capital at a high rate of interest under questionable superintendence.

But he adds:—

"A rapid fortune can never be made by working a Coffee estate. Years of patient industry and toil, chequered by many disappointments, may eventually reward the proprietor; but it will be at a time of life when a long residence in the tropics will have given him a distaste for the chilly atmosphere of old England; his early friends will have been scattered abroad, and he will meet few faces to welcome him on his native shores. What cold is so severe as a cold reception?—no thermometer can mark the degree. No fortune, however large, can compensate for the loss of home, and friends, and early associations. This feeling is peculiarly strong throughout the British nation. You cannot convince an English settler that he will be abroad for an indefinite number of years; the idea would be equivalent to transportation: he consoles himself with the hope that something will turn up to alter the apparent certainty of his exile; and in this hope, with his mind ever fixed upon his return, he does nothing for posterity in the colony. He rarely even plants a fruit-tree, hoping that his stay will not allow him to gather from it. This accounts for the poverty of the gardens and enclosures around the houses of the English inhabitants, and the general dearth of any fruits worth eating. How different is the appearance of French colonies, and how different are the feelings of the settler! The word 'adieu' once spoken, he sighs an eternal farewell to the shores of 'La belle France,' and, with the natural light-heartedness of the nation, he settles cheerfully in a colony as his adopted country. He lays out his grounds with taste, and plants groves of exquisite fruit-trees, whose produce will, he hopes, be tasted by his children and grandchildren. Accordingly, in a French colony there is a tropical beauty in the cultivated trees and flowers, which is seldom seen in our own possessions. The fruits are brought to perfection, as there is the same care taken in pruning and grafting the finest kinds as in gardens in England."

It must be confessed that this is not complimentary to our countrymen. But we must pause; to return to these pleasant pages hereafter. We have only space to add that the reader who merely seeks for a few hours' amusement will find Mr. Baker's book full of entertaining anecdotes concerning the people, the hunting, the shooting, and all the out of door pursuits of beautiful Taprobane; while he who is seeking for an emigrant's home in a tropical island will gather a rich harvest of sterling information concerning the farming, the mining, and other industrial occupations of the island.

Garden Memoranda.

Messrs. Paul's Nursery, Cheshunt.—In addition to an extensive collection of Roses which this nursery is well known to contain, on visiting it the other day we noticed several other things to which attention may perhaps be usefully directed. In the herbaceous borders five or six varieties of Aster were literally masses of flower, rendering them almost as gay now as in the height of summer. A. multiflorus, a kind with Heath-like foliage and small white flowers, was especially conspicuous, and there were some blue sorts equally valuable for autumn decoration. Requiring as these plants do, so little care or labour in their culture, it is surprising that they are not more cultivated than they are. Anemone japonica and its paler-coloured hybrids are also plants that flower very showily at this season. A blue Sage, which we saw here, called Salvia Lilleana, might likewise be added with advantage to the winter garden. It is a hardy Continental kind, which is as yet but little known. Nor in looking for autumn flowering plants should Oxalis floribunda be forgotten, for it will keep in bloom from July up to Christmas; and where there is a little shelter what can be gayer at this season than O. Bowei, whose round bright rosy blossoms are as large as a shilling, and produced in such abundance as to be striking and effective even at a distance? This variety is however not so hardy as floribunda, and succeeds best on a warm dry border by the side of a wall. Tagetes lucida, with golden yellow flowers, is also a useful plant at this time of year, and to the above must likewise be added different sorts of Phloxes, some one or other of which is in flower almost every month in the season. With the above and Delphiniums, among which the beautiful D. Hendersoni is now in full beauty, a garden might be kept tolerably gay and cheerful at a time when otherwise there would be little to interest. The variegated variety of Arundo Donax is also a pretty plant well worth growing. It is, however, we fear scarcely hardy enough to stand our winters.

Of glass houses—of which there are several here, each devoted to one class of plants—a long span-roofed one was wholly filled with Hollyhocks in pots. These were some of the finer kinds, which are taken up from the open ground about the beginning of October. They are grown all winter under glass, and by spring they are sufficiently forward to supply a crop of cuttings before they are planted out again. Among these were the following first-class varieties, viz., Beauty of Cheshunt, light rosy red—one of the finest; Blushing Bride, delicate blush, spike handsome and compact; Charles Barron Improved, salmon pink; Darius, orange buff, large and showy; Diana, rosy peach edged with carmine, shape perfect; Glory of Cheshunt, clear yellow, spike large and handsome; Honourable Mrs. Ashley, peach shaded with lilac, one of the finest; Lizzy Improved, clear peach, similar in style to the last, but more brilliant; Lord Jocelyn, crimson and very fine; Louis Napoleon, silvery blush, veined with purple, and though not a show flower very effective; Magician, cherry, with dark maroon base; Memnon, beautiful light crimson, spike large and fine; Miss Ashley, light fawn, and handsome in shape; Narcissus, clear yellow; Queen Eleanor, bright rosy peach with silvery edges, quite new and distinct; Rosy Morn, bright rose; Solfaterre, lemon coloured, and good in form: Souvenir, purplish rose; Swansdown, white, edged with lake; and White Globe, pure white, large and compact. Several of the above have been raised from seed by the Messrs. Paul, who have been very successful in producing new and good varieties of Hollyhocks. The finer kinds are largely propagated here by eyes, which are taken off in summer and planted in a pit under glass in light sandy soil placed over a gentle bottom heat.

Of Rose blooms still in perfection many handsome bouquets might yet be gathered. Of old varieties still in flower were Hybrid Perpetual:—Baronne Prevost, Duchess of Sutherland of similar colour, but apparently a finer late flower; the glorious Géant des Batailles, and Mrs. Elliott, large rosy purple. Bourbon:—Dupetit Thouars, crimson; Justine, rose and prettily cupped; and Paul's Prince Albert, purplish crimson and a profuse late bloomer; China:—Mrs. Bosanquet, a fine late kind and President d'Obeque, cherry rose. Tea-scented:—Adam, fine large salmon rose; Safranot, buff with an Apricot coloured centre; Vicomtesse Decazes, yellow tinted with copper; and Narcisse, pale yellow, and a free bloomer. Noisette:—Caroline Marniesse, a creamy-white, which flowers in clusters; and Ophirie, copper-coloured, distinct and nearly evergreen.

Of newer kinds in bloom, there were Hybrid Perpetual:—Triomphe de Paris, dark velvety crimson; Duchesse d'Orleans, lilac blush, a large, full, and well-shaped flower; General Castellane, brilliant crimson, and a profuse late bloomer of somewhat dwarf habit; Prince Leon, bright crimson, large and full; Chipetouzikoff, dark red, and good in shape; Docteur Juillard, rosy purple, shaded with carmine; Souvenir de Madame Lise, brilliant red, shaded with blackish crimson, a profuse late flowerer, and dwarf in habit; Madame de Cambacères, rosy carmine; Madame Philip, blush, pink edged with rose, and a fine bold flower; Madame Fremion, beautiful light rosy crimson; and General Jacqueminot, brilliant red, very rich and velvety.

The following new kinds we did not see in flower, but they are reported to be good. Moss:—Baronne de Wassenaër, a bright red which flowers in clusters; Clemence Beaugrand, pink; Comtesse Doria, crimson; Felicité Bohain, bright rose; Gloire de Mousseux, blush, very large; and Vaudael, dark purple with lilac edges. Perpetual Moss:—Madame Edouard Ory, rosy carmine; and Salet, rose with blush edges. Hybrid Perpetual:—Alphonse de Lamartine, delicate rose; Baron Laray, carmine; Empereur Napoleon, brilliant in colour, but not first-rate in shape; Julie de Guinnoiseau, blush, globular; Lord Raglan, scarlet crimson edged with violet; Madame Masson, reddish crimson, which changes to violet; Madame Martel, white, tinted with rose; Melanie Leroy, rose; and Panaché d'Orleans, flesh colour, striped with rose and purple.

Young Roses, we need scarcely say, are annually raised here in great quantities, and most of them are struck in the open air under hand-glasses. When large enough to occupy 5-inch pots, they are plunged in open tan beds, where they remain all the summer till about this time, when the most tender of them are moved under glass.

The plants intended for exhibition are also plunged in the open ground, and are moved in-doors about the 1st of November, when those selected to be shown in May are pruned. Those for the June exhibition are cut in a month later. By plunging them out of doors till about this time the wood, if the autumn is favourable, gets thoroughly well ripened, and when that is the case a good bloom next season may almost with certainty be relied on.

A portion of this nursery is devoted to the growth of hardy ornamental trees, of which Messrs. Paul state that they have a collection of nearly 800 different species and varieties, including Conifers, and Evergreen and deciduous shrubs. These are planted in what is called "the arboretum;" they are not arranged according to their botanical affinities; but different forms and tints are placed in juxtaposition with the view of producing pictorial effect. Among Conifers we remarked a good plant of Libocedrus chilensis, which was very little injured here last winter; a handsome compact variety of Red Cedar, some 10 feet in height; Abies Pinsapo, 9 feet high and nearly as much through at the base; a Deodar, 25 feet in height; Abies nobilis, a blue looking kind called A. alba glauca, together with numerous Junipers and Cypresses. A variegated variety of Red Cedar was growing both out of doors and under glass; it is said to be hardy, and if so it will doubtless prove an acquisition, as it is reported to grow very freely, and its variegations are much whiter than those of the variegated Chamæcyparis. Among other variegated trees and shrubs were good specimens of the following, viz.:—Gold-edged Weeping Ash and Elm; Aucuba-leaved Ash and Bird Cherry: together with variegated Snowberry, Philadelphus, and Spanish Chesnut, &c.

Of weeping trees the gold-leaved Weeping Privet, the Kilmarnock Weeping Willow, with black wood and foliage as large as that of an Apple tree; the gold barked weeping Ash; and the weeping Sophora japonica with dense dark massive foliage, were perhaps the most remarkable.

When speaking of variegated evergreens, we forgot to mention the silver-leaved Phillyrea, which is one of the most beautiful of wall plants, but not sufficiently hardy to stand our winters without such protection. We also remarked that scattered here and there among the evergreens hardy climbing plants were introduced and trained to stakes about 7 feet in height, and when in bloom doubtless with good effect.

Of Deodars we observed an amazing quantity, varying from 2 feet to 8 feet in height, and most beautiful

they were both in form and colour. The deep loamy soil of this nursery appears to be just what is wanted to have them in perfection.

Fruit trees are also largely cultivated here; but these we had not time to inspect.

FLORICULTURE.

Tulips.—Examine the bulbs, and if not previously done, let them now be arranged for planting, making the alterations and improvements noted down in the Tulip book during the blooming time; this should be done immediately the bulbs are taken up, while the changes intended to be made are fresh on the mind. New varieties should be procured at once, and then re-arrange them. The bed should now be got ready for planting. If the soil has been only in use one year, and the bulbs did well in it, there is no advantage to be derived from changing it, for they will do well in the same soil (if it is good) for two or three successive years; all that is required is, to remove about 3 inches from the surface, laying it in a ridge by the sides of the bed; then fork over the mould left in the bed, laying that also in a high ridge for a week or ten days. If the soil requires changing, it need not be removed; take about 10 inches off the top, then put about 6 inches of two-year-old rotted turf and loam and road grit, well mixed together (three-fourths loam and one-fourth grit), on the soil left in the bed; fork it well over two or three times, turning some of that left with the mould just added, so as to mix it well, and lay it up in a high ridge; two or three days before planting, rake it down, laying it 2 inches higher in the middle than the sides. In planting, place a small quantity of river-sand on the spot the bulb is to occupy, and put as much sand on the bulb itself as will just cover it; then carefully put the mould on the bed, covering the bulbs 4½ inches deep in the centre, and 3 inches on the outsides; protect the bed at once, by placing small-sized iron hoops over it, rising about 6 inches from the surface, and run some small string diagonally from each hoop. About the second or third week in October is the best time for planting in general, but it is not yet too late. Choose dry weather if possible for the operation. As a rule the best plan is to begin planting whenever the bulbs push forth their green spear, and the fibres swell at the bottom of the bulb; for the longer they are kept out of the ground when this is the case the greater injury they will sustain.

Miscellaneous.

On the Juice of the Star Apple.—The juice of this luscious fruit (Chrysophyllum Cainito) has, I have found, the property of coagulating on exposure to the air very like coagulable lymph. I have a note of one trial only. After dividing the fruit with a knife (the knife was much blackened, chiefly, it would appear, by the cortical part), the inner mucilaginous portion with the seeds was scooped out, well mixed with about an equal bulk of water, and pressed through a coarse linen cloth. What was thus obtained was semifluid (its coagulation had commenced), of a creamy appearance, and uniform consistence. Under the microscope it appeared to be composed chiefly of exceedingly minute granules, the largest not exceeding the $\frac{1}{10000}$ of an inch in diameter, which were rendered brown by tincture of iodine, with the exception of a very few that were tinged blue. After two hours a pretty firm coagulum had formed with the separation of a transparent fluid, and so great was the contraction as to be equal to about one third of the diameter of the containing vessel, a circular glass one; and so coherent and firm was the coagulum itself, that it admitted of being lifted out without breaking or change of form. On the following day the coagulum was found still more contracted, and in all its dimensions. The transparent fluid surrounding the coagulum was sweet. It was not rendered turbid by nitric acid. In a few days it began to ferment, and in a few more it became acid. The contraction of the coagulum continued increasing during several days. After about a fortnight it softened, became pultaceous, and emitted an offensive smell not unlike that of chyme as met with in the cadaver. Under the microscope, as before, it exhibited a granular texture, without the admixture of any fibres. *Dr. Davy in the Edin. New Philosophical Journal.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Whatever watering may be necessary here should be done early in the day so as to allow of getting the superfluous moisture dispelled before night, for there is much more danger from damp among plants in flower at this season than from a rather low temperature, and on cold dull cloudy days it will be advisable to use a little fire-heat with air during the day so as to secure a moderately dry state of the atmosphere before night. Use fire-heat very sparingly, however, and only where it may be necessary to prevent injury from damp, or to prevent the temperature falling below 40°, or where things are brought from warmer houses it will hardly be safe to allow the night temperature to average below 45°, but in houses containing a mixed collection of plants there is more danger to be apprehended from a high night temperature than by keeping it somewhat lower than may be suitable for some of the inmates.

FORCING DEPARTMENT.

Pineries.—Plants swelling their fruit must be assisted with a warm moist atmosphere, for it is difficult to get Pines to swell properly after this season under any circumstances, and unless the atmosphere can be kept warm and moist they will make but little progress. Therefore use sufficient fire-heat to secure a night temperature of at least from 65° to 70°, and 75° by day allowing it to rise considerably with sunshine, and admit a little fresh air during the day when the weather is mild, using sufficient fire-heat to allow of doing this without lowering the temperature, and if there is the means of admitting fresh air so as to bring it into contact with the pipes on its entrance into the house, a little may be admitted with advantage in all states of the weather, and in the case of houses which have to be kept warm in winter there should always be some contrivance for admitting fresh air under or against the heating apparatus so that it may get warmed before coming into contact with the plants, and with proper arrangement a moderate supply may be admitted constantly without requiring any extra amount of fuel to keep up the temperature. Also endeavour to secure a steady bottom-heat of about 85°, and endeavour to keep the soil about the roots in a properly moist state, giving clear, rather strong, manure-water when necessary; but if the atmosphere is kept properly moist the soil will not require much water for some time. It is very difficult however to get Queen Pines to swell properly after this season, and any plants of this variety showing now should, unless in cases where ripe Pines of any size or quality will be valuable early next spring, be kept cool and dry as soon as they have done flowering, until the middle or end of January, and then be afforded a brisk moist temperature; and treated in this way, we have often found them to swell off exceedingly well, and where ripe Pines in winter are in demand Cayennes, Black Jamaica, and Montserrats should be grown to furnish the supply from November to April, for those not only swell better in winter than Queens, and the larger sorts of blacks, but are also less liable to be hard and inferior in quality. Fruit approaching maturity must also be kept warm, but the atmosphere should be kept rather dry, admitting fresh air freely on every fovourable opportunity, for anything like moderately well-flavoured fruit will not be obtained at this season without a liberal use of fire-heat. If any of the young stock in pots appear to want shifting examine these at once, and shift such as are found to be at all pot-bound, for young plants if kept short of pot room through the winter will be apt to start into fruit instead of growth in spring. But in repotting at this season be careful to have the balls and soil to be used in a healthy state as to moisture, and place the soil where it will get warmed before using it, so as to avoid checking the roots.

FLOWER GARDEN AND SHRUBBERIES.

The season is now so far advanced that it will be very unsafe to trust such things as large plants of Scarlet Geraniums, Fuchsias, &c., which it may be intended to winter for use next season to the mercy of the weather any longer, and these should be taken up and placed in safe quarters without loss of time. Plants, however, which are still in good condition, and which can be covered at night when there is reason to apprehend frost may be left for some time longer. It will also be advisable to get the whole stock of variegated Geraniums into their winter quarters at once, for the hardiest of these will not bear much frost without the foliage and young wood being injured, and where the plants have to be wintered in situations which are not very suitable for them they should be taken up before they are at all injured by frost, as they will be much more liable to damp and die back in winter if the wood is at all injured by frost. Unless where there is a sufficient stock of these they should not be cut back, as is usually done with the old Scarlets, but should be kept over the winter just as they are lifted from the beds, and cut back early in spring after starting them into growth, when the cuttings will root very freely in heat, and in the case of "Flower of the Day," or other free growers, will make useful sized plants by turning out time, and even the strongest growers of these do not cover a bed very quickly unless planted thick, and the plants should therefore be wintered in as large a state as the accommodation will permit. The autumn rooted stock of Verbenas, &c., must be well attended to, keeping them perfectly clear of greenfly, and exposing them freely to the air on every favourable opportunity, so as to prevent anything like growth after this season, and keep the plants hard, in which state they will be much less liable to fog and die off under a week or two's confinement in winter than if they were kept in a growing soft state until overtaken by severe weather. Things which are not sufficiently established must, however, be treated somewhat more kindly, for there is but little chance of carrying such things over a severe winter unless they are at least well rooted, and these might with advantage be placed upon a gentle bottom-heat to encourage the roots, but do not keep the atmosphere close and moist, for growth should not be encouraged after this season.

HARDY FRUIT AND KITCHEN GARDEN.

Any fruits remaining on the trees should be gathered at once, for there will be little gained by allowing them to hang longer on the trees, while there will be some danger of their being blown down and bruised. Keep the fruit-room cool and airy, but Pears approaching maturity will be improved in flavour by removal to a warm dry room a few days before they are wanted for use, particularly such as are not fully ripe. Proceed with the planting of young trees, and root-pruning, or lifting such as require this attention, and take care after disturbing the roots to secure the trees well against wind, so as to prevent their being rocked about and the roots injured, and do this before there is any chance of their being blown down. If not already done take advantage of dry days, when the ground is in working order, to take up and store Carrots, Beet, Parsnips, &c., and stack them in sand in a cool place where they will be conveniently got at when wanted for use.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Oct. 25, 1855, as observed at the Horticultural Gardens.

Satur 3	53.4	37.6	45.5	14	0.82	3	3	5	2	3	6	5	2

The highest temperature during the above period occurred on the 29th and 30th, 1833, and 31st, 1854—therm. 67 deg.; and the lowest on the 3d, 1845—therm. 20 deg.

Notices to Correspondents.

Insects: *T G.* It appears to us preferable to allow the rooks to hunt for the grubs which you have sent (which are the *young* larvæ of the common May-bug, Melolontha vulgaris) rather than to let the latter go on growing, as they will do for at least a couple of years, during which time they will of course quite destroy the Grass which would shoot up again. After the rooks had taken their departure, it will be worth your while to employ children next summer to catch and destroy the May-bugs.—*Rochford.* The little yellow oval masses are not eggs. They are the silken cocoons spun by the larvæ of small parasitic Ichneumon flies (Microgaster glomeratus), which have lived within the bodies of the Cabbage caterpillar.—*A G.* We suppose the grubs which eat the roots of your turf are the larvæ of the May-bug (Melolontha vulgaris). The dead patches should be turned up and the grubs collected. Fowls and ducks will find them out.—*Old Sub.* Dust your Pear and Plum leaves with powdered lime, which will destroy the slimy grub of the Tenthredo Æthiops. *W.*

Lotteries: *Hortus.* We believe the schemes you mention to be just like other gambling transactions. Had we not, during the last war, grand *British* lotteries?

Names of Fruits: *J Newton.* 1, Golden Russet; 2 and 12, Brabant Bellefleur; 3, Dutch Mignonne; 4, Northern Greening; 6, Fall Pippin; 7, Gravenstein; 9, Hall Door, probably; 10, Sam Young; 11, Flat Nonpareil; 13, Nonsuch; 15, Early Nonpareil; 17, Scarlet Nonpareil; 18, 19, 21, Hawthornden; 22, De Neige; 23, Screveton Golden Pippin; 24, Pennington's Seedling; 25, Cockle Pippin; 27, Cornish Gilliflower; 28, Easter Pippin; 30, Adam's Pearmain; 36, Calville Blanche d'Hiver; 37, Sturmer Pippin; 38, Blenheim Pippin. Pears:—2, Passe Colmar; 3, Beurré de Capiaumont; 4, Winter Nelis; 5, Napoléon; 6, Marie Louise; 7, 9, 12, Beurré Rance; 8, Swan's Egg; 10, worthless; 14, Black Worcester; 15, Beurré Diel. —*J E H.* 5, Tulip Apple; 7, Pigeon; 9, Early Nonpareil; 11, Beauty of Kent, but a small specimen; 15, apparently the London Pippin.—*P W J.* The Pear is the Chaumontel. The Apples cannot be at present identified.—*R M* 1, Aston Town; 2, Autumn Bergamot; 3, apparently Ambrosia; 5, Bishop's Thumb; 6, Dovenné Blanc; 7, Swan's Egg; 8, Urbaniste.—*W R.* 1, Beurré Rance; 3, Catillac; 4, Beurré Diel; 5, Louise Bonne (of Jersey); 6, 7, Vicar of Winkfield; 9, probably Figue de Naples; 10, Beurré Bosc; 11, Ross Nonpareil; 12, Minchall Crab.—*Dalla.* 1, Wyken Pippin; 2, King of the Pippins; 3, Golden Reinette; 4, Lamb Abbey Pearmain; 5, Hawthornden; 6, Downton; 7, (?) Court of Wick; 11, 16, Ribstone Pippin; 15, Bedfordshire Foundling; 17, Dutch Mignonne; 19, 20, Franklin's Golden Pippin. Pears: 1, Van Mons Leon le Clerc; 2, Glou Morceau; 3, with the exposed side deep red is the Spanish Bon Chrétien.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Theta.* The "Ipomœa" is Argyreia speciosa from the East Indies. The ugly Orchid is Acampe papillosa.—*W F.* The true Service Tree is Pyrus domestica. What they have sold you for it is a totally different plant, Pyrus americana, the American Mountain Ash.

Poplars: *An Old Pupil.* We cannot imagine these to be ever as profitable to the planter as Larch, and certainly not in exposed places. Their favourite habitation is low damp alluvial land. See Agricultural side

Primroses: *A M P.* Taken up now and packed in stiff clay in a wooden close box, the roots will travel safely for four months. If you wish for seed it must be sought in the woods. It is not, we believe, a trade article.

Sunflower: *An Old Pupil.* If you have no machine you had better treat your Sunflower stalks like Hemp, steeping or retting them until the pulp is rotten, then bleaching them by exposure to air, and afterwards scutching them in the usual way. We suppose this to be the readiest means of separating the fibre from the stalks of the Sunflower. Can any one favour our correspondent with better advice? He would be much obliged.

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents, the insertion of whose contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
Wm. Inglis Carne, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITROPHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. Pubser, Sec.

THE LANDOWNERS' WEST OF ENGLAND AND SOUTH WALES LAND DRAINAGE AND INCLOSURE COMPANY.—Incorporated by Act of Parliament, 1848.

Directors.

William Porter, Esq., (Chairman), Hembury Fort, near Honiton.
The Right Honourable Lord Clinton, Heanton, Satchville.
Sir John Kennaway, Bart., Escott, Ottery.
Sir Thomas Tancred, Bart., Stratton House, Cirencester.
Sir Charles Lemon, Bart., M.P., Carclew, Cornwall.
Samuel Trehawke Kekewich, Esq., Peamore, near Exeter.
Richard Meade King, Esq., Pyrland Hall, Taunton.
Richard Sommers Gard, Esq., Rougemont, Exeter.
Thomas Snow, Esq., Franklyn, near Exeter.
Thomas Hussey, Esq., Waybrook, near Alphington.
William Wippell, Esq., Rudway, Thorverton.
Arthur Whitehead, Esq., Dix's Field, Exeter.
John Stogdon, Esq., Southlands, Heavitree.
William Denis Moore, Esq., Pensylvania, Exeter.
Robert Bradford, Esq., Royal Exchange Buildings, London.
William Cole Cole, Esq., Highfield, Exmouth.
Richard Edward Arden, Esq., Sunbury Park, Middlesex.
Robert Cook, Esq., Park Street, Bath.
Thomas Sheffield, Esq., Palace Gate, Exeter.
William Henry Place, Esq., Gloster Villas, Maida Hill, London.
John Swaffield Orton, Esq., Upper Hamilton Terrace, St. John's Wood, London.

Dividends paid last ten years have averaged 5*l.* 12*s.* per cent.

The Extension of Works into nearly all the counties of England requiring a larger Capital, the Directors have determined to issue some of the remaining SHARES of 25*l.* each; 2*l.* 10*s.* per share, payable on allotment, or the whole amount can at once be paid up. A Committee of the House of Lords sat in June last to consider the powers of the three Drainage and Improvement Companies' Acts, when the Inclosure Commissioners of England and Wales were examined, and admitted that the Works executed by this Company were most satisfactory; that the powers of this Company's Act of Parliament were very great for a private company, more particularly the power authorising owners of land to make *permanent* charges for the cost of draining and improvements, whilst under the other Companies' Acts a charge could only be made for a term of years.

Applications for Shares to be made to the Secretaries.
(By order of the Board.) Bidwill & Brodie, Secretaries.
Offices of the Company, 9, Bedford Circus, Exeter; 30, Parliament Street, London.

THE LANDOWNERS' WEST OF ENGLAND AND SOUTH WALES LAND DRAINAGE AND INCLOSURE COMPANY.—The Directors are prepared to issue DEBENTURES in sums of Fifty Pounds and upwards, at 5*l.* per cent. interest, for any term not exceeding five years. Applications to be made to the Secretaries.—By order of the Board,
Bidwill & Brodie, Secretaries.
Offices of the Company, 9, Bedford Circus, Exeter; 30, Parliament Street, London.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Incorporated by Special Act of Parliament.
Offices, 52, Parliament Street, London.
Directors.
Henry Ker Seymer, Esq., M.P., *Chairman.*
Sir John V. Shelley, Bart., M.P., *Deputy-Chairman.*

John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., M.P.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

The Company will afford equal facilities to Landowners for the execution of works of improvement either by their own Agents or by means of the Company's staff.
William Clifford, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial.—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable William Napier, Managing Director, 2, Old Palace Yard, Westminster.

LORD EBRINGTON'S PRIZE for the SONS AND RELATIVES OF YEOMEN AND FARMERS IN THE COUNTY OF DEVON.—A Prize of 20*l.* is offered by Lord Ebrington to any person of the above description, between the ages of 18 and 23, who (bringing with him the required Certificate of competent Scriptural knowledge), shall pass the best Examination in

1. The English Language.
2. The Geography and History of the British Empire.
3. Practical Mathematics.

The Examination will be held at Easter, 1856. The names of Candidates must be sent on or before January 1, 1856, to the Secretary of the Bath and West of England Society, Poulteney Street, Bath; or to the Rev. J. S. Brereton, West Buckland, South Molton, of whom further information may be obtained.

The Rev. G. Martin, Chancellor of the Diocese, and Sir Stafford Northcote, Bart., M.P., have kindly undertaken to conduct the Examination.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. Nesbit, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre.

Mr. Humbert (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

LAND DRAINAGE.

MR. BAILEY DENTON, Engineer to the General Land Drainage Company, offers the following publications, which may be had by post (stamps being sent with the order) of W. P. Metchim, 20, Parliament Street, London.

1. LAND DRAINAGE AND DRAINAGE SYSTEMS. Second issue (1855), price 3*s.*
"The best practical treatise we have yet seen." *Agricultural Gazette.*—"A very able treatise." *Mark Lane Express.*

2. TABLES OF COST OF LABOUR AND MATERIALS. Price 1*s.* 6*d.* For the Pocket.

3. RELIEF OR SURFACE MODELLING, as Suggestive of Drainage and the Profitable Use of Drainage Waters. Second Edition (1850), price 3*s.* 6*d.* Medals R. A. S. E., 1840, and Exhibition, 1851, were awarded for this method of Modelling.

GENERAL DRAINAGE AND THE DISTRIBUTION OF WATERS. A Paper reprinted from the "Westminster Review" (1842). Price 2*s.* 6*d.*

Also, THE DRAINER'S A LEVEL FOR THE USE OF WORKMEN. Price 30*s.*

Mr. Bailey Denton's engagements do not preclude him from Designing or Superintending the Drainage of Estates on terms to be ascertained of him at No. 52, Parliament Street, London.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to Fowler & Fry, Bristol, Licensed Makers of Corne's Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street Westminster.

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. Brandreth Gibbs, Honorary Secretary,
Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1855.—The Seventh Great Annual Exhibition of CATTLE, SHEEP, PIGS, and DOMESTIC POULTRY, will be held in Bingley Hall, Birmingham, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December next, when PRIZES will be awarded as follows:—

	£	s.	d.
CATTLE.—Including Two Extra Prizes of 20*l.* each and Two Gold Medals or other pieces of Plate of the value of 20*l.* each, for the best Ox or Steer, and the best Cow or Heifer	340	0	0
SHEEP.—First Prizes of 10*l.*, and Second Prizes of 5*l.*, for Leicesters, Long-Woolled Sheep not being Leicesters, South or other Down Sheep, Shropshire, and other Black or Grey-faced Short-Woolled Sheep—10 classes	150	0	0
PIGS.—Including Prizes for Pens of Breeding Pigs of a large and small breed	60	0	0
ROOTS.—Including a Silver Cup, value Five Guineas, for the best Collection of four different varieties	27	6	0
POULTRY.—Including Nine Silver Cups, of the value of Ten Guineas each, for the best Pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, Game and Gold, or Silver Bantams; and for the best four Pens of Pigeons, to be exhibited, especially for this prize	451	10	0
	£1037	16	0

Exclusive of Silver Medals to the Breeders of Cattle, Sheep, and Pigs, and Prizes in the Extra Classes and for Cottagers' Poultry.

Mr. Ottley has also offered a Gold Medal, of the value of Ten Guineas, as an extra prize, for the best Pen of Polish Fowl of any colour, to be selected from the several classes for this variety.

Prize Lists, Certificates of Entry, and any further information may be obtained from the Secretary. The Entries close on Saturday, Nov. 10. John Morgan, Jun., Sec.
Offices—38, Bennett's Hill, Birmingham.

The Agricultural Gazette.

SATURDAY, OCTOBER 27, 1855.

As this is the season for trimming hedges, we may be permitted to call attention to some facts and observations connected with living fences.

It is an admitted principle that of all plants suitable for fences in the various circumstances in which these are required the Whitethorn (*Cratægus oxyacantha*) is the best adapted for farming purposes, as it bears clipping better than any other species of shrub, branches abundantly afterwards, and besides offers a formidable barrier in the thorns with which the plant is so plentifully armed. If, therefore, this plant be admitted to be the *best* for our purpose—and its universal cultivation is evidence that it is so—it follows that any admixture of other species must be injurious to the fence, and indeed would thus assume the nature of weeds; and yet it seems remarkable that there is scarcely a fence wherever we go but has become much injured by the presence of many species of plants which, so far from being of benefit, are so injurious as in time to lead to the destruction of the fence as an efficient protection against the exit or intrusion of cattle.

The following list of plants will afford us examples of such injurious species, which we shall comment upon under the subjoined heads:—

1. *Herbs which smother the hedge by reason of their climbing habit.*
   Bryonia dioica, White Briony
   Tamus communis, Black Briony
   Convolvulus sepium, Hedge Bindweed
   Lathyrus sylvestris, Hedge Sweet Pea.
2. *Trees or Shrubs devoid of thorns, which leave no protection when the hedge is bare of leaves.*
   Acer campestre, Maple
   Cornus sanguinea, Dogwood
   Euonymus europæus, Spindle tree
   Sambucus nigra, Elder
   Viburnum Lantana, common Guelder Rose
   " *Opulus*, Mealy ditto
   Ligustrum vulgare, Privet
   Corylus Avellana, Hazel Nut.
   All forest trees.
3. *Trees or Shrubs which though thorny are yet, by difference of growth and habit, inferior to the Whitethorn as a protection.*
   Berberis vulgaris, Berberry
   Pyrus torminalis, Wild Service tree
   Prunus spinosa, Blackthorn
   Rhamnus catharticus, Buckthorn.
4. *Shrubs bearing prickles, but not uniform in growth and uncertain in duration.*
   Rubus, Blackberry—all the species
   Rosa, Dog-rose, Hedge Briar—all the species.

1. The first forms here tabulated would scarcely have been mentioned only that they differ greatly from mere hedgerow weeds, by which the young fence or *quickens* are too often so seriously injured

when in the hands of a slovenly farmer; with regard to which, however, we may just remark upon the folly of planting hedges if they be not cared for, as neglect of weeding for the first few years of growth is so injurious that the fence seldom recovers it, and can never afterwards be a hedge of first-rate character.

The plants of our list, however, are such as gain strength with the advance in height of the hedge in which they occur, most of their class possessing strong underground perennial *rhizomes*, underground stems, which like those of the Black Briony increase from year to year, each season sending up an increase of stronger shoots; and there twisting about in the hedge in every direction, though they make the hedge look thick by reason of their large and thickly placed leaves, yet when these fall off they invariably leave a weakness in the growth of the fence, the Whitethorn with its small leaves having been completely smothered and its wood not being allowed to harden on account of the shutting out of air and light by the broad-leaved intruder. The Bindweed is injurious in the same way, its twining habit like the hug of a false friend only embraces to destroy, and this is the most difficult to eradicate, as while the bine entwines the branches of the fence the rhizome is no less active in spreading among the roots, so that a whole hedgerow quickly becomes smothered with this weed. However in all this group of plants we may prevent present mischief by cropping the branches as they appear, a treatment to which their roots must ultimately succumb, as indeed no part of a plant can increase if its leaves, *the plant lung*, be but prevented growing.

Closely allied to the foregoing in their effects are the Honeysuckle (*Lonicera Periclymenum*), and the Bitter Sweet Nightshade (*Solanum dulcamara*). In these, however, the stems are more or less perennial, but they possess no armature; their older branches are constantly decaying, so that they are useless as a fence, while they prevent the due growth of the hedge in which they have established themselves.

2. Our second group, though presenting species which are seldom viewed in the light of intruders, and indeed are too often encouraged in our hedgerows, yet if carefully examined will show us that weak places in living fences are mainly due to their presence. Let us examine the Elder by way of example: here we have a tree sending up a complete thicket of straight shoots; if our hedges be kept neat this soft-wooded quick growing plant soon overtops it, and presents an unsightly appearance. Its leaves are large and early deciduous, so that they effectually prevent the growth of any other species with it, whilst its own shoots become caney, branchless, and liable to decay; thus affording no protection in themselves, they are cut away in the laying of the hedge, leaving a gap which can never be adequately filled up, and which, whatever expedient be adopted, will ever present a weak place in the fence.

Indeed, all the shrubs in this division, and all the trees which from stooling out after being cut down in hedgerows assume the character of shrubs are injurious from their smothering effects, and from being deficient in those requisites so well combined in the Whitethorn: and where any of them have established themselves, there either is or will be at some future period a weakness in the fence, more or less serious, according to the habit of growth of each individual intruding and the general want of care in the fence management.

3. Though the shrubs in the third list would at first sight appear from their possession of Thorns to be liable to only slight objection, yet it must be borne in mind that the *Pyrus torminalis* and *Rhamnus catharticus* do not present this armature on their young shoots; this they have in their older tree state, in which they would be of no use for fences from presenting boles and not lateral branches in stooling out, and these being cut down, the consequent shoots act much like those in the list preceding. Shrubs of the character of the *Berberis vulgaris* and *Prunus spinosa*, though presenting thorns in the young state, are yet objectionable from the want of the following requisites: they send up straight reedy shoots on being cut down, these are little liable to branch out laterally, so that their hedge is never a close and thick one; and besides, they have neither of them the capabilities for laying or the power of endurance under constant cropping and trimming, which processes, though they would ultimately destroy shrubs of this character, only make the Whitethorn hedge more tidy in its appearance, and more efficient as a fence.

4. The individuals in the fourth list, though of only two genera, are so numerous in species, and so universal in all hedgerows, that they have become important for good or evil; an examination of the method of growth of the two generic forms, while it will present us with some interesting differences, will at the same time afford us examples of enemies, which are not the less so because they appear to be armed in our favour. The wood of the different species of Blackberry, like that of their congener the Raspberry, is biennial; and hence, while the shoots of the previous year are bringing forth their flowers and fruit, new or barren shoots are either preparing by *stolons* from the ground or from the bending down of the flexile branches, and rooting in the soil like the *scions* of the Strawberry. The Blackberry bears a great quantity of large leaves, and insinuates itself by its flexile arms amongst the Whitethorn, acting to the detriment of the hedge in the following methods, which we view as so many counts of indictment against it.

a. It covers up, and therefore smothers and impedes the growth of the hedge.
b. Its dead branches leave their places by dying out.
c. It stools out in advance of the fence, thus being unsightly in making it broad and straggling, and too frequently indeed encroaching upon the field crop itself.

The Roses, though more perennial in habit, completely take possession of their place of growth, presenting in youth an almost impenetrable thicket, but as they get older the old stocks present smooth straight sticks only branching towards the top. These plants stool underground, and thus from sending up shoots in every direction become a spreading evil in advance of, as well as in the run of the hedgerow, thus causing an increase of trouble and expense in keeping it in order.

Here, then, we may sum up these remarks by observing that from a long and attentive examination of the habits of growth of plants usually found in hedges, we are fully convinced that the Whitethorn is the best adapted for a living fence; we therefore view all other species as interlopers and enemies which, from various causes, prevent the due and vigorous growth of our favourite and friend to the ultimate production of gaps and weak places, which give rise to the thrusting in of bits of dead Thorn to stop up holes, or the safer though equally unsightly expedient of post and rail.

From these observations, therefore, our conclusion should be to view all plants in merely farm hedges other than the Whitethorn as weeds, and to root them out in as early a stage of their growth as possible, as otherwise little can be done than cutting them down, and then it is in their stooling out and creating thick bushes that they are most objectionable. If forest trees be permitted in hedgerows it should be with the intention of training them up for timber, in which case low lateral branching should be prevented, but these, notwithstanding every precaution, necessarily produce weak places in growing, and when ultimately cut down completely ruin the fence; but in this case, as the fence will, by reason of age, naturally have passed its best period, it would not unfrequently be better to attempt its renewal than to keep working year after year at the patchy old scrubs one sometimes sees encumbering the ground.

SCHOOLS FOR LABOURERS.

My subject is the policy of agricultural instruction in our common country schools. This is of course to be defended by the same argument as that which justifies technical or professional education of any other kind. The possibility of it is limited by the humble means within reach of the teachers of such schools, and by the early age at which the labour of children in the field becomes valuable enough to induce their parents to remove them. It is the latter point—the possibility of conveying agricultural instruction in these schools, the means at the command of the teachers, the methods they might employ, the extent to which mere language is capable of conveying agricultural truth that is the most likely to provoke discussion. But on the former part of the subject, including the advantages derivable from instruction so given, I wish to add a few words to what has been already said on the advantage of what may be called a professional education for agricultural labourers.

In the first place, then, the policy of the agricultural instruction of children in country districts of course rests upon the advantages of intelligence in agricultural labourers as in all other working men, both to themselves and to their employers. Boys who are to be carpenters and mechanics should be taught drawing, and their lessons in it, in arithmetic, and so on should have special reference to the handicraft or art by which they are to earn a maintenance. No one will deny this, neither therefore can it be denied that those who are to be employed in the fields, whether as ploughmen, cattlemen, or shepherds, should receive special instruction on those subjects in connection with which *their* livelihoods are to be earned. It is true that in the few instances in which I have known this better education given, boys have availed themselves of it to work themselves up out of the agricultural labourer class altogether—and this is not at all an undesirable result—certainly not to themselves nor to those in that class whom they leave behind them; but when the means which they have used shall be in general operation, the result will be—not an abandonment here and there of the class on whom those means have been brought to bear, but a general elevation of the whole in intelligence and merit—so that labouring men will no longer be a hindrance, as they often at present are, to the progress of agricultural improvement. As the thing at present is I have no hesitation in saying that at whatever age you take them agricultural labourers very often prove this hindrance in the experience of the enterprising agriculturist who may wish to introduce a novelty in practice, or to test the experience of others in his profession. Take them as boys, and nine farmers out of ten will tell you that in the first year or so after they leave school or home they are much more plague than profit; and though I would not quote as just the opinion of the farmer who said that for every boy upon his farm a man was needed to look after him; yet of boys not so looked after the opinion of another farmer may be safely taken—that while one boy was no doubt a boy, two boys were but half a boy, and three were ne'er a boy at all. This, however, is true of them only during the first year or two of service, when the *farmer* has to do the work of education for them *imperfectly*, much of which, I contend, might have been better done by the teacher in the school. Then, again, take them as men—and what farmer does not know the difference between intelligence and stupidity in his working men?—I heard Mr. Bullock Webster, an agricultural engineer of some eminence, state the other day that having to employ some hundreds of agricultural labourers in different parts of the country, he found large numbers of them almost useless to him on account of their ignorance. I do not suppose that ignorance often reaches the length of utter uselessness upon a farm, but I am quite sure that the successful progress of a farmer is very often limited by the ignorance of his men. I am quite sure that before that superiority of intelligence which makes one man a better farmer than another can fully show itself upon a farm, it very often has to spend itself for years in educational influence upon the men who are there employed. The same man who has farmed successfully in Scotland, and is known there as a good agriculturist, comes south and fails—because of our climate, it is said, and because of our English clays, neither of which will yield to Scottish management; yes, but often and in great degree because he has not the same machinery here that he could command there: and I do not refer to his implements, but to his men. The more intelligent labourers whose services he could procure in Scotland are as it were self-acting tools;—they need but to be "set" correctly at the beginning, and will go through their work correctly to the end. Exchange them for careless uneducated and ignorant men—some of whom, I am sorry to say, I have known and employed—and you could not be sure either that your instructions were understood at first or would be attended to longer than your personal superintendence was continued.

And I look for another advantage ultimately accruing to farmers as the result of agricultural instruction given to the children of the labourer, beside that of being no longer restrained and limited by the inefficiency and ignorance of their working men. There is an immense amount of ignorance in this country still amongst the occupiers of land themselves—no doubt among the small occupiers, but therefore unfortunately among the many. It is not ten years ago since I was told by a corn-factor, in large business in one of the largest corn markets in the west of England, that more corn was sold to him by men who put a cross opposite their names than by those who signed a receipt in full.

I do not believe that that could be said of any market now; but if any proof be needed of the ignorance which still prevails, the success of fraudulent manure dealers would amply furnish it. Societies and periodicals have attacked that trade continually, but in vain; for its customers are men who do not read, and publishers and writers therefore work in vain;—the teacher is the man before whom it must ultimately fall: and agricultural ignorance in the middle class, while attacked in the van by such institutions as the Royal Agricultural College at Cirencester, and in the main body, I hope, by schools urged on by Lord Ebrington's scheme of district examinations under the superintendence of the Society of Arts, will be all the more effectually routed if also attacked in the rear and from below by the efficient agricultural education of the labouring class. The policy, then, of agricultural instruction to the children of agricultural labourers is demonstrable from the obvious tendencies of things as well as from the personal experience both of labourers and farmers. That some among the latter both admit it and desire it is proved by the handbill which is before me, in which the East of Berwickshire Farmers' Club offer certain prizes for the encouragement of agricultural instruction in the parish school of the district. The offer is I suppose almost unique of its kind, and I therefore add it:—

Eyemouth, Feb. 12, 1850.

Prizes for Agricultural Instruction in Schools, offered by the East of Berwickshire Farmers' Club.

With the view of encouraging boys, before leaving school, to acquire some general knowledge of the principles of scientific agriculture, the committee will expend a sum not exceeding 6*l.*, to be applied in the purchase of books, medals, or chemical apparatus, to be presented to any schoolmaster who has been successful in teaching the principles of agricultural chemistry, and to the boys in his school who have shown proficiency in that branch of instruction, during the course of the ensuing spring and summer of 1850. *Conditions.*—1. The boys must have been

taught from Johnston's "Catechism of Agricultural Chemistry,"* or any other approved elementary treatise. 2. The above premium will be awarded only after such an examination as may enable the committee of superintendence to judge of the success of the schoolmaster, and the proficiency of the boys. 3. Any schoolmaster who is desirous of obtaining for his school the above premium, will intimate to the secretary of the club at what time it would be convenient for his school that the examination should take place, the said notice being given not less than one month previously. Thos. Bowhill, Secretary.

It seems to me, then, that the only objections which can be offered to the policy of attempting the agricultural instruction of children in our country schools must come from those who deny its possibility. And that happily has been proved by cases of success which have already been detailed in the columns of this Journal. *John C. Morton.*

COST OF HORSE LABOUR ON ARABLE FARMS.

[The following remarks include the substance of one of the chapters in Mr. Stephens's instructive little volume on the Deep Cultivation of the Yester Farm.]

At Yester Mains, containing 504 imperial acres, eight pairs of horses and eight ploughmen have been usually employed. Besides performing the customary labours of the fields, they have to bring coals from the coal-hill for the mansion-house and garden, draw wood to the saw-mill, stones and gravel to the roads and drives, hay, corn, and straw to the riding stables, cart vegetable matter from Danskine to the land or elsewhere, and perform a number of jobs about the ground. A cattleman and two assistant boys are required to look after about 70 head of oxen and cows, and a number of pigs. One man and eight boys and girls are employed in the various manual operations of the farm—such as assisting in the making of the Potato and Turnip land; singling and hoeing the Turnips; pulling them, rooting, and shawing and filling them into carts; making meadow hay; reaping at harvest; attending on the threshing-machine; raking dead leaves about the grounds, and doing many other jobs. Two labourers are also employed to feed the threshing-machine, stack the straw, cut gaw-furrows in the fields, pile up Turnips in store, and other similar works about the farm.

On Broadwoodside, containing 228 imperial acres, three pairs of horses and three ploughmen are employed. Besides the ordinary farm-work, they drive coals from the coal-hill for the use of the mansion-house and garden, gravel to the drives, vegetable matter from Danskine for the land, and wood for fences. There are four women-workers, who besides doing the manual labour required in the fields, attend the threshing-mill and corn-barn. A labourer feeds in to the threshing-mill, fills dung, and does other sundry jobs. A boy attends to the cattle, including cows.

On Danskine, containing 235 imperial acres, three pairs of horses and an odd one are employed, and three ploughmen and a lad to work the odd horse. The ploughmen of this farm have little else to do than work the farm work, which includes the driving of the vegetable matter to the land. Three women-workers perform the manual labours of the fields, and attend the threshing-machine and corn-barn; a labourer jobs at any work on the farm; and a boy attends the cattle and cows.

The wages of the grieves, ploughmen, labourers, and field-workers of these farms are regulated by the rate of the county. The grieves and ploughmen receive a comfortable house and good garden, with the keep of a cow for the year. The labourers' wages vary according to the demand. The women-workers receive 5*s.* a week. The grieves have all been ploughmen on the farms which they now superintend. One of the present grieves has been 30 years in the Marquis's service, the other two several years. They were all promoted to the grieveship for their skill, character, and conduct as ploughmen. To those who wish to adopt the Yester deep land-culture, difficulties will at first arise in the use of the implements and the guidance of two pairs of horses together; but one of the many results at Yester indicate that intelligent and true-working grieves, ploughmen, and horses, will soon accommodate themselves to the work, and learn to evade every difficulty.

A single glance will suffice to inform any farmer that on none of the farms is a greater strength maintained than what is usually required to work their respective quantities of land. On Yester Mains are eight pairs of horses to work 504 imperial acres—that is, 63 acres to each pair—which is quite enough on any farm on which the five-course shift is practised on friable loam, and too much where the farm consists principally of strong clay. Each pair of horses must have a ploughman to take charge of and work them. Eight field-workers and a superintending grieve are not too many for a farm of 500 acres. Over and above the ordinary labours of a farm, the men and horses and field-workers have jobs to do that are not common on a farm, such as raking and leading off dry leaves from extensive grounds, leading wood to and from the saw-mill, leading straw, hay, and corn to the riding stables, which are always extensive in a nobleman's establishment, and driving coals for the use of the mansion-house and garden, which amount to a large number of loads in the course of the year. One cattleman at least is required to take charge of the cattle in winter, and a large private dairy belonging to the mansion house; and where these are numerous, as they are at Yester Mains, two assistant boys are also required for the better attending to their welfare. A shepherd is required where a breeding flock is kept on a farm. A labourer is also required to keep the fences and ditches in order, and to do many other smaller jobs which are too frequently neglected to be done by tenants. Now, it cannot with truth be said that a larger working establishment is maintained on the farm of Yester Mains than what is requisite on farms of similar extent in the occupation of tenants. Any argument founded on the "force of money," cannot therefore be applicable to the extent and kind of work that has been done on this farm up to the present time; for every tenant, occupying a similar extent of farm, would require the same strength to conduct it in the ordinary way that an improving farm is conducted, without reckoning on the extra labour bestowed upon the subsoil-trench-ploughing. Two pairs of horses out of the eight are to be reduced for the future on this farm; and were it not for the heavy extra cartage which the horses here have to perform for the house and garden, five pairs would be sufficient to do all the farm work.

Each pair of horses work 76 acres on Broadwoodside farm, which is a sufficient quantity of land for any pair of horses to work. The number of labourers of all kinds is not greater than the size of the farm warrants. The jobs, extrinsic to the labour of the farm, are undertaken by the ploughmen of this farm in common with those of Yester Mains.

On Danskine farm 67 acres are allotted to each pair of horses, assisted by an odd horse. From the hilly nature of the surface of this farm, that extent of land is quite enough for the horses. The ploughmen are chiefly confined to what is done on the farm, the driving of the vegetable matter to the land being their chief extra labour. The labourers are not too numerous for a farm of 235 acres.

* Copies of this treatise, with strong binding for schools, may be obtained, at the reduced price of 7*d.*, by applying to the secretary of the club.

EXPERIENCES IN LAND DRAINAGE.

XXXVI.—Drainage operations on all descriptions of land have been satisfactory.—I have generally adopted a parallel system.—The prevailing depth of the drains has been from 3 to 4 feet on clay soils, according to circumstances.—I have made no difference in my mode of draining between arable and Grass lands, except where the land is flat, the drains have been put rather wider apart.—The drains have been generally with the fall. We have followed the furrows where the land is in ridges, in most cases having found better results than from cross draining.—The pipes used have been 2-inch pipes for minor, and 4-inch pipes for main drains. Collars have lately been discontinued, they not being considered necessary at the depth adopted.—The average number of acres discharging at the several outlets has been, generally speaking, about 10 acres.—The soil and subsoil are various. The above observations generally apply to heavy clay land with clay subsoil.—The geological formation is the lias. *From his Grace the Duke of Rutland.*

XXXVII.—The result of my drainage operations on all descriptions of land has not been satisfactory. On the strongest lands I think my drains too near, they are 12 yards apart.—The drainage adopted has been generally parallel.—None less than 4 feet deep.—I have made no difference in draining between arable and Grass land.—The direction of the drains is with the steepest fall. I have not followed the furrows except where they are very steep.—The pipes used have been 1 in. and 1½ in., always with collars. Main drain 3 to 4 inches.—The average number of acres discharging at the several outlets is various, according to the sloping of the ground.—The soil is generally strong clay.—The mean height of the land drained above the sea level is about 300 to 350 feet. *From W. Evans, Esq., M.P., Allestree Hall.*

XXXVIII. The result of my land draining is satisfactory on all descriptions of land.—It is a parallel system.—From 3 feet to 6 feet deep.—The drains are at wider intervals on the Grass lands.—We have followed the fall of the land.—Two-inch diameter circular pipes have been used for minor drains, from 3 to 6-inch ditto for main drains. No collars or socket pipes. Soil or turf is found to answer better than collars or socket pipes round the joints. In going through quicksands we take the drain half a foot below the level, and fill to the level with sound loam or clay.—I have found great benefit by using air pipes or tanks in the fences.—About six acres on the average go to each outlet. 320 acres drained. Two outlets of open drainage.—Soil light loam. Subsoil clay and soil mixed on the red sandstone series.—About 7 feet above the level of the sea, with a rain fall on the average of 18 inches. *From Rev. R. Brook, Gateforth House, Yorkshire.*

XXXIX.—The result of drainage operations on all descriptions of land has been satisfactory.—The drainage adopted is the parallel system.—The prevailing depth from 3 to 12 feet deep.—No difference in draining between arable and Grass land.—The direction of the minor drains with the fall, in all cases, sometimes in the furrows, but generally otherwise.—Two-inch pipes for minor drains, and from 3 to 8 inches for main drains.—No benefit by giving air at places to either main or minor drains.—The average number of acres discharging at the several outlets about eight.—The soil and subsoil, loam with both gravel, sand, and a clay subsoil.—The geological formation, red sandstone. *From Sir S. Crompton, Bart., Woodend, Thirsk, Yorkshire.*

XL.—The result of my drainage operations on all descriptions of land is satisfactory.—The drainage is parallel, with one or two exceptions of "herringbone."—The prevailing depth is 4 feet.—In arable land we drain generally 8 yards apart; in Grass we have not placed our drains so near, nor so regularly.—The direction is with the fall. In some instances, where the furrows are 8 yards or so apart, and the ridges high, we follow the furrows.—The pipes used for minor drains are principally 2 inch, with 3 or 4 inch outfalls. We occasionally use collars with 1½ inch pipes on sand land.—Five or 6 acres discharge at each outlet.—The soil, sand or loam, some clay, some warp; subsoil, clay.—The geological formation is alluvial deposit.—The rainfall on the east coast of Yorkshire averages 24 inches. At Barlow, Drax, Camblesforth, &c., where the above remarks principally apply to, it will not average so much, I think. *J. Maister, Beverley.*

XLI.—The system is parallel, 30 inches deep.—As to direction, the furrows have been followed where the land is in ridges.—Bushes have been used for minor drains, and 1½-inch pipes for main.—The average number of acres discharging at the several outlets is from 2 to 6.—The soil and subsoil are sandy loam and clay over a chalk.—About 200 feet above the sea. *From Lionel Ames, Esq., The Hyde, St. Albans, Herts.*

XLII.—I have within the last three years drained upwards of 1200 acres of land in Herts and Bedfordshire of various soils, and the result has been highly satisfactory in all cases.—I have in almost all cases adopted a parallel system.—The depth varies from 3 feet 6 inches to 5 feet; the average about 4 feet.—I have made no difference in draining between arable and Grass land, except that perhaps the drains on the Grass land are at somewhat greater distance.—The direction of the drains is with the fall. I have followed the furrows where the ridges are high and the furrows low, on account of the expense.—I have used for minor drains 1½-inch pipes and collars in gravelly soil, and 2 inch pipes in stiff soil, and from 3 to 6-inch pipes for main drains, and in some cases 8 inches.—The average number of acres discharging at the several outlets varies. The average is 7 or 8 acres.—The soil and subsoil is various, but chiefly strong clay or clay and gravel mixed with veins of sand. *John Hawkins, Hitchin, Nov. 25.*

XLIII.—My land draining has been perfectly satisfactory.—I have made parallel drains, and according to the fall of the ground, from 3 feet 6 inches to 4 feet.—No difference has been made between arable and pasture land.—As to the direction of the drains, the furrows have not been attended to.—In furrow drains 2-inch pipes have been used, and in mains, 4, 5, 6, and sometimes 8-inch pipes have been required. No collars or socket pipes used.—No aperture for air has been ever left.—Average size of the fields is about 16 acres, each having its own outfall, some into larger mains with an 8-inch pipe.—A sandy clay; some parts a pure sand, and others a stiff clay.—Stratums of limestone prevail throughout. *T. W. Craster, Craster Hall.*

XLIV.—The result of my drainage operations on all descriptions of land has been very satisfactory.—The drainage adopted is parallel.—The depth about 4 feet and from 27 to 30 feet apart.—The distance between drains in Grass is 6 feet greater.—The direction of the minor drains is with the fall, without regard to ridges.—For minor drains I have used 1¾-inch pipes, and for mains from 2½ to 5 inches. No collars.—The average number of acres discharging at the several outlets is 9 or 10.—The soil and subsoil generally stiff blue clay and stony.—The geological formation magnesian lime, and red sand rock.—The mean height of the land above the sea level is 250 feet, more or less.—The average depth of rainfall is about 28 inches. *From Sir William Lawson, Bart., Brough Hall.*

XLV.—My land draining has been most satisfactory, and more particularly so when followed up by proper cultivation.—A parallel system entirely has been adopted.—From 4 to 5 feet.—The Grass land is drained wider apart and deeper, generally from 40 to 60 feet apart, and 5 feet deep; tillage 30 feet apart.—Always with the fall, and without respect to furrows.—Two-inch pipes have been used for minor drains, and from 3 to 6-inch pipes for mains, without collars or sockets.—Not exceeding 5 acres, 3-inch outlets; not above 9 acres, 4 inches; and above 9 acres, 6-inch outlets.—Soil varies from strong loam to tough clay; subsoil clay very hard, and mixed with stones. *From the Hon. G. F. H. Russell.*

XLVI.—My drainage operations have been perfectly satisfactory on all descriptions of land.—I adopted the parallel system.—The prevailing depth of ordinary drains is 4 feet, but in some cases 5 feet.—I have placed the drains a greater distance apart in the Grass lands.—The drains are placed in the direction of the greatest fall. Where the old ridges were very much raised and where there was any fear of the land not being laid perfectly level I have followed the furrows.—I have used 2½-inch cylindrical pipes for minor drains, and 4-inch and 6-inch do. for mains.—I consider direct openings into any drain very objectionable, consequently I have not made any places to give air.—The average number of acres discharging at an outfall may be stated at 15 acres.—The soil is heavy and very tenacious and the subsoil a particularly retentive clay. The minor drains are placed from 21 to 25 feet apart in tillage lands, and from 25 to 30 feet in Grass lands.—The geological formation is the usual Northumberland coal formation, being white sandstone, shale, clay, &c.—Height above the level of the sea ranges from 300 to 500 feet. *Mary Le Bell, Higham.*

XLVII.—My drainage operations on all descriptions of land have been satisfactory.—I have adopted a parallel system.—Four feet 6 inches.—Placing the drains wider apart on Grass land.—The minor drains are placed in the line of the greatest fall.—Two and a half-inch round pipes for minor drains, and 4 and 6-inch

do. for mains.—The average number of acres discharging at the several outlets is about 10.—The soil and subsoil very variable.—The geological formation is Northumberland coal formation.—The mean height of the land drained above the sea level is 500 feet. *From Sir W. C. Trevelyan, Bart., Wallington, Northumberland.*

XLVIII.—The result of drainage operations on all descriptions of land has been satisfactory.—The drainage is parallel.—The prevailing depth of the drains is 4 feet; main drains, 5 feet.—I have made no difference in the mode of draining between arable and Grass land.—The direction of the minor drains is with the fall; where the furrows have been very much curved I have drained across them, but generally I have kept in the furrow.—I have used 2-inch pipes and 5-inch pipes; no collars.—The soil and subsoil are a sandy clay, over the coal measures.—The height above the sea is considerable, but the land here grows good Wheat, which it ceases to do a little higher. *Major W. Cadogan, Brinkburn Priory.*

Home Correspondence.

Perennial Pea.—I observed in a late Number some inquiries as to the value of the Perennial Pea for cattle food, and remember that I asked you the same question some years ago. I should be glad of your opinion as to another plant, the blue Lupin; being perennial, very early, and producing much seed, and growing luxuriantly in poor borders of the garden, I conceive it would answer both as green food and for seed. I have seen in Italy large fields of the white Lupin used as fodder, and the seed would surely give oil (a high priced article at present) and cake might be made from the refuse. Would not the Horse Chesnuts also be available for oil and cake? In Germany they are bruised and given to sheep. In this country they appear to be quite neglected, although the deer eat them. I cannot help thinking that the Jerusalem Artichoke is also undervalued. It produces abundantly without trouble or manure, and contains more sugar than Potatoes, and more nourishment, and the numerous stalks might be used as thatch, &c., and perhaps for paper. *W. B., of R——.*

Mangold Wurzel as Food for Pigs.—Some short time since I noticed in your *Gazette* inquiries on this subject. I have much pleasure in adding my testimony to their good qualities as pig food during the late spring and summer months. I have this summer fed six pigs almost entirely on Mangold Wurzel, and they have done remarkably well. I last Thursday (Sept. 27) exhibited some roots at our horticultural show, the growth of 1844, perfectly hard and sound. I fed the pigs up to the middle of August with them. Orange Jelly Turnips sown in April or early in May will then come in. Your correspondent should grate these with Bushe's Turnip grater; let them ferment in a tub two or three days, and he will find his pigs thrive well and cheaply, especially if he mixes meal or bran with the fermented Turnips. The Turnips when fermented are quite hot and a perfect pulp; Bushe's Turnip grater is an invaluable addition to the farmer's implements. Cattle will thrive on anything in the shape of cut chaff if mixed with fermented Turnips—no small object with such a hay season as the last! *S. P., Machynlleth.*

Irrigation.—My irrigation being now perfect, without check or hindrance of any kind, I consider it an agricultural duty to allude to the difficulties, and show how they have been overcome. Smell from the tank: although domed over with trap doors, the effluvia was inconvenient at 100 yards distant. The introduction of a jet of waste steam cooks the smell as it rises. The steam must be introduced above the liquid, not into it. Steam is a wonderful purifier. A constant jet of air pumped through a gutta percha tube into the liquid, causes a constant boiling up of the solid and liquid, so that they are both drawn into the suction. This air tube is generally near to the suction bulb, thus counteracting the tendency to solidification around the bulb, which would otherwise take place. The suction pipe and the air pipe must all be of gutta percha, so as to be easily pulled up, shaken or examined. I began with iron pipes in the tank, but found them useless because they could not be lifted or examined. The bulb at the end of the suction pipe should be at least 3 feet long and 2 feet diameter, with about 200 holes of 1 inch diameter, so as to admit a gradual easy entrance for the manure. On the top of the tank you will have a winch or well rope attached to the suction bulb. An occasional shake or examination of the bulb will be useful. This may be done without stopping the pumps. If you have much solid matter in the tank, and only use it occasionally, the liquid will become sufficiently dense to float the whole mass several feet thick. In order to intermix and distribute this mass, a jet from the pumps will cut it to pieces and mix it with the fluid. A weighty collar should be placed round the nozzle of the air pipe to keep it down in the liquid. So much for the tank. I have before stated that it is of 30 feet diameter and 30 feet deep to the top of the dome—circular of course. The part in the ground is of 4½-inch brickwork, the dome of 9-inch work. The cost about 80*l.*; when drawn down it drains the adjoining soil in wet weather. Pump valves: Nothing will plague you so much as these if you neglect to keep them perfectly true and level on their seats. It is absolutely necessary to have spare valves, and have them turned true every now and then, otherwise you will draw air instead of liquid. Of course your plunger barrels must be carefully packed with greased rope. A very large air vessel is indispensable, not less (for such pumps as mine) than the size of a 20-gallon cask. I have three in immediate connection with the pumps. If you are deficient in air vessel you will break your machinery, and you must have in addition escape valves close to the pumps; otherwise when there is a stoppage on the fields you will break your machinery by hydraulic pressure. If your pump barrels are too large in proportion to your subterranean pipes, you will come to a dead lock, break machinery, or waste power. There is a proper proportion and velocity that cannot be violated with impunity. Again, long lengths of small gutta percha tubing impede the transmission of fluids. I never use now smaller tubing than 2-inch, and this is inflexible unless you insert at intervals corrugated joints. The jet alone causes much resistance, and if taken off the engine at once increases its speed. Mr. Telfer uses no jet, and gets no fountain. This may answer well on his sandy soil, but on our hard and cracking clay such a system does not answer for obvious reasons. Of course in standing crops of roots, &c., a fountain or shower of at least 40 to 50 feet is imperative. Working a double set of 1½-inch hose with two jets greatly eases the engine. My two pumps are of 20-inch stroke, 5½ inches diameter, and make from 20 to 30 strokes per minute, discharging from 70 to 100 gallons per minute. *J. J. Mechi.*

Wool.—I have been much pleased by reading a paper in the Royal Agricultural Journal on wool by Prof. Wilson, and have drawn up from it the accompanying table; the weight of fleece, however, of the South and Hampshire Down is not in the essay—perhaps you can supply the omission. *A. H. F. C.*

Breed.	Weight of Sheep.	Weight of Fleece	Price of Wool per lb.	
			Wethers.	Hogs.
Long Wools:—				
Lincoln	1 yr., 80 to 100 lbs.	8 to 10 lbs.	12½*d.*	13*d.*
New Leicester	2 yrs., 120 to 150 lbs.	7 lbs.	12*d.*	12½*d.* to 13*d.*
Cotswolds	2 yrs., 120 to 150 lbs.	7 to 8 lbs.	12*d.*	12½*d.* to 13*d.*
Romney Marsh... ...	2 to 3 yrs., 120 to 150 lbs.	8 lbs.	13*d.*	.....
Exmoor	4 to 5 yrs., 60 to 75 lbs.	4 to 5 lbs.	12*d.*	12½*d.*
Black faced	3 to 4 yrs., 60 to 65 lbs.	3 lbs.	8*d.* to 9*d.*	.....
Devon S. hams	2 yrs., 100 to 120 lbs.	9 lbs.	9*d.* unwashed	.....
Baupton	2 yrs., 120 to 150 lbs.	7 lbs.	12½*d.*	.....
Herdwick	4 to 5 yrs., 40 to 50 lbs.	3 to 4 lbs.	8*d.* to 9*d.*	13*d.*
Intermediate Wool:				
Dorset	2 yrs., 80 to 100 lbs.	6 lbs.	13*d.*	.....
Cheviot	3 yrs., 70 to 80 lbs.	5 lbs.	12½*d.* to 13*d.*	13½*d.* to 14*d.*
Welsh	4 to 5 yrs., 30 to 40 lbs.	1 to 1½ lb.	12½*d.*	13½*d.*

—*From R. A. Journal, Vol.* 16, *p.* 222, *&c.*

Produce of Wheat.—The fine autumn weather we have had lately has enabled the small farmers on the high lands adjoining the moors to secure their corn as sound as their brother agriculturists had done in the more favoured districts, and harvest may now be fairly said to be ended. I stated long ago in your columns that I was satisfied the yield of Wheat on most lands would be short, and the sample inferior. The new Wheat brought to market has fully borne out this opinion, but I am sincerely glad to have to add that the whole crop may be considered as perfectly sound, and this is a very great advantage, especially to the poor who have to consume the inferior corn; and had the harvest proved unsound, and prices high as at present, they would no doubt have eaten much that was unfit for human food. I have threshed two lots of new Wheat; the first grew on 16 acres of strong clay land. There were on the whole 16 acres 7780 sheaves, or 648 stooks of 12 sheaves each. The result was—marketable corn, 270 bushels; part of the crop where lodged and kept separate, being inferior corn, 42; backends or tail corn, 39; total, 351 bushels, or nearly 22 bushels per acre. The second lot was grown on 6 acres, and it had 3933 sheaves or 327½ stooks of 12 sheaves. It gave 179 bushels, and the backends or tail corn were very little inferior to the best corn. This field had therefore very nearly 30 bushels per acre; it was a beautiful crop, most of it standing, and in good years would have certainly yielded 40 bushels per acre. The Wheat in both these lots was red, straw white, and in the first quantity the good corn weighed 61 lbs., and in the second 62 lbs. per bushel. I have recently been over a great deal of land in Yorkshire and the midland counties, and although there is here and there a splendid field of Turnips to be seen, I do not consider on the whole that we have more than half an ordinary crop of Turnips in these counties. *Roaldus.*

Farmers' Clubs.

Witham.—The ploughing match took place on the farm of Mr. Wm. Hutley, and a more than local interest was imparted to the competition by the offer of a prize of 5*l.* by Mr. Bentall, ironfounder, of Heybridge, open to the ploughmen of Essex. There were 45 competitors. It was awarded to George Mynard, in the employ of Mr. Aldham, of Ulting. The winner appropriately used Bentall's plough. At the annual dinner, the Chairman said they were under great obligations to Mr. Mechi for the good he had done to agriculture by working away at all kinds of improvements, as he had done at Tiptree Hall. There could be no doubt that it had been a great benefit to agriculture, whatever the result had been to Mr. Mechi himself, and he begged to propose that gentleman's good health.—Mr. Mechi acknowledged the toast, and also thanked the chairman for his commiseration. He had no hope that agriculturists generally would ever believe that he was farming at a profit, and he doubted if many of them would admit, after they were convinced, that drainage, irrigation, steam-power, and many other things, which involved a large amount of capital were really essential to profit. He did not expect these things to be generally admitted in this generation. As far as his own farming was concerned he felt that "Othello's occupation" was almost gone. When he sowed the first guano in that neighbourhood people smiled and said it was a mere peppering the soil and could do no good: now he constantly met his neighbours' waggons with it. (Hear, hear.) His steam-engine again was considered most ridiculous; but now steam-engines were as common as Blackberries. Formerly there was a strong belief in this locality that deep cultivation was injurious; but there had been a great change in that respect also, though he was not satisfied that the prejudice was altogether done away with. It was impossible to read the reports from different districts and not see the improved tone of the agricultural mind in this respect, and that those things which he (Mr. Mechi) did years ago, and about which their Chairman had such serious doubts on the score of profit, were now being carried into practice. It was time something should be done to remove from the agriculturists of the country the disgrace of not being able to feed their own population, when they had millions of acres not half farmed. He must exempt the farmers of this neighbourhood, who took a high rank as practical agriculturists; but the country generally could not be judged of by the neighbourhood of Witham. It was impossible to travel from one end of the kingdom to the other without seeing that bad farming was the rule, and high or good farming the exception; and therefore he felt that the application of the stimulus of censure was imperatively called for, until a more satisfactory state of things should be brought about. He agreed in what had been said as to the great usefulness of this Society in regard to the labourers. The improvement of their cottages was a most important question; and he thought they might lay great blame upon the state of the law. When the temptation to landed proprietors to get rid of cottages from their estates, in order, he might say, to impose the population upon an adjoining parish, should be done away with by enlarging the area of settlement, he believed a most beneficial effect would be produced. Already that had been partially the case. It was very easy to come to sound conclusions upon the subject; every 100 acres of land required stabling for four horses, and ought to have accommodation for at least four labourers; but the demand caused by the increase of population and the non-building of cottages often led sordid men to divide what would otherwise be good dwellings, and so forced families into most indecent limits. The existing state of things enabled men to do that; but if there was a sufficiency of proper cottages the inducement would be done away with. The question affected all: and it was very desirable that upon these occasions public opinion should be brought to bear upon it: the more moral the labouring population were the better it would be for employers and society generally; and there could be no doubt that the system of over-crowding produced disease, which often entailed a heavy charge upon the poor-rates. In conclusion, he begged to assure Mr. Bullock that he was now reaping a very good return for his improvements. This year he could not help making a good profit, and he was satisfied that it cost many of his neighbours a higher rate to produce corn than himself, simply because their landlords had omitted to make those improvements which few practical men would now deny to be remunerative. Who would dispute that the interest upon drainage was more than paid in a crop? (Hear.) And in the same way good buildings, steam-engines, and improved implements were all remunerative. Then there was putting in a proper quantity of seed, which was a very important point, because not only was there a large quantity of corn wasted by being sown in excess, but the injury to the crop was more than equal to the rent. He often asked how they knew they were sowing the proper quantity, and whether they had ever tried less? Many said they had never done so, and did not want to try it; and it was this pig-headedness on the part of agriculturists which he wished to remove; as he was satisfied unless they tested the proper quantity of seed upon particular soils, and the powers of the manures they applied, it was impossible to arrive at any sound conclusion. He felt perfectly comfortable about his own improvements, and he hoped his neighbours would cease to feel for him so much as they had done. (Laughter.) He believed the pity was often mutual, and that he pitied others as much as they pitied him; but time melted everything down, and the next generation would not differ so widely upon these subjects as it had been his lot to do with many of his brother farmers. (Hear and applause.)

Mr. Cox said Mr. Mechi claimed the credit of convincing them that draining was profitable; but Mr. Hutley himself, and many other farmers in the neighbourhood, were satisfied of that, and had drained their land before Mr. Mechi came into the neighbourhood. (Hear and cheers.) Mr. Mechi: Would not Mr. Cox admit that the great bulk of the heavy land of Essex was undrained? Mr. Cox did not know that he would. Mr. Mechi: Taking the south side of the county—from Witham to Tiptree, and from thence to the sea, was there any drainage worth mentioning? Mr. Cox said it was such a cold uncomfortable part of the country that he very seldom visited it. Mr. Mechi said the question was too important to be evaded. There were tens of thousands of acres of land in Essex which were not drained because the occupiers did not believe it would pay. Take 10 miles round Witham, would they find the heavy lands generally drained? Several gentlemen said they believed they were; and Mr. Gooday said he was farming land which his father drained 30 years ago. Mr. Jonathan Hutley said he had cut land ditches in his Dengey Hundred land, and they did not draw a foot on each side. Chalk took off the water a great deal better than drains. Mr. Mechi hoped when they got statistics of the agriculture of the country the extent of drainage on the different soils would be specified, and that would settle the question whether the heavy lands were drained. The Chairman proposed the healths of Mr. Dixon and Mr. Thedam, as gentlemen who had generally favoured them with the results of experiments in farming. (Cheers.)

Mr. Dixon wished first to advert to the question of drainage, because, although he believed Mr. Mechi was correct in saying that on the strong cohesive clays in the south of the county very little drainage had been done, he believed the reason to be this: the farmers of that district had methods of getting the water off without drainage; and as they could grow as large a crop as on any of the drained clays in the county, they doubted if the extra benefit from drainage would compensate the cost. With regard to the prejudices of the agricultural mind, no doubt most men thought themselves pretty well at the top of the tree—(laughter)—but that applied to other callings as much as to farming. With regard to his own land (without pretending to say the system was one of universal application), he had found the burning of clays and deep cultivation very successful. The benefit of getting the lower soil uppermost he believed to be that the solid bottom undisturbed by the plough had for ages received the subsidence of manures and fertilising properties of the soil, and a different implement to the plough was required to bring them up—either the spade or fork. This year he had cultivated 18 inches deep, and with 9 inches of the bottom soil to the top, at a cost of 4*l.* per acre; it was planted with Potatoes, no manure having been used but 1½ cwt. of Guano and 1½ cwt. of salt. Upon 5 acres three men had been engaged nearly three weeks, and they took up on the average from 150 to 180 bushels per day, and of that quantity there were only about 9 bushels small or diseased. The total crop averaged 3 bushels to the rod and 480 bushels to the acre. The kinds grown were the Fluke and the Scotch Down: the latter, from not knowing their habit, he planted too thick, or he had no doubt the crop would have been still heavier: as it was he got 12 tons per acre.

Mr. Mechi, reverting to the question of drainage, asked Mr. Hutley if he did not hold several hundred acres of heavy land, which was undrained?—Mr. Hutley said he did, and he should like to thresh his crop out against Mr. Mechi's and give him a quarter in (Laughter).—Mr. Thedam said he had made no experiments this year; but he was surprised to hear thin seeding brought up again, which he supposed was settled two years ago, when many farmers suffered in their crops from that cause. Where the land was good he thought 4 pecks per acre sufficient; and 6 pecks ample; but there were uncertainties of season to be considered. With regard to burning, it might be beneficial upon some soils, but he had known instances where a considerable expense was incurred in the process, and the land injured by it. He had tried it himself, and believed he "burnt his fingers." Upon land like Mr. Dixon's it appeared to be efficacious; but the facts he mentioned showed that there was no rule without an exception. Statistics had been mentioned, and very likely an accurate account of the crops, &c., might be a good thing for consumers, but he did not believe it would be so good for the farmers. For instance, if the average produce of the country was 16,000,000 of quarters, and the consumption 18,000,000, if there was a very plentiful year, and the merchants had the means of knowing that the yield had been equal to the latter quantity, it would put an end to all speculation, and the farmer must suffer from that fact being known. (Hear, hear.) He had been very much surprised this season at there being so little corn at Mark Lane? Mr. Mechi: Because the farmers don't want money. Mr. Thedam believed there had been more Wheat threshed since harvest than in any of the last 20 years; but the local demand was such that it was not taken to London. The Chairman proposed "the health of Mr. Hutley," and alluded to the first-rate character of his farming. Mr. Hutley expressed the interest he took in the Society, and its benefit to the farmer by encouraging good workmen. With regard to what Mr. Mechi had said about guano, he believed he used more guano before Mr. Mechi began farming than he (Mr. Mechi) had done since. (Laughter.) He should like to go into other matters, but his health would not allow him. Mr. Mechi would be glad if Mr. Hutley could mention dates. He (Mr. Mechi) used guano when it was 20*l.* a ton, and, with all respect for his friend, he thought he had made a little mistake.

Golspie, Inverness: *Sheep Farming.*—Mr. Loch said: It is not a great many years ago, at any rate it must be within the memory of many living men, that the sheep farmers on the border counties, hitherto pre-eminent in their line, heard for the first time with some surprise that, through the skill and enterprise of a few energetic men, a remote region in the north, amidst its brown mountains, and notwithstanding its uncertain climate, was found capable of rearing a class of sheep fitted to dispute the palm with those reared on their own green hills; and that the sheep of Sutherland, in spite of these difficulties and disadvantages which thus attended their culture, speedily acquired a pre-eminence that gave them the preference in every market-place throughout the country. Happily this pre-eminence still continue—Sutherland sheep and Sutherland farmers still retain, as they deserve, the reputation which was acquired by the labour of their predecessors; nor has anything yet been done by them to endanger it. But let us for a moment consider whether there are not discoverable some symptoms that may, if not taken in time, have a tendency to endanger our future possession of the first rank. For example, let me ask whether the same zeal and earnestness prevails now as formerly in supporting the periodical exhibitions of sheep, by means of which those engaged in their culture are enabled to compare the results of their own efforts with those of their neighbours, to interchange ideas, and adopt improvements? During the period of progress that existed in Sutherland in the early part of the century, or at any rate during a large portion of it, men made it their business to encourage these exhibitions, which contributed to such beneficial results; but is that the case now? It is certainly the case that the only sheep show at which I have been present since coming to the county—that at Lairg—was a very indifferent one, indifferent not only in point of the numbers exhibited, but in their quality; and it was peculiarly mortifying that the two first prizes were won by sheep bred in the south and imported into the county. It has been my business to inquire of others whether these impressions of mine were well founded, and I regret to say they have been confirmed by those best able to judge. Two reasons have been given me for the change. One was given me by the gentlemen themselves who declined to exhibit, and it was this, that they objected to certain regulations under which sheep were admitted for exhibition which permitted their owners to make them up so as to conceal their defects by means of rough clipping; that they did not choose to place their sheep clipped honestly in competition with others-thus fraudulently made up; they also objected to artificial feeding. The other reason assigned was certainly not given me by the gentlemen who declined to exhibit, for it was to this effect, that these gentlemen having gained or inherited a certain reputation for the excellence of their stock, were afraid to place it in jeopardy by running the risk of being surpassed by the sheep of rival exhibitors, and that for this reason they kept their sheep at home. Now, it seems to me that both these reasons are fallacious. I will confess that when the first reason was originally named to me by a gentleman of great experience, it weighed with me very considerably, and I thought that he did right to abstain from a contest that seemed so unfair. A little consideration, however, induced me to take another view. It seems to me that if the judges appointed on these occasions understand their business, they will be able to distinguish between what is fictitious and what is real, and will be able to tell whether the sheep submitted to their inspection are made up or not, and that they will decide accordingly. For my own part, I can only say, that were I a judge, and to find a sheep appearing in this way under false colours, a prejudice would be more or less created on my mind against him, and I should feel inclined on that ground alone to set him on one side. But, surely, without reference to a feeling of this sort, good judges will always have it in their power to do justice to the true merits of the animals on which they have to pronounce an opinion; and thus, I think, the first reason affords no good ground for withholding stock from these exhibitions. As regards the second, if it really exists as a reason by which gentlemen are deterred from exhibiting, there can be no difficulty in condemning it, for surely a motive of this sort, if permitted to operate extensively, would sow the seed of certain decay in the high position which the sheep stock of Sutherland now deservedly occupies. What could be more fatal to the continuance of this excellence than that the sheep farmers should take pains to avoid subjecting their sheep to comparison with others, lest they should discover that having been once superior they were so no longer? Why, the very object and intent of these shows is to discover whether any change of this sort is going on. Who can be interested in learning the deterioration of a flock so much as the owner of that flock? He should seek for this knowledge, if the fact be so, and not shrink from it. How else is he to maintain his place, and how can we be sure that the county will maintain its place, if its principal sheep farmers, content to rely on a reputation already established, are deterred by the fear of possibly losing it, from submitting their flocks to frequent comparison with others? They should bear in mind that in human affairs it is frequently more difficult, and demands more constant exertion and care to maintain a position than in the first instance to acquire it—and that this is now their case, surrounded as they are by active and energetic rivalry. I believe, as I said before, that the sheep farming of this county still deserves, as much as it has ever done, the high reputation awarded to it—and that that against which I have ventured to caution you is as yet but a symptom, which we are in ample time to correct.

Knighton.—*On Preserving the Turnip Crop.*—Mr. Smythies read a paper on this subject, from which the following is an extract:—Every one that has grown a good crop of Turnips is fully aware that it can only be done at considerable cost; it must surely, then, be very false economy to grudge a small outlay to preserve it for consumption in the best possible condition. If you cut a Turnip through that has been well stored, and compare it with one that has been exposed to all the changes of temperature of a long winter, you must be convinced of the superior feeding qualities of the former, even supposing the latter be not wholly rotten and useless. In a hard winter like the last, the loss caused in this way by the frost is almost incalculable. Not only do Turnips exposed to the frost become rotten, but they are bad food for stock whilst they are frozen, and they cannot even be taken up during a frost without great waste and loss. Besides the injury to the Turnips caused by exposure to the weather, I have no doubt the land is robbed a good deal by letting them stay undrawn so long. I think, therefore, that it will be the truest economy on all farms to secure a sufficient quantity of Turnips to carry us through the greater part of the winter and the whole of the spring. On the generality of soils in this district I think it is best to take half the crops to the yards, for consumption by the cattle, and leave half to be eaten on the field by the sheep. Those for storing should be pulled when the land is tolerably dry, so that the soil may be shaken from them without much application of the knife, which should only be applied to remove the small roots and the tops, which latter should be cut off an inch from the bulb. I have found it the best plan to take every alternate eight rows, putting four rows into one on either side, which leaves a convenient space for the passage of a cart between them. There are various methods of storing Turnips for fold-yard consumption, but I believe the best plan is to place two rows of five-barred hurdles at such a distance apart that a cart will just back up between them, wind them well with straw, and fill level with the top, and cover them with sufficient straw to secure them from the frost. Those left in the field may be thrown together into convenient heaps and covered with soil, in which way they will keep quite fresh to a late period in the spring. In consuming Turnips, whether by cattle or sheep, care should be taken that they are ripe before they are used, as I am sure that when given in an unripe state they are as unpalatable and unwholesome to animals as unripe fruit is to ourselves. In giving them to cattle they ought to be cut into such slices as will not choke them, and given in quantities varying according to the age of the beast, and the purpose for which he is designed. When given to feeding beasts they are generally used in too large quantities, acting injuriously on them by over stimulating their kidneys; 70 or 80 lbs. a day, in conjunction with straw and a little flour, will be found ample for most.

Miscellaneous.

The Return of the Irish Flax Crop for the present year, as prepared by order of Government, has just been completed, and shows a very considerable decrease in the breadth of land devoted to this important produce. The return is as follows:—

Return in statute acres of the extent of Flax in Ireland in 1855 compiled by desire of his Excellency the Lord Lieutenant, in anticipation of the general tillage return:—

Total in statute acres—In 1854, 151,403; in 1855, 97,192.
Total decrease in statute acres, 54,211.

Total extent of Flax grown in Ireland in the following years:—1850, 91,040 acres; 1851, 140,536 acres; 1852, 137,008 acres; 1853, 174,579 acres; 1854, 151,403 acres; 1855, 97,192 acres.

Cultivation of Sand-hills.—At the late meeting of the British Association, the Rev. Dr. Paterson, of Glasgow, read a paper "On the Cultivation of Sea Sand, or Sand-hills." The writer assumes that in Britain there are many hundred thousands of acres of sea sand, driven into heaps by the wind, and absolutely useless. Being on the level of the sea, such deserts enjoy the best of climate, but continue hopelessly barren, on account of the hitherto unconquerable difficulties of dealing with the subject. The shifting nature of the mass from the action of winds—very like the driving of snow—renders every effort abortive, and soon obliterates what the hand of industry had wrought. Should these difficulties, however, at a moderate cost, be overcome, the encouragement is immense—say a million of acres turned into Clover and waving corn, instead of waves of desert sand. The writer has seen a small sheltered corner reclaimed which yielded 10*l.* per acre of annual rent; and the soil was originally no better, and in fact no other, than that of the common sand-hills. The method proposed is first to have a command of water raised from the sea, or from the nearest river or brook, and

ready for distribution, after the manner already in use for the application of liquid manure to a farm. In the latter case, the cost of the apparatus is profitably incurred, when the object is only the applying of manure; in the former the application would be, in the first instance, to the creation of the soil; whilst it would still remain for the purpose of manuring as occasion might require. Having thus a command of sea or river water, all the obstacles to an easy and cheap cultivation are immediately overcome. Let navvies be employed to level the breadth of a ridge or two running in the direction of the most prevailing wind; and let their work be instantly followed by a copious irrigation. On the warm wet sand, which the winds in that state will not stir, spread plenty of guano, or bone dust, and sow Clover, with a few grains of Barley, and Perennial Rye-grass, and in a few days there will be a beautiful verdure, leaving to the owner the choice of sheep grazing or cutting with the scythe. Speaking of a ridge-breadth formed like a road, it is only meant that such is a beginning; and that the levelling and sowing keep pace; and evident it is that neither extent nor exposure on such a plan can prove any hindrance; though it may be expedient on account of the freaks of the wind, to leave it, for a little time, a narrow space to play upon, between the unlevelled brow of the desert and the new sown ridge, taking care that that narrow space itself be duly watered. Where irrigation from the sea is found most convenient, there will be also the advantage of a saline manure; and it is observed that sheep are always exceedingly fond of Grass that has been showered by marine spray, or washed by the tide. It is needless to speak of enclosures which will be proper where the waste regions are large, as doubtless Thorns will grow, especially the Sea-thorn, where Grass and corn can be made to thrive. And it need not be observed that the planting of hedges should be at the first, when they would get their share both of the guano and irrigation. After the hedges are well grown, the surface consolidated, and the soil has acquired some admixture of vegetable mould, the plough may be thought of, but till then it will be as wise to let well alone. For aught that the writer can see, there is no reason to fear the perfect and economical success of the methods now suggested; and it is earnestly to be hoped that some noble spirited proprietor, such as the Earl of Eglinton, who is not a little interested, will try the experient.

Calendar of Operations.

OCTOBER.

Wester Ross: *October* 22.—The harvest having been early finished a great deal of our autumn labour has been already accomplished; although the ground has been uncommonly dry, the greater part of the green crop lot on many farms has had its winter furrow; leas have been seed-furrowed for Wheat; a large proportion of the Potato crop has been uplifted, and some farmers have been in such haste to have them out of the ground, that they waited neither for the ripening of the Potatoes nor for the cooling of the atmosphere, and the result has been that whole pits have heated, and undergone decomposition. Although the proportion of diseased Potatoes is small, the number is still increasing, and as there is risk in keeping them over the winter, the earliest opportunity will be taken advantage of for getting rid of such a peculiarly precarious crop. A more abundant return, or Potatoes of finer quality, we have never had. Our Turnips are not so heavy generally as we anticipated a few weeks ago. The continued drought brought on mildew, and, although we have had of late abundant showers, they have not attained maturity. Individual Turnips, however, have been taken notice of in different parts of the country as having reached an extraordinary size, and amongst the largest of these were two grown on this farm, one weighing 15 lbs. 3 oz. and the other 16½ lbs., without the shaws; they were both of the Pomeranian kind. Leas and stubbles are now quite bare, and we are necessitated to supply the stock somewhat earlier than usual from our Turnip field. Our last Muir of Ord market was one of the dullest and cheapest we have had for years. An unprecedentedly large number was exhibited, and many hundreds went off unsold. The better kinds, however, such as good crosses and fat cattle, fetched fair prices. The scanty supply of straw forced many to exhibit stock for sale, which in other circumstances would have remained at home. There is a good demand for Turnips to be eaten off by sheep, and a good crop will fetch some 5*l.* or 6*l.* an acre. We cannot say much as yet about the yield of our grain, as very little has been threshed out. Wheat and Barley are spoken of as yielding well, and of good quality. Oats are deficient both in quantity and quality, and the straw is miserably short. Labour is abundant, and wages are high; and, although provisions of all sorts are uncommonly dear, the cry of complaint is seldom heard.

Notices to Correspondents.

Bacon: *Ignoramus.* You cannot put too much salt. Read the recipe in last week's Paper. Keep the bacon in a cool dry place in a bin with layers of malt dust; or, when well dried, you may put it in a bag with dry Oatmeal, and hang it on the kitchen wall.

Cambridge Roller: *R H.* We have no doubt it will do very well for your Clover.

Chemistry: *J B.* You cannot teach yourself the art of chemical analysis so as to execute the same with accuracy. You require practice under the eye of an experienced analyst.

Draining: *An Old Pupil.* We do not know your circumstances. The answer would depend a good deal on whether you need any one to direct and superintend the process. If you do, you had better take his advice.

Giant Sainfoin: *Cor.* Sow about 4 bushels of the rough seed, *i.e.* the seed unshelled, per acre in April. You may drill it across the Barley if the field is clean.

Moles: *Sub.* They must be extirpated by the trap.

Water Meadow: *Q Q.* The rule is to water night and day for a week, and then let the land thoroughly dry for about three days: but this rule cannot be rigidly adhered to. In some seasons so long a flooding would cause a scum to arise, owing to a partial rotting of the vegetation, and if in that state frost were to occur it would kill the Grass.

Wheat: *R H.* If you could deposit the seed about 1 inch under the surface it would be "well" covered. The dibble should set the seed at about 3 inch intervals, or less in the rows. There would be no advantage in dibbling on raised ridgelets.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „ long	3 „ 3 „		1	15	0
3 „ ditto	3 „ 6 „		2	12	0
3½ „ ditto	3 „ 6 „		2	18	0
4 „ ditto	3 „ 6 „		3	5	0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	12	0
2½ in. long	ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps. 103, Newgate Street, London.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. Seeley (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AT THE NORWICH, GLOUCESTER, LINCOLN and CARLISLE SHOWS,

The Prize for the best LINSEED and CORN CRUSHER was awarded to E. R. & F. Turner, St. Peter's Iron Works, Ipswich.

E. R. & F. Turner invite the attention of Agriculturists and others to the following machines of their manufacture:—

ROLLER MILLS for Crushing Linseed, Oats, Barley, Malt, &c., of various sizes, with or without Bean-mill combined. The numerous prizes awarded these Mills by the Royal and other agricultural societies, render comment on their merits unnecessary.

PATENT COMBINED GRINDING and CRUSHING MILL for reducing Barley, &c., to a fine and soft meal, and crushing Oats, Linseed, &c., is strongly recommended for the variety of purposes to which it is applicable, and for its perfect and economic working. Price 25*l.*

CHAFF CUTTERS, for horse or steam power, cutting three lengths, with facility for changing the length of the cut almost momentarily, and other valuable improvements.

OILCAKE BREAKERS, made entirely of iron, with case-hardened teeth suitable for all descriptions of cake. Price 3*l.* 10*s.*

FIXED STEAM-ENGINES, on the horizontal direct acting principle. Long experience and attention to the practical working of steam-engines of every variety, have enabled the manufacturers to offer these Engines as inferior to none—either for efficiency, economy, or durability—and at prices which will be found comparatively low.

Superior Portable Steam-Engines and Threshing Machines, Horse-Power Threshing Machines, Circular Saw Tables, One Horse Carts, and various other Implements, are also manufactured at the above Works.

Illustrated Price Lists sent free on application.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THIS IS THE ORIGINAL PATENT for important improvements in Stable Fittings, including a method surpassing all others for conveying the straps and halter-weights to the back of the fitting to prevent the horse being cast in the stall. Stable Fittings of every description, plain, enamelled, or galvanised. All kinds of Stable Furniture in stock. Iron Hurdles, Gates, Fencing, &c.

MANUFACTURER OF KITE'S PATENT NOISELESS CAST IRON SMOKE-CURING CHIMNEY CAPS (200 on Buckingham Palace.)—The merits of this invention are proved by practical experiments daily at the Crystal Palace, in the south-west gallery.

Price Lists and Illustrations sent on receipt of two postage stamps.

James Barton, Iron Founder, &c., 370, Oxford Street, a few doors east of the Pantheon.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

COTTAM AND HALLEN

HAVE made important additions to their original Invention of PATENT ENAMELLED MANGER RACK AND WATER TROUGH AT ONE FIXTURE, the main features of which are shown in the above engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

THE CRYSTAL PALACE FLOWER BASKETS and HANGING GARDENS, made to the original Sydenham Pattern, and a variety of other new and elegant designs for the Conservatory, Verandah, Drawing Room, Boudoir, &c., by W. RICHARDS, Imperial Wire Works, 370, Oxford Street, London, nearly opposite the Princess's Theatre; and at the Crystal Palace.

A large stock on view from 3*s.* 6*d.* upwards. Flower Stands, Trainers, Game and Garden Fencing, and Wire Work of every description. Conservatories and Aviaries fitted up in superior style. Window Blinds of all sorts.

370, Oxford Street; and Garden Entrance, Crystal Palace, Sydenham.

WEIR'S SPIRIT DRAINING LEVEL.
Price 30*s.*; Case, 1*s.*
Requires no graduated staff or computation. Any labourer can use them.

WEIR'S PENDULUM WORKMAN'S LEVEL, for use in the Drain. Price 15*s.*
Terms cash.
Illustrated Catalogues sent post free.

EDWARD WEIR, 2, Fitzroy Terrace, and 16, Bath Place, New Road, near Fitzroy Square, London.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. The same prices charged at all the Establishments.

DR. DE JONGH'S
LIGHT BROWN COD LIVER OIL.

TESTIMONIAL from DR. LETHEBY,
Professor of Chemistry and Toxicology in the Medical College of the London Hospital, Medical Officer of Health to the City of London, Chemical Referee to the Corporation of London, &c. &c. &c.

"I have frequently had occasion to analyse the Cod Liver Oil which is sold at your establishment. I mean that variety which is prepared for medicinal use in the Loffoden Isles, Norway, and sent into commerce with the sanction of Dr. DE JONGH, of the Hague.

"In all cases I have found it possessing the same set of properties, among which the presence of cholaic compounds and of iodine in a state of organic combination are the most remarkable; in fact, the Oil corresponds in all its characters with that named 'Huile brune,' and described as the best variety in the masterly treatise of Dr. DE JONGH.

"IT IS, I BELIEVE, UNIVERSALLY ACKNOWLEDGED THAT THIS DESCRIPTION OF OIL HAS GREAT THERAPEUTICAL POWER; AND, FROM MY INVESTIGATIONS, I HAVE NO DOUBT OF ITS BEING A PURE AND UNADULTERATED ARTICLE.

"College Laboratory, London Hospital, Sept. 24, 1855."

Sold ONLY in bottles, capsuled and labelled with Dr. DE JONGH's Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH's sole Consignees; and by most respectable Chemists in town and country.

Half-pints (10 oz.), 2*s.* 6*d.*; Pints (20 oz.), 4*s.* 9*d.*; Quarts 40 oz.), 9*s.*: IMPERIAL MEASURE.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 30 years have been held in constant and increasing public estimation as the purest farinæ of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6*d.* and 1*s.*; and Family Canisters, at 2*s.*, 5*s.*, and 10*s.* each.

HOLLOWAY'S OINTMENT AND PILLS EXCELLENT REMEDIES FOR ABSCESSES.—Mr. Wm. Alsop, of the sloop Wesley, informed Mr. Reinhardt, Druggist, Hull, that a child of his had a dreadful abscess on the thigh, and that the medical men gave him no hopes of the child's life. Mr. Reinhardt then recommended him to use Holloway's Ointment; he did so, and the abscess soon healed, and the little patient is now as well and as strong as any child can be, entirely through the virtues of the Ointment, which are beyond all praise.—Sold by all Medicine Venders throughout the world; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODS, Malta.

COLDS, COUGHS, ASTHMA, INFLUENZA, and DISEASES of the CHEST and LUNGS, arise chiefly from alternations of Temperature. Painful and troublesome as these diseases are, they may be speedily and effectually removed by the judicious use of

SPENCER'S PULMONIC ELIXIR.

SPENCER'S PULMONIC ELIXIR is admirably adapted to promote expectoration, ease the breathing, loosen the phlegm, abate fever, and allay the tickling sensation which occasions the cough, without tightening the chest; and for all temporary and local affections—such as wheezing, irritation of the throat, palpitation of the heart, hoarseness of the voice, influenza, &c.—it affords immediate relief. While in more chronic disorders, as periodical coughs or inveterate asthma, it is equally valuable in its effects, although, of course, a longer perseverance in the use of the article is required.

*** Ask for SPENCER'S PULMONIC ELIXIR.

Prepared only by T. Roberts & Co., Crane Court, Fleet Street, London; and sold wholesale and retail by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in the Kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each. *** The bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

HEAL AND SON'S EIDER DOWN QUILTS; also GOOSE DOWN QUILTS, from 8*s.* 6*d.* to 24*s.* LIST of PRICES and SIZES sent free by Post.—196, Tottenham Court Road.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST, BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City. Circulars free by post.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as a blessing highly conducive to the purposes of health and longevity. Among the various preparations offered for the purpose,

ROWLAND'S ODONTO, or PEARL DENTIFRICE,

stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, this unique compound will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, fix the teeth firmly in their sockets and, from its aromatic influence impart sweetness and purity to the breath. Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—ROSALIE COUPELLE'S CRINUTRIAR is guaranteed to produce Whiskers, Moustachios, &c., in a few weeks, and restore the Hair from whatever cause, strengthen it, prevent its falling off, and effectually check greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness. Sold by all Chemists, price 2*s.*, or sent free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN—"Through using it I have an excellent moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS. They contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders, from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges.

1st,—From the frequency and extent of his purchases: and
2dly,—From those purchases being made exclusively for cash.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are ON SHOW over his SIXTEEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz., from 12*s.* 6*d.* (two light) to 16*l.* 16*s.*

LAMPS OF ALL SORTS AND PATTERNS.—WILLIAM S. BURTON invites attention to his season's SHOW of LAMPS. It embraces the Moderateur (the best Parisian specimens of which have been carefully culled), Argand, Solar, Camphine, Palmer's Magnum, and other lamps for candles; and comprises an assortment which, considered either as to extent, price, or pattern, is perfectly unrivalled.

Pure Colza Oil, 5*s.* 6*d.* per gallon.
Palmer's Candles, 9*d.*, 9½*d.*, and 10*d.* per lb.
Patent Camphine, 3*s.* 10*d.* per gallon.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

FREDERICK YOUNG AND CO.'S LINE.

NEW ZEALAND.—For WELLINGTON direct, CANTERBURY, and OTAGO, one of the most magnificent magnificent ships afloat, the new, fast-sailing, British Frigate WESTMINSTER, A1 for 13 years, 790 o.m., 731 n.m., 1200 tons burden, JOHN WESTGARTH, Commander, loading in the East India Docks, to be despatched 25th November, calling at Plymouth to embark Passengers. This superb vessel, built expressly for the passenger trade and just launched at Stockton, from the beauty of her lines and the exquisite symmetry of her proportions, is expected to make the passage out in 80 days. Her spacious and elegant poop is upwards of 50 feet in length, and the rare and choice compartments offer every comfort and convenience to ladies and families proceeding to the Colony. An experienced Surgeon will proceed in the vessel.—FREDERICK YOUNG & Co., New Zealand Colonists' Rooms, 74, Cornhill.

MR. HASLAM will Sell at the Auction Mart, on TUESDAY and WEDNESDAY, Oct. 30th and 31st, as above, consisting of most of the newest and best Perpetual Roses, warranted true to name.

THAMES BANK, PIMLICO.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Joseph Robinson to submit to public competition, on the above premises, on WEDNESDAY, Oct. 31, at 11 for 12 o'clock, without the least reserve, a very choice and select Collection of Fancy and other varieties of Pelargoniums, also a collection of Pompone Chrysanthemums, about sixty neat specimens, a few Azaleas, also a fine collection of Dahlias, three Greenhouses, and a light Spring Van. J. R. assures purchasers that every plant will be correctly named and labelled.—Catalogues had 6*d.* each, returnable to purchasers, of the Auctioneers, American Nursery, Leytonstone, Essex, and of Mr. J. ROBINSON, 2, Glasgow Terrace, Thames Bank, Pimlico.

CLAPHAM RISE.
To NOBLEMEN, GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, on the Premises, Clapham Rise, near London, on MONDAY, October 29, and following day, at 11 o'clock each day (by order of the executors of the late Mr. Henry Groom) the whole of the extensive, costly, and unrivalled collection of TULIPS, Offsets, and Breeders, which include the most rare and approved varieties in cultivation, and choice Seedlings not in the possession of any other grower, being the study of 40 years of the deceased's life, whose judgment and taste was universally admitted. Also Dutch and other Bulbs, consisting of the finest Double and Single Hyacinths, Narcissus, Crocus, Early Double and Single Tulips, Jonquils, a rich assortment of Ranunculuses, Gladiolus, Anemones, &c., with 1500 Lilium lancifolium in great variety, Japonicum, &c. May be viewed prior to the sale.—Catalogues may be obtained 1*s.* each, returnable to purchasers, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

WANDSWORTH ROAD.

MESSRS. PROTHEROE AND MORRIS have been instructed by Messrs. Chandler & Sons to Sell by Auction, on the premises in the Wandsworth Road, early next month, a collection of the following ORNAMENTAL TREES, EVERGREENS, and SHRUBS, comprising Laburnums, Almonds, Poplars, Lilacs, Evergreen Privets, Variegated and Green Hollies, from 2 to 8 feet high; Arbor-vitæ, from 2 to 8 feet; Laurels, large Box, Scarlet Arbutus, very handsome; crimson and other Rhododendrons, well set with flower buds; yellow Azaleas, Kalmias, Daphne hybrida, Escallonia, Veronicas, &c., &c.; also dwarf Apples and Pears well adapted for potting, Gooseberries, Currants, and Vines, Chrysanthemums, Passion flowers, Myrtles, &c., &c. This Sale is worthy the attention of Planters, as everything is in fine condition and will move well. An announcement of the days of sale will shortly be made, and Catalogues prepared.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction at the Mart, Bartholomew Lane, on FRIDAY, November 2d, at 12 o'clock, a first-class collection of Dutch Bulbs, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemones, Crocus, Tulips, Snowdrops, Ranunculuses, Gladiolus, &c. Also a selected assortment of fine Standard and Dwarf Roses, including Hybrids, Bourbons, Chinas, Noisettes, &c.; and American Plants comprising Hybrid Rhododendrons, Ghent and other Azaleas, Kalmias, Andromeda floribunda, beautifully furnished with bloom buds, &c.—On view the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

NURSERY STOCK.—WHALLEY RANGE, MANCHESTER.

MR. CAPES begs to state that he has received instructions from Messrs. H. Bigland & Co., in consequence of the expiration of their lease, and the grounds having to be given up, to Sell by Auction, on WEDNESDAY and THURSDAY, November 7th and 8th, and the following day if required, at 10 o'clock each morning, the entire of the remainder of their STOCK of Evergreens, Fruit and Forest Trees, two Greenhouses, Dutch Pit, and other Effects, at the Britannia Nursery, Whalley Range, near Manchester. Catalogues will be ready a week prior to the sale.—22, Princess Street, Manchester.

FOUR HUNDRED FINE ASH TREES; ALSO SIXTY OAK AND SEVENTY ALDERS.

HORTICULTURAL SOCIETY OF LONDON.—The AUTUMN MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, November 20th, from 12 to 4 P.M. The Chair will be taken at 2 P.M.

BRITISH POMOLOGICAL SOCIETY.—An Extraordinary Meeting of the British Pomological Society will be held at the Rooms, 20, Bedford Street, Covent Garden, on MONDAY, the 5th of November, to compare and determine the merits and qualities of Fruits, for the election of Members, and for general business. The Chair will be taken at 1 o'clock.

It is hoped that all who take an interest in the cultivation of FRUITS and FRUIT TREES will forward to the meeting specimens of such varieties as they can obtain, correctly named, and otherwise assist in promoting the objects of the Society.

Persons desirous of becoming Members are requested to make application to the Secretary on or before the day of meeting. Members are elected at all the Meetings of the Society; and 10s. entrance fee, with 10s. annual subscription, constitute membership.—Robert Hogg, Secretary.

STOKE NEWINGTON CHRYSANTHEMUM SOCIETY.—The Ninth Annual Exhibition of this Society will be held at the Manor Rooms, Church Street, Stoke Newington, on WEDNESDAY, November 14. Doors open at 12 o'clock. Admission from 12 to 4, 1s.; after 4 o'clock, 6d.

OSAGE ORANGE (MACLURA AURANTIACA).

MESSRS. MORRISON AND SON have to offer about 50,000 Plants (5 to 6 inches high) of this fine new Hedge Plant (see *Gardeners' Chronicle*, May 13, 1854), price 10s. per 100. Price to the trade on application. Railways to all parts of the kingdom.—Nurseries, Mountcoffer, Banff, N.B.

HARDY HEATHS.

WATERER AND GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

W. TOWNSEND has now ready to send out GERANIUM CYDONIA CARMINEA—for description see Advertisement, 4th August; has been exhibited at the National Society, 15th June and 26th August, and obtained a Certificate. Plants 5s., 7s. 6d., and 10s. 6d. each; one over to every three ordered in the trade. Post-office orders payable at Bayswater.—Notting Hill.

GOOD PINES WANTED,
From 2 lbs. to 4 lbs. each.
Forward immediately to George Taylor, Jun., Fruit Salesman, St. John's Market, Liverpool.

WANTED TO PURCHASE, about 150 yards of EVERGREEN PRIVET HEDGE, about 3 or 4 years' old, in good condition, and about 4 feet high.—Address, stating price, to W. W., 4, Grove Terrace, St. John's Wood, London.

TO BE SOLD, at a nominal price, 200 DOZEN GERANIUMS, in large and small 60's; clean, strong, uniform in size, and all early, free-flowering, saleable sorts.—R. Bullen, Dulwich Common, Surrey. Enquire at the Alleyn's Head.

RASPBERRY CANES.

TO BE SOLD CHEAP, about 1000 fine RASPBERRY CANES, at 6d. the dozen for the lot.—G. P., Mr. Brown's, Bootmaker, Shoreditch.

SPANISH CHESNUTS.

TO BE SOLD, about 200,000 Strong SPANISH CHESNUTS, from 2 to 4 feet. Price sent on application to Waterer and Godfrey, Knap Hill, Woking, Surrey.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4s. per dozen.—The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. Cobbett's Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

THE FLUKE KIDNEY POTATO (TRUE).

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, can now supply the above at 4s. per bushel of 56 lbs., or 7l. per ton. Post-office orders to be made payable at Middleton, Lancashire.

SEED POTATOES.—Fluke Kidneys, 4s. per bushel of 56 lbs.; 7l. per ton; Lapstone Kidneys, 5s. Early Shortstop Ashleaf Kidneys, 6s. per bushel of 56 lbs.; sacks, 6d. per bushel extra. All orders must be accompanied by a remittance.—Apply to Humphrey Chamberlain, Kempsey, near Worcester.

SEEDS FOR EXPORTATION.

SUTTON AND SONS *are now prepared to execute orders for exportation for New Seeds, growth of* 1855, *consisting of the most desirable sorts, properly packed to arrive in good condition. Free on board at London, Bristol, or Southampton.*

Sutton & Sons, Seed Growers, Reading.

SECOND IMPORTATION.

FRESH IMPORTED BULBS *bloom much finer than those which have been long exposed to the air before planting.*

John Sutton & Sons, Reading, Berks, can supply fine BULBS, just imported, at low prices. See their Catalogue, which may be had, post free, in return for one penny stamp.

THE BEST CUCUMBERS FOR FORCING.—

VINES FROM EYES.

JOHN AND CHARLES LEE beg to offer a very superior stock of all the leading kinds of VINES, both for planting out and for fruiting in pots.

Nursery and Seed Establishment, Hammersmith.

VINES FOR FRUITING IN POTS.

MESSRS. J. AND J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to announce that they have a very choice selection of the best sorts of VINES from eyes grown in 12 and 15-inch pots, Price 5s. and 7s. 6d each.

N.B. Strong Vines for planting out, 3s. 6d. each.—Nov. 3.

TO PINE GROWERS.
LIVERPOOL IS THE BEST MARKET.

FORWARD TO GEORGE TAYLOR, Jun.,
FRUIT SALESMAN,
The Grand Stand,
St. John's Market,
Liverpool.

Terms—Cash.

ROSE CATALOGUE.

J. AND J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to announce that their New CATALOGUE of ROSES for 1855 and 1856 is now ready, and may be had on application.

ROSES, HOLLYHOCKS, ETC.

A. PAUL AND SON'S PRICED DESCRIPTIVE CATALOGUES of ROSES and HOLLYHOCKS are now ready, and may be had post free on application.

A fine stock of CONIFERÆ, ORNAMENTAL TREES and SHRUBS, FRUIT TREES, &c. Prices furnished on application.

Nurseries, Cheshunt, Herts.—Nov. 3.

PELARGONIUM CATALOGUE.

J. DOBSON AND SON'S ANNUAL CATALOGUE, with full descriptions and prices of Beck's new varieties and other leading kinds, may be had on application.

Woodlands Nursery, Isleworth.

N. GAINES begs to announce his PRICED CATALOGUE for the ensuing season is now published, containing Show and Fancy Pelargoniums, Azaleas, Camellias, Fuchsias, Chrysanthemums, Verbenas, Ericas, Epacris, Ferns, Stove, and Greenhouse Plants, &c., and will be sent free on application.

The Nursery, Surrey Lane, Battersea.

BASS AND BROWN'S new AUTUMN CATALOGUE, comprising a considerable portion of descriptive and useful information for purchasers, will be sent free by post for three penny stamps, or gratis to their customers, who may not have received them.

Seed and Horticultural Establishment, Sudbury, Suffolk.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.

☞ The Catalogue describes the colours of the Rhododendrons.

The American Nursery, Bagshot, Surrey.—Nov. 3.

AMERICAN PLANTS.

WATERER AND GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.

Knap Hill Nursery, Woking, Surrey.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.

American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway, where conveyances may be had.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

DUTCH FLOWERING BULBS.

JAMES CARTER AND CO.'S CATALOGUE OF DUTCH AND CAPE BULBS, the most comprehensive and select published, will be forwarded *free of charge* and *post paid*, upon application to address at foot. *The Bulbs are as usual of first-rate quality.*

James Carter & Co., 238, High Holborn, London.

R. PARKER begs to inform his friends and patrons that his PRICED CATALOGUE of DUTCH BULBS is now ready, and will be forwarded post free upon application.

Paradise Nursery, Hornsey Road, Holloway.

DUTCH FLOWER ROOTS.

PETER LAWSON AND SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, respectfully intimate that they are now ready to execute orders for HYACINTH ROOTS, &c., &c., of the finest kinds and in excellent condition. Catalogues may be had, free, on application.

27, Great George Street, Westminster.—Nov. 3.

IMPORTED DUTCH BULBS.

EVAN PAUL begs to inform his patrons and friends that he has received his first importation of the above, which have arrived in first-rate condition, early orders for which are respectfully solicited. Catalogues forwarded postage free on application.—The Nurseries, Derby, Nov. 3.

IMPORTANT NOTICE TO NURSERYMEN.

DONALD AND SON, of the Goldworth Nursery, Woking, near Ripley, Surrey, beg to intimate they will not publish a New Trade Catalogue this season, but refer their numerous customers to the one of last year, which substantially contains all they have now to offer. The stock generally is remarkably good, and free from blight.

N.B. Any amount of Dwarf Maiden Apples and Pears, &c., can be well supplied. Fruit tree stocks are good but scarce.

PANSIES.

J. DOBSON AND SON have a large and healthy Stock of the above, consisting of the best sorts only, which are now ready for sending out, at 6s., 9s., 12s., and 18s. per dozen.

Woodlands Nursery, Isleworth.

CHOICE PANSIES.

JOSEPH NORRIS, Osterley Park, Hounslow, offers the following fine Pansies at 12s. per dozen, viz.: Brilliant, Earl Mansfield, Emperor, Father Gavazzi, Lady Emily, Lord Raglan, Miss Talbot, Monarch, Ostrich, Sovereign, Sir J. Cathcart, Sir J. Paxton. 25 finest varieties, including the above, 1l. 1s; 25 fine ditto, 15s.; 25 pairs fine Pinks, 12s.

Sent to any address, package and hamper included, on the receipt of Post Office Order payable at Hounslow.

WAITE'S DANIEL O'ROURKE PEAS.—The best Early Pea in cultivation can be supplied in any quantity and price had on application to J. G. Waite, Seed Merchant, 181, High Holborn, London.

TO THE TRADE.

ISAAC DAVIES can supply the following New GERANIUMS at reduced prices:—Fair Ellen, Phaeton, Pandora, Petruchio, Serena, Topsy, Grand Sultan, and Cloth of Silver.—Larkfield Nursery, Wavertree, Liverpool.

EDWARD P. FRANCIS offers to the Trade strong MANETTI STOCKS, well established in big 60 pots for Grafting. Price on application. Rose Lists forwarded as usual.

Rose Nurseries, Hertford.

AZALEA INDICA.

JOHN AND CHARLES LEE beg to offer good Plants of the most select kinds of AZALEA INDICA, well set with buds, at 18s., 30s., and 42s. per dozen.

Nursery and Seed Establishment, Hammersmith.

AZALEA INDICA LEEANA.

JOHN AND CHARLES LEE are now prepared to send out this fine Seedling, which for habit of growth and substance of petal, combined with perfect shape and purity, is decidedly the best white Azalea yet out. It has gained Certificates wherever exhibited. Price 21s.; a few extra strong plants at 42s.—Nursery and Seed Establishment, Hammersmith.

NEW VARIEGATED GERANIUM—MRS. LENNOX.

JOHN AND CHARLES LEE are now sending out this novelty, which is a decided improvement on The Mountain of Light. It is of much more vigorous growth than that variety, the margin of the foliage is of a purer white, and in other respects it possesses the same good qualities. Price 7s. 6d.

Nursery and Seed Establishment, Hammersmith.

FRUIT TREES IN POTS.

JOHN AND CHARLES LEE have the finest stock of the above ever yet offered, consisting of—

PEACHES	APRICOTS	CHERRIES
NECTARINES	PLUMS	APPLES

and PEARS

All warranted to bear good crops the first season.

Nursery and Seed Establishment, Hammersmith.

AGRICULTURAL SEEDS, ETC.

PETER LAWSON AND SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, are supplying the following seeds of the best quality:—

Italian Rye-Grass, Foreign seed	Dwarf Essex Rape
Crimson Clover (Trifolium incarnatum)	Winter Tares
Alsike Clover (Trifolium hybridum)	Natural Grass Seeds, for Pastures and Lawns, &c. &c. &c.

27, Great George Street, Westminster.

CABBAGE—SUPERIOR SORTS.

JOHN CATTELL has still a large supply of fine Bedded Plants of the above at 5s. 6d. per 1000; also Red Cabbage bedded, at 1s. per 100; and Cauliflower ditto, Early and Late, at 1s. 6d. per 100. Orders to the amount of 1l. are delivered carriage free to London, and to the Edenbridge Station, South-Eastern Railway. No charge for crates, baskets, or packing. A remittance or reference to accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

MESSRS. E. G. HENDERSON AND SON beg to announce that they have now received their noted collection of HYACINTHS in excellent condition, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with, Catalogues of which, together with their Plant and Seed Lists, will be forwarded post free on application.

CUCUMBER HENDERSON'S NAPOLEON III., in packets, 3*s.* and 5*s.* 6*d* each.

CALCEOLARIA, CINERARIA, and PRIMULA SEED of first quality, 2*s.* 6*d.* and 5*s.* per packet.

FUCHSIAS.—Banks' Favourite, 10*s.* 6*d.*; Prince of Wales, 10*s.* 6*d.*

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (PAMPAS GRASS).—E. G. H. & SON having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2*s.* 6*d.* each, 25*s.* per dozen, or 7*l.* 10*s.* per 100.

Wellington Nursery, St. John's Wood.

THE TRUE LANCASHIRE SHOW GOOSEBERRIES.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, can now supply 24 strong plants for 12*s.*, or 12 plants for 7*s.*, of the below-named GOOSEBERRIES, which are of fine flavour. Weights taken from the Gooseberry Grower's Register of 1855, viz.:

	dwts.	grs.		dwts.	grs.
London	30	5	Lady Leicester	22	16
Thumper	26	18	Random Green	22	15

Napoleon	22	22	Broomgirl	20	0
Overall	22	22	Coppice Lass	19	10

Post Office Orders to be made payable at Middleton, Lancashire. Catalogues on application.

WATERER AND GODFREY respectfully invite the attention of parties engaged in Planting to their fine Stock of the following HARDY ORNAMENTAL TREES, &c.

Araucaria imbricata, 2, 3, 4, 5, 6, 7, and 8 feet high, in quantities, all stocky well grown plants; the larger sizes especially it would be difficult to match.

Cedrus Deodara, 1½, 2, 3, 4, and 5 feet, by the thousand; do. a fine lot of larger, 6, 7, and 8 feet; do. some magnificent Trees, 10 to 15 feet. These are all in a famous condition for Transplanting, having been annually removed.

Cedars of Lebanon, 3, 4, 5, and 6 feet; do. a few splendid Trees, 10 and 12 feet.

Cedars Rio Virginian, 5 to 8 feet.

Cedars, variegated white, 2, 3, and 4 feet, one of the handsomest variegated plants we know. We had a large stock. It is extensively planted at Elvaston Castle.

Cryptomeria japonica, fine plants, 4 to 7 feet.

Cupressus macrocarpa or Lambertiana, 3, 4, 5, 6, 7, and 8 feet. Nothing can be handsomer than some of the specimens of this fine hardy plant.

Juniper, Chinese, 2, 3, 4, and 5 feet; a fine lot of large plants, 6 to 8 feet.

Do. Irish, upright, 3, 4, 5, and 6 feet; do. larger, up to 8 and 10 feet. Our stock of the two last mentioned Junipers we believe to be quite unequalled, the Irish especially; the larger sizes are under perfect columns.

Do. recurva, 3, 4, 5, up to 8 feet.

Do. hispanica or thurifera, 2, 3, and 4 feet.

Abies Douglasi, 2, 3, and 4 feet. A fine lot of large and very handsome plants, 7, 8, 10, and 12 feet.

Picea nobilis, several hundreds of nice plants, 1½ to 2 feet, well grown, and with good lead. None are grafted. A few taller specimens up to 6 feet.

Do. Nordmanniana, a large quantity of remarkably handsome plants, 1½, 2, 3, and 4 feet. Nothing can exceed the vigour of these plants, and all from seed.

Do. Pinsapo, magnificent plants, 4 to 7 feet high, in perfect health.

Pinus insignis, 1½ to 3 feet; a few good specimens up to 7 feet.
" Lambertiana, from seed, 4, 5, and 6 feet.
" Cembra, 3, 4, 5, up to 10 feet.
" Montezumæ, fine plants, 4 and 5 feet.
" macrocarpa, 2 and 3 feet, from seed.

Weeping Larch, clean, stems good, heads 7 feet high.

The following 10 varieties form a very singular group. They are of dwarf habits; the well known Abies Clanbraziliana may be taken as the type of the whole. We believe our collection to be quite unique, and, we may add, most interesting.

Pinus strobus pumila (the dwarf Weymouth).
" sylvestris pumila (the dwarf Scotch).

Abies Clanbraziliana	Abies pumila	All dwarf varieties of the Spruce Fir.
" compacta	" diffusa	
" pygmæa	" Gregori	

Picea pectinata pygmæa (the dwarf Silver Fir), Hudsoni.

Yew, common English, 3, 4, 5, 6, and 7 feet, in large quantities.

Do. upright, Irish, 4, 5, 6, and 7 feet; some splendid plants, 8 to 12 feet.

Do. Dovaston or Weeping, a great many fine plants, worked on straight stems, 7, 8, and 10 feet high, with good heads.

Do. adpressa, 2 and 3 feet.

Do. do., worked on common Yew, as standards.

Do. gold striped, 1½ to 2 feet, by the thousand.

Do. do., a splendid lot of plants, 4 to 6 feet.

Do. do., worked as standards on the common Yew, 8 to 10 ft. high.

Do. do., worked on Irish Yews, 6, 7, and 8 feet high.

Do. elegantissima, or new gold striped; a large quantity, 1½ to 2½ feet, and also worked as standards on the common and Irish Yews. We may safely assert our stock of Golden Yews is unsurpassed.

Do. yellow berried (true), very beautiful when in fruit as we have it, 1½ to 3 feet.

Libocedrus chilensis, 2 to 3 feet, very handsome and bushy.

Thuja Wareana, fine bushes, 3, 4, 5, 6, and 8 feet. This is one of the most useful, and, at the same time, ornamental hardy plants we possess.

Do. American, for hedges, doubtless the very best, 4, 5, and 6 feet.

Do. aurea, or Golden Arbor-vitæ. This plant originated at this Nursery; it has now, as it deserves, become a universal favourite. Our stock of it enables us to offer a choice of many hundred fine specimens, from 1½ to 3 and 4 feet high, and as much through—in fact, perfect globes.

Wellingtonia gigantea, a few of the finest plants in the country, being near 1½ feet high, and as much wide.

Hollies variegated, by the thousand, 2, 3, and 4 feet high. Some splendid Plants, 10 to 15 feet high.

We may here remark with reference to the large specimens alluded to in this Advertisement that every one of them is in a condition to transplant, and travel any distance with perfect safety. They have one and all been annually removed in our Nursery, and in soliciting a personal inspection of our stock, we believe we are justified in stating it offers a choice which is to be found in but few establishments of its kind in this country.

The Nursery may be reached in 40 minutes by Train from the Waterloo Station: and the South Western Railway Company having a Branch on to the North Western, enables us to send plants to all parts, in trucks throughout, without packing and other extensive additions.

Knap Hill Nursery, Woking, Surrey.

W. NICOL, GARDENER, Rossyln House, Hampstead, begs to inform the public that he has arranged to send out his incomparable early Pea "OMER PACHA," through the eminent house of William Clark, Seedsman, &c., 25, Bishopsgate Street Within, the price of which will be, quarts, 5*s.*; pints, 3*s.*; prepaid either by postage stamps or otherwise. As the stock is very limited early application to Mr. CLARK would be advisable. W. N. begs to assert that the above Pea far surpasses in all good qualities every other in cultivation.

BERNARD SAUNDERS, NURSERYMAN and FLORIST, Cæsarean Nurseries, Jersey, respectfully informs Amateurs and Florists that he has a good Stock of Yellow and White-ground PICOTEES to offer for sale this season, at 2*s.* 6*d.* per pair, orders for which will be thankfully received and promptly executed. Also a small quantity of well ripened Seed of the PHORMIUM TENAX or NEW ZEALAND FLAX, at 2*s.* 6*d.* per packet of 60 Seeds.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. SEELEY (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY, WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. ROE (late FREEMAN ROE), Hydraulic Engineer, 70, Strand, London.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s.*

M. WEDLAKE, 118, Fenchurch Street, London.

OAT-CRUSHING AND BEAN-SPLITTING MILL (TURNER'S No. 5).

This Mill is recommended to the use of every person keeping a Horse, as superior for efficiency, durability, and ease in working to any manufactured. Two bshls. of crushed corn afford more nourishment both to old and young horses than three bushels of uncrushed!

Price £5 15*s.* 6*d.*

Made and Sold by E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present reduced prices of Glass for Cash:—

SHEET SQUARES.—In Boxes of 100 feet.

21 oz. " 3½*d.* to 5*d.* " " "
26 oz. " 3¾*d.* to 7½*d.* " " "

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Beehive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in Glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY & Co., 35, Soho Square, London.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London near the Southwark Iron Bridge.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of CORNE'S Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

NEW ROSES.

WILLIAM WOOD AND SON have again much pleasure in recommending their beautiful Seedling Rose, the Perpetual DUCHESS OF NORFOLK; the colour is a very rich vivid crimson, the underside of the petals shaded with lively pink, giving the flowers an exquisite shell-like appearance.

Price for Standards, or Dwarfs, 3*s.* 6*d.* each.

Williams' Evergreen Climbing Rose, 1*s.* 6*d.* each—This Rose is a seedling from the Ayrshire Splendens fertilised with the Yellow Tea Rose; its flowers are creamy white, deliciously sweet-scented.

N.B. The New Rose Catalogue and Supplement may be had on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

TRAINED FRUIT TREES.

WILLIAM WOOD AND SON have much pleasure in recommending their very extensive and superior stock of Dwarf two-years-trained PEACHES, NECTARINES, and APRICOTS, which they feel assured cannot be excelled. The trees are remarkably healthy, and furnished with well ripened shoots; they will be supplied at 60*s.* per dozen.

Pyramidal Pears on Quince stocks, per doz.	...	24*s.* 0*d.*
Pyramidal Plums, extra fine do.	...	20 0
Pyramidal Apples, do. do.	...	16 0

Catalogues forwarded on application. Extra plants presented with each order, to compensate for distant carriage.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

ROSE CATALOGUE, ETC.

MESSRS. LANE AND SON, NURSERIES, Great Berkhampstead, Herts, beg to inform their patrons that the undermentioned descriptive CATALOGUES may now be had. General Rose, Tree and Shrub, and Fruit; also of Azalea Indica, Camellia, Hollyhocks, &c.

The Hardy Rhododendrons are fine; the Araucaria imbricata, Cedrus Deodora, the Pinus, with all other Evergreen and Deciduous Plants, are remarkably healthy, forming fine specimens, giving immediate effect, and well worthy the attention of Planters.

A NEW SEEDLING APPLE FROM THE RIBSTON PIPPIN.

STEPHEN SHILLING begs to offer to gentlemen and the trade Trees of his entirely new Apple named OMER PACHA, it being a first-rate hardy grower, strong compact habit, early and productive bearer. Fruit excellent flavour (dessert), ripe in November, keeps until May. Respectable testimonials given from those who have tasted the fruit. Strong plants supplied at 5*s.* 6*d.* each, or 60*s.* per dozen. The usual discount to the trade where one dozen or more are taken. Early application is requested as the stock is limited; all orders carefully and promptly attended to. Fruit of the above can be seen at the office of the *Gardeners' Chronicle*, the British Pomological Societies' Rooms, 20, Bedford Street, Covent Garden, Messrs. Nutting & Son, 46, Cheapside, Messrs. Sutton & Sons, Reading, Mr. C. Turner, Royal Nursery, Slough, and at the North Warnborough Nursery, near Odiham, Hants.

NEW PHLOX, PANSIES, & PENTSTEMONS.

DOWNIE AND LAIRD, NURSERYMEN & SEEDSMEN, 17, South Frederick Street, Edinburgh, beg to intimate that they are now sending out their new Phlox Countess of Home, figured in Turner's "Florist" of December last; it has been awarded First Class Certificates at the Royal South London Floricultural Society on August 30, and the National Floricultural Society on Sept. 6, and is unquestionably one of the finest Phloxes yet raised; white, with distinct dark crimson centre, form perfect, grows to the height of 2 feet. Price 5*s.* each, or to the trade, 30*s.* per dozen, and may be had of the principal nurserymen in England or Scotland.

D. & L. are also prepared to send out the following new Pansies and Pentstemons, which they warrant to be first-class flowers. Pansies: Annalla (D. & L.), glossy black self, pure white brow, large, and of extra fine form, 5*s.* each; Jeannie, (D. & L.), dark self of the richest texture and finest form, with a circle of blue round the eye, first-rate show flower, 5*s.* each; Mrs. Dundas (D. & L.), cream and deep purple blotch, large and fine form, 3*s.* 6*d.* each. Pentstemon M'Nabiana, ruby scarlet, grows to the height of 2 feet, stem strong and erect, free bloomer, 5*s.* each; Pentstemon purpurea magnifica, large purplish blue with a white throat, grows to the height of 2½ feet, free bloomer, 5*s.* each. The above two beautiful varieties are in the way of Purpurea hybrida, but quite distinct in colour, and will be found a great acquisition.

PLANTING SEASON.

JOHN CATTELL respectfully invites an inspection of his extensive Stock of Fruit, Forest, and Ornamental Trees and Shrubs, American Plants, &c., &c., consisting of the most esteemed varieties of each kind of Fruit Trees in standards and dwarfs, trained and untrained. Also the best varieties of Gooseberries, Currants, Raspberries, Strawberries, Filberts, Spanish or Kentish Cob Nuts, &c. A general collection of Evergreen and Deciduous Trees and Shrubs, Coniferæ, &c.

The American Plants are particularly well grown, containing selections of the richest and most distinct varieties of Ghent and other Azaleas, Sikkim, Hybrid Scarlet, and other Rhododendrons. The Andromeda floribunda and Kalmia latifolia are remarkably fine. Roses are also extensively and well grown; the collection contains all the newest and most select of the older varieties. Priced Catalogues of the various descriptions of stock are now ready, and may be had on application.

NEW PORTUGAL LAUREL.

CERASUS LUSITANICUS MYRTIFOLIUS.

JOHN CATTELL has much pleasure in informing his patrons and the public that after the 1st of November he will be prepared to send out plants of this very desirable new hardy Evergreen; the habit of growth is quite upright, like a Bay, and the whole plant is densely covered with beautiful shining leaves. As a single specimen it is quite distinct from any other hardy evergreen.

Strong Plants, 3 years old, 7*s.* 6*d.* each	80*s.* per doz.
Do. do., 2 years do., 5*s.* each	50*s.* per doz.
A few extra strong Plants	10*s.* 6*d.* each.

Nurseries, Westerham, Kent.—Nov. 3.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardslevi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

FRUIT TREES IN POTS.

H. LANE AND SON offer the following Fruit Trees in Pots, well set with bloom buds, consisting of Apples, Apricots, Currants, Figs, Gooseberries, Nectarines, Peaches, Pears, Plums. Also a fine assortment of the finest Vines from eyes, and Strawberries for forcing; dwarf-trained Cherries, Nectarines, Peaches, Pears, Plums; standard-trained Apricots, Nectarines, Peaches, Pears; pyramidal Apples and Pears; standard Apples, Cherries, Pears, Plums; also Currants, Gooseberries, &c.—The Nurseries, Great Berkhampstead.

WHEAT FOR WINTER SEEDING.

WILLIAM BARNES invites the attention of his patrons and friends to that well-known and much esteemed species called the OLD LAMMAS or Winter Wheat, and which he warrants the true original without admixture of any sort, and perfectly clean. This Wheat has been grown by himself on light black soil, and the character of it remains permanent, having no tendency to degenerate or liability to disease. It may be sown on the coldest description of clay and heavy land, and as late as the last week in December with the almost certain prospect of affording a good return.—For further particulars, address WILLIAM BARNES, the Elms Farm, Spalding, Lincolnshire.

J. R. AND A. PEARSON, Chilwell Nurseries, near Nottingham, beg to offer the following:—

Collections of first-rate CARNATIONS and PICOTEES, 12*s.* per dozen pairs.

The finest summer ROSES, show varieties, 21*s.* to 42*s.* per 100, own roots.

PERPETUAL ROSES, grafted on short stems, one foot in height, 12*s.* per dozen.

RHODODENDRONS, the finest in the country, 30*s.* per dozen varieties, all hardy.

AZALEAS, a selection of the best hardy kinds, from both the Continent and the best English growers, 24*s.* per dozen, all own roots. ROCK PLANTS, 6*s.* per dozen.

NEW HARDY PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer the following New HARDY PLANTS:

RHODODENDRON MADAME WAGNER (hardy) ...	15*s.* 0*d.*
" PRINCE CAMILLE DE ROHAN (hardy) ...	7 6
WEIGELIA MIDDENDORFI.—N.B This splendid Weigelia has been sold already *twice* under wrong names. The one I offer here is *warranted the true species.* Good Plants each	12 0

A. VERSCHAFFELT begs to inform Amateurs and the Trade that he has just published a new PLANT LIST, containing the English and Continental Novelties.

His Catalogue may be obtained on application of his Agent, Mr. R. SILBERRAD, 5, Harp Lane, Great Tower Street, London.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 3, 1855.

IT is hardly possible to exaggerate the importance, as regards the successful cultivation of exotic plants, of correct notions as to the immense varieties of CLIMATE which exist in tropical countries, even in contiguous provinces, and of the causes on which those differences depend. The cultivator, indeed, is for the most part well aware that a totally different vegetation occurs at great heights, from that which is found on the lower portions of the same mountains, where it approximates to or is identical with that of the plains. He knows, too, that in different latitudes the heights at which alpine forms commence is different, and he is prepared to a certain extent to make the necessary allowance. When, however, the information he receives is limited to an indication of the particular province from whence an individual species may come, he is quite at a loss, and can only act upon general notions of the temperature required by plants from a certain quarter of the world. Suppose, for instance, India be the country in question, the commonly received notion of the climate is confined to great heat at one time of the year and a deluge of rain at another, though independent of the particular height above the level of the sea at which any district may be situated there are infinite varieties of climate, ranging from perfect drought to a rain-fall of which we can form no conception, and that accompanied by very different hygrometric conditions of the atmosphere. A range of hills if high enough will condense the greater portion of the moisture brought by gales from the sea, so as to impede its further progress except where there may be depressions in the chain low enough to admit of the passage of any considerable quantity of air, insomuch that while on one side the rain-fall may be counted by hundreds of inches, that on the other will be reckoned by time, and under certain conditions the most arid districts may be separated by a few miles only from one remarkable for humidity. The truth, however, is that such local details are scarcely to be met with except by wading through a vast variety of books, which are quite beyond the general range of the cultivator.

It was therefore with much pleasure that we perused the introduction to the first volume of HOOKER and THOMSON's *Flora Indica*,* a work which should be in the hands of every intelligent cultivator, in which the climate of the whole of India taking it in a very wide sense, so as to extend from Affghanistan to the Malayan Peninsula, is discussed with an amount of detail and intelligence which is not anywhere surpassed, and which reminds one of the most lucid expositions of HUMBOLDT. Nor are these the only merits of the volume. The geographical details themselves and the map illustrative of them, together with the explanation of the author's notions of the general formation of the vast Himalayan range—principles which may be applied with profit to correct the crude notions of geographers in other countries—afford at once general conceptions of a vast territory which could scarcely be formed before, and a starting point from whence important improvements will we have no doubt arise hereafter.

In a merely strict botanical point of view the work is calculated to be of infinite service. The extensive travels of the authors themselves through India, and the vast mass of materials which has passed through their hands, has enabled them to give an account of the geographical distribution of the plants of India and their connection with European, African, Siberian, and Australian forms which would have been absolutely impossible to any previous writers on the subject, and has a most important bearing on many geological arguments. The loose notions, again, which prevail on the limits of species, and the reckless way in which multitudes of useless names are daily inflicted on science, from imperfect materials, or from an inability to perceive that differences do not necessarily indicate distinctions, is matter of regret to every intelligent naturalist. The authors have in consequence not only enunciated their opinions on the subject in a manner not to be misunderstood, while they have exposed by pertinent instances the prevailing evil to which we have just referred, but have put their views in practice in the specification of the 15 natural orders which are comprised in the remainder of the volume. The mode in which these are treated is a model which may well be adopted by future botanists, embracing not simply the correct definition and limitation of species, but discussions of the greatest interest with regard to structure and affinities. The general observations, for instance, on Menispermads and Nymphæads will be read with advantage by the most practised botanists, and will be found highly suggestive. The anomalous structure of the stem in either order is discussed with a fullness and intelligence which make one regret that the portion of the Flora which have come under the authors' hands is at present so small. The vexed question of the affinities of the Water Lilies is decided in favour of their being true members of the great division of Exogens, on a full consideration of their structural peculiarities; and it may be added as a corroboration of their views that the germination of Limnanthemum as observed by GRIESBACH is almost identical with that of Nymphæa.

It is very unfortunate that the East India Company was not induced at the suggestion of the British Association to promote this work, either by a liberal pecuniary grant or a large subscription. The completion of it in its present form, all important as it is to the interests of India as well as of science in general, is scarcely possible with mere private resources. Their promise to take its merits into consideration on its completion would scarcely have been made if they had been really aware of the difficulties which lay before the authors. We still, however, hope now that the first volume is brought under their notice, they will reconsider the question, and insure if possible the continuation of a work which is admirably begun, and would reflect honour upon their patronage.

OF the value of LIQUID MANURE to crops in a growing state no one can entertain a doubt, but the best mode of applying it is a subject open to discussion. The usual practice, we need not say, is to water the surface of the ground with it among the plants it is intended to benefit; but this is objectionable in more ways than one. In the first place a portion of it when thus applied is wasted in evaporation under the influence of a powerful sun, and from being used where it affords no nutriment to the crops; and, in the second place, besides its being unsightly on the surface of the soil, which it bakes and hardens, and renders impervious to air, it is alleged to be injurious to health from the noxious odours which arise from it, more especially during the hot weather of summer, when its application is of most importance. This last objection was that which caused our great market gardeners to give up the use of London sewage in the Fulham fields, and to employ clean water in its place.

Mr. WILKINS of Walworth, however, has recently patented a plan for distributing liquid manure, which seems to obviate these objections, and from the glowing accounts of this system and its results, furnished by one of our correspondents last week, (see p. 709) we have been induced to visit that gentleman's experimental garden at Reading, where

* *Flora Indica; being a systematic account of the Plants of British India, together with observations on the structure and affinities of their natural orders and genera.* By J. D. Hooker, M.D., F.R.S., and Thomas Thomson, M.D., F.L.S. Vol. 1, 8vo., pp. 285. Pamplin. With Maps.

the plan is being carried out, in order to judge for ourselves.

The ground in question lies close to the railway station, and is certainly well worth inspection. Mr. Wilkins's mode of applying liquid manure is to give it to the roots of plants under ground instead of using it on the surface. He prepares his manure in a covered tank similar to a tanner's bark liquor pit of a size proportioned to the quantity required. This tank has a false bottom, placed at from 1 to 2 feet from the bottom of the tank, and pierced with numerous small holes. Into this tank is thrown a quantity of solid manure, such as road sweepings, dung from stables and cow houses, and all refuse animal and vegetable matters. The tank is then filled up with water which, in passing through the manure, gets impregnated with its qualities; this liquid descends through the perforated false bottom, and thus, as it were, strained and cleared, is pumped up into a tank on a higher level, to give it a fall into a pipe which conveys it to the beds in which the crops operated upon are growing.

The ground on which this experiment has been tried is laid out in beds 3 feet in width, and divided into equal lengths by a walk, on one side of which the beds are irrigated on Mr. Wilkins's principle, while on the other they are not. The different crops may therefore be compared with facility. The beds, on what is called "the new system," are prepared as follows:—The earth is dug out to the depth of about 2 feet. In this excavation a water-tight bottom is formed of bricks, with sides of the same from 4 to 6 inches high, to prevent the liquid from running over until the earth has absorbed it. Upon this bottom is put one row of half-drain tiles, running the whole length of the beds—loose and not jointed. At the end of each bed an admission-pipe for the liquid slopes from the surface to the end of each row of drain-pipes just mentioned, and at the other end of the bed is an upright round earthenware pipe, to indicate at what height the liquid stands in the bottom of the bed. When it is found to be 4 inches in depth the supply is cut off. The bottom being formed as just described, the soil is filled in as before and proceeded with as in ordinary gardening. It has been contrived by means of one gutta percha or common gas-pipe, with arms to each bed, and furnished with a stop-cock to shut the liquid off or allow it to flow as may be required, to manure the whole of the beds at once. The liquid passes along their entire length, and rising through the small spaces between the drain-pipes feeds the plants; the bottom being watertight none of it is permitted to run to waste, and by means of a cock or plug at the end of each series of pipes the supply may be drawn off when desired. This is the arrangement in the model garden at Reading.

That this system of applying manure is productive of extraordinary results no one who has seen Mr. Wilkins's crops will for a moment doubt. But how, let us inquire, could it be otherwise? The plants are supplied with an abundance of food in a condition best fitted for their wants, and where they can most readily avail themselves of it, viz., at the tips of their roots. Besides, during the hottest weather and times of drought, they have always a supply of moisture, which keeps them growing while other crops not so favourably situated are either perishing from want of water, or are at least comparatively inactive. Under such circumstances can it be wondered at that the manured beds have yielded, as all of them have done, more than double the produce of similar beds planted with the same crops; but managed in the ordinary way. Celery, now to be seen in the ground, is much larger and finer than that not treated on Mr. Wilkins's plan, and beautiful Potatoes have this year been produced in sand, poor earth, and sawdust alone, all reported to have been quite free from disease. One tuber planted in pure sand has produced 94 Potatoes, while two sets in the same material under the old system only furnished 77 Potatoes. One plant of Ash-leaved Kidney in sawdust has yielded 26 tubers, weighing altogether 3½ lbs., while a plant in the same material, but irrigated with manure, has produced 101 Potatoes, weighing in all 24 lbs. One red Mangold Wurzel, under the new system, weighed 14 lbs. 14 oz., and measured 23 inches in length, and the same round, while the same description of root, under the old system, only weighed 5 lbs. 10 oz., and measured 13 inches in length, and 19 inches in circumference. So likewise with Carrots; under the new plan one weighed 1 lb., while the best from a bed under ordinary culture weighed only 7 oz. Swedes and Kohl Rabi have also nearly doubled their usual size, as also have Hemp and Flax. Lucerne and Italian Rye-grass have afforded five cuttings in the season, while that to which no liquid manure was given only yielded two cuttings. Hops, both cuttings and yearlings, are bearing a full crop from top to bottom, while the same kind of plants without manure have not made half the growth, and have no Hops on them at all. Of two Vine cuttings, both planted at the same time, one in a manured bed, the other not, the one fed with the liquid is about 15 inches high, while that which had no such encouragement is scarcely 4 inches in height—and the same holds good in regard to other crops.

Mr. Wilkins, in short, professes to show how the produce of light land, be it ever so poor, can by his plan be very greatly increased, and that in certain instances, not only may two crops be grown where only one has before been produced; but that good crops may be obtained from soils that had previously been considered all but worthless. It will be seen that the experiments above recorded, as far as they go, bear out this statement provided the outlay is, as Mr. Wilkins asserts, one to be not only covered by the produce, but actually productive of profit.

We understand that a company is being formed to give the system a fair trial. That wonderful crops might be grown by it we are certain; but its cost appears to us to be against its general adoption. Bricks for bottoming the beds are dear, we doubt if it would even pay to employ a cheap concrete on a large scale for the purpose, to say nothing of other objections to which we may advert hereafter. In the meanwhile the subject deserves the attention of those who have the means of putting it into practice.

We may add that although Mr. Wilkins's process is patented yet that he gives ample encouragement to the poor allotment holder and cottager to employ it; for he states that either of these renting a cottage and garden at not more than five guineas per annum, may use the patent for their gardens at 1*d.* a-year.

Why do Pears and Apples crack, and put on the appearance of rifted bark? That question we shall endeavour to answer in the following memorandum. People little suspect that this ruin to their crops is one more example of the enormous injury inflicted upon plants by parasitical fungi.

Both Pears and Apples are extremely subject to be attacked by a parasitic fungus, which produces black unsightly spots upon the fruit, rendering them almost unsaleable, and ultimately inducing decay from the rupture of the cuticle, and the consequent exposure of the subjacent tissues. The fungus is known under the name of *Spilocæa Pomi*, but we may observe that it has no pretensions to rank as a distinct genus, and is in fact a mere form of the *Helminthosporium Pyrorum* which is often so abundant on the leaves of Pears in autumn, and is so destructive to the young shoots. Specimens of Pears so affected have just been forwarded to us by the Marquis of Huntly, with a view to the suggestion of some remedy, and we think that the identity just mentioned indicates the probability of its yielding, like other cases of mould, to the application of sulphur. In order, however, that this may be effectual, the intelligent cultivator must anxiously watch for the first indications of the disease, which commences sometimes very shortly after the fruit is set. There is the greater necessity moreover for an early application, because the fungus is very insidious in its attacks, and on the fruit at least, is in the first instance developed beneath the true cuticle, insomuch that if it is to be arrested effectually the evil must be attacked before the first spores are perfected.

The beneficial effects of the application of sulphur in this case are at present doubtful, because it does not necessarily follow that inasmuch as sulphur acts destructively on white moulds it should have the same results with those dark coloured species which have very different affinities. It is, however, worth a trial, and the evil is so destructive, that we doubt not that it will be put to proof next year. With proper precautions and intelligence on the part of the cultivator we have little doubt as to the result.

It may be useful to add a few words to this notice relative to the fungus itself. We have just said that the *Spilocæa* is identical with the *Helminthosporium*. But it appears further, from the observations of M. Desmazières, that it is nothing more than the *Cladosporium dendriticum*, Waller., and that when it grows on the leaves of Service or Apple, it becomes the *Actinonema Cratægi*, P. & A. *Pomi*, Lév. Other synonyms might yet be added, and amongst them that of *Phlyctidium Cratægi*, Waller. This is a specimen of what the cryptogamic botanist has to contend with every day, and is but a sample of the state of botany in other branches. There is, however, a hope of better things before us. The leading cryptogamists are every day exerting themselves to eliminate the host of false species with which they are oppressed, and we shall be greatly disappointed if the example of Dr. Hooker and Dr. Thomson in their "Flora Indica," does not lead to a complete reformation amongst phænogamists. *M. J. B.*

Erratum.—In p. 707, col. *c*, for "Black Italian Poplar" read Lombardy Poplar.

New Plants.

146. Passiflora cinnabarina.

P. *cinnabarina*; (Disemma) foliis trilobis palmatisque tenuibus lobis ovatis, petiolis eglandulosis, coronâ exteriore quam interior plicata densa villosa multò longiore.

This very pretty species was discovered in New Holland by Lieut.-Colonel Sir Thomas Mitchell, the distinguished Australian traveller, who gave seeds of it to the Horticultural Society. As it has been extensively distributed from the Chiswick Garden some account of it will be useful. It is a graceful bright green climber, with thin half transparent leaves, which are mostly 3-lobed, but occasionally palmate, and having slender

stalks entirely destitute of glands. The flowers grow singly on weak wiry stalks, and are of a dull red colour except the coronet which consists of yellow threads converging into a cone and concealing a second coronet which is plaited, thick, and shaggy. The fruits are like yellow Plums, have a distinct perfume like that of a ripe Melon, and form a very beautiful appearance while hanging in profusion from branches trained over the rafters of a greenhouse, which is all the shelter it requires.

VEGETABLE PATHOLOGY.—No. XCIV.

376. Hypertrophia* (*Excessive development*).—The main end of vegetable life is the securing the production of perfect seed for the propagation of the species, or of some other subsidiary mode of increase by buds, bulbs, &c., where the production of good seed is difficult of accomplishment. These latter formations are in many cases perfectly normal, and cannot be considered in the light of morbid phenomena. But besides these more immediate provisions for vegetable growth, deposits of nutritive matter are laid up in the common tissues, or in more or less modified organs, sometimes years before

* From ὑπερ excess, and τροφη nutriment.

they may be wanted for actual use, either to carry on the growth of the plant more vigorously after a season of rest, or to insure such a stock of active vitality at some future period as may be necessary to the profuse production of fruit, which in due season is usual in many trees. Such deposits take place in different parts both of herbaceous and ligneous plants, and under certain circumstances the growth of these is promoted by the cultivator to effect certain ends which are more profitable to him than if the plant went through the usual series of processes, without any deviation from the normal course. It is rare moreover that one organ can be nourished excessively without deterioration or suppression of some neighbouring organ, and in consequence such plants may never produce perfect seed at all, or only in small quantities. It is to this tendency to lay up nutriment for future use in particular organs to which the cultivator has had recourse in the production of so many of the valuable productions with which our gardens and orchards are stored; and though doubtless such plants are, in a certain sense, in a diseased condition, they answer his purposes so well that his object is rather to cherish the disease than to suppress it.

377. Hypertrophy is not, however, always harmless. It may arise from more causes than one, though in general it is essentially constitutional. Perfect fruit is for the most part produced only where the several organs of which the flower is composed maintain their normal proportion to each other. This may and does differ in different plants. The petals may be suppressed in consequence of the unusually great development of the sepals; or a large portion of the stamens may pro-

duce no anthers, and so on of other cases. Still if the usual proportions are maintained, the proper quantity of pollen grains and ovules will be perfected, and impregnation will take place, ending in the production of good and abundant seed. But if any organ undergoes a degree of development foreign to the particular species, the others will suffer, and the result will be abortive. Every organ is in turn liable to hypertrophy from purely constitutional causes; and even after impregnation has taken place, parts of the ovule may be so highly developed as to prevent entirely the perfection of the embryo. The multiplication of the various organs, and the accompanying hypertrophy in double flowers afford familiar instances, as does the swelling of the upper part of the funiculus in Gourds and other Cucurbits, which is sometimes so excessive as to form a sort of false arillus.

378. Hypertrophy is sometimes however of a more general character, affecting the whole plant, and producing distortion or a total change of habit and character. This often arises from the irritation produced by fungal growths or insects, and will be treated of when we come to the consideration of the effects produced by parasites. It may exist however without the presence of any parasite, and be as strange as regards the forms which the several organs assume. One of the most curious with which we are acquainted is the Pelargonium figured in the *Gardeners' Chronicle*, 1850, p. 579, and reproduced in the shape of the annexed cut.

It first made its appearance in the gardens of the Horticultural Society of London. The stem was swollen and made only imperfect attempts at the formation of leaves. As these swellings increased it was found that the cellular matter of the stem was excessively developed, assuming on the surface a warty or tuberculate appearance; that the warts were of a great variety of sizes, all tapering to a sharp point, some divided into two plano-convex parts, and a few supported by minute stunted leaves. The plants were feeble in their growth, made little progress, and gradually lost their leaves. Both cuttings and old plants were attacked. By degrees the fleshy masses rotted off, but the plants remained unhealthy during the rest of the summer. It does not appear that these excrescences were true galls, though the plants where they did not perish ultimately recovered to a great extent their normal condition.* *M. J. B.*

MEMORANDA

Intended to show some instances in which the agency of man has been brought into play in the production of plants, of insects, of birds, and also on a more extended scale, on localities and on climates; and to show that however these effects may appear permanent, they originate in taking advantage of those laws to which the Almighty Power has subjected all alike—plants, insects, animals, localities, climates, and man himself.

FIRST—OF PLANTS.

1. When quartered in Canterbury prior to 1812 the following fact was pointed out to me as occurring on chalk. Wherever the Grasses had gained the ascendancy over the White Clover, the farmer had only to broadcast with coal ashes to restore to the Clover the superiority it had lost, and that this superiority continued about three years when the Grasses over-topped the Clover, which shrunk into insignificance.

This effect appears to be principally due first, to the form of the plants: *a*, The leaf of the Clover, is broad; *b*, The leaf of the Grass, is narrow. They both act as condensers of moisture, with which they supply the centre *c*, the seat of life.

Wherever the Clover can spread itself and can gather moisture in sufficient quantities for its supply, its broad leaf outspans the narrow leaf of the Grasses, but as soon as the Clover has an insufficient supply of moisture then the narrow leaf of the Grasses overtops and extends beyond it, and as before said, the Clover sinks into insignificance. Secondly. This influence is due also to the hygrometical quality of the coal ash. This substance absorbs much of that moisture in rainy or damp weather, which is too great for the action of the leaves, and thus acts as a reservoir, which retains moisture, about the centre of both plants. The comparative superiority of the two shows plainly in which the supply has been deficient. The result proves that that deficiency is made up. Thirdly. Some portion is due, probably, to the mechanical effect of the coal ash, by rendering the surface soil better fitted for the expansion of the roots of the Clover; and, fourthly, something is due to the chemical decomposition of the coal ash; but the two last are not of consequence in this instance where the object is to show that the farmer in Kent, on chalk, can at his pleasure influence the production and the reproduction of white Clover. In this case the Clover sinks into comparative insignificance, but—it remains—it exists.

2. I was quartered at Christ Church, Hampshire, in 1815. The barracks are situated on a small plain, a deposit from the sea, where the surface soil rests upon sand, but is so superficial as only to admit of a ridge (?) of 4 inches. It so happened that the first crop of a stranger was on the ground; this man laughed at the caution of the natives, and set his share at least 6 inches deep. The result was a most abundant crop of that noisome stinking weed Charlock. So vigorous was it, that there was scarcely a trace of Turnips, of which the ordinary quantity of seed had been sown. The farmers (the natives as he called them) said, that he had turned up the seeds of this most noisome weed which they had overcome by dint of weeding, and this in spite of their warning. Here the Charlock was only buried, and awaited its day.

3. In the seaboard parts of Virginia, U. S., N. America, there is a vast tract of sand, nearly on a level with the sea. It is the region of the mist; scarcely any kind of tree is found to exist here except the Yellow Pine, which fairly luxuriates, and is the lord of the ascendant. Here, as elsewhere, the Pine tree is the child of the mist; here, as elsewhere, it stretches up its arms to catch the dews of heaven; and here the Yellow Pine avails itself of the peculiar state of the district under the influence of the Gulf stream to riot both as to multitude and dimensions. But as the country becomes more elevated, and is, or has been, covered by the Yellow Pine, the following facts occur. When from any cause the Yellow Pine is removed, a species of Pine, resembling the Scotch Fir, replaces it; if these are cut down they are replaced by the White Cedar, and should the Cedar be removed Hickories, Oaks of many kinds, Chesnuts, &c., in all at least 20 different species, spring up. All trace of the original Yellow Pine is lost, to a superficial inquiry, and the whole natural productions appear changed. Such is the change produced by the plough and the axe in the hands of man; but neither the Yellow Pine nor the Scotch Fir nor the White Cedar are destroyed, but each, in turn, has been the tyrant of its day, and each in its turn has sunk into insignificance as the situation has become more suitable to others, and less favourable to itself.

4. Instances occur daily of the production of new plants in localities by turning up deep cuttings on railroads, &c.; but the instance which occurred on the return of Col. Fitzclarence (afterwards Lord Munster) from Judæa, by way of Egypt, will suffice for this division of the subject. In this instance he brought home a bulbous root which was found in the hand of a mummy. The mummy was proved to have rested in its tomb upwards of 2000 years. After his arrival in England the bulb grew, but whether it came to perfection I know not. It is sufficient that the vital power existed, after having been arrested, and suspended for at least 2000 years, and that it was called into activity by the accidental circumstance of having been taken from its place of repose by a man, and having been exposed to treatment calculated to arouse suspended vitality. To sum up, we have here vitality which had been suspended for 2000 years in the plant restored by the agency of man. We have the Yellow Pine made to give place to the Scotch Fir, the White Cedar, the Hickory, &c., in succession by the plough and the axe of man. We have the Charlock brought into activity by the wilful stupidity of man, and we have the White Clover made to alternate with the Grasses at the will of man. *C.*

(*To be continued.*)

* I raised this year from seed a very curious Pelargonium, with extremely laciniated crisp and variegated leaves, and a compact dwarf habit. The constitution, however, was so weak that I was unable to preserve it longer than the beginning of the present month, October.

MR. PHILLPOTTS' ORCHID-HOUSE AND PITS.

The extract from the "Journal of the Horticultural Society," given in the *Gardeners' Chronicle* of July 21, page 485, relative to the mode of heating adopted at Porthgwidden, near Truro, will be most acceptable to many readers who are interested in such matters, and being accompanied with plans and sections, it cannot fail to be extremely useful to those who may contemplate, or are engaged in, the erection of buildings of a similar description. Mr. Phillpotts has for many years devoted much of his time to horticultural pursuits, and is acknowledged to be one of the best informed on the subject in Cornwall. His Orchid-house and pits, although on a small scale, are very complete, and admirably suited for the purposes to which they are applied. I have seen them repeatedly, and on all occasions the plants they contained were in the most perfect state of health and beauty, affording evidence not to be mistaken both of good management and successful cultivation.

In the construction of the house and pits Mr. Phillpotts lays no claim to anything more than what he states to be "a practical rather than a scientific adaptation of the plans of others, avoiding their mistakes." The Heywood House pit, which gave him the first idea of his own range, would appear to be a modification of the pit designed by Mr. Glendinning, and published in the *Gardeners' Chronicle* of 1844. The Orchid-house is span-roofed, but, in my opinion, is rather too narrow. The principals are secured at the top by iron work after the manner of the Banksia and Acacia houses at Kew, of which an account, with plans and sections, will be found in the *Gardeners' Chronicle* of Feb. 1, 1845. In several instances I have observed the same mode of securing the principals of a span-roof adopted, and with the best effect, as it gives to a house of this description a light and neat appearance, and renders it more suitable for the general purposes of cultivation than a lean-to house on the old plan.

Perhaps one of the best things about the erections at Porthgwidden is the excellent manner in which they are treated by means of hot-water pipes, with open troughs and cisterns. The form and arrangement of these are well deserving of attention, and if adopted by others cannot fail to answer, provided due care is taken that the power of the apparatus and amount of heating surface are in proportion to the cubic contents of air required to be heated to a certain temperature. It must not be supposed, however, that the command of a powerful supply of heat and moisture is all that is necessary to insure success in cultivation, for after everything has been done in this way that may be deemed necessary, it will be found that there is still another point of as much importance as the above to which the attention of the cultivator must be particularly directed. I allude, of course, to the introduction of a proper system of ventilation, which is so essential to the health of plants, and, when overlooked, is in most cases one of the principal causes to which failure is to be attributed.

The importance of air in motion to plants has been often adverted to in the *Gardeners' Chronicle*, but the best mode of creating a circulation, and effecting this desirable object, has yet to be ascertained. Mr. Phillpotts would appear to have well considered the matter, and has made ample provision for the escape of the heated air along the ridge of his Orchid-house, as well as for the admission of an abundant supply of fresh air by ventilators in the front and back walls. The great secret of his success, however, will be found to lie in the air chamber, with several drains leading from it, and opening into the pits, &c., by means of which a supply of fresh air, either dry or charged with vapour, can be admitted at all times, and so regulated as never

to produce a draught likely to affect any plants that may be exposed to it. Although this is only a modification of one of the principal features which characterised the Polmaise system of heating, still I think the way in which it has been applied is worthy of especial notice, and may be viewed as a step in the right direction towards solving the difficult problem regarding aëration that has so long occupied the attention of some of our very best gardeners.

The plan of having ventilators along the ridge of the house, in the manner represented in the large sketch, with openings at the back, and a wide coping to protect the roller blind in front, is the same as was adopted by Mr. Booth at Carclew, in 1846, when reconstructing a stove for Sir Charles Lemon, Bart. The only difference, as Mr. Booth informs me, consists in the ventilators at Carclew being hung a little above the centre, and having each a small piece of lead let into the wood, so as to prevent them from opening unless when required for the purpose of giving air.

The roller blind has been long in use for the covering of hot-houses, and I believe was first successfully applied as a shade to some pits at Syon in 1828, by Mr. Forrest, when gardener to the late Duke of Northumberland. An account, accompanied with a sketch to show the mode of fixing this sort of blind, will be found in Loudon's "Gardeners' Magazine," vol. v., page 510.

Although it would appear from what has been stated that there is really little novelty in the construction and arrangement of the Orchid-house and pits at Porthgwidden, I trust it will not be inferred that they are on this account devoid of interest. So far from this being the case, they are, in my opinion, worthy of being regarded as models of their kind, in which some of the chief improvements in the heating and ventilating of horticultural buildings, up to 1850, have been introduced with considerable skill and complete success, and our acknowledgments are due to Mr. Phillpotts for having made the public acquainted with his plans, and the result of his experience. *C. Truro.*

DESTRUCTION OF MUSTARD SEED CROPS.

From a communication which we have received from Professor Henslow it appears that the little blue beetle Phædon Betulæ, has again this autumn renewed its attacks upon the Mustard seed crops in the Fen districts near Ely. In the early part of the autumn of 1854 they were so numerous that hundreds of thousands might be collected in a few minutes by shaking the stems of the white Mustard over a newspaper, as stated in the Proceedings of the Entomological Society on the 4th Sept. (p. 24); they entirely devoured the leaves and barked the stems and coshes, or seed-vessels, the seed thereby becoming lean and of inferior quality. In the present month of October we learn from a letter from Mr. Henry Balls that they are equally prevalent in the Fen districts, and that they have attacked all green crops, especially Mustard and Garlick, the former being devoured to the very stalks, and in many places in the district they have cleared 50 acres, and then passed to the next field, being Cole seed, making a path in their progress. A plan for arresting these ravages had been tried by laying straw between the two fields and then setting it on fire to windward. They now (middle of October) appear to have taken to their winter quarters in crevices of gate-posts and other similar situations. They have not been noticed in their preparatory states; this is a point which appears to us to require especial investigation on the spot, where we apprehend the larvæ will be found feeding upon the leaves of allied species of hedge-row plants. *J. O. Westwood.*

Home Correspondence.

American Plums.—We are indebted to the Americans for some really valuable Plums. Among them the Jefferson holds the first rank; ripening just after the Green Gage, and being quite equal to it in flavour and far superior in beauty, it cannot be too highly eulogised. I had some fine fruit in pyramids this season, which, owing to the fine weather in September, slightly shrivelled on the trees, and became of a deep golden colour, blotched with red; they were full of delicious juice; I thought them superior even to the Green Gage. Denniston's Superb, ripening 8 or 10 days before the Green Gage, is also a valuable Plum; this year the fruit were particularly fine from pyramids; Huling's Superb is also a very large and very rich Plum; the Autumn Gage, an oval medium-sized yellow Plum, is very valuable, as it hangs well on the tree till after the middle of October. Blecker's Scarlet is a useful kitchen Plum, remarkable for its hardiness and productiveness. Smith's Orleans, an oval reddish purple Plum, has not proved quite equal to its reputation in America. Columbia is a large, round, and very handsome Plum, rich and sugary but rather dry, and ripening with a crowd of other sorts, is not so valuable as the first-named varieties. I may here mention that Plums in Nottinghamshire, north of Trent, rarely attain their full size and flavour; the climate seems too cool and moist for them, for if large-sized fruit are obtained from trees against walls, flavour is sacrificed. Corse's Nota Bene, an oval purple Plum of medium size, is I think a Canadian Plum, from Montreal; this is an enormous bearer, withstanding our spring frosts well, and ripening early in August. Plums are becoming most valuable fruit, for owing to several new varieties the dessert and the kitchen can be supplied from the end of July till nearly the end of October. *T. Rivers.*

Danger attending Transplanting Trees at Midsummer.—I am surprised that Mr. Scott should pronounce in such a dogmatical tone "midsummer" to be the best time for transplanting trees and shrubs, "and October and November" to be only "second best" for that purpose. I, however, by no means wish to say that Mr. Scott has been unsuccessful in his operations. By securing good balls to his plants, having but a short distance to convey them, perhaps a week's dull weather after planting, or deluging them with water, and screening them from the scorching rays of the sun;—by a fortunate concurrence of these circumstances, I say, Mr. Scott's practice may have terminated in success. But is he not upholding a system—or, at least, trying to do so—contrary to the laws of nature, as I will now endeavour to show? Mr. Scott will surely agree with me when I state that plants are in a more active state of growth at midsummer than in autumn; that, owing to perspiration from the foliage, the roots have more to do at midsummer than in autumn; and that, consequently, the less roots are disturbed at that season the better—and it is almost impossible to lift a plant of any size without injuring its roots to a greater or less extent. As roots, therefore, are the principal feeders of the leaves, what can be expected but failure when they are mutilated and exposed to air while the plant is in luxuriant growth? Besides, the atmosphere is much drier and hotter at midsummer than in autumn, and hence there is a greater amount of evaporation going on, and, as I have already stated, a more abundant supply of sap required of the roots. How, therefore, can this be furnished when the roots are rendered in a great measure inactive?—which must be the case for some time after transplanting. I trust that these facts, without entering into further detail in the matter, will suffice to show the danger attendant upon the system Mr. Scott so positively asserts to be the best. If Mr. S. will only adopt the two months he condemns—"October and November"—and include September, he will find them far better adapted both theoretically and practically for the purpose of transplantation than the season he recommends. *W. A. Blithfield.* [We, at least, are no advocates of Mr. Scott's views.]

Artificially Frosted Glass.—Many are practically cognisant of instances where this kind of glass is used as a means of shading, so as partially to intercept the sun's rays; but the advocates of the practice must be blind, or they would see at once the ill effects of which it is productive. When used for such structures as vineries, pineries, and houses devoted to hard-wooded plants, every cultivator endeavours to prevent a prostration of the faculties of his plant when in a growing tender state by intercepting intense sunshine, at the same time admitting as much light as possible; but when such plants have completed their growth, their manifestations alone will teach us how indispensable is a due amount of this agent to the ripening of their wood; and how is this to be accomplished beneath frosted glass? The appearances of the Vines and plants grown under such disadvantageous circumstances will afford ocular demonstration of the evil. The wood will be long-jointed, sappy, and watery, the leaves will have long slender petioles, and lamina of meagre size etiolated and pallid, thus deteriorating them until they become so constitutionally impaired as to be valueless in all their growing, flowering, and other properties, even if exposed to a clearer medium and more favourable circumstances hereafter. With such unfavourable demonstrations and impracticabilities attending this mode of shading, why not resort to a more expeditious, easier, and cheaper method, which will possess greater advantages and incur less risks than the mode in question? *J. R. T., gr. to G. S. Wintle, Esq., Hucclesate Gardens, near Gloucester.*

Orchard Houses.—Being about to erect an orchard house, induced by the favourable accounts which have been given of their success, I think it probable that some of your readers may be able to give information which would be of advantage to myself and others in like circumstances. In a lean-to house of small size, erected by an amateur in my neighbourhood, the plants, though having fully the distance between them recommended by Mr. Rivers, appeared too crowded, and those in front were pressing up against the glass. It struck me that the house ought to be wider and higher than Mr. Rivers originally recommended, and that a span-roof would possess great advantages. The opinion of any of your readers who may have experience on the following points will therefore be a favour: viz., most suitable height, width, and form of house generally, and, as applicable to my own case, whether it is indispensable that a span-roofed house should stand south and north, as it cuts up my garden very much to place it otherwise than south-east and north-west, or south-west and north-east. *A Ten Years' Subscriber.*

Salix Babylonica var. annularis.—I am not aware that the origin of this variety of Weeping Willow is precisely known. My earliest recollection of it is that my father gave 15*s.* for a plant in a pot 6 inches high. It was kept in the greenhouse a year or two, and finally proved to be as hardy as the species. So late as the publication of Loudon's "Arboretum" it is not known where it sprang from; but if its origin is buried in obscurity, a curious return to its nature has convinced me that it is but an accidental sport—perhaps of one shoot that has been perpetuated. About 25 years ago I planted in our nursery a tree by the road-side to attract notice; for 20 years it showed no sign of change, but a single shoot in the following year grew more vigorously than the rest, and produced the leaves in their usual form. This shoot has continued to ramify, and every twig from it shows the original character, whilst every other part retains its curled character of leaf and shortened and condensed ramification. *William Masters, Exotic Nursery, Canterbury.*

Double-flowered Peach.—I send you a fruit grown in my garden on a standard double-blossomed Peach. I am led to suppose that its fruiting is rather an unusual occurrence. The Peach in question fell off on Saturday last. *A., Dulwich Common, Oct.* 30. [The double-flowered Peach, being only semi-double, will occasionally produce fruit, but it rarely ripens, and when it does has no value.]

Yew Berries.—I do not remember to have ever seen a more abundant crop of these than there is this autumn. Observing that the birds eat them greedily, I occasionally eat a few and find them sweet and grateful as the purest honey. Allow me to ask whether they may be made into jelly, and eaten in that form with impunity. *Rusticus.* [Take care you don't kill yourself. The pulp is harmless, no doubt—but the kernel is a dangerous poison.]

Poplars and Varieties of Larch.—In reply to "An Old Pupil," you state that Poplars can never be so profitable as Larch in dry exposed places. Generally speaking this may be the case, but still there are exceptions, and an extreme one presents itself in the spot from which I write. It is subject to great droughts, and as much exposed as most parts of the kingdom (as those who witnessed the gale of Friday last can testify); yet the Black Italian, the best, and to my fancy by far the nicest looking of Poplars, surpasses all trees by its extraordinary growth, and that in exposures where the Larch positively requires shelter: without which in the course of most seasons its beautiful green is browned and its tender shoots destroyed by the severity of the gales, and an atmosphere saturated with salt; consequently in such localities, particularly where shelter is the object, the Poplar will be found the more suitable of the two. While speaking of Larches allow me to express my regret that the many beautiful and striking varieties which exist of this tree should be confounded in a common name. No doubt to most people a Larch is a Larch, and there ends the matter; but observers cannot help seeing how widely the forms of many differ from the stiff compact pyramidal habit which characterises the race, more especially those recently raised, and demand a place for elegance of habit among Deodars and Cedars of Lebanon. For profit or Hop poles probably the common sorts may be preferable, but when they are to form part of park scenery, surely a little trouble in selecting them would be well bestowed; many of their habits are greatly changed and only fully developed by age, still the tendency to do so is observable even in the nursery, and quite perceptible before they have arrived at an age fit to plant out. It is probable that many of the venerable specimens which now command our admiration might not literally produce "seed after their kind." Nevertheless much might be done to furnish varieties for ornamental purposes, and I have no doubt that any attention paid to the subject would meet with reward. *J. M., Folkstone, Oct.* 27. [Our correspondent has mistaken the question. The Lombardy Poplar was the tree inquired about, not the Black Italian, which makes a great difference.]

Wireworms and Fruit.—I have often been struck by the amount of mischief done to various crops in a short time by wireworms, and cannot conceive how so small a creature can find its food, growing, as it does, a good distance apart, with such certainty. If a field affected by them be carefully examined it will be found that the soil in many instances is not so full of the insects as a person would imagine from seeing the amount of injury done, and it is necessary to believe that they have rather the power of selecting and finding the food they like best, than that they travel along eating anything suitable lying in their path. I have been led to make these remarks from observing their good taste in the selection of fruit. Almost all the lower animals which eat fruit appear to like best those varieties valued by man. I have often remarked this in the case of sheep and game, the latter particularly; for whilst the cooking Apples lie almost unmolested under the trees, Ribstone Pippins, Malsters, Wykin Pippins, &c., are almost always spoilt before the morning. I hardly think, however, that the wireworm would be expected to be so nice in its choice, but so it is: I have observed many baking Apples just attacked and left, whilst a good eating variety has been full of the worms. From a Bess Pool Apple I extracted 24 fine fat fellows (many of them contained from 6 to 12), whilst from a nearly ripe Comte de Lamy Pear I took out the almost incredible number of 37. I should state that all our orchards are carefully gathered every few days, so that I have no reason to believe these fruits had lain long on the Grass. *T. R. Pearson, Chilwell.*

Shell Rain in the Isle of Wight (*see p.* 710).—I earnestly hope that "C." of Winchester will give some more particulars regarding the fall of shells at Osborne. Were any of the shells living? Over how wide an area did they fall? During how long a time are they believed to have fallen? At what hour and on what day? Did only one kind of shell fall? I hope "C." will forgive me for suggesting to him how very desirable it is that so extraordinary and very interesting a fact should be authenticated by the narrator's name. It is really almost a duty towards the science of natural history to do so. Were the Zua identified by any good conchologist?—this seems to me an important point. *C. D., Down.* [The Zua was very obligingly identified by Dr. Baird

of the British Museum. Our correspondent's name is C. Winchester; he is the intelligent foreman in the Royal Gardens at Osborne, and will, we hope, furnish the additional information asked for.]

Cucumber Growing (see p. 710).—I was much surprised to see the account of my hybrid Cucumber in your Paper of last week, which account was communicated totally without my cognizance. I feel it an imperative duty to say that the party has exceeded the bounds of truth, both as regards the quantity of fruit cut, and the average length. I am not acquainted either with the merits or demerits of Mr. Sutton's Cucumber. *R. Massey, Kirby Hall, Oct.* 19.

Management of Roses in Beds (*see p.* 709).—Permit me to ask Mr. "J. M.," of Folkstone, whether he would recommend Roses in beds to be manured in autumn or in spring—say in November or in March, and why he would so recommend it. I do not ask for any other than real information, being by no means actuated by a spirit of criticism. *Devon.*

Cuphea platycentra.—My employer has succeeded in raising standards of this beautiful plant, 4 feet high, with large heads, which are at this time loaded with fine foliage and flowers. This has been effected by beginning with them when they are cuttings, keeping all lateral shoots stopped, and the leader of each tied to a neat stake, shifting the plants into larger pots as soon as they required it, and using a rich compost. Treated as standards they show to better advantage their small but beautiful flowers, and afford a pleasing variety during the summer months in shrubberies and flower borders, where they should be plunged in their pots for convenience in lifting and housing them at the approach of frost. They should be liberally watered in dry weather, using for them occasionally a little liquid manure. *R. Gilbert, Abbey Wood, Bexley Heath.*

Atmosphere of Hothouses.—Having occasion to refer to your reprint of my description of the plant-houses erected by me at this place (in your number of July 21st), I find that you have perpetuated a mistake, which, if I had been aware that you were about to honour me with a republication, I would have begged to rectify. The passage to which I refer runs thus—"the air of plant-houses of this description should be in direct proportion to the light, the moisture, and to the heat." It should have been "the temperature of the air should be in direct proportion to the light, and the moisture to the heat." This is a rule which I consider most important, for I have observed that a moist atmosphere, at a low temperature, in the winter, is most dangerous to plants; indeed, on one occasion, when by accident my open troughs were left uncovered in the winter, with a temperature of 62°, several Orchids suffered, and some died. This, I believe, would not have happened in summer; and if I am right in my belief, I can only account for the difference by supposing that, in summer, the light, which is the main source of vitality, being more intense, the plants are in a more vigorous state and better able to resist any unfavourable condition of the atmosphere. I think, too, that humidity at a low temperature degenerates into what we call "damp," and I suspect that some otherwise fine Orchids which I saw at Chiswick this summer, had suffered in their health and appearance from some such treatment during the last winter. Whether the light has any effect on the quality of the air, I leave others to decide; my impression is that it has. The subject is an interesting one in connection with the all-important question of ventilation, and the public, and plant growers in particular, might be much benefited by seeing it discussed by yourself or some of your scientific correspondents. *T. Phillpotts, Porthgwidden, Truro.*

FLORICULTURE.

The Ranunculus.—In Mr. Atkinson's (of Worcester) catalogue of Dutch bulbs just received we find the following useful remarks on the culture of this flower, which he states were originally intended for our columns. "What can be gayer," he observes, "than a bed of well-grown Ranunculuses? Their fine forms, richness, and diversity of colours claim for them universal admiration; and yet, singular as it may appear, with all their attractions, they are not half so extensively grown as they deserve to be. If lovers of floral beauty, however, were once to pay a visit to the magnificent collections of Messrs. Tyso, Lightbody, and others, when these are in the height of their bloom, I feel satisfied that they would never rest contented until they had a bed in their own grounds to view at their pleasure. I am aware that the Ranunculus has been termed by many a shy and uncertain flower, which, in fact, it is if planted without trouble or care, and afterwards left to chance, but under skilful cultivation it will be found to blossom most profusely. The only difficulty is in getting up the tubers at the proper time, when sufficiently ripe, and preserving them as plump as possible until planting time. A few brief remarks as to the best mode of culture may not be out of place. The situation for the beds, which are best prepared in autumn, should be a moist cool place, where they will only be subjected to a few hours' morning sun, bearing in mind that a moist subsoil is required in order to ensure successful cultivation. The place being selected, remove the old soil to the depth of nearly 2 feet and 4 feet in width; sods cut from a rich old loamy pasture to the depth of 3 or 4 inches, and about 16 inches wide, should then be laid at the bottom, to form the foundation of the bed, treading them firmly down. The remainder should be filled up with the same compost collected a few months previously, and turned several times before using it. To this may be added a portion of well decayed cow-dung and leaves, and if the loam is rather stiff, a portion of sand may be introduced. This should also be pressed firmly down, and the whole may remain in that condition till planting time; the beds should be little above the level of the surrounding ground, and in order to give them a neat appearance they should be edged round with slate. Fork the soil over lightly previous to planting, but not exceeding 2 inches in depth. Planting should never be deferred after the middle of February, and the roots will be benefited by being placed in the light a few days before they are put into the bed. Embrace the first opportunity of a fine day to rake the beds and get them perfectly level and marked neatly out previous to planting, in order that the roots may be put in at equal distances; they should be placed about 5 inches apart and 6 inches asunder row from row. It is better to give them a little extra room at all times than to overcrowd them. If the collection is small they may be dibbled in with the finger, carefully set with the prongs downwards, and covered over about 1½ inch deep; but if the collection is extensive, drills should be drawn at equal distances across the beds, placing the roots at the bottom of them, and covering them with the loose soil; as soon as the plants appear above ground, which will be about April, the surface soil should be carefully and firmly pressed round about the roots, and if the weather should set in very hot in May, the beds should be carefully watered, in order to prevent the soil from cracking; old tan placed over them at this stage of growth will also be found very beneficial. In order to prolong their blooming season a temporary shading should be erected over them, just sufficient to protect them from the hot sun and rain, but the beds should nevertheless be kept in a moist state. Wireworms often attack the roots, and therefore they must be guarded against. As soon as the foliage has begun to decay protect the beds from wet, or the roots may be excited to grow again, which would be very injurious to them. The most essential point connected with their cultivation is, as I before observed, taking up the roots and properly storing them away. They should be lifted as soon as the foliage has turned quite yellow, and stored away in a dry airy situation, drying them as gradually as possible, in order to keep them plump. When sufficiently dry they may be placed in drawers, in order that they may be easily looked over, still bearing in mind that a cool but dry atmosphere is the only means of preserving them in a sound state." New varieties are raised from seed, which may be sown now or in January, in beds furnished with frames and glasses; it should be strewed thickly on the surface of the prepared soil, and then covered with a sprinkling of mould, not exceeding the eighth of an inch in thickness; the plants usually appear in about a month, they should be regularly watered and air admitted day and night, except in severe frosts, when it will be necessary to protect them. The Turban varieties make splendid early beds, and should be extensively planted by all lovers of floral beauty—they are very cheap, so that no florist need be without them. The properties of a good Ranunculus are a strong straight stem, from 8 inches to a foot in height, supporting a large well-shaped blossom at least 2 inches in diameter, and forming two-thirds of a ball; the petals should be thick, smooth on the edges, and gently cupped; the colour (whatever it may be) should be dense; if an edged flower, the edging should be perfect, and the marking uniform on every petal—striped or speckled flowers on the edges are termed imperfect ones.

Miscellaneous.

The Form of Aquarium which, after upwards of five years' experience and observation on the natural habits of the various animated tenants, I have now adopted, consists in a four-sided vessel having the back gradually sloping upwards from the bottom at an angle of 45° to 50°, and the consequently extended top sloping slightly downwards, and resting on the upper part of the back. The bottom, therefore, becomes necessarily narrow. The front for the purposes of observation, and the top for the admission of light, are to be of glass; the back, ends, and bottom being constructed of slate; the whole fixed in a stout framework. The advantages of this arrangement are:—1st. That it allows of a most extended view of the whole interior of the aquarium. 2d. That it enables the occupants to resort to water of any depth they may desire, or even to ascend the sloping back and emerge from the water. 3d. It admits of a much larger surface of water being exposed to the action of the light; and, 4th. The sloping top allows the water which condenses on the glass, from the effect of radiation, to trickle off and return to the aquarium without first resting on the zinc or iron frame-work. I need hardly mention that the sloping back is to be covered with light rock-work extending to a short distance above the water-line. *Warington in Annals of Natural History.*

Orange Trees.—The collection of Orange trees belonging to the Luxembourg is one of the most remarkable of any of the public gardens in France, both from the number and age of the trees. Orange trees, it is known, attain a vast age. In the Orangery at Versailles is one known under the three names of "Grand Connétable," "François I.," and "Grand Bourbon," which is more than 400 years old. It comes from some pippins of a tree of bitter Oranges planted in a pot at the commencement of the 15th century by Eleanora of Castile, wife of Charles III., King of Navarre. The trees which sprang from them were preserved in the same case up to 1499, at Pampeluna; they afterwards passed into different hands as rare and precious objects, and then became the property of the Constable de Bourbon, who placed them in his château de Chantelle, in the Bourbonnais. The property of the constable having been confiscated in 1522, the Orange trees were sent to decorate the Palace of Fontainebleau, which François I. had caused to be restored and enlarged. When Louis XIV. had terminated Versailles, and built its magnificent Orangery, he gave orders that all the Orange trees existing in the royal residences should be conveyed to it; this was in 1684, and the Orange trees of Pampeluna, which were among those thus removed, were then two and a half centuries old. The "Grand Constable," the most remarkable of them, is, notwithstanding its great age, still perfectly vigorous. *Galignani.*

Favourite Flowers.—Every flower is a favourite with somebody, though everybody does not fix his affections on the same identical favourite. As in matters matrimonial, every Jack finds his Jill (*chacun trouve sa chacune*); so, in floral attachments every object of attraction bewitches its own special object whom its influence attracts. Rousseau had his Periwinkle, Girofalo, the painter, his Gilliflower, whence he derives his pictorial name. Linnæus fell into a rapture of adoration the first time he beheld the golden blossoms of the Furze; while Burns worshipped with fond devotion that wee modest crimson-tipped flower, the Daisy. The late King and Queen of Otaheite wore Sunflowers in their bosoms on drawing-room days. There are memorial flowers; the Flos Adonis, or Pheasants' Eye, sprang from the blood that fell from Adonis's thigh when the savage boar inflicted the death-wound; the Hyacinth rose to perpetuate the perishing beauty of another comely stripling. The Vergiss-mein-nicht, or Forget-me-not, is a modern remembrancer of lovers' vows. There are dynastic flowers; the Lily of the Bourbons, the Violet of the Bonapartes, and the Broom-twig, the Planta genista, or Plante des Genets, of our own vanished Plantagenets. There are national flowers; the touch-me-not Thistle of Scotland, the delicate Wood-sorrel or Shamrock of Ireland, the blood-stained Roses (both white and red) of England, the perfumed Rose of the orientals, the Water-lilies of India, the Tuberose of Italy, to which might be added the Geraniums of the Cape, the Cactuses of America, the Lilies of Guernsey, the double Pomegranates of Morocco, the Scarlet Quince and a hundred other beauties of Japan, the Chrysanthemum and a thousand more charmers from China, the Gentian of the Alps, and the blushing crab-blossom of Siberia. . . . . So, pray, which are your favourite flowers—the Lily of the Valley, the Dandelion, or the Daffydowndilly, which comes before the swallow dares to come, and meets the winds of March with beauty? I will candidly tell you which are mine. As Cowslip, the dairymaid, when pressed to patronise a bird (after the fashion of Venus, Juno, and Minerva, who selected doves, peacocks, and owls respectively), answered, "Well, I should like a nice roast duck;" in like manner, if you put me to the question about my flowers, I must confess that I have a weakness for Caper buds whenever there is a talk of boiled legs of mutton; for Borage and Nasturtium flowers to crown a salad; for Cowslips and cream while the cuckoo singeth; for a dish of cooked Artichokes whenever they are to be had (I cannot even yet manage them raw *à la poivrade*); for Camomile fomentations when seized with the face-ache; for Marigold broth when I want to bring out the measles or the scarlet fever; for Elder-flower water to strengthen and cleanse the few scant hairs that remain on my cranium; for a glass of Clary wine as an exhilarator and anti-lachrymatic; for a tisane of Violets and Lime-tree blossoms when the doctor prescribes a cooling dilutent; for decoction of Rose leaves when he says I am feverish; for the dried bouquet, which I treasure flattened between the leaves of a certain folio volume; and for the pretty little pot-flower (never mind what genus and species it belongs to) which Mary Jane presented on my birthday. *Dickens's "Household Words."*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Attend to the last week's directions as to guarding against damp, giving air freely when the state of the weather admits, and use fire heat only when it is indispensable, and then as sparingly as may consist with safety. It will probably be necessary to subject many plants to gentle forcing in order to secure a constant succession of bloom for furnishing this house, for few plants will make much progress at this season unless encouraged with a temperature considerably warmer than would be required to preserve them in health. But where forcing must be resorted to, use foresight, and endeavour to avoid having to subject the plants to a very high temperature, which is very injurious to many things; and the flowers cannot be expected to last so long as if they were developed in a temperature more suitable to the habit of the plant. Take advantage of unfavourable weather for out-doors work to get the foliage of Camellias, Orange trees, &c., thoroughly cleaned, for it is hardly less essential to the health of such things that their foliage be kept clean and in a fit state to perform its functions than

that their roots be kept in a healthy active state. It is a somewhat tedious operation to wash the leaves of a large specimen singly by hand, but fortunately this is seldom necessary, as most plants may be cleaned at this season when the foliage is not in a tender state, by laying them on their sides and well washing them with water at about 140°, or even 166°; throwing the water against them with considerable force from the engine will not injure the matured foliage of hard-wooded plants. Any neglected specimens that may be badly infested with scale may require to be gone over with a brush for the purpose of removing the scale, as warm water will not be sufficient to clear plants of this pest. But the most expeditious and satisfactory method which we have tried of cleaning plants of scale, or whatever else they may be infested with, is to well moisten the foliage, &c., with the composition recommended in Williams's "Orchid Grower's Manual" (see page 21), laying the plant in a damp place, and allowing a few hours for the composition to take effect, and then well washing the plant with warm water from the engine, which we generally find sufficient. In the case of dense specimens, however, it will be necessary to look over the inner branches, against which the water cannot be thrown with any force; but this will not occupy much time, as a mere wipe with a sponge will be sufficient to remove scale or filth. Had Mr. Veitch, from whom Mr. Williams states he received the receipt, advertised this composition in the same determined manner Messrs. Page & Co. have done theirs, he would have done gardeners a real service, and would doubtless have made a good thing of it. But we would not recommend using this mixture upon trees which cannot be laid on their side without adopting some precaution to prevent its reaching the roots; this may be easily done, however, by placing something round the stem to absorb it and prevent its reaching the soil. GREENHOUSE.—Look over the plants here frequently, and examine things very closely that are liable to suffer from mildew and damp, such as Leschenaultias, Boronias, &c, for a short neglect will sometimes result in the disfigurement of a promising plant. The Boronias, Leschenaultias, Gompholobiums, &c., are very impatient of exposure to cold drying winds, and if these must be wintered in the same house with the hardier kinds of greenhouse plants, they should occupy a part of the house where they will not be exposed to cold draughts; but air must be admitted by the top sashes freely on fine days. Also exercise the greatest caution in the application of water, especially in the case of tender-rooted things which have not well matured their season's growth, for if the balls of these get saturated the roots will be checked and the specimens greatly injured. Therefore, never water until the ball is so dry that it cannot safely be withheld longer, and then give enough to moisten the whole of the ball, whether large or small. Young specimens of Azaleas, which have been growing in heat, had better be removed to a cool-house for a few months, which will cause them to start away more freely in spring. Keep Cinerarias and other soft-wooded stock clear of green fly, and endeavour to secure stocky plants by affording them sufficient pot-room, and admitting fresh air freely whenever the weather permits. Cinerarias are rather liable to be attacked by mildew at this season, and if this enemy makes its appearance apply sulphur immediately it is perceived.

FORCING DEPARTMENT.

PINERIES.—Where the bottom-heat is obtained from fermenting materials it is generally found to decline very rapidly on the occurrence of dull cloudy weather, and any necessary addition of tan, or whatever else is used should be made directly it is wanted, so as to secure a steady temperature of about 85° for the roots. In adding fresh fermenting matter at this season it will be worth being at some trouble to have it in a rather dry state, for when used very wet it is apt to chill the roots at first, and when fermentation commences the heat often becomes so strong that the plants must be raised. VINERIES.—Ripe Grapes will require to be frequently looked over, cutting out any decaying berries; and if the bunches have not been well thined, the inside berries must be carefully examined in the event of damp weather, otherwise the bunches will be very liable to get disfigured. Avoid, if possible, having pot plants requiring watering in houses where the fruit is expected to hang for any time, and where any plants must be kept under the Vines they should be watered in the morning, using a little fire-heat with air to get the atmosphere dry before night. Gentle fires will be necessary here when the weather is damp, but use no more than may be necessary to keep the atmosphere in motion, for too much warmth is nearly as injurious as damp. Vines that are pruned, and being rested previous to being started shortly, should be kept cool, keeping the house open, and if there is any cause to fear that the wounds will not be properly dried up during the time that the Vines can be allowed to rest, give them a coat of rather thick white lead which will effectually prevent bleeding. If not already done, get the border covered with something to keep it from getting saturated with wet, for it is of the greatest importance to have the border in a dry kind state when the Vines are started and especially when this is early in winter. Where new borders have to be made this season, attend to providing the necessary material for the purpose in time to allow of having it in good condition by the time it may be wanted for use, and where young Vines have to be procured from the nursery, these should be looked out as soon as possible, and before the stock has been too often picked over.

FLOWER GARDEN AND SHRUBBERIES.

Those who purpose making additions to their collection of Roses should do so at once, as there will be a better chance of obtaining good plants now than after the nursery stock has been repeatedly picked. And the present season is also very favourable for planting all but tender sorts, which had better be kept under glass until next May; but these should be procured at once, and if they can be placed in a gentle heat through the winter, they will grow freely, and furnish cuttings which will root just as freely as a Verbena. In preparing ground for Roses let it be trenched at least 2 feet deep, and well incorporate a very heavy dressing of manure with the soil to the full depth. It is hardly possible to make the mould too rich for any kind of Rose, particularly the autumn-blooming kinds, and 4 or 6 inches of good rotten farm-yard dung will not be too much where the soil is naturally rather light and poor. Large headed standards that have done blooming for the season should be cut back pretty freely, to lessen the chance of their being injured by heavy gales of wind. Continue to clear the beds of their summer occupants as these become unsightly, and after trenching or doing whatever can be done to save time at next planting out season get them furnished for the spring. Also look over the herbaceous borders, and make any projected alterations there, taking up and dividing any of the coarse growing plants that may be inclined to encroach too much upon their neighbours. The modern system of gardening is fast driving this class of plants out of cultivation; but many of them are really beautiful, and if they were more largely grown our gardens would not have that naked appearance in spring which is too often seen. Sweep and roll Grass frequently, and keep gravel walks hard and smooth by frequent rollings.

HARDY FRUIT AND KITCHEN GARDEN.

Let there be no lack of attention in the fruit-room at present, for fruit requires more care during the first few weeks after gathering than all the season afterwards. Give just sufficient air to carry off damp, but nothing more, as allowing dry winds to blow over the fruit would only cause shrivelling. Strawberries for early forcing should be placed where they can be protected from drenching rains—a cold frame or pit, where either can be spared, would be the best situation for them; but the lights should not be put on save in case of rain and frost. And, indeed, the whole stock in pots for forcing would be benefited by being placed where they could be guarded from heavy rains. We may now expect sharp frosts at any time, and all necessary preparations should be made at once, such as having a good stock of covering for the most forward Lettuce, Endive, &c. Cauliflower in head, if not wanted for use, may be pulled up and hung in a cool shed, where it will keep good for weeks, and will be out of the way of injury from frost, unless this should be very severe. The late crops of Celery should now be earthed up rather closely, making the ridges as narrow at the top as can conveniently be done, and nicely finishing the sides with the back of the spade so as to prevent, as far as possible, the soil about the plants getting saturated with wet. The soil about the early crops, or that fit for use, should also be made to throw off the wet as much as possible, pressing it firm about the tops of the plants, and making the top of the ridge narrow and smooth. Of course Celery will not be earthed up after this season when the plants are wet, neither should it be done when the soil is wet, if this can be avoided. Mixing plenty of quick lime with the soil about the plants will, we think, be found of considerable use in preventing their rotting in winter, and it will also save them from being disfigured by slugs. The Asparagus haulm may now be cleared off, cleaning the ground, and giving a good dressing of rotten manure; and in the case of young plants which are only very lightly covered, the manure might be mixed with a quantity of leaf soil, applying a good solid coat 2 or 3 inches thick if the manure and leaf soil can be spared.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the week ending Nov. 1, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 5th, 1852, and 6th, 1834—therm. 63 deg.; and the lowest on the 9th, 1854—therm. 18 deg.

Notices to Correspondents.

APPLES: *S A P.* Your seedling Apple No. 1 is middle sized, handsome, well coloured, and of tolerably good flavour, but the flesh is too dry; 2 is not good; 3, absolutely bad; 4, indifferent; 5, small, with brisk flavour but not rich. The Pear is small, roundish, with tender but coarse grained flesh, and a sweetish flavour resembling that of the Bezi de la Motte.‡

BOOKS: *Constant Reader.* Cobbett's English Gardener (6s.); Neill's Fruit, Flower, and Kitchen Garden; The Manse Garden, a little Scotch manual; or perhaps Mawe and Abercrombie's Gardening. We cannot give you prices, because publishers will not mark them on the volumes they issue.

DURMAST OAK: *J P*, and others. Your information is extremely useful. If other correspondents having a personal knowledge of Quercus sessiliflora and pedunculata, and of their timber, would be so good as also send us their experience, a difficult question of the highest national importance would be finally set at rest.

INSECTS: *C N R.* Water the roots of your Picotees and Carnations with tobacco-water or an infusion of quassia, to destroy the aphides clustering round them.—*W F S.* The gall sent is distinct from the common Oak Apple, which is very much larger, with numerous cells; it is more like the gall figured in the *Gardeners' Chronicle* on the 24th March in the present year, but is distinct from it. *W.*

LEAD: *Ten Years.* We do not know whether sea water will act on leaden pipes. We should have thought that the sulphate of magnesia, which is so abundant in such water, would have protected the surface of the lead. Perhaps you have had an iron or copper screw soldered into the lead; in that case an electrical action would be set up, and the water would become contaminated.

MIGNONETTE: *B C.* Tree Mignonette is obtained by selecting and potting a vigorous young plant, the flowers of which are to be pinched off as often as they appear during the first season. It must be repotted as occasion may require; the lower shoots must be removed in autumn, and the plant must be kept during winter in a room or greenhouse above the freezing point. The second season it may be treated in a similar manner; and the next year it may be allowed to bloom, which, with care, it will continue to do for several years.‡

NAMES OF FRUITS: *Z.* 2, Autumn Bergamot; 3, Glou Morceau; 4, Duchesse d'Angoulême; 5, Comte de Lamy; 7, Easter Beurré; 8, Beurré Diel; 9, Beurré Bosc; 10, 11, Doyenné Blanc; 14, Aston Town.—*J S Wath.* Apples, 1, Turk's Cap; 2, Kirke's Lord Nelson; 3, resembles the Brabant Ballefleur; 4, Large Hunthouse; 6, Worthless; 7, Nonsuch; 8, Beurré de Capiaumont; 9, Beurré Rance; 10, Glou Morceau. The seedling Apple has a brisk acidity, and appears to be a good keeper; it is too unripe to judge of its merits at present.—*E B H.* 1, 10, Napoléon; 2, Marie Louise; 3, Ne Plus Meuris; 4, Seckel; 5, 6, 14, 16, Passe Colmar; 8, Doyenné Blanc; 9, 18, Glou Morceau; 11, Catillac; 12, St. Germain; 15, Beurré Diel; 17, Winter Nelis.—*R A.* 1, Napoléon; 2, Marie Louise; 3, Crassane; 4, Brown Beurré; 5, Seckel; 7, Blenheim Pippin; 8, Waltham Abbey Seedling.—*W F.* 3, Golden Horny; 5, Pearson's Plate; 6, Hughes' Golden Pippin; 7, 10, Dutch Mignonne; 8, Paradise Pippin; 9, New Rock Pippin; 11, Court of Wick; 12, Seckel Pear.—*Ioatæ.* 19, Bergamotte Cadette; 23, Doyenné Blanc; 25, Althorp Crassane, Marie Louise, and Easter Beurré are correct; the one named Orange Bergamot is decayed, but undoubtedly false.—*Henry B.* 2, Brabant Bellefleur; 5, Dumelow's Seedling; 6, Pearson's Plate; 8, London Pippin; 10, Downton; 11, Easter Beurré; 12, Ne Plus Meuris; 13, Beurré de Capiaumont; 15, Hughes' Golden Pippin; 16, Borsdorffer; 18, Hormead Pearmain; 19, Sturmer Pippin.—*S C.* 1, Winter Nelis; 2, Passe Colmar; 3, Louise Bonne (of Jersey); 4, Beurré Bosc; 5, appears to be the Althorp Crassane; 6, Beurré Diel.—*J C W.* 1, Winter Nelis; 2, Seckel; 3, Old Colmar.—*H Bellew.* 1, Uvedale's St. Germain; 2, Chaumontel; 3, Swan's Egg; 6, Kerry Pippin; 7, Margil; 8, Ribston Pippin; 9, 10, Gausel's Bergamot; 13, Bezi Vaet; 15, Ne Plus Meuris. With regard to the quality of No. 1, it is a baking Pear, and is only good for that purpose.—*Clapham, W.* 7, Jean de Witte; 9, Passe Colmar.—*R S, Tuam.* 2, Passe Colmar; 3, 12, Beurré Rance; 4, 11, Marie Louise; 5, 8, Glou Morceau; 6, 10, Doyenné Blanc; 9, 15, Beurré Diel; 13, Napoléon; 16, Autumn Bergamot; 18, Uvedale's St. Germain.‖

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Eben.* Of your Oaks, No. 1 is Qu. pedunculata; 2 and 3 are Q. sessiliflora. As the specimens come apparently from large trees, you will probably be able to give us some certain information respecting the difference in their timber, for which we shall be much obliged to you.—*Tilehurst.* It looks like a morsel of some form of Chrysanthemum grandiflorum. Had you told us whether it is annual or shrubby and hardy or tender we should have been able to form a more exact opinion.—*R M D.* It is either a Cedar of Lebanon or a Deodar. It is impossible to say which without seeing the trees.—*T. Gaines.* Acacia lophantha.—*J H O.* 1, Adiantum hispidulum; 2, A. tenerum; 3, A. cuneatum; 4, Nephrodium molle. *S.*—*A C.* It is Polystichum angulare. *S.*—*O S.* Both are Lastrea spinulosa. *S.*—*F P.* 1, Doodia caudata; 2, Platyloma rotundifolium. *S. M W.* Celtis australis, the Nettle tree.—*G W.* It looks like a morsel of Achyranthes aspera, a tropical weed; but it is impossible to be certain without seeing the flowers.—*X., Cheshire.* It is only Quercus pedunculata. Surely Q. sessiliflora does grow in your county. Would you inquire and let us know what the timber merchants say to its timber—that is to say if they distinguish it.—*Julius.* Senecio Cineraria; *alias* Cineraria maritima.

RHUBARB: *Amateur.* If you have no means of getting earthenware Rhubarb pots, make a few upright boxes about 15 inches square and 2 feet high, open at both ends. Place these over the crowns of such plants as you intend to force, and then form little beds of dung and leaves round them, keeping the dung on the outside and the leaves next the boxes. Raise the beds a little higher than the boxes, whose tops should be covered with the dung; but before that is done, a piece of slate or wood should be put over the top of the box to keep out the dung and throw off wet. A stick pushed into the beds and left there will tell, on being drawn out and felt, whether they are too hot or too cold. By the above plan you may always calculate on having Rhubarb from a month to six weeks earlier than you would have it from the open ground.‡

THE TAMARISK: *B H.* The only species which thrives away from the sea is Tamarix gallica, which is quite at home in inland places. A specimen in heavy damp clay is now in sight of our windows a few miles from London, and forms one of the prettiest ornaments of a not very unadorned garden. *Tamarix germanica*, the kind with blue leaves and pale green shoots, is not worth growing in inland places.

TRANSPLANTING FERNS: *W G.* will be obliged by some of our correspondents informing him what is the proper method for transplanting the common Fern successfully.

TRENCHING: *Lumbricus* states, in reply to "Colo's" request (see page 710), that he should carefully trench the ground over to the depth of 2 feet, and that the work should be performed at 1*d.* per yard.

*** A few correspondents who are this week unanswered will receive replies next week.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than any other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

DRAINAGE OF LAND.

MR. J. JOHNSON, DRAINAGE ENGINEER, is desirous to undertake the Drainage of Land by Contract or Commission. Temporary Tileries erected in any part of England, and Drain Pipes manufactured at moderate prices. Every description of Drainage Tools.—Abingdon Street, Westminster.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre.

Mr. HUMBERT (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., M.P.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise: or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

The Company will afford equal facilities to Landowners for the execution of works of improvement either by their own Agents or by means of the Company's staff.
WILLIAM CLIFFORD, Sec.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street Westminster.

LORD EBRINGTON'S PRIZE FOR THE SONS AND RELATIVES OF YEOMEN AND FARMERS IN THE COUNTY OF DEVON.—A Prize of 20*l.* is offered by Lord EBRINGTON to any person of the above description, between the ages of 18 and 23, who (bringing with him the required Certificate of competent Scriptural knowledge), shall pass the best Examination in

1. The English Language.
2. The Geography and History of the British Empire.
3. Practical Mathematics.

The Examination will be held at Easter, 1856. The names of Candidates must be sent on or before January 1, 1856, to the Secretary of the Bath and West of England Society, Poulteney Street, Bath; or to the Rev. J. S. BRERETON, West Buckland, South Molton, of whom further information may be obtained.

The Rev. G. MARTIN, Chancellor of the Diocese, and Sir STAFFORD NORTHCOTE, Bart., M.P., have kindly undertaken to conduct the Examination.

SMITHFIELD CLUB, 1855.—FAT CATTLE SHOW.—The ANNUAL CHRISTMAS SHOW of FAT CATTLE, SHEEP, and PIGS, will take place on the 11th, 12th, 13th, and 14th of December, 1855, at the Carriage Bazaar, King Street, Portman Square, when nearly 800*l.* will be awarded in Prizes and Medals.

The printed forms of Certificates, properly filled up, must be returned to the Honorary Secretary on or before SATURDAY, November 10th. Prize Sheets and the necessary printed forms of Certificates are now ready, and can be obtained on application to B. T. BRANDRETH GIBBS, Honorary Secretary, Corner of Half-moon Street, Piccadilly, London.

All communications on the Club's business should bear the words "Smithfield Club" on the outside.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1855.—The Seventh Great Annual Exhibition of CATTLE, SHEEP, PIGS, and DOMESTIC POULTRY, will be held in Bingley Hall, Birmingham, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December next, when PRIZES will be awarded as follows:—

	£	s.	d.
CATTLE.—Including Two Extra Prizes of 20*l.* each and Two Gold Medals or other pieces of Plate of the value of 20*l.* each, for the best Ox or Steer, and the best Cow or Heifer	340	0	0
SHEEP.—First Prizes of 10*l.*, and Second Prizes of 5*l.*, for Leicesters, Long-Woolled Sheep not being Leicesters, South or other Down Sheep, Shropshire, and other Black or Grey-faced Short-Woolled Sheep—10 classes	150	0	0
PIGS.—Including Prizes for Pens of Breeding Pigs of a large and small breed	69	0	0
ROOTS.—Including a Silver Cup, value Five Guineas, for the best Collection of four different varieties	27	6	0
POULTRY.—Including Nine Silver Cups, of the value of Ten Guineas each, for the best Pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, Game and Gold, or Silver Bantams; and for the best four Pens of Pigeons, to be exhibited, especially for this prize	451	10	0
	£1037	16	0

Exclusive of Silver Medals to the Breeders of Cattle, Sheep, and Pigs, and Prizes in the Extra Classes and for Cottagers' Poultry.

Mr. Ottley has also offered a Gold Medal, of the value of Ten Guineas, as an extra prize, for the best Pen of Polish Fowl of any colour, to be selected from the several classes for this variety.

Prize Lists, Certificates of Entry, and any further information may be obtained from the Secretary. The Entries close on Saturday, Nov. 10. JOHN MORGAN, Jun., Sec.

Offices—38, Bennett's Hill, Birmingham.

WARNER'S $4\frac{1}{2}$-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with $1\frac{1}{4}$ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

$1\frac{1}{2}$-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

$1\frac{1}{4}$ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
$2\frac{1}{4}$ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
$2\frac{1}{2}$ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
$3\frac{1}{4}$ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
$2\frac{1}{2}$ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
$2\frac{1}{2}$ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from $1\frac{1}{4}$ to $1\frac{1}{2}$ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

The Agricultural Gazette.

SATURDAY, NOVEMBER 3, 1855.

WE beg the attention of our readers to the fact already advertised in our columns, that the Smithfield Club and the Birmingham Association both hold their annual show of fat cattle, &c., during the week ending December 15; that printed forms of certificates, properly filled up, must be returned to the secretaries, in the former case B. T. BRANDRETH GIBBS, Esq., Half-Moon Street, Piccadilly; and in the latter, J. MORGAN, jun., Esq., 38, Bennett's Hill, Birmingham, on or before November 10. Applications for these printed forms should at once be made.

TURNIPS, as we find them in common cultivation, may very readily be referred to two distinct types: one with white flesh, generally mentioned as "the Turnip;" another with yellow flesh, which goes under the name of "Swede." These two forms present very many varieties and distinct characteristics, which are more or less permanent, having reference to the season and manner of growth, form, size, colour, and substance; and when any of these characters are obtained with tolerable permanency, the individuals in which they occur may be called varieties, or in common vernacular "sorts."

Now, in order to understand the nature of these sorts, it will be necessary to premise that the two types of Turnip just mentioned are derived from two species of wild plants belonging to the same genus as the Cabbage, as thus:—

The common Turnip, *Brassica Rapa;*
The Swedish Turnip, *Brassica campestris;*

to which may be added Rape or Coleseed, *Brassica napus.*

These three plants, which are described as distinct species by botanists, are yet not without evidence of being themselves varieties; for, as remarked in HOOKER and ARNOTT'S "English Flora," 6th edition, p. 40, "although these three are readily distinguished in cultivation by their radical leaves alone, there are strong grounds for considering *all to be varieties*, as they scarcely differ in other respects."

But further, there appears no good reason for separating Brassica from Sinapis, as will be seen from the following analyses of the two genera. In the work above cited, Dr. ARNOTT, indeed, ventures the remark that "*the distinction between the two genera is purely artificial.*"

Analyses of genera:—

1st. *Brassica.*—Pod two-valved (with a sterile or one, or several seeded beak). Seeds in a single row. Calyx erect.	2d. *Sinapis.*—Pod two-valved (with a sterile or one, or several seeded beak). Seeds in a single row. Calyx patent.

Here then we see that the common and Swedish Turnips are derivatives from two wild plants, which if of distinct species are yet so nearly allied as to be capable of hybridising, and hence we may have hybrids (varieties) produced from (among others) the following sources.

1st. Hybrids from the union of species with species.
2d. Hybrids from variety with variety.
3d. Hybrids from varieties with species.

These admixtures acting and re-acting upon one another will account for the great number of sorts of Turnips which have been propagated up to the present time, as well as for others which may from time to time be produced.

Technical, therefore, as this introduction to our subject may at first seem, it still opens up to us the

following important practical subject for our inquiry and consideration, namely: If all our sorts of Turnips are derivatives, how are they to be kept up in purity and efficiency?

The stock farmer, in the case of a breed of cattle, would answer:—Look carefully to the blood of the creatures from which you breed, and do not breed from animals of an inferior kind, and in all cases choose the most perfect forms and most healthy subjects.

Now, if we can be brought to consider that the principles are the same in the propagation of pure varieties of plants as in pure breeds of cattle, a great difficulty in the production of seeds of a good quality and true to their sort will be removed. As these, therefore, are objects which may in either case be attained by attention to simple rules, the three following are offered as of primary importance in the case of Turnips:—

1st. *Never grow seed from a stock that has been repeated on the same farm.*

2d. *When determined to seed any sort, always choose your subjects.*

3d. *The patch to be seeded should always be as far as possible removed from others of the same family.*

1st. If we view different sorts of Turnips as derivatives from a wild stock, their peculiarities having been induced by the operation of circumstances very different from those to which their wild parents were subject, we shall at once see that the moment we allow our subjects to revert to the conditions of a nomadic life, they may be expected to become wild to a greater or less extent, and thus it is that continually sowing own-grown seed leads to that deformity of root which has been previously described in these columns as finger and toe, but besides this, as we have repeatedly proved from experiment, each year leads to a wilder habit of growth, with an increasing tendency to *running*, and what is termed *sporting*, and going off into varieties. What the continuance for a series of years of using own-grown seeds from the same stock may effect, we are unable to say, but in as far as experiments at present support our view, we should not be surprised to find at the end of seven or eight years not only that every trace of the original sort had been lost, but that several varieties of the genus Brassica, and even Sinapis, all of annual tendency, would be the result. The branching of the roots is the first step in this downward tendency, the loss of the bulb and consequent running to seed or annual habit the next: these we have seen brought about in the third generation of own-grown seed, and we may expect that a descent so rapid at first is at least as rapidly maintained.

2d. That a choice of subjects for propagating seed is desirable for the maintenance of purity, any one may satisfy himself of by looking over even the best crops. What crop of Turnips is free from double crowns, large and straggling foliage, distorted roots, and generally unhealthy individuals, to say nothing of "sports," or hybrids of hybrids? Careful choice, therefore, should be made of examples for seeding, and that not from one but several examinations, at different periods during their growth. We have seen patches of Turnips left for seed where they have grown, and every plant which could add its quota to the bulk—whether healthy or unsound, sport or otherwise—was made to do so. Here the seed was very faulty, and the same seed grown on the same spot the following season resulted in disease to a greater or less extent of the whole crop.

3d. The different varieties of Turnips are hybrids. It follows, from their number and great variation, that this plant has a peculiar facility of producing sorts; some of them, indeed, have been brought about by artificial, *i. e.* intentional hybridising; others by choosing as seeding plants varieties which have been hybridised accidentally. The process is exceedingly simple, both naturally and artificially. This will be easily made apparent from an experiment which we have still going on in our experimental plots. Thus, in the summer of the year 1854 we planted a patch of Rape by the side of some seeding Turnips, and another patch with Rape intermixed with the Turnips, so that they might flower at the same time; the patches were each 5 yards square, and managed as follows:—When fecundation, which was allowed to proceed without assistance, was finished, the whole of the Rape was carefully removed, so as to prevent the possibility of any Rape seeding with the Turnips, the Turnip seed was collected in due course, and two 5-yard plots sown with it during the present summer. The resulting crop, which is just now in vigorous growth, consists of malformed and diminutive Turnips, scarcely one being of normal shape, presenting either double crowns or forked roots, and with these, which are themselves anything but true to sort, are intermixed several plants an apocryphal Rape, with a few of the true Rape aspect. Here, then, appears good evidence of hybridisation from contact of two plants of the same genus, purposely planted in proximity; and besides this, we see in the degenerate Turnips the result of using own-grown seed in the same soil; the marked effects in this instance of the past year leading us to expect a still further decline on repeating the experiment. If then we are right in considering the admixture of Rape in the instance quoted to be the result of hybridisation—and there seems little reason to doubt it when we know what we can do upon trial, and moreover when we can constantly see its effects in *sports* of every kind—it follows as a necessity that Turnips for seed should not only be chosen of good sort but should be kept, in seeding, as far removed from all sources of contamination as possible; and hence that the choosing a plot of ground at the corner of a field for the production of Turnip seeds of different sorts is not good in practice. We have seen Swedes, Red Turnips, and White Turnips, placed for seed side by side, and though it is impossible to watch the result of these cases, yet the quantity of impure seed there is in the market, and indeed the almost total impossibility of obtaining a true sort, is hence, to a considerable extent, accounted for.

In concluding this part of our subject we wish it to be understood that there are other causes in operation which greatly affect seed growing, such as climate, soil, and general management; and indeed the latter is an important consideration, as after all the growth of good seed requires as much care and attention to details as the production of good stock, and the cause of so many failures in the quantity and quality of our crops is to be found in the often combined efforts of ignorance and dishonesty in our seed growers and seed merchants, though we have yet to learn why the exercise of skill, energy, and straightforwardness in the one case should not be as successful as it would be important in the other.

STEAM CULTIVATION.

In my last (p. 620) I proposed that the farmer should subdivide a field into allotments, for the purpose of enabling him to substitute steam for horse-power in cultivation—that these allotments should each contain one half acre, or not more than an acre, and that the content of such plots should be inscribed within the area of a "circle;" since this particular figure would enable us to fulfil the all important condition of "time" in operating. It now remains to me to explain what kind of machine, and what combination or arrangement of powers will be required to operate on arable land, when inscribed in such circular figure. A machine to be capable of executing any of the customary operations of tillage, by the circular method proposed, over half an acre of land, must be nearly 84 feet in length. Now the first impression affecting the mind of the farmer on reading this will not arise, probably, so much from the fact that this machine will be longer than any he has been accustomed to use, as from an idea how expensive will be the mechanism or interior works required to fill up this machine so as to render it capable of executing the usual processes—such as tilling or grinding up the soil, sowing seeds, hoeing weeds, harrowing or compressing light lands, &c. He will naturally say—"If an 8-feet drill now costs me 20*l.*, what will one of 80 feet cost?" and so on through the whole series of tillage instruments required. I beg him at once to dismiss all fear from his mind, since I am not going to propose he shall continue to pursue any such expensive arrangements as are now in vogue to attain his ends in the field.

The reference to this question of economy in contrivance brings me to the consideration of that point which I only alluded to in my last letter—viz., if the English farmer desires to introduce and profitably apply that economical power steam in the place of the living horse, he must in a measure return to that simplicity of operating in the field from which he is fast departing. I will here state that in the course of my investigation on this subject of steam cultivation (when pursued some years back with closer application than I can now devote to it), I elicited the following important deduction, viz.:—That you cannot with profit employ an expensive permanent mechanic agent on a cheap temporary operation. Now, I beg to call the farmer's and mechanist's particular attention to this axiom; since it is the law by which I work, and the key to all my propositions in this matter of the farmer's field practice. It is through the possession of that deduction or axiom I can write with confidence; by the aid of that axiom I can tread in a right path, whilst the agricultural mechanist having no such rule or guide is liable to great error in the nature of the mechanism he constructs for the farmer's use. I will briefly illustrate by examples what I mean by my axiom of "You cannot, with certain profit, employ a permanent mechanism on an operation temporary in its nature." I employ illustration, because I think the best way to become acquainted with a thing is to view it in respect to things which have relation to or similarity with it. Let us take first a railway locomotive. Now, this is an expensive permanent piece of mechanism, invented to convey passengers, &c., between towns, which is only a cheap temporary operation. Since it has been discovered that if a locomotive were to travel but once or twice a day between London and Greenwich it would be unprofitable; or if it had to travel but twice a week between London and Birmingham it would not pay; or even if such a permanent piece of mechanism ran every hour between London and Greenwich for one month, and was then put aside in a shed for six months—it would not pay. Why is this?—simply because the important axiom I have offered to your notice would be infringed; that is, the nature of the machine employed (which is permanent) not agreeing with the nature of the requirement, which is temporary. Let us now apply the same axiom to certain agricultural examples. We will take, first, reaping machines: now it will happen that whenever the farmer's chief produce shall fall to a natural price these machines must fail, because we have in them a permanent mechanism, invented to perform an operation which is temporary, viz, reaping; for nine months in the year these unphilosophical machines will be rusting in a shed, and the money they have cost lost to the farmer and his country; the same with the hay-tedding machine—here we have a permanent mechanism invented for a temporary operation, and what is the result?—for ten months in the year this mechanism will be rusting and profitless. Again, we have had permanent mechanism invented to perform the very temporary operation of dibbling!—and even a liquid manure machine (unless it be convertible to other purposes) cannot maintain its ground, when prices fall. Why is this sure to occur? Because all these inventions offend the mechanical axiom I have propounded, viz.: That you cannot employ permanent mechanism to perform a temporary operation, unless the mechanism employed be so inexpensive in proportion to the benefit derived, or the price paid for the article produced be very high. But I may sum up my views on the point in this form, viz.: That mechanism being expensive and permanent in its nature must be continually employed all the year round. Now, no farmer will deny that the most striking characteristic of his field operations, is, that they are temporary. Hence every true inventor would say, "Then so must the mechanism be;" and proceed to construct accordingly. I shall follow such a course, leaving it quite open to the agricultural mechanist to put his permanent mechanism in the place of my temporary contrivances if he shall think it advisable or judicious, after hearing my arguments.

We will now proceed to invent a machine and combine its mechanism. We will lay bare the whole process of invention required to fashion a tillage machine, which shall not only perform one, but nearly all the customary operations of the field. It will be recollected, that when we sought to discover the "method" whereby the versatile powers of steam could be applied with its usual efficiency in the field, we had to interrogate nature; we have now to search out the particular mechanism or means through whose use we can till land, sow seeds, hoe weeds, irrigate growing, cut or collect matured crops, &c.; to obtain the necessary information on this point we must leave nature, and apply direct to common sense and past experience. Our case is this, viz., we have half an acre of land to cultivate in two and a half minutes of time—we are supposed to have decided that it shall be cultivated on the circular method: and in consequence that it will require a machine of nearly 84 feet in length, extending from a fixed point; and acting like a moveable radius. The point now to be elucidated is, how shall we fill, or fit up the whole length of the machine with mechanism adapted to execute all the known labours of tillage, and also capable of doing the work in an effective manner? Now, an inventor must first obtain the right elements or materials necessary for his purpose, before he can combine them; hence he would proceed thus—he would ask, 1st, What is the characteristic of the operations connected with tillage? Answer—They are temporary, only lasting for a short time. Then, he would say, So must my mechanism be. 2dly, Are they varying or unvarying? Answer—Ever-varying. Then so must my mechanism be capable of continual variation—first for one purpose, then for another.

He would now proceed to ask, What is the object sought for by the farmer in the field? The answer would be, To produce a thing of life, called a plant; in fact, to manufacture a real living object, from a real live seed and soil. Upon discerning the result of this interrogation, a new and unexpected light would break in upon his mind, and he would see that it was no longer a dead material (as in other arts) he had to work upon; or a dead object to be manufactured, but a real thing of life; it was no longer like dead hay in the barn he had to assail by mechanical contrivances; it was no longer dead and dried straw he had to deal with, like the steam-thresher in a farm-yard, but real living objects to be manufactured. This was the main problem he had before him! At first the inventor will seem lost for information. If by putting a handful of Turnip seeds in at one end of a box, and then by turning a few ingeniously contrived cast-iron wheels acting upon pinions, &c., he had to grind out 5 tons of full-grown Turnips, the thing would seem simple enough and in strict accordance with his experience, because he would then have only to comply with approved rules and analogy, and they would carry him through; but he finds directly he leaves the manufacture of the dead *matériel* in the barn, and enters the field, he is brought into contact with the manufacture of life in the form of a vegetable. He finds the homestead and the field are two totally distinct departments, and the object of each

is totally different from the other. So he says, "In the barn or homestead I observe the object is the manufacture of a dead material; and the essential element to ensure success here is cast-iron undoubtedly—but this is the field wherein the chief object is to manufacture a living material;" he continues, "it is of no use attempting to invent a machine, be it expensive or otherwise, unless I obtain for it the essential element to ensure success in the manufacture I am about to fashion it for; of what use will it be making a thing and puffing it into ephemeral existence by stating it will do all that is needed, when after a brief trial it will die a natural death, and be no more heard of." So he asks himself this commonplace question—"What is the essential element to ensure success in the rearing or production of life, for I must have it?" And he finds the answer is—"*Attention, unremitting attention.*" When he says "Can I obtain this from cast-iron materials in chief? No—for who ever heard of infants (which is 'life') being reared by cast-iron nurses, or of fine plants being produced by cast-iron gardeners?" Again he asks, "Then from whence can I obtain this element 'attention,' so essential to ensure success in plant production, which is the business for which I am about to construct a machine?" The answer he obtains is only from the "head and hand of man." Here he seems in what the Americans call a "fix." He sees, he knows cast-iron mechanism is, and has been the chief and appropriate thing for the barn, but that the "attention" of man is the chief thing for the field. Now, this position is awkward, because he knows full well nearly everybody thinks there is no limit to mechanism; that to start an idea in these latter days in opposition, as that mechanism may have a boundary and a limit, and be out of place in any one branch of an art or manufacture, even though that manufacture be one of "life" itself, would be rank heresy and schism; to undertake to define where mechanism begins and "man" ends, or man begins and mechanism ends, is a dangerous and difficult task. However, knowing the "terms" of invention, he perseveres in eliciting the conditions of composition absolutely required to form a tillage machine cheap, yet substantial and suitable to the usual requirements of the farmer in the field. And he succeeds in this way; he says, "So I must have 'man' in the field, because I require his 'attention' all the year round;" but there are certain preparatory but temporary operations, which are purely mechanical, which must be executed by mechanism and be performed by the ordinary rules of mechanics; so he asks this question—"Hence, how can I obtain mechanical command over a man, so as to cause him to become, for the short time I may require him, strictly a piece of mechanism?" He finds the answer to this is, "By taking him off his legs,"—by moving him, instead of allowing him to move himself over arable land! Now I call your particular attention to this. Here the inventor obtains the essential element to ensure success in plant production, viz., attention; and also discovers the method whereby he can acquire the necessary control or command over it, so as to make it serve as a piece of temporary mechanism in the composition of a machine for executing tillage.

Having found that man, the labourer, is the most valuable piece of mechanism a farmer can have in the field department of his business, he proceeds to discover how he can apply him to perform the mechanical and temporary operation of tillage. He says, "There are only two things absolutely necessary in field mechanism, viz., leverage and steerage. By using the fixed point (point d'appui) with my machine I obviate the necessity of studying 'steerage' altogether; hence the only thing to provide for is 'leverage;' that is, to use something which shall be capable of elevating or depressing a lever, having tillage mechanism at its extremity." This he finds the ordinary skill of man is fully equal to; the only precaution required being this, viz., that you carry him instead of allowing him to carry himself. By putting him in the gallery 84 feet long, he finds he can readily fulfil this condition, and that one man can manage a great length of tillage mechanism. So by using a man, an inventor at once obtains a cheap and plentiful species of "mechanism" ready made to his hands, to fill up an apparently long machine. Consider yourselves, what is there in tillage practice so elaborate or so difficult which the ordinary skill of man cannot encounter and accomplish; that man who can point pins or drill the eyes through a handful of needles with such speed and dexterity that the unaccustomed eye cannot follow him in his work—what is there in field operations which he cannot do, provided you supply him with certain necessary artificial means, and endow his hands and legs with the required artificial power? Literally nothing, as you will discover when I come to analyse and pass in review the operations of the field, and place them before your eyes and minds in their real "native" simplicity. Modern improvers (well-meaning, no doubt), have tried hard and long to throw the cloak of elaboration upon that branch of the farmer's art, which is simplicity itself; but the best commentary on their past attempts is, that not one single expensive elaborate attempt has ever succeeded, been profitable, held its ground, or been imitated by others. By results we judge the correctness of proceedings, and we can all of us emphatically say, that in all our observation or experience we never yet saw an elaborate experiment or an elaborate mechanism succeed in the field. Hence what is the inference? Why, that intricacy and elaboration are out of place; and that "simplicity" is the very soul of that department of the farmer's practice which is carried on in the field. Simple as Nature is the farmer's art, and we must assist that simplicity, not seek to supersede it. *Charles Burcham, London.*

MR. CAIRD'S ESTIMATE OF THE HARVEST.

[The following is portion of a letter addressed to the *Times* on this subject by Mr. Caird.]

THE English Wheat crop of 1854 proved one of the best on record. It appeared a large crop at harvest, but it threshed out even better than it promised. The fineness of the harvest weather perfected a bountiful crop. This was followed by a continuance of the same propitious weather during seed-time, and, as Wheat was then selling at such a price as most farmers hardly expected to see again, every acre that could be got ready was sown with Wheat. So much for the autumn seed-time. When spring came one bushel of Wheat was worth two of Barley, and the advantage was plain enough of substituting the one crop for the other wherever practicable. Accordingly an unusually large breadth of spring Wheat was sown last season. If we suppose that only one-fourth of the usual breadth of Barley land was sown with Wheat, that, on the four course system, would add one-fourth to the average breadth of land under Wheat.

The weather during May and June was too cold for the Wheat crop, with late frosts, and at this period the crop suffered considerably, especially in the south. It was fully 14 days later than usual in coming into ear, in some places three weeks. But July was warm and forcing, and the weather on the whole was favourable while the crop was in bloom. Towards the end of the month the effect of blight made its appearance, and it then became manifest that the ear was partially defective. On the 4th of August harvest was commenced on the Sussex coast, by the 15th it was general over the south of England, and during the next six weeks the weather was everything that could be wished for the cutting and in-gathering of the crops throughout the kingdom. Within that time all the valuable Wheat crops were secured, and in excellent order.

The crop has now been tested in all parts of England, and, while the yield is found to fall considerably short of the great crop of last year, and in some particular districts, owing to special circumstances, is very defective; yet, on the whole it is believed to be nearly an average produce per acre over much beyond an average surface. The farmers' deliveries of Wheat in the various English markets during the first week of October for the last three years, as shown by the *Gazette*, are a pretty accurate indication of the correctness of this conclusion. For the week ending October 6 the Wheat delivered was—

1853.	1854.	1855.
95,494 qrs.	151,801 qrs.	155,921 qrs.

From these figures we should be almost justified in assuming that any defect in the yield is compensated by the increased breadth under crop.

I am inclined, however—and I think it will be a prudent calculation—to assume that the yield of the last Wheat crop is something below an average. We may take it at one-tenth, and then with the foregoing *data* we have the following results as the produce of 1855, viz.:—

	Qrs.
Average Wheat crop of the United Kingdom ...	13,500,000
To which add one-fourth for increased breadth sown in consequence of high prices, a favourable seed time, and a liberal use of guano ...	3,375,000
	16,875,000
Deduct one-tenth for defective yield of last crop	1,687,500
Total estimated Wheat crop of 1855 ...	15,187,500
Estimated annual consumption of the United Kingdom	18,000,000
Apparent deficiency to be supplied from abroad	2,812,500

which is little more than one-half of the average annual importation of the last five years.

But there are two important circumstances to be taken into account which will materially diminish this apparent deficiency—the lateness of the harvest and the economy of consumption caused by high prices. The harvest was three weeks later than usual, and we may thus save three weeks' consumption of the present crop. This saving, however, is not one on which it would be prudent to reckon, for in the same degree the stock of old corn in the country must have been diminished; and a greater margin than this will always be required on hand to meet unforeseen contingencies. But the economy of food caused by high prices is self-evident to every one, and, if we take it at one-tenth, there will remain little more than 1,000,000 quarters of Wheat and Flour, for which we shall be dependent on foreign supply.

There can be little doubt that the present range of prices will procure this supply from America and Egypt alone, even should the northern European ports be closed against us by the defective crops and high prices anticipated abroad.

Now, if these figures could be relied upon, there would be no further anxiety on the food question. I cannot, however, ask for them any greater dependence than may be given to the result of individual inquiry and observation and a pretty accurate knowledge of all the Wheat-growing districts of Great Britain. It will be obvious to those who have studied the question that the result of this estimate is mainly governed by the supposed increased breadth of land sown with Wheat last season.

If my estimate should prove accurate, the present price of Wheat is not likely to be maintained. But, if I have materially erred in this, the deficiency may prove very serious. Is this a question that should any longer be left to doubt and uncertainty? The evidence taken by the Lords' Committee on Agricultural Statistics last session conclusively proved the practicability of obtaining accurate returns of the acreage under each crop in the kingdom, which, if at present in operation, might have been published six weeks ago, and would at once have given certainty to the trade in corn, now fluctuating with every new rumour from week to week. The present average price of Wheat is exactly 20*s.* a-quarter higher than it was at this time last year! Each month's consumption is thus costing the country 1,500,000*l.* more than it did then; and yet successive Governments hesitate about an outlay of some 30,000*l.* to obtain accurate returns, which would calm public anxiety as to the supply of food, and would remove that uncertainty and apprehension which alarms public credit and paralyses trade. Of all the mistaken economies ever committed by a great nation there has never been one more delusive than to grudge the cost of ascertaining facts upon which the trade and welfare of the country are so much dependent. *James Caird, 6, Serjeant's Inn, Temple, Oct. 29.*

Home Correspondence.

Fisken's Plough.—By the way of satisfying "W. B.," and preventing the future misapprehension of other people, I will just re-state the facts of the case at issue. In Fisken's apparatus we have a wire rope laid along the ground and fastened to an anchor at each end of the field. This rope is passed one turn round a grooved barrel upon a travelling frame to which the ploughs are attached; so that when the barrel revolves, it winds its way along this stationary rope. The strain upon the rope—and therefore upon whichever anchor the windlass or ploughing machine may be approaching—is not greater than the draught of the machine. In order to actuate the barrel, an endless hemp rope, driven by a portable steam-engine, is passed round a pulley at each anchor (that is, at each end of the field), and this rope drives a rigger upon the travelling carriage, which rigger communicates motion to the barrel by means of a pinion and spur-wheel. As this light rope is mounted upon "horses," both the anchors bear a strain sufficient to hold up the double length of rope from touching the ground, to which must be added the drag arising from the friction of the rollers upon the "horses." The strain upon the anchor at the end of the field furthest from the engine is no greater than the draught of the travelling machine plus the slight strain due to the light driving rope as just explained. The strain upon the anchor nearest to the engine is greater; because, in addition to this, it has to bear (or rather, may have to bear) a strain equal to double the draught of the rope between the engine and the travelling windlass; the other pulley having to do only with the slack rope. The driving-rope having a velocity 11 times greater than that of the machine it propels, its "draught" is 11 times less; thus the anchor nearest to the engine has to sustain a total strain equal to the draught of the plough-carriage, plus two-elevenths of the same draught, plus the slight strain arising from the suspension of the driving rope and the friction of the small rollers upon which it rests; to which must be added an allowance for the friction of the wheelwork upon the travelling carriage. In other inventions, in which the ploughs are drawn bodily by an endless wire rope, itself travelling at the same pace as the ploughs, the pulley at the far end of the field has to resist a strain equal to double the draught of the implements plus that of the heavy rope, which moves with great friction over the ground. The above is a statement not of opinions but of facts, which neither "W. B." nor any one else can destroy, so that I maintain my assertion that Fisken's plough works with very little more strain upon the anchorages than is due to the simple draught of the implement. *I. A. C.*

Adulteration of Manures.—In the address of Dr. Anderson to the Scotch Agricultural Society is the following statement:—"A very remarkable instance of this occurred to me some time since. I analysed a manure professing to be manufactured by a particular process, which it is unnecessary to explain; and calculating from the amount of its valuable matters I fixed its price at 1*l.* 5*s.* per ton: in doing which my estimation was based on the regular market prices of these substances; so that it was possible for any person, by mixing salts of ammonia, &c., to produce a manure of equal value for that price. Some time after, I met the individual for whom the analysis was made, and he informed me that he had shown it to an extensive dealer in manures, who had said, that he had no doubt it was quite correct, but that he could himself afford to give for the manure a much higher price than I had fixed, because he knew that, in the present state of the market, he could sell it for 4*l.* or 5*l.* per ton. Here, then, was a person prepared to speculate on the ignorance of the farmer, by inducing him to pay, for this substance, nearly three times its actual value. It is scarcely possible to adduce a more striking illustration of the risk to which the farmer is laid open by the want of chemical information." If this is done to the keen and wealthy farmers of Scotland, what must be expected for small farmers, where agriculture is in arrear? It is a lamentable reflection that farmers, working early and late, should be preyed upon by a set of harpies, who thus swindle them out of

their profits. Small farmers cannot be expected to study chemistry, as Dr. Anderson recommends. But now there is an official chemist, Dr. Voelcker, of Cirencester College, appointed by the West of England Agricultural Society, who will examine their manures at a very reasonable rate, they may agree among themselves to have a few well averaged samples assayed yearly, to detect these swindlers, and drive them from the market. Not seller's samples, but drawn from different parts of their purchases, and well mixed, so as to form average samples of the whole. Let them reflect on being thus cheated of a bag of Wheat, or a ton of Turnips, per acre, year after year: and think how many assays this would pay for, and leave a good profit for ther own pockets, instead of going for articles nominally cheap, but really little worth. Nor is the farmer the only sufferer. The country needs all that can be produced from its soil; and whatever is thus hindered by falsified manures is a national injury. *I. Prideaux.*——I see that your correspondent from the Fens reports that now, as ever, an enormous amount of roguery is going on in the guano trade. I belong to an agricultural society held in a small out-of-the-way place, called Dolsdown. Among other benefits we hope to confer on the neighbourhood is the detection of adulteration in manures, carried out in the following manner:—A farmer requiring a load of guano or superphosphate selects a suitable trustworthy man as waggoner; he is provided with a small tin canister; when the waggon is loaded the driver requests the vendor to take a small quantity out of one of the bags, and in his presence to seal it up in the canister; this sample is sent to be analysed, and the chemist's report, be it good or bad, is read at the next meeting. I cannot but think that if this plan were carried out by the numerous influential societies held in all parts of the country, we should hear no more complaints of adulteration of manures. *Thomas Sibbald.*

Thin Seeding.—It is gratifying for us to know from your leading article that you bespeak attention to our remarks on sowing of corn. As to our experimental yards, and the inference you draw from them, we agree with you in most points—especially that a whole acre cannot be expected to produce as much proportionately as a single isolated yard; nor did we ever intend to convey such a conclusion, however differently the meaning of our statements may have been construed in this particular. The idea and practice, as we desire to convey it and to have it understood, differs but little from Mr. Smith's plan of Lois-Weedon—viz., planting only half the land continually in square yards or a yard wide, alternately fallowing and interlining other crops in the intervals, with this difference only—that we sow much less seed than Mr. Smith, and profess to obtain thereby considerably more produce. We only quote the productions possible to be obtained from extreme wide distances of planting, and small quantities of seed, with the view of proving the absurdity of sowing 20 times the quantity to obtain less. We beg also to observe that our single yards referred to were grown surrounded by other crops (French Beans), though not amidst other crops of corn. Also, that another yard side by side, treated alike in every respect, was sown with the same kind of seed at the rate of 3 bushels per acre, and produced only a quarter of a pint of inferior stuff, or little more than 2 quarters per acre. What then can be expected from a full crop equal to this all over the ground? We are now farmers of 100 acres and not gardeners, but have to rejoice that we were first gardeners; neither of them are mean occupations. Sir Joseph Paxton was once a gardener, and the junior of our establishment was once a partner with him in the Duke of Devonshire's garden at Chiswick. Let us but endeavour to follow his good example, and we doubt not of good results. *Hardy & Sons, Seed Growers, &c., Maldon, Essex.*

Drains with Brushwood.—Being about to drain some wet clay lands which lie very high and far away from good roads and at a long distance from a draining-pipe maker, and where the stone of the neighbourhood is so hard that it is very expensive to break up for draining purposes, but where underwood is abundant, I am anxious to inquire if any of your numerous correspondents have had any experience in draining with underwood of about 12 or 14 years growth, such as Blackthorns, Hazels, and Oak, &c. I remember the farmers using brushwood extensively for draining when I was a boy 30 years ago, but as I was moved far away from the neighbourhood when I was very young I have no means of knowing how it answered except in one instance, which I was told three years ago was still satisfactory. I was also lately informed of a party of workmen who in making a road through some fields in Herefordshire cut through some drains that had been made with brushwood—Willow—the branches of which were quite sound, but no persons in the parish remember the drains being made. Any information respecting the effects of using brushwood in drains would greatly oblige your subscriber. *H. B.*

Cattle Feeding.—I agree with Mr. Harkness, that at present prices bullocks will pay 6*s.* per ton for Turnips, having unlimited Oat straw gratis, and receiving a very small portion of extra food. Irish Turnip crops and English ditto are quite a different affair. With an Irish climate and soil, no doubt Turnips can be grown at 6*s.* per ton, and of a good succulent quality. But how stands the matter in our dry Wheat-growing English districts? I will venture to state, that taking the whole county of Essex (one million of acres), the Swede Turnip crop does not this year average nine tons per imperial acre. In fact, in many cases, the crops are an entire failure. The cost of the Swede crop will be certainly 20*s.* per ton this year, and on an average it is seldom less in Essex than 10*s.* to 11*s.* Let me not be misunderstood; I am a strong advocate for root cultivation, but I repeat what I have before said, that on an average of seasons and soils, the return for the Turnip crop is, independent of manure, much less than its cost. Your own large experience in this matter confirms my statement. The Mangold Wurzel and white Turnip are the more suitable crops for Essex. I have this year 28 tons of Mangold Wurzel per English acre, but if I can sell them in the spring at 16*s.* to 20*s.* per ton, I will certainly do so, and replace their exhaustion by guano, Rape cake, &c. I find that after Mangold Wurzel I can grow a large spring crop either of Oats or Barley, by a dressing of 2 cwt. of guano. In fact, this year I have over 64 bushels of Barley per acre after Mangold Wurzel without any dressing. It may be interesting to some of your readers to know that my crops of 1854 averaged Wheat, 39 bushels per acre imperial; Barley, 64 bushels; Oats, 88 bushels; Beans, 32 bushels. This year I have reason to believe they will be heavier. Generally speaking I dare not guano for my cereal crops. I mention these facts, as I see Mr. Harkness' correspondent implies that I farm high but badly. *J. J. Mechi.*

Dairy Production.—Referring to my communication on this subject in your number of August 11, in which I gave the result of a trial made of the produce of three ordinary milk cows for the week extending from June 26 to July 2, which may be taken as the period of maximum production in the year (the production then being found to be at the rate of 1*l.* 6*s.* 10*d.* per week for the three cows, or about 1*s.* 6*d.* per diem for each cow, the fresh milk being valued at 2*d.* per quart), I now give you below the result of a trial made with the milk of four cows for eight days in October, which may be considered as a period of medium production. The cows were fed with cut second-crop Clover, with, as before, a daily run in a Grass paddock with a supply of running water. It will be noticed that on the first and last days of the trial the milk of each cow was measured, and is stated, separately. On the 21st, which was Sunday, they were milked but twice, say at 9 a.m. and 6 p.m.; on the other days they were milked at 6 a.m., 1 p.m., and 8 p.m.

	Cow qts.	Morning quarts.	Noon quarts.	Evening quarts.	Total. quarts.

Which if sold fresh at 2*d.* per quart, would bring 1*l.* 15*s.*, being at the rate of 1*s.* 1*d.* per day production from each cow; but it was not so used, and our experience (as shown below) is similar to that which I chronicled in my last communication, viz., that milk may be as profitably disposed of by being converted into butter, &c., as by being sold fresh. This finding is contrary to the generally received opinion, and it may be of instruction to those who, acting on that opinion, put themselves to much trouble and expense to bring their milk fresh to market. It is true that the manipulation and sale of butter, &c., involves also labour and supervision, but not to the same extent as does the delivery of the milk in bulk.

Return from 210 quarts of milk as above:—

	£	s.	d.
Cream collected therefrom 25 quarts, which when churned gave 24 lbs. of butter (as salted) at 1*s.* ...	1	4	0
16 qts. of buttermilk, sold or used for household, 1*d.*	0	1	4
54 qts. skimmed milk ditto ditto 1*d.*	0	4	6
Remainder of milk made 29 lbs. curd, at 2½*d.*	0	6	0
	£1	15	10

Being 10*d.* more than the value in the shape of fresh milk. *S.*

Salt for Retention of Ammonia.—Your "Allerton" correspondent (p. 700) is, I suppose, aware that the excellence of used fishery salt as a manure depends not on its purity as chloride of sodium, but on its richness in oil and animal matter; and he is surely right in preferring this, to which he can add sulphate of lime (gypsum) in any proportion, to mere impure salt, with sulphate of lime in uncertain proportion; and fishery salt is good to mix with guano, equal parts, not merely to retain the ammonia, but to improve the quality of the products, as the guano increases their quantity. But it will not bear the cost of very distant carriage; its price should not be more than 25 per cent. above that of ordinary agricultural salt. And so of the ashes; the proportion of sulphate of lime may be increased with gypsum, but it does not act well dry; whether mixed with or contained in the ashes, they must be damped to retain the ammonia. *J. Prideaux.*

Drainage and the Improved Temperature of the Soil.—I have read, as every one engaged in draining would read, the statement of the experiments on the temperature of the soil at Yester Mains of land drained and land undrained, with considerable interest and some disappointment. But I am not disposed with Mr. Clutterbuck to accept those experiments as proof conclusive of the fallacy of the theory that "by drainage the temperature and therefore the climate of soils is elevated." My disappointment arises from the fact that as the statement does not go to confirm the theory it will be hastily accepted by many in the negative, although the attendant circumstances are most fairly described by Mr. Stephens. All should observe that the trial was not upon the same land before and after the operation of draining, and in the same condition of tillage and culture, but it was made in different fields differently cultivated. I have heard that Mr. Parkes has for some years past been carrying out a series of experiments on the temperature of soils before and after drainage, and the public will do well to defer their judgment until the results are published, as it is to be hoped they will shortly be. One very extraordinary circumstance has come to my knowledge, showing the activity of atmospheric influences in a drained soil. Drains have been observed to run after a discontinuance of that duty without any fall of rain on the surface, and upon referring to the barometer it has been found that the quicksilver had fallen very considerably whenever this has been the case. If this curious circumstance can be corroborated by careful investigation, how can Mr. Stephens assume that at 18 inches deep, in a drained soil, a thermometer is "not sensibly affected by the changes of temperature in the atmosphere?" While suggesting that agriculturists should suspend conviction on this point, I cannot help turning to what was reported to have been said at Witham the other day—that "the occupiers of undrained land doubted whether the extra benefit would compensate the cost of draining." Will any one assert that the increased produce resulting from drainage is not at least 1 bushel to every 24 bushels grown on undrained land? I hardly think there is a man who has fairly tried the question who will hesitate to affirm that the gain is very much more than a twenty-fourth. But it is not necessary to prove a greater increase than this to show that drainage must be profitable to the occupier. We will leave out of the question all reference to easier tillage and earlier growth, as involving too many words for the purpose. Drainage now is a landlord's operation. The tenant has only to do with the interest on the outlay, and if we accept 5*s.* per acre as representing that interest (the annual contribution of the tenant), it must be conceded that an increase of 1 bushel to every 24 bushels of corn and Pulse hitherto grown will more than pay it. With respect to open "land ditches" as a means of draining soils of a tenacious nature, it is notorious with all men practically acquainted with the subject that they fail altogether in that object. It is often observable that a clay subsoil at a given depth is wetter within a yard of an open ditch than within three times the distance of a sufficiently deep underdrain. *J. Bailey Denton, 52, Parliament Street.*

The New Forest.—Your correspondent Charles Paul in *Agricultural Gazette*, Oct. 20, states that "we have a New Forest of 92,656 acres," confounding the extent of forest with that of the land within the boundary, one-third of which consists of cultivated land, and includes towns, villages, and private property of all descriptions. Of the remaining 60,000, 6000 have always been enclosed for the protection of young timber, and this quantity is now, I believe, more than doubled, and over the remainder, whether consisting of woodland or heath, the neighbouring poor enjoy very extensive rights. Whatever may be thought of Mr. Charles Paul's plan, of which he may see plenty of examples within and around the New Forest, it is a pity that the above error should go forth. *S. B.*

Farmers' Clubs.

LOUGHBOROUGH: *Agricultural Statistics.*—At the meeting of this Association Mr. Packe, M.P., made the following remarks on the subject:—They all know that this which had been called their own hobby in matters of legislation, many people said was "dead." He would perhaps not go so far as that—but he would admit that it was "gone to grass." There had been sitting this session a committee of the House of Lords who had had a motion brought before them to "inquire into the best mode of obtaining accurate agricultural statistics in the United Kingdom, and to report thereon." The peers, composing that committee, seemed all to have entertained a similar opinion that it was settled that the collection of agricultural statistics would be for the interests of the country generally, and no evidence whatever had consequently been taken as to whether it would be right or wrong, injurious or inquisitorial into private affairs and interests; but they had jumped to the conclusion that the whole nation was in favour of it. Thus the committee rather laconically observed at the commencement of their report that the advantage of obtaining agricultural returns was so obvious "that this committee deems it scarcely necessary to dwell upon it." This done, the committee had recommended that power should be given by act of Parliament to enable the government to compel the occupiers of land to fill up schedules of returns! That has been the recommendation of the committee without the examination of any witnesses, social or political, or inquiring whether it would be agreeable to the agricultural interests generally that such statistics should be taken! They had passed a series of resolutions of which he might read a few most important, purporting that the collection of agricultural statistics was an object of national importance; that whilst many classes would be benefited by it, none would derive greater advantage from it than those connected with agriculture; and that this being the case, power should be accorded by act of Parliament

to compel the necessary returns to be made. There were to be two classes of returns :—1st, Returns of facts, and 2dly, estimates. In the facts would be returned the acreage of land, and an account of the extent of each crop that was grown. The estimates were to comprise returns of the crops harvested: and the first class of returns were to be required by the 1st July; the second between the 1st and 10th November in each year. As it was further supposed that the collection of agricultural statistics would be of general utility, the expense was to be defrayed out of the National Exchequer. Testing in another manner the opinion of those gentlemen who said they would be advantageous to all classes, he begged leave to say that last year 4000*l.* had been expended, from the estimates of the House of Commons, in obtaining through the poor-law machinery returns of this nature from different parts of the kingdom. They themselves knew something of this, having been one of the counties selected for that experiment. These counties were in number 10 or 10½, counting the West Riding of Yorkshire. They had been selected by the poor-law board, and as far as the returns went were curious instances of the feeling of the country. From the report which the committee had received from the poor-law inspectors, he should just read extracts. The reports from these 10 counties out of the 32 were strong indications of the feelings of the farmers throughout England upon the subject—although they would bear in mind that the matter had been only tried, and was merely an experiment in these 11 counties—or not so many—10½. The counties selected were Suffolk, Norfolk, Hampshire, Wiltshire, Leicestershire, Berkshire, Worcestershire, Brecknockshire, Shropshire, Derbyshire, and the West Riding of Yorkshire. How, then had the farmers received the poor-law inspectors in their endeavours to obtain these returns for the Board of Trade? In Norfolk and Suffolk the same poor-law inspector had reported that in several unions the co-operation of the guardians had been refused, and that hostility had proved itself to exist through the agency of market-place and a market-table discussion. This had been stated in documents presented to the House of Commons. In some of the unions, the document in question went on to say, success had been impeded by the unconquerable prejudices of occupiers, and large occupiers, whom it was impossible to reach—and if reached impossible to convince by argument. In Hampshire and Wiltshire, again, the experiment of collecting agricultural statistics in that district the inspector regretted to say had "failed." He attributed this to the refusal to report (so essential) of a numerous body of agriculturists, who had demurred on the grounds of the injurious tendency, insidious nature and mischievous character of the inquiry; and it was thought that the Government had an eye to taxation, or some other thing of the kind, injurious to the interests of the farmers. In their own county (Leicestershire), as the gentlemen he was addressing were well aware, the Loughborough Union had considerably resisted the inquiry; great resistance had been shown in another union; in Bilsden Union it had been found totally impossible to obtain any report at all. Mr. Ingram, the clerk to the Bilsden Union, had written to Mr. Weale, the inspector, in January, 1855, regretting to inform him that the Agricultural Statistics Committee had come to the conclusion that the serious difficulties and opposition thrown in their way rendered it impossible to complete the returns of last year. Several classifiers apprehended that the effect would be to place the guardians and ratepayers in antagonistic positions, were the law carried out. This was, therefore, the feeling in five counties. Now, in Berkshire it was found that there was a general and determined opposition to the adoption of the measure; and it having become desirable to hold a special meeting to meet objections and explain away difficulties, it was found to be in vain to attempt assembling the board of guardians on any day but that of their ordinary meetings, from their distrust of the inquisitorial objects, utility, and consequences of the proposed returns. In Worcestershire and Brecknockshire, the only counties where the measure had been tried, only seven out of 35 unions had complied. In Shropshire and Derbyshire, the prejudice that they would open an undue interference with private business had taken hold of the minds of many wealthy and respectable farmers. And what the inspector spoke of as most provoking was, that several of the committee had themselves refused to fill up the schedules! One favourable account had been obtained from what could hardly in any degree be called an agricultural county—the West Riding of Yorkshire. It was very well understood that the West Riding of Yorkshire was one vast hive of manufacturing industry; but greater unanimity had prevailed there in making these returns; and the same passages found in the reports of other counties were not seen in the reports relative to that county. He (Mr. Packe) should be the last person to wish to state anything in bitterness or hostility. But he had read nothing which had convinced him of the advantages of those agricultural statistics; and yet the farmers' concerns were to be laid open, as recommended in this report of committee. From a noble friend of his, whom everybody knew well in that county, and for whose zeal in agricultural matters he had the greatest possible admiration, he differed, in so far as when he ventured to say "it would do the farmer no harm," he (Mr. Packe) must reply, "it would do him no good." The farmer had been rather hardly dealt with of late years by the legislature; and it must be proved to him (Mr. Packe) not only that the measure in question would do the farmer no harm, but that it would do him some good. (Loud cheers.) Some parties thought it would be a beneficial measure. But at the taking of Kertch, in the Sea of Azoff, a great number of quarters of corn had been destroyed which it was said had cost the importers but 12s. a quarter; and there had no doubt been a great quantity destroyed which had only cost this price. Now, if an inquiry were established into what they were to get for their corn, what quantity was likely to come to market, &c., the greatest possible advantage would be given to the importer, and the buyer of corn would be ready for them. In consequence, it could not be said that it was a beneficial consideration for the farmer; but in order to see what it was likely he would be able to produce, this measure was proposed; and as to prices—look at present prices, and say whether it was probable they could do better, or even as well. (Laughter and cheers). Why meddle with them, then, and injure their concerns? When they were making their fortunes by farming, was it not provoking to have an inquiry made into what they had got? He would simply ask this: If there were a great many large shops of the metropolis which at a certain season of the year were compelled to sell at a reduced rate; and if the concerns of these houses were published, and returns made of all that their back shops contained stored away, because it would not sell, and if all this were done with a view that we might not know how to buy their goods, why, we should only want to know what they had got to sell, wait till they were forced to reduce their rates, and then become their customers. (Great cheering.) He would be glad to know where the distinction was betwixt the case of the shopkeeper and that of the farmer. Yet there were many opinions prevalent upon the subject, and he wished to take the course which was best and most beneficial for the agricultural interests. But as at present advised, with these documents before him, and knowing the opinions of the inspectors of ten counties, he felt obliged to say that he should have some difficulty in being able to acquiesce in this measure.

Crewkerne.—At the annual meeting of this society the Bishop of Bath and Wells enumerated some of the advantages of an allotment; among others, its affording a pleasing pursuit after the labours of the day, the delight which the cultivation of vegetables was sure to bring, and the result of the attachment to his allotment which the cottager generally felt, drawing him away, as it did, from injurious pursuits and immoral recreation, and giving him a stake in the country. A well-kept allotment was the index to the habits and tastes of its owner. The same feelings which prompted him to keep it clean and free from weeds would operate upon his domestic tastes; he would like also to see his cottage clean and cheerful, his children orderly and happy, and his pig, if he kept one, well looked after. He also treated his children, in a moral sense, on the same principles as he did his garden, knowing that if not trained to morality their minds would be choked with noxious weeds. He took care that they attended regularly at school and church, and that he never went himself to the beerhouse. The beerhouse was the bane of England. It was that which filled our workhouses and gaols, and brought to ruin those who haunted it. Even, to make the best of the beerhouse haunter, he was a cruelly selfish being, for he spent in his own indulgence the means which ought to go to the support of his own family; and, not content with this, he too often reeled home to maltreat the wife whom he had so solemnly sworn to protect, and the children so prone in after-life to follow his pernicious example. Some remarks had been made in the report upon the important subject of education. He, for one, was inclined to carry it out much further than by many was thought either necessary or prudent. The time was coming when machinery would be employed in agriculture to a much greater extent than now, and when, therefore, the labourers who worked it must obviously be intelligent and skilful. But what sort of preparation for such labour were the children of labourers but too generally undergoing? Why, while still a child, having learnt hardly anything whatever, a boy was generally taken from school just at the time when he might begin to profit by it, and put to keep birds from the corn. Some few years ago he had a friend, a clergyman in Hampshire, who was an enthusiast in education, and who made up his mind that he would do what he could to carry out his views. Accordingly, he built commodious school-rooms, engaged the best masters, and induced both the farmers and labourers to send him their sons, and to allow them to remain at school a much longer period than usual. He adapted his education to the wants of each class, so as to fit them for the relative positions which they would be called upon to fill—instructing the farmers' sons not only in the elementary subjects which were taught in common to both classes, but also, among other sciences, the important science of agricultural chemistry. In a few years he was surrounded by an intellectual population. But his object had not been effected without opposition. One farmer was particularly annoyed when he found it becoming more difficult and more expensive than formerly to get the birds frightened. But the Government, appreciating that clergyman's exertions, had rewarded him with the deanery of Hereford, and at a public meeting the other day he had had his health proposed by the very farmer who had formerly found so much fault with him, and who frankly admitted that he had seen his error, and that if it had cost him more to get his labour done he was amply repaid by the superior manner in which it was performed.

Reviews.

Bread for the People secured by the Skilful Cultivation and Efficient Supervision of Estates. By Layton Cooke, Land Agent and Surveyor. W. H. Dalton, Cockspur Street.

Mr. Cooke supposes that 48 bushels of Wheat are obtainable per acre in this country by "energy, skill, and capital," possessed "in the requisite degree;" and that if these qualities in other degrees produce respectively 32 and 16 bushels per acre, then of the land under cultivation it may be assumed that one-tenth is held under the first, three-tenths under the second, and six-tenths under the third supposed case. The whole will yield thus after the rate of 240 bushels per 10 acres, which is supposed to be the present average yield of the country. And then the following speculation is indulged in:—

"If a change in the cultivation should occur, to place the occupiers in the following position:—

Tenths.		Bushels.
3 in the first class of 48 bushels	=	144
4 in the second class of 32 "	=	128
3 in the third class of 16 "	=	48
		320

"The average produce would be increased to 32 bushels per acre, or 50 per cent. on the produce of the kingdom; and if the whole of the cultivated land were in the occupation of tenants of the first class, and was cultivated according to the most approved modes at present in practice, the increase would be 100 per cent. on the present average produce of the kingdom."

Of course any result deemed probable may be calculated on assumed data in this manner, and the method of attaining it may be represented in a variety of ways, most of them probably less plausible than the above. We do not think, however, that the advantages of energy, skill, and capital, are in any degree enforced by the representation of the results which on assumed data they may be shown to produce.

The history of a single instance such as that related by our correspondent "B," the other week, at page 698, is much more conclusive than any speculations as to possibilities on the wide scale of the whole country can be. Besides we are not willing to admit the data on which Mr. Cooke proceeds.

No one is more anxious than we are to impress the truth that produce depends on cultivation quite as much as it does on the original quality of the land; but we do not believe that six-tenths of the Wheat land of this country yield only 16 bushels per acre, nor do we believe that that degree of energy, skill, and capital which obtains 48 bushels per acre over one-tenth will be sufficient to obtain that quantity from all. The nine-tenths which, according to Mr. Cooke, yield less than this produce, do so on account of a natural disability of soil as well as on account of an unfortunate disability in their occupiers—and the former consideration is one which underlies and affects whatever amount of energy, capital, and skill may be brought to bear upon the land—so that over a naturally poor soil a greater effort must be made to produce the same result.

As a specimen of Mr. Cooke's speculations on this subject we extract the following passage from his pamphlet:—

"It has been suggested, that double the annual amount of produce might be obtained by adopting an improved mode of culture, and it is proposed to indicate the means by which a gradually increasing population might be provided for, from a territorial area, which admits of no extension.

	Millions.
Assuming the 46 millions of acres now under cultivation, and farmed according to the present management, to be equal to the population of 1841, namely	26
By bringing into cultivation 15 millions of acres capable of improvement into a state equal to that of the 46 millions of acres, the annual production would be increased one-third in quantity, and sufficient for an additional population of	8
By bringing 5 millions of acres of the inferior descriptions of Grass land into a state of cultivation equal to the average of land now available to that purpose, would provide for an additional population of	3
	37
Assuming the several descriptions of land capable of being cultivated to such a depth as would increase the produce one-half in quantity, the addition would be sufficient for the sustenance of a population of	18
	55
The extra cultivation of the land effected by reducing it to a more minutely granulated state, exposing a greater surface to the action of atmospheric influences, dew and rain, admitting of the manure being more intimately diffused throughout the soil, and affording greater facilities for the roots of plants to obtain nourishment, would tend to increase indefinitely the productiveness of the earth; but the additional amount of produce obtainable by these means are dependent upon the degree of pulverisation attained, which for the present pu pose is supposed to effect the production of food to the extent of 50 per cent. on the amount previously obtained, and consequently sufficient for a population of	27
Giving a gross quantity corresponding to a population of ... ... millions	82

"No inconsiderable additional amount of produce might be obtained by the general adoption of appliances familiar to the more intelligent cultivators of the present day, and this quantity would be capable of expansion as the science of agriculture shall be further developed.

"Much is also expected from geological, chemical, botanical, and mechanical discoveries, and from

numerous permanent improvements, such as the application of marl to light sandy soils, the application of chalk to heath lands found to be deficient in calcareous substances; by an effectual system of draining; by the general adoption of irrigation and warping, in all situations in which those important improvements may be severally applicable.

"Without presuming to hazard an opinion in respect to the actual extent of the benefit to be derived from economising manure, and turning to good account the immense quantity that is constantly running to waste; it is nevertheless believed to involve a question as to an addition of millions of stones of meat and millions of bushels of corn to the annual home supply.

"Nor is it attempted to estimate the loss sustained by reason of a vast extent of arable land being in small inclosures, surrounded by wide hedge rows and shaws; suffice it to say, that in some instances the waste has been found to exceed one-fourth of the whole, leaving barely three-fourths of the land in such instances applicable to the purposes of cultivation.

"The productive power of the land is susceptible of vast expansion, and the products are capable of being multiplied to an extent to which no one at the present time can assign a limit: we are, however, in a position to comprehend, and cannot fail to observe that agricultural improvements are universally and pre-eminently desirable; for by whichever party effected, they possess the peculiar merit of benefiting all who are interested in them—the consumers, by obtaining food at a reasonable price; the producers, by obtaining a proportionately larger amount of profit; and whenever an efficient supervision is adopted, an important prospective advantage is secured to the proprietor."

Miscellaneous.

Potato Digging Machine.—Mr. Hanson's patent Potato digging machine was tried on Thursday, at one o'clock, on a field belonging to Mr. Renwick, farmer, Maryhill. There was a large assemblage of agricultural gentlemen, landed proprietors, and engineers. The machine is of a simple yet peculiar construction, and is not of large dimensions. It runs on four wheels, two small ones at the muzzle, and two about the size of cart wheels on each side of the body of the machine. A sock, which tapers from a point to a plate about a foot and a half in breadth, is made to enter the drill at a depth below the deepest Potato roots. A series of grapes is made to revolve immediately above this sock, which effectually scatters the Potatoes above the soil, and separates the roots from the shaws. The axle of the wheels on which the machine is supported is so constructed that the wheel with the grapes is worked by it, and can be stopped on turning, or on other necessary occasions. A box is placed in the centre of the machine for containing the necessary implements for yoking, unyoking, and altering the machine. It was drawn on Thursday by two horses, and worked by two men; one of them drove the horses, while the other worked the machine. The weather was exceedingly fine, and the soil was in excellent condition for the experiment. A few minutes after one o'clock the horses were attached and the machine started. During the first round it was driven at great speed, but wrought beautifully. The roots were scattered clearly above the ground over a breadth of 2 yards. After two drills had been opened the horses were stopped for a few minutes, and the gentlemen who were on the ground having assembled around the machine, Mr. Hanson, the inventor, who was present, proceeded to explain the mode of operation. He said that he had a shaft which could be attached to it for the purpose of supporting a plate of zinc against which the Potatoes would be thrown, so that they would fall in a regular line, and not be too much scattered. We afterwards heard Mr. Hanson explain that the machine could lift Turnips at a distance of 6, 9, 12, or 18 inches by the attachment of hoes instead of grapes. He also stated in answer to a question put to him, that it could easily be made to throw the Potatoes to both sides, so that it might be made to lift a field without requiring to turn round a number of drills. Not a single root was cut or injured in the slightest degree, and none were left in the ground. The method of lifting Potatoes with the grape cannot at all be compared with it, and it works with about double the speed of the common plough, while it destroys none of the crop. *Scottish Daily News.*

Notices to Correspondents.

BONES AND ASH: *W J F.* You had better use fine bone-dust, unless you take a large quantity to lie together for a considerable time. We will publish a good recipe for you next week.

LIME: *Lime* is best applied in compost, but more especially in vegetable compost. However, you may add the road-dust to the heap without harm.

PIGS: *G J B.* We prefer the Berkshire. There are plenty of breeders of them near Cirencester, Farringdon, &c. You might apply to Mr. Howley, of Cirencester, or Mr. Moore, of Highworth, Berks. In fattening nothing will beat Barley-meal; a bushel a week for a 7 or 8 score pig along with steamed roots.

POULTRY: *J J.* In point of merit there is no difference in the two varieties of "Brahmah Pootra" fowls. They only differ in feather.

THE BEST MANURE: *W. Gerard.* "The best manure" is the farm-yard dung from well fed full-grown cattle, and the best way to apply it is—ploughed in now on a cleaned corn stubble.

WHEAT: *G J.* Fenton White is a good sort for land on which the Wheat is likely to be laid.

WHITE WHEAT, &c.: *Cookham.* We do not know where "Grace's White" is to be obtained.——"Mr. Porter, Southwark," used to make and sell corrugated iron roofing; we do not know whether that address will now help you. Slate and timber is, in our judgment, the cheapest roof in the long run.

THE MISCELLANEOUS WORKS OF W. M. THACKERAY.

This day is published, in crown 8vo, price 6s., Vol. I. of

MISCELLANIES. By W. M. THACKERAY.

VOLUME I. CONTAINS—

THE BALLADS—THE BOOK OF SNOBS—MAJOR GAHAGAN—THE FATAL BOOTS—and COX'S DIARY.

BRADBURY & EVANS, 11, Bouverie Street.

WORKS BY W. M. THACKERAY.

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*: and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—ROSALIE COUPELLE'S CRINUTRIAR is guaranteed to produce Whiskers, Moustachios, &c., in a few weeks, and restore the Hair from whatever cause, strengthen it, prevent its falling off, and effectually check greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness. Sold by all Chemists, price 2*s.*, or sent free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN—"Through using it I have an excellent moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS. They contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders, from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges.

1st,—From the frequency and extent of his purchases; and

2dly,—From those purchases being made exclusively for cash.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are ON SHOW over his SIXTEEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz., from 12*s.* 6*d.* (two light) to 16*l.* 16*s.*

LAMPS OF ALL SORTS AND PATTERNS.—WILLIAM S. BURTON invites attention to his season's SHOW of LAMPS. It embraces the Moderateur (the best Parisian specimens of which have been carefully culled), Argand, Solar, Camphine, Palmer's Magnum, and other lamps for candles; and comprises an assortment which, considered either as to extent, price, or pattern, is perfectly unrivalled.

Pure Colza Oil, 5*s.* 6*d.* per gallon.
Palmer's Candles, 9*d.*, 9½*d.*, and 10*d.* per lb.
Patent Camphine, 3*s.* 10*d.* per gallon.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

IRON HURDLES.

TO BE SOLD, a large quantity of PATENT TWISTED IRON HURDLES, strong, cheap, and elegant in appearance. To be seen at Messrs. BOYDELL & GLASIER'S, Camden Works, Hawley Crescent, near the Canal Bridge, Camden Town, London.

FLORISTS' BUSINESS.

TO BE SOLD, the NURSERY GROUND, GREENHOUSES, &c., of the late Mr. HENRY GROOM, at Clapham Rise, Surrey, and the Goodwill of the well-established Business to be sold by Private Contract. The Premises (exclusive of a strip of ground held rent free, subject to six months' notice) are held at the low yearly rent of 80*l.* for an unexpired term of 36 years from Michaelmas 1855, and comprise 3¼ acres. Front entrance in the Clapham Road, and back entrance in the Bedford Road. The Buildings consist of a handsome Show-house in the front, and Greenhouses, Hothouse, Pits, Sheds, &c. The house adjoining, late in the occupation of Mr. Groom, is not comprised in the Lease, but may be rented.—The Premises may be viewed on application, and further information obtained of Messrs. PROTHEROE & MORRIS, American Nursery, Leytonstone, Essex; and of Messrs. BARNES & BERNARD, Solicitors, No. 2, Great Winchester Street, London.

TO GARDENERS, NURSERYMEN, SEEDSMEN, AND FLORISTS.

TO BE SOLD, in consequence of the ill-health of proprietor, a capital BUSINESS in the above line, with a first-rate connexion, and of 17 years' standing. The Premises, which are convenient and well situated, will be sold together with the Business. One-half of the purchase money may remain on security of the premises.—For particulars apply to Mr. LENDON, Nurseryman, &c., Wellington, Somerset.

TO FLORISTS, GENTLEMEN'S GARDENERS, & OTHERS.

TO BE LET ON LEASE, for 7, 14, or 21 years, three miles west of Hyde Park Corner, a COMPACT NURSERY, with Dwelling-house. In an excellent situation for growing, and well stocked with Shrubs, Plants, &c.; three span-roofed Houses; a Show-house, Pits, and Frames. Good stabling, Cart-sheds, and Potting-sheds.—For particulars apply to Messrs. PROTHEROE & MORRIS, Leytonstone, Essex; or to Mr. AMBROSE, Battersea, Surrey.

TO BE LET, CHEVINGTON WOODSIDE FARM, in the parish of Warkworth, Northumberland; tithe free, and entered to at May-day, 1856, containing about 566 acres, of which 90 acres are in old Grass. The tillage land is of sound good quality, and the old Grass is very valuable fattening pasture. A large portion of the farm has been thorough drained under Government grant. The Farm is within two miles of the Addington Station. Mr. Thos. Brown, of Whitefield House, near Acklington, will show the farm with a plan.—Further particulars may be had by application to GEORGE A. GREY, Esq., Millfield Northumberland, by whom offers will be received till 12th Nov.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

TO BE LET, 100 Acres of LAND suited for the growth of AMERICAN PLANTS and for GENERAL CULTIVATION, in large or small quantities, at 10*s.* per acre, free from all charges. The situation offers great advantages for a market gardener, as it is within two miles of Farnham and the Aldershot military encampment, where vegetables are in great demand.—Apply to TRIMMER & HEWETT, Farnham, Surrey.

Sales by Auction.

PREPARATORY NOTICE.—SALE OF NURSERY STOCK.

MESSRS. HIDE AND PATCHING, of Worthing, beg to announce that Mr. Hide has been instructed to Sell by Auction, in the month of November, the whole of the Nursery Stock growing in Head's well known Nursery Gardens at Worthing, Sussex, consisting of Choice Ornamental Evergreens, Deciduous, and Flowering Shrubs and Plants of every variety. The day of Sale will be shortly announced; Catalogues are in preparation, and when ready may be had of Messrs. HIDE & PATCHING, Worthing.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to Sell by Auction, without reserve, on the premises opposite the Railway Station, Blackheath (the ground being required for building), on MONDAY, the 19th November, and following day, at 11 o'clock each day, the valuable NURSERY STOCK, consisting of Laurels, from 3 to 6 feet; fine Chinese Arbor-vitæ, 3 to 6 feet; handsome Deodars, 3 to 8 feet; large Fan and other Yews, 4 to 10 feet; Aucuba Berberis, variegated and green; Hollies, Laurestines, Sweet Bays, Lilacs, Mountain Ash; Standard and Trained Fruit Trees, Gooseberries and Currants; about 1500 yards of strong Box-edging, about 300 capital Camellias, well set with bloom; Rhododendrons, Azaleas, Standard and Dwarf Roses, Pinus, Cryptomerias, &c., &c.—May be viewed prior to the sale, and Catalogues had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

NURSERY STOCK.—WHALLEY RANGE, MANCHESTER.

MR. CAPES begs to state that he has received instructions from Messrs. H. Bigland & Co., in consequence of the expiration of their lease, and the grounds having to be given up, to Sell by Auction, on WEDNESDAY and THURSDAY, November 7th and 8th, and the following day if required, at 10 o'clock each morning, the entire of the remainder of their STOCK of Evergreens, Fruit and Forest Trees, two Greenhouses, Dutch Pit, and other Effects, at the Britannia Nursery, Whalley Range, near Manchester. Catalogues will be ready a week prior to the sale.—22, Princess Street, Manchester.

MAIDENHEAD.

MR. J. WILLMER will Sell by Auction on the Premises, CHRISTIE'S Nursery, Maidenhead, on MONDAY, November 12, and two following days, at 12 o'clock each day, the whole of the Nursery Stock, comprising Taxodia sempervirens, Cryptomeria japonica, Juniperus Bedfordiana, Piptanthus Nepalensis, Cedrus deodora, Cedar of Lebanon, Pinus excelsa, Araucaria imbricata, Pinus Cembra, Laurels (Portugal), English and Irish Yews, striped and green Hollies, Chinese Arbor-vitæ, Red Cedar, Phillyrea, Standard and Dwarf Roses, Scotch Spruce and Larch, Fir Oaks, Limes, Birch, Acacia, Sycamore, Plane, Laburnum, Poplars, &c.; Seakale and Asparagus Plants; Standard and Dwarf Fruit Trees; Greenhouse Plants; Greenhouses, Pits, Lights, Garden Pots, &c.—May be viewed one week prior to the Sale, and Catalogues had (6*d.* each, returnable to purchasers) on the Premises, and of the Auctioneer, Sunbury, Middlesex.

SALE OF NURSERY STOCK, ORNAMENTAL TREES, EVERGREENS, IRISH YEWS, ETC.

MR. GEO. C. HYNDMAN has received instructions from Mr. WILLIAM CAMPBELL, who has purchased from the Executors of the late Mrs. M'Cullough her interest in Nurseryville, near Comber, in the county of Down, formerly the property of the late Mr. John Harvey, to Sell by Auction, without reserve, on TUESDAY, November 6th, at 11 o'clock, on the premises, a great extent of well-grown HEDGES, comprising Beech, Thorn, Evergreen, Privet, Portugal and Common Laurel, Arbor-vitæ, Box, and Yew; a large collection of IRISH YEWS, from 1 to 10 feet high; a variety of Azaleas, Fuchsias, Junipers, Rhododendrons, &c.; fine specimen plants of Variegated Holly, Arbutus, Rhododendron, Laurustinus, Scarlet Thorn, Double Cherry, Yew, Weeping Ash, Fern-leaved Beech, Magnolia, &c.; several fine Camellias, inured for some years to the open air; Camellias in pots, &c. The sale will be found worthy the attention of gentlemen laying out ornamental grounds, as the whole must be sold off, in order to clear the place for new arrangements, and the reception of fresh stock.—Belfast, Nov. 3.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c.

Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility Gentry, and the Trade, in most of the counties in England.

C. STEPHENSON, late STEPHENSON AND SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

J. OVERALL begs to inform the Nobility, Gentry, Nurserymen, and others requiring Horticultural Buildings, Lights, and Frames, that by intrusting their orders to him, they may depend upon first-class workmanship and good materials at the most economical prices.

J. OVERALL, Horticultural Builder, 16, Shacklewell Lane, near Kingsland, London.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, and FREDERICK MULLETT EVANS, of No. 2[illegible], Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, November 3, 1855.

SIR COLIN CAMPBELL ... ... „ 1 6
LORD KENYON'S FAVOURITE ... „ 1 0
WARD'S IMPROVED SION HOUSE „ 1 0
Sutton & Sons, Seed Growers, Reading.

SECOND IMPORTATION.

FRESH IMPORTED BULBS *bloom much finer than those which have been long exposed to the air before planting.*
John Sutton & Sons, Reading, Berks, can supply fine BULBS, just imported, at low prices. See their Catalogue, which may be had, post free, in return for one penny stamp.

WAITE'S DANIEL O'ROURKE PEAS.—The best Early Pea in cultivation can be supplied in any quantity, and price had on application to J. G. Waite, Seed Merchant, 181, High Holborn, London.

DUTCH FLOWER ROOTS.

PETER LAWSON and SON, Seedsmen and Nurserymen to Her Majesty the Queen, and to the Highland and Agricultural Society of Scotland, respectfully intimate that they are now ready to execute orders for HYACINTH ROOTS, &c., &c., of the finest kinds and in excellent condition. Catalogues may be had, free, on application.
27, Great George Street, Westminster.—Nov. 10.

R. PARKER begs to inform his friends and patrons that his PRICED CATALOGUE of DUTCH BULBS is now ready, and will be forwarded post free upon application.
Paradise Nursery, Hornsey Road, Holloway.

DUTCH FLOWERING BULBS.

JAMES CARTER and CO.'s CATALOGUE OF DUTCH AND CAPE BULBS, the most comprehensive and select published, will be forwarded *free of charge* and *post paid*, upon application to address at foot. *The Bulbs are as usual of first-rate quality.*
James Carter & Co., 238, High Holborn, London.

BASS and BROWN'S new AUTUMN CATALOGUE, comprising a considerable portion of descriptive and useful information for purchasers, will be sent free by post for three penny stamps, or gratis to their customers, who may not have received them.
Seed and Horticultural Establishment, Sudbury, Suffolk.

PLANTING SEASON.

WM. URQUHART and SONS respectfully intimate that their PRICED LIST OF FOREST TREES, SHRUBS, HERBACEOUS PLANTS, &c., may now be had on application.—Dundee, Nov. 10.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.
☞ The Catalogue describes the colours of the Rhododendrons.
The American Nursery, Bagshot, Surrey.—Nov. 10.

AMERICAN PLANTS.

WATERER and GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.
Knap Hill Nursery, Woking, Surrey.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.
American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway, where conveyances may be had.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERA, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.
G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

SCARLET RHODODENDRONS.

J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine bushy Plants of the above 2 to 3 feet high, in Pots, well set with Flower buds.—Price 10*s*. 6*d*. each.

VINES FOR FRUITING IN POTS.

MESSRS. J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to announce that they have a very choice selection of the best sorts of VINES from eyes grown in 12 and 15-inch pots. Price 5*s*. and 7*s*. 6*d*. each.
N.B. Strong Vines for planting out, 3*s*. 6*d*. each.—Nov. 10.

ROSE CATALOGUE.

J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to announce that their New CATALOGUE of ROSES for 1855 and 1856 is now ready, and may be had on application.

PEARS GRAFTED ON THE QUINCE AS PYRAMIDAL SHAPED TREES.

J. and J. FRASER beg to announce that their Priced List of the above is now published, and may be had post free on application.
J. & J. F. have sold a large number of these Trees for the last three years, and have received numerous letters from gentlemen in the country speaking in very high terms of their productiveness. They can therefore recommend them with greater confidence to the notice of their friends and the public in general.
Lea Bridge Road, Essex.

VINES FROM EYES.

JOHN and CHARLES LEE beg to offer a very superior stock of all the leading kinds of VINES, both for planting out and for fruiting in pots.
Nursery and Seed Establishment, Hammersmith.

AZALEA INDICA.

JOHN and CHARLES LEE beg to offer good Plants of the select kinds of AZALEA INDICA, well set with buds, at 30*s*., and 42*s*. per dozen.
Nursery and Seed Establishment, Hammersmith.

AZALEA INDICA LEEANA.

JOHN and CHARLES LEE are now prepared to send out this fine Seedling, which for habit of growth and substance of petal, combined with perfect shape and purity, is decidedly the best white Azalea yet out. It has gained Certificates wherever exhibited. Price 21*s*.; a few extra strong plants at 42*s*.—Nursery and Seed Establishment, Hammersmith.

NEW VARIEGATED GERANIUM—MRS. LENNOX.

JOHN and CHARLES LEE are now sending out this novelty, which is a decided improvement on The Mountain of Light. It is of much more vigorous growth than that variety, the margin of the foliage is of a purer white, and in other respects it possesses the same good qualities. Price 7*s*. 6*d*.
Nursery and Seed Establishment, Hammersmith.

FRUIT TREES IN POTS.

JOHN and CHARLES LEE have the finest stock of the above ever yet offered, consisting of—

PEACHES	APRICOTS	CHERRIES
NECTARINES	PLUMS	APPLES

and PEARS.
All warranted to bear good crops the first season.
Nursery and Seed Establishment, Hammersmith.

GOOD PINES WANTED,
From 2 lbs. to 4 lbs. each.
Forward immediately to George Taylor, Jun., Fruit Salesman, St. John's Market, Liverpool.

CHRYSANTHEMUMS.

WOOD and INGRAM beg to offer fine flowering plants, covered with healthy foliage to the bottom, of good sorts, both Pompone and large flowering varieties, at from 6*s*. to 9*s*. per dozen.—Nurseries, Huntingdon.

ROSES, HOLLYHOCKS, CONIFERS.
(Wholesale and Retail.)

A. PAUL and SON beg to inform their Patrons and the Trade generally, that owing to extended experience and improved systems of culture, their ROSES, HOLLYHOCKS, and CONIFEROUS PLANTS are this season unusually fine.
Nurseries, Cheshunt, Herts (13 miles N.E. of London).

SUPERB DWARF HYBRID PERPETUAL ROSES BUDDED ON SIX-INCH STEMS.

WILLIAM WOOD and SON respectfully solicit attention to their very extensive and splendid stock of the above. The plants are vigorous, and expressly suited for potting or forcing: they are also very eligible for grouping, consisting of all the leading kinds, and will be supplied at 12*s*. to 18*s*. per doz. Catalogues may be had on application.
N.B. A very liberal allowance to the Trade.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

HARDY HEATHS.

WATERER and GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

OSAGE ORANGE (MACLURA AURANTIACA).

MESSRS. MORRISON and SON have to offer about 50,000 Plants (5 to 6 inches high) of this fine new Hedge Plant (see *Gardeners' Chronicle*, May 13, 1854), price 10*s*. per 100. Price to the trade on application. Railways to all parts of the kingdom.—Nurseries, Mountcoffer, Banff, N.B.

THE FLUKE KIDNEY POTATO (TRUE).

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, can now supply the above at 4*s*. per bushel of 56 lbs., or 7*l*. per ton. Post-office orders to be made payable at Middleton, Lancashire.

SEED POTATOES.—Fluke Kidneys, 4*s*. per bushel of 56 lbs.; 7*l*. per ton; Lapstone Kidneys, 5*s*. Early Shortop Ashleaf Kidneys, 6*s*. per bushel of 56 lbs.; sacks, 6*d*. per bushel extra. All orders must be accompanied by a remittance.—Apply to Humphrey Chamberlain, Kempsey, near Worcester.

BERNARD SAUNDERS, NURSERYMAN and FLORIST, Cæsarean Nurseries, Jersey, respectfully informs Amateurs and Florists that he has a good Stock of Yellow and White-ground PICOTEES to offer for sale this season, at 2*s.* 6*d.* per pair, orders for which will be thankfully received and promptly executed. Also a small quantity of well ripened Seed of the PHORMIUM TENAX or NEW ZEALAND FLAX, at 2*s.* 6*d.* per packet of 60 Seeds.

PARKER'S RAGLAN POTATO.—This Seedling Potato has been raised by Mr. BENJAMIN PARKER, of Accrington, Lancashire, Gardener, and is distinguished by the name of the late Lord Raglan, as indicative of its sterling worth. Its shape is somewhat oblong, but its body of almost equal depth on every side. It has a skin of even thickness, not smooth, but like that of a fine Orange; is free from blotches, and can be peeled at one strip or cutting. There need be no waste in dressing this Potato for the table; besides which saving, its regular form and pure substance must soon make it welcome in every family. From an analysis by John Lightfoot, jun., Accrington, it appears to contain one sixth more farina than the old Fluke Potato, or rather above 15 per cent. more of that essential ingredient. Its chief virtue, however, is that of being ripe in July, so that it can thus be gathered before the usual period of the Potato blight. The Potato is quite sound, not an instance of decay having hitherto occurred. Mr. PARKER has devoted six years to the production of this Seedling Potato, which is pronounced by many agriculturists and chemists to surpass in properties of early culture and in excellence of quality any other species of Potato in the kingdom. Mr. PARKER offers the Potato from beds to save winter storage at 14*s.* per stone of 14 lbs., in canvas bags, to any order.

Address, Mr. BENJAMIN PARKER, Gardener, Accrington, Lancashire, with reference or remittance. Sole Agent, EDWARD TAYLOR, Seedsman, Lowerhouse, near Burnley.

We, the undersigned, confidently recommend Mr. PARKER'S Raglan Potato to public notice:—John Mercer, F.R.S., Chemist, Oakenshaw; John E. Lightfoot, Chemist, Accrington; Thomas Lightfoot, ditto; John Lightfoot, jun., ditto; Richard Taylor, Gardener to Le Gendre N. Starkie, Esq.; Huntroyd; Thomas Birtwell, Gardener to John Taylor, Esq., Morton Hall, near Whalley.

WATERER AND GODFREY respectfully invite the attention of parties engaged in Planting to their fine Stock of the following HARDY ORNAMENTAL TREES, &c.

Araucaria imbricata, 2, 3, 4, 5, 6, 7, and 8 feet high, in quantities, all stocky well grown plants; the larger sizes especially it would be difficult to match.

Cedrus Deodara, 1½, 2, 3, 4, and 5 feet, by the thousand; do. a fine lot of larger, 6, 7, and 8 feet; do. some magnificent Trees, 10 to 15 feet. These are all in a famous condition for Transplanting, having been annually removed.

Cedars of Lebanon, 3, 4, 5, and 6 feet; do. a few splendid Trees, 10 and 12 feet.

Cedars Rio Virginian, 5 to 8 feet.

Cedars, variegated white, 2, 3, and 4 feet, one of the handsomest variegated plants we know. We had a large stock. It is extensively planted at Elvaston Castle.

Cryptomeria japonica, fine plants, 4 to 7 feet.

Cupressus macrocarpa or Lambertiana, 3, 4, 5, 6, 7, and 8 feet. Nothing can be handsomer than some of the specimens of this fine hardy plant.

Juniper, Chinese, 2, 3, 4, and 5 feet; a fine lot of large plants, 6 to 8 feet.

Do. Irish, upright, 3, 4, 5, and 6 feet; do. larger, up to 8 and 10 feet. Our stock of the wo last mentioned Junipers we believe to be quite unequalled, the Irish especially; the larger sizes are under perfect columns.

Do. recurva, 3, 4, 5, up to 8 feet.

Do. hispanica or thurifera, 2, 3, and 4 feet.

Abies Douglasi, 2, 3, and 4 feet. A fine lot of large and very handsome plants, 7, 8, 10, and 12 feet.

Picea nobilis, several hundreds of nice plants, 1½ to 2 feet, well grown, and with good lead. None are grafted. A few taller specimens up to 6 feet.

Do. Nordmanniana, a large quantity of remarkably handsome plants, 1½, 2, 3, and 4 feet. Nothing can exceed the vigour of these plants, and all from seed.

Do. Pinsapo, magnificent plants, 4 to 7 feet high, in perfect health.

Pinus insignis, 1½ to 3 feet; a few good specimens up to 7 feet.
" Lambertiana, from seed, 4, 5, and 6 feet.
" Cembra, 3, 4, 5, up to 10 feet.
" Montezumæ, fine plants, 4 and 5 feet.
" macrocarpa, 2 and 3 feet, from seed.

Weeping Larch, clean, stems good, heads 7 feet high.

The following 10 varieties form a very singular group. They are of dwarf habits; the well known Abies Clanbraziliana may be taken as the type of the whole. We believe our collection to be quite unique, and, we may add, most interesting.

Pinus strobus pumila (the dwarf Weymouth).
" sylvestris pumila (the dwarf Scotch).

Abies Clanbraziliana	Abies pumila	All dwarf varieties of the Spruce Fir.
" compacta	" diffusa	
" pygmæa	" Gregori	

Picea pectinata pygmæa (the dwarf Silver Fir), Hudsoni.

Yew, common English, 3, 4, 5, 6, and 7 feet, in large quantities.

Do. upright, Irish, 4, 5, 6, and 7 feet; some splendid plants, 8 to 12 feet.

Do. Dovaston or Weeping, a great many fine plants, worked on straight stems, 7, 8, and 10 feet high, with good heads.

Do. adpressa, 2 and 3 feet.

Do. do., worked on common Yew, as standards.

Do. gold striped, 1½ to 2 feet, by the thousand.

Do. do., a splendid lot of plants, 4 to 6 feet.

Do. do., worked as standards on the common Yew. 8 to 10 ft. high.

Do. do., worked on Irish Yews, 6, 7, and 8 feet high.

Do. elegantissima, or new gold striped; a large quantity, 1½ to 2½ feet, and also worked as standards on the common and Irish Yews. We may safely assert our stock of Golden Yews is unsurpassed.

Do. yellow berried (true), very beautiful when in fruit as we have it, 1½ to 3 feet.

Libocedrus chilensis, 2 to 3 feet, very handsome and bushy.

Thuja Wareana, fine bushes, 3, 4, 5, 6, and 8 feet. This is one of the most useful, and, at the same time, ornamental hardy plants we possess.

Do. American, for hedges, doubtless the very best, 4, 5, and 6 feet.

Do. aurea, or Golden Arbor-vitæ. This plant originated at this Nursery; it has now, as it deserves, become a universal favourite. Our stock of it enables us to offer a choice of many hundred fine specimens, from 1½ to 3 and 4 feet high, and as much through—in fact, perfect globes.

Wellingtonia gigantea, a few of the finest plants in the country, being near 1½ feet high, and as much wide.

Hollies variegated, by the thousand, 2, 3, and 4 feet high. Some splendid Plants, 10 to 15 feet high.

We may here remark with reference to the large specimens alluded to in this Advertisement that every one of them is in a condition to transplant and travel any distance with perfect safety. They have one and all been annually removed in our Nursery, and in soliciting a personal inspection of our stock, we believe we are justified in stating it offers a choice which is to be found in but few establishments of its kind in this country.

The Nursery may be reached in 40 minutes by Train from the Waterloo Station; and the South Western Railway Company having a Branch on to the North Western, enables us to send plants to all parts, in trucks throughout, without packing and other extensive additions.

Knap Hill Nursery, Woking, Surrey.

SPLENDID HYACINTHS, ETC. (IMPORTED).

JAMES CHARTRES AND CO. can strongly recommend their 20*s.* Collections of the above, which have always given such general satisfaction. 12 splendid named Hyacinths for pots or glasses; 12 do. do. for Borders; 6 Polyanthus Narcis.; 12 Pheasant-eyed do.; 6 splendid Early Tulips for pots; 12 do. Late do. for Borders; 100 Crocus, sorts; 12 fine Iris; 6 Snowflakes; 6 Double Jonquils; 25 Double Snowdrops. A general and priced Catalogue on application.—Seed Warehouse, 74, King William Street, City, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present reduced prices of Glass for Cash:—

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST, BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.

Circulars free by post.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. SEELEY (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

NETTING FOR SHEEP-FOLDS, MADE OF COCOA-NUT FIBRE, a material known to possess the most extraordinary durability when exposed to the alternations of weather. It will wear out several sets of tarred hemp netting, and is so light that a herdsman may with ease carry 200 yards of it. 3½ and 7-inch mesh, 6*d.* per yard. Sold in Nets of 50 and 100 yards long, 48 inches high, by the Manufacturer, W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, Islington, London.

POULTRY, RABBIT, AND SHEEP FENCING, HARE OR RABBIT NETS, ON CORDS, for Covert Shooting, 12 mesh over, 4 feet wide, 2*d.* per yard; 18 mesh over, 6 feet wide, 3*d.* per yard; 24 mesh over, 8 feet, 4*d.* per yard; each edge corded, ½*d.* per yard extra. Extra stout do., 18 mesh wide, 4*d.* per yard, suitable for Poultry Fencing. Square mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for Fencing against Fowls, Cats, &c., at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, London.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1*d.* per square foot. CROGGON'S Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to CROGGON & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late STEPHENSON & PEILL), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.

HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4*s.* 9*d.* each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5*s.* 3*d.* each.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

IRON BUILDING AND ROOFING WORKS.
GAS STREET AND BERKELEY STREET, BIRMINGHAM.

JOHN HENDERSON PORTER, ENGINEER and CONTRACTOR, Patentee of a new system of constructing (cheaply and expeditiously, by ordinary labourers) Portable Buildings and Sheds—formed of ordinary planks or boards—peculiarly suitable for Farm purposes. A novel shed has recently been erected in the Agricultural Department of the Crystal Palace at Sydenham. Corrugated and Galvanised Iron Roofs and Roofing Plates, Eaves, Gutters, Rain-water Pipes, Tanks, Fences, &c.—London Office, 1, Riches Court, Lime Street.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

NEW ROSES.

WILLIAM WOOD AND SON have again much pleasure in recommending their beautiful Seedling Rose, the Perpetual DUCHESS OF NORFOLK; the colour is a very rich vivid crimson, the underside of the petals shaded with lively pink, giving the flowers an exquisite shell-like appearance.

Price for Standards, or Dwarfs, 3*s.* 6*d.* each.

Williams' Evergreen Climbing Rose, 1*s.* 6*d.* each—This Rose is a seedling from the Ayrshire Splendens fertilised with the Yellow Tea Rose; its flowers are creamy white, deliciously sweet-scented.

N.B. The New Rose Catalogue and Supplement may be had on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

TRAINED FRUIT TREES.

WILLIAM WOOD AND SON have much pleasure in recommending their very extensive and superior stock of Dwarf two-years-trained PEACHES, NECTARINES, and APRICOTS, which they feel assured cannot be excelled. The trees are remarkably healthy, and furnished with well ripened shoots; they will be supplied at 60*s.* per dozen.

Pyramidal Pears on Quince stocks, per doz.	...	24*s.* 0*d.*
Pyramidal Plums, extra fine do.	...	20 0
Pyramidal Apples, do. do.	...	16 0

Catalogues forwarded on application. Extra plants presented with each order, to compensate for distant carriage.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

MYATT'S ADMIRAL DUNDAS STRAWBERRY.—Strong plants packed and delivered free in London, 25*s.* per 100. Also MYATT'S British Queen, Cinquefolia, Globe, Eliza, Mammoth, 3*s.* 6*d.* per 100; Keens' Seedling, Hooper's Seedling, Black Prince, Bicton Pine, 3*s.* 6*d.* per 100.

MYATT'S BRITISH QUEEN.—In reply to several correspondents, and in confirmation of the private answers I gave last summer, I beg leave to state that the only Strawberry bearing the name of "British Queen" is MYATT'S, and when Mr. Beach, in his advertisement says "his true British Queen," he is obviously in error, and arrogates to himself the credit due to my late father, Mr. JOSEPH MYATT, who was the originator of the variety in question.—W. MYATT, Manor Farm, Deptford.—Nov. 10.

GRAPE VINES FROM EYES.

R. GLENDINNING respectfully begs to offer an extensive collection of all the principal kinds of GRAPE VINES in pots extra strong, either for forcing in the pots or planting out.

PEACHES and NECTARINES, established in pots two and three years, full of blossom buds, and will doubtless produce fine crops the next season; also strong FIGS in pots.

A large and extensive assortment of trained Peaches, Nectarines, Apricots, Plums, Cherries, Pears, and Apples, in fine health.

R. G. would particularly direct attention to his very large collection of Pears for Pyramidal Training. They are from 5 to 7 feet high, and grown especially for the purpose, with abundance of short shoots. The Horticultural Society's nomenclature has been adopted with all the Fruit Trees; they may, therefore, be relied upon as correct.—Catalogues of the above and all other Nursery Stock may be had on application.

Chiswick Nursery, London.

MESSRS. E. G. HENDERSON AND SON beg to announce that they have now received their noted collection of HYACINTHS in excellent condition, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with, Catalogues of which, together with their Plant and Seed Lists, will be forwarded post free on application.

CUCUMBER HENDERSON'S NAPOLEON III., in packets, 3*s.* and 5*s.* 6*d* each.

CALCEOLARIA, CINERARIA, and PRIMULA SEED of first quality, 2*s.* 6*d.* and 5*s.* per packet.

FUCHSIAS.—Banks' Favourite, 10*s.* 6*d.*; Prince of Wales, 10*s.* 6*d.*

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (PAMPAS GRASS).—E. G. H. & SON having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2*s.* 6*d.* each, 25*s.* per dozen, or 7*l.* 10*s.* per 100.

Wellington Nursery, St. John's Wood.

TO PLANTERS.

J. SCOTT, Merriott, Crewkerne, Somerset, offers the following:—Deodara Cedars, from 3 to 8 feet, by 6 to 16 round, at 3*s.* 6*d.* to 30*s.* each; Cedar of Lebanon, same size and price; African Cedar, 2 to 3 feet, 3*s.* 6*d.* each; Red Cedar, 3 to 6 feet, 18*s.* to 30*s.* per dozen; Cedar of Goa, 18 inches, 1*s.* 6*d.* each; White Cedar, 5 feet, 3*s.* 6*d.* each; Cryptomeria japonica, 4 to 10 feet, very fine, 2*s.* 6*d.* to 15*s.* each; Taxodium sempervirens, 4 to 10 feet, 2*s.* 6*d.* to 10*s.* 6*d.* each; Cupressus macrocarpa, 2½ to 5 feet, 2*s.* 6*d.* to 5*s.* each; C. Govineana, 2 to 3 feet, 3*s.* 6*d.* each; C. funebris, 1 to 3 feet, 1*s.* 6*d.* to 3*s.* 6*d.* each; Thuja pendula, 3 feet, 5*s.* to 7*s.* 6*d.* each; T. aurea, 1 foot high, 3 feet round, 3*s.* 6*d.* each; Juniperus chinensis, 4 feet, fine, 5*s.* each; J. squamata, 5 feet, 5*s.* each; J. excelsa, 3 feet, 7*s.* 6*d.* each; J. tetragona, 18 inches, 2*s.* 6*d.* each; Irish Yews, 4 to 7 feet, fine, 3*s.* 6*d.* to 10*s.* 6*d.* each; Taxus adpressa, 2 to 3 feet, 5*s.* to 7*s.* 6*d.* each; Siberian Arbor-vitæ, 3 to 6 feet, 1*s.* 6*d.* to 3*s.* 6*d.* each; Pinus excelsa, 2 to 7 feet, 1*s.* 6*d.* to 7*s.* 6*d.* each; P. insignis, 2 to 5 feet; 2*s.* 6*d.* to 7*s.* 6*d.* each; Standard Portugal Laurels, 4 to 6 feet stems, 3*s.* 6*d.* to 7*s.* 6*d.* each. Apricots, Peaches, and Nectarines, drop trained, 42*s.* per dozen; Pears and Plums, do., 24*s.* per dozen; Pears, Plums, and Cherries, dwarf Pyramids, 18*s.* per dozen. These Fruit Trees are all healthy and young, including every Fruit worth growing. 150 sorts, large and Pompone Chrysanthemums, in 6-inch pots, at 6*s.* per dozen.—Nov. 10.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Conifers will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

AGRICULTURAL SEEDS, ETC.

PETER LAWSON AND SON, SEEDSMEN AND NURSERYMEN TO HER MAJESTY THE QUEEN, and to the HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, are supplying the following seeds of the best quality:—

Italian Rye-Grass, Foreign seed	Dwarf Essex Rape
Crimson Clover (Trifolium incarnatum)	Winter Tares
Alsike Clover (Trifolium hybridum)	Natural Grass Seeds, for Pastures and Lawns, &c. &c. &c.

27, Great George Street, Westminster.

THE TRUE LANCASHIRE SHOW GOOSEBERRIES.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, can now supply 24 strong plants for 12*s.*, or 12 plants for 7*s.*, of the below-named GOOSEBERRIES, which are of fine flavour. Weights taken from the Gooseberry Grower's Register of 1855, viz.:

	dwts.	grs.		dwts.	grs.

Post Office Orders to be made payable at Middleton, Lancashire. Catalogues on application.

NEW HARDY PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer the following New HARDY PLANTS:

RHODODENDRON MADAME WAGNER (hardy) ... 15*s.* 0*d.*
" PRINCE CAMILLE DE ROHAN (hardy) ... 7 6
WEIGELIA MIDDENDORFI.—N.B. This splendid Weigelia has been sold already *twice* under wrong names. The one I offer here is *warranted the true species.* Good Plants each 12 0

A. VERSCHAFFELT begs to inform Amateurs and the Trade that he has just published a new PLANT LIST, containing the English and Continental Novelties.

His Catalogue may be obtained on application of his Agent, Mr. R. SILBERRAD, 5, Harp Lane, Great Tower Street, London.

A NEW SEEDLING APPLE FROM THE RIBSTON PIPPIN.

STEPHEN SHILLING begs to offer to gentlemen and the trade Trees of his entirely new Apple named OMER PACHA, it being a first-rate hardy grower, strong compact habit, early and productive bearer. Fruit excellent flavour (dessert), ripe in November, keeps until May. Respectable testimonials given from those who have tasted the fruit. Strong plants supplied at 5*s.* 6*d.* each, or 60*s.* per dozen. The usual discount to the trade where one dozen or more are taken. Early application is requested as the stock is limited; all orders carefully and promptly attended to. Fruit of the above can be seen at the office of the *Gardeners' Chronicle*, the British Pomological Society's Rooms, 20, Bedford Street, Covent Garden, Messrs. Nutting & Son, 46, Cheapside, Messrs. Sutton & Sons, Reading, Mr. C. Turner, Royal Nursery, Slough, and at the North Warnborough Nursery, near Odiham, Hants.

NEW CHRYSANTHEMUMS.

JOHN SALTER begs to inform his friends that his unrivalled Collection of Chrysanthemums is now in bloom, including many seedlings, among which is ALFRED SALTER, the finest light flower in cultivation. A visit to the winter garden will amply repay those amateurs who may honour him with their patronage.—Versailles Nursery, William Street, near Hammersmith Turnpike.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 10, 1855.

THE degree of durability of the VITAL PRINCIPLE in seeds, revived by our correspondent "C," has again, as on former occasions, produced many remarks and inquiries from others. Let us, then, endeavour once more to put this very curious question in a clear light, with the aid of such additional illustration as the last few years have afforded.

That the tales told by credulous writers of seeds that have laid for centuries in such places as mummy-cases, should have met with disbelief on the part of the more sagacious part of the public, is no more than might have been expected from the unsatisfactory nature of the evidence upon which such statements usually rest. That they are in some cases indeed untrue is certain, and in others probable. But it is in the highest degree unphilosophical to refuse to examine what are called facts, merely because some can be shown to be false, or because some principle which they involve is incomprehensible to our limited understanding.

Three classes of statements have been adduced in support of the opinion that the vitality of seeds is inexhaustible; some absolutely false, some doubtful, others susceptible of what we regard as rigorous proof. Among those which we take to be absolutely false are some of the statements of Arabs and Egyptians, that seeds or bulbs, which have grown, were taken from the cases of mummies. No doubt the bulb mentioned by our correspondent "C" is one of them; another is the Pea called Grimstone's, which was proved in the garden of the Horticultural Society to be identical with the common "Branching Marrow Pea," (see p. 115, 1849); and to this may certainly be added all the stories told of Onions and Garlic still living at the expiration of hundreds of years. The principle of vitality so remarkable in seeds does not exist in bulbs in a durable form. To the doubtful class we must refer all mummy Wheat, the history of which was formerly given in our columns (p. 757, 1846): for although we do not regard the reasons for disbelieving its authenticity quite sound, nevertheless we may allow that some suspicion attaches to it.

After eliminating these cases there still remains a large body of evidence which cannot be contested, from which no other inference can be drawn than that, under peculiar circumstances, the animation of a seed may be suspended for an indefinite period, and then be revived if it is presented to the conditions upon which vegetable growth depends. In works upon Vegetable physiology many such instances are mentioned upon authority which no one disputes (See Lindl. Intr. Bot. II. 259, 4th ed.). Instead of repeating them we prefer on this occasion to rest our case upon evidence of a somewhat less hacknied kind. M. PÉPIN has lately proved experimentally that Coniferous seeds retain their vitality unimpaired for many years. He found that Pinus Pinea grew when 16 years old, Pinasters at the same age, and Scotch Firs when 13 years old. Now if it is conceded that the vitality of a seed may be suspended for 13 or 16 years, it is perfectly conceivable that it may also be suspended for 130 or 1300, or any other number of years. Nor is it allowable in an inquiry of this sort to insist upon the *quomodo* of suspended vitality being explained. Were we to disbelieve everything that cannot be explained our belief would be very circumscribed. The sudden appearance of Charlock all over railway cuttings and elsewhere, a perfectly well authenticated fact, is merely an example of the same nature as M. PÉPIN's Coniferous seeds; and Oaks and other plants which suddenly appear when the Pine forests of North America are cleared would seem to belong to the same class. But the most remarkable examples of which we have any knowledge are those of the Melrose sand pit, and of the Dorchester tumulus. It is recorded in the Annals of Natural History, vol. xiii. p. 89, that seeds taken from the bottom of a sandpit, from 50 to 60 feet above the level of the Tweed, and 25 feet below the surface, grew and produced Polygonum Convolvulus, Sorrel, and an Atriplex—we believe patula. How many years were required to bury these seeds 25 feet deep in sand at so high a level we leave our geological friends to determine. Mr. KEMP, who drew attention to this curious fact, dates the deposit long before the time of the Romans in Britain.

The Dorchester tumulus case is of much the same character. A Mr. MACLEAN having opened a barrow near Maiden Castle found a coffin containing the remains of a human body, coins of HADRIAN, &c.; and among them a quantity of dry turfy matter, which, from its position he regarded as the remains of the intestines. A portion of this turfy matter the writer of the present notice received from Mr. MACLEAN for the purpose of examination. He found in it a considerable number of Raspberry seeds, many dead, all much decayed superficially, but some with an appearance of life. Some of the latter were sown with every possible precaution against error. The season was mid-winter, the place a hothouse, and the gardener was perfectly ignorant of the history of the seeds entrusted to him. One or two grew and produced a common wild Raspberry plant, which is still alive in the Garden of the Horticultural Society. It is understood that Mr. PAGE, the nurseryman of Southampton, also saw the turfy matter alluded to, and recognised Raspberry seeds in it. We entertain the most entire conviction that this example is open to no reasonable doubt. It had, however, been objected to, upon grounds which we thought very insufficient, so long ago as the year 1836, and this led to some correspondence with Mr. MACLEAN, then alive, a copy of which we now, for the first time, publish without curtailment. We do this in the hope that it may finally set at rest a vexed question, for if, in one instance only, it can be demonstrated that a seed has retained its vitality 1000 years, all the other instances of similar longevity, concerning which rigorous proof is deficient, may, nevertheless, be judged of better by the mere aid of circumstantial evidence.

COPIES OF THE CORRESPONDENCE RESPECTING THE DORCHESTER RASPBERRY CASE.

"London, Aug. 9, 1836.

"Sir,—After some little trouble I have procured the address of the clergyman who I mentioned to be referred to, viz., Rev. C. Bristed, Winterborne, Monckton, Dorchester, Dorset. The farmer's name is Phelps, whose servant furnished me with one portion of the under-jaw with teeth found previously by him in the same barrow, and who will assist (if still there) Mr. Bristed in naming the two labourers, who I employed in discovering the other matters. You will cause Mr. Bristed to be particular in his inquiries of the man who gave me the Roman coin, and to whom I gave a portion of the stomach which he had taken home as a great curiosity, but on my discovering afterwards what it contained I returned on purpose to obtain it from him, fearing it should be laid aside or lost. I found this was the case; it could not be found, which on mentioning the circumstance the individual will call to his recollection. As to the seed *no* person could conjecture anything about it without an examination *and a curiosity*

which not one in a thousand would contemplate if they was and knew *what contained it.* R. MACLEAN."

"Dorchester, Feb. 23d, 1837.

"Sir,—That an apology is due to you from me, who have suffered your note of August 8th last to remain until the present time unanswered, is beyond question; but perhaps that apology may be found in my desire that the explanation you wish regarding the very interesting and extraordinary circumstances connected with the Raspberry seeds you have received from me should be given as fully as possible, and that explanation I therefore deferred until my annual visit to this part should have enabled me to make such enquiries and adduce such corroborative testimony as must place the matter beyond question. I am not surprised that doubts should have been entertained in regard to so extraordinary a circumstance as the vegetation of seeds after having been inhumed some 20 centuries or more, and hence I was naturally more desirous to produce satisfactory support of the statement.

"The account given by the two gentlemen who visited Monkton in June, 1833, is, I dare say, quite correct as far as regards their own labours. Indeed, the researches I made corroborate that account, having found in that part of the barrow previously opened the disturbed skeletons, and the fragments of the urn. But the interesting discovery I made was not at all connected with the part of the barrow opened by them. The portion excavated by them may be understood as the division marked (*a*) in the diagram. The labourers under my direction made a further excavation (*b*), and in this portion, that had not been before disturbed, we found a male skeleton, which afforded the interesting phenomena in question. Close to the pelvis were plainly observed the fæces that must have been contained in the colon, or large bowel, at the time of death, this indicating by the bowels being unexhausted that that death must have been one of violence, particularly from the circumstance of finding a large tusk of the wild boar near the sternum, showing it was worn as an ornament. These fæces were a hard compact mass, retaining perfectly the exact form and curvature of the bowels. Of these I carried away considerable portion, with the tusk of the wild boar, and other trifling remains discovered, and on closer examination in the evening I ascertained the fæces to be full of small seeds firmly imbedded in a hardened mass of digested matters. This agglutinated mass was brittle and mouldy, and the seeds might be extricated by friction and repeated washings. The seeds with which you were furnished were some of those so extricated. You also had a fragment of the fæces as discovered. Mr. Sydenham, of the *Dorset County Chronicle*, had a portion of the fæces from me the following day. He has extracted a few of the seeds, and has preserved the remainder in the form in which it was discovered. One of the labourers (Gould) also took a portion, and bears testimony as to the contents. That you should have been informed that no seeds were found is natural, inasmuch as at the time of the excavation the only appearance of the fæces was that of a hard agglutinated mass resembling a piece of mouldy decayed rope, it being the subsequent investigation only that brought the seeds to light. Out of a great number to whom I gave portions of the seeds none succeeded in producing plants with the exception of yourself and Mr. Page, of Southampton.

"I annex a certificate of the circumstance, signed by the labourers (in presence of two respectable gentlemen who have also signed their names), whom I have been so fortunate as to find still in the neighbourhood, and preserving a perfect recollection of the circumstances.

"I trust that this detail will suffice to remove all doubts as to this very interesting and singular fact.

"R. MACLEAN."

"We, the undersigned George Gould and James Bishop, labourers of the parish of Winterborne Monkton, near Dorchester, do hereby certify that in October, in the year 1834, we opened a barrow in the above parish, under the superintendence and direction of Mr. Maclean. That the barrow had been partially opened before (say about ¼). That in the parts so previously opened many human bones were found scattered about, with some remains of an urn and burnt ashes. That on our clearing this away we made a further excavation in a part of the barrow (immediately adjoining) not before touched; we found with other remains a human skeleton, by the side of the lower part of which the contents of the bowels were lying in a firm and compact serpentine form, resembling a piece of mouldy decayed rope. That the greater portion of these contents was taken by Mr. Maclean, and that I, George Gould, took also away a small portion, and afterwards found that it contained a great number of small seeds. In witness of the truth of this statement, we have hereunto set our hands, this 22d day of February, 1837.

"Witness to the signing: "GEORGE GOULD,
"John Sydenham, jun., The mark + of
"James Savage." "JAMES BISHOP."

"Fordington Vicarage, Aug. 21st, 1851.

"Dear Sir,—Mr. Maclean has been dead, I think, two or three years. I knew him, and should consider that he was accurate both in observation and in statement. He related the history of the Raspberry seeds to me within a twelvemonth of the time when the seeds began to germinate. "The Raspberry plants," he said, "are now several months old." There is no doubt that he opened a barrow near Maiden Castle and that he found in the usual position the skeleton of the man who was buried there. Nor is there any reasonable grounds to doubt that he found as he stated the lump which proved to be a mass of Raspberry seeds. He said nothing to me of his supposition that they were fossil seeds; nor of the depth at which they were found.

"HENRY MOULE."

WILL any cunning workman in metals, or carver in wood, or tracer of architectural, domestic, or personal decorations, cast his eye upon this faithful

portrait of a flower, and consider whether it does not suggest FORMS and PATTERNS now unthought of.

It is only a Fuchsia, but one of rare beauty and unusual proportions. For the opportunity of representing it we are indebted to Mrs. GERARD LEIGH, of Walton Rectory, near Liverpool, from whence we have received a wax model very skilfully executed after the original by Miss NEWTON. In its natural position it hung downwards, like any other Fuchsia, but we have reversed it, the better to show its form and proportions.

The calyx was a cup with 12 equi-distant furrows, and as many fleshy rays, each the exact counterpart of all the rest; the petals formed a ring of eight short leaves enfolding each other; and the stamens stood erect within them, in a ring of 20 stout threads clustering round a graceful curved central column (style), set with eight purple jewels at its very end (the stigma). All this apparatus stood upon a roundish base (ovary) extending downwards into a slender stalk (peduncle).

The calyx was white, the petals deep rose, the threads of the stamens white, their anther-heads crimson, the column white, the end deep purple, while the base or ovary and its stalk were green.

The order of the colours was therefore, beginning from below, GREEN, *white*, DARK ROSE, *white*, PURPLE, *white*, DEEP PURPLE. In every case the darker colours were separated and brought out by an intermediate space of white. Had the colours been otherwise contrasted the beauty of arrangement would have been impaired; as for instance, if the colours had been white, white, rose, rose, white, purple, white. But nature would not have produced such a succession of colours. And this may serve to show that those who wish to know how colours are to be contrasted should attentively observe their succession in nature, which always produces beautiful arrangements, although not of what to us seems equal beauty.

But this is not all which the flower before us should teach. It is needless to say that for the purposes of flat decoration what is termed conventional drawing is indispensable; that is to say, instead of representing natural objects as they really are ideas only are taken from them, perspective is abandoned, and the artist is confined to the arrangement of lines in beautiful patterns. Now it is impossible not to recognise in those designs which are pronounced the most beautiful by persons of refined taste, a very close approach to the forms of natural objects, and most especially to the numerical proportions which parts bear to each other. These numerical proportions are in fact invariable in plants, and it is this indeed which renders conventional representations, in which proportion is truly observed, so universally agreeable. The eye is accustomed to them wherever it turns in nature, and recognises, although no doubt unconsciously, the beautiful forms to which it is accustomed, even when they are reduced to a mere tracing upon a wall or a lady's dress. On the other hand it is offended when the rules which determine natural forms are neglected. That this is beginning to be very generally felt is, we think, indicated by the admiration with which the race of Ferns is now so largely received.

In flowers the rule is that all the parts shall be symmetrical; that is to say there is, as a rule, some fundamental number into which all the parts may be resolved, or in case of this law being departed from, then the symmetry is restored by a variety of simple, yet most beautiful contrivances, into the nature of which this is not the time to enter. The Fuchsia, in its unchanged state, belongs to the first or regular class of structures, its fundamental number being four. Thus its ovary contains four cells, its calyx has four divisions, its petals are four, its stamens eight, its stigma four-lobed. Its numerical proportions will therefore be $4+4+4+(4\times2)+4$. Upon examining our beautiful monster it will be found that the fundamental number four is still maintained, viz. $(4\times3)+(4\times2)+(4\times5)+(4\times2)$, notwithstanding all the disturbance which its structure has undergone.

Those who believe that truth is the foundation of all beauty, in the material as well as the moral world, will find that the example now before them is only one among myriads of facts to which they may refer in defence of the faith that is in them.

IT may be as well to observe that all the fruit exhibited at the meeting of the HORTICULTURAL SOCIETY, in Regent Street, on the 20th instant, must be fit for immediate use. Unripe fruit will be regarded as not being present.

New Plants.

147. OUVIRANDRA FENESTRALIS, *Poiret.*

THIS is one of the most curious plants that have been lately introduced. In the swamps of Madagascar there grows, beneath water seldom if ever below 70° Fahr. and most frequently 74° or 76°, a herb with delicate dull green leaves pierced with holes like coarse lace, and continually throwing out bubbles of air. The holes are arranged in long lines and are separated by cross bars, which divide off the whole leaf into a series of parallelograms. In fact the leaf is all veins, without the green web which in other cases connects them. The root is said to be eatable; the flowers to be pink and sweet scented, in forked spikes like those of *Aponogeton distachyon*, to which it is nearly related.

We recommend this to the attention of microscopists, who will find its structure worthy of a very attentive examination. It is understood that the entire stock of it has been transferred by the Rev. W. Ellis, of Hoddesdon, to whom Europe owes the possession of so great a curiosity, to Messrs. Veitch & Son, of the Exotic Nursery, King's Road, Chelsea. The former gentleman informs us that he found it succeed best in loam and vegetable mould, and sunk 5 or 6 inches under water, so as to allow the leaves, which are sometimes as much as a foot long, plenty of room to float. We should add that the water should not be lower than 75°; that it should be in part changed daily, which Mr. Gordon effects in the Horticultural Garden by pouring enough warm water into the tank to cause it to overflow; and we would further recommend the surface of the earth in which it grows to be paved with fragments of *white marble*, so as to enable the wonderful network of the leaves to be distinctly seen.

We cannot conceive a more beautiful ornament of a drawing-room in summer time than a large glass tank with the Ouvirandra floating in it.

Since the above was in type we have been favoured by Mr. Ellis with the following interesting statement:—

The natives of Madagascar describe the plant as growing on the margin of running streams. The root or rhizome is about the size of a man's thumb in thickness, and six or nine inches long after branching in different directions, like the roots of the Ginger or Turmeric; but in one continuous growth, not a succession of distinct formations attached at the termination of one and commencement of another. The root is composed of a white fleshy substance, apparently without large or tough fibres, and is brittle like a Radish. It is covered with a somewhat thick light brown skin, which does not exhibit fringed or fibrous edges when broken. The

plant is attached to the sides of the streams in which it grows by immense numbers of very long fine fibres, which penetrate and adhere firmly to the loam or clay of the banks. Entangled among these fibres were large quantities of decayed leaves and other vegetable substances, from which the plant probably derived a large portion of its nutriment. Mr. Ellis was told that it also grew in places which were dry at certain seasons of the year, that the leaves then died down, but the root buried in the mud retained its vitality, and when the water returned, fresh leaves burst forth. The natives spoke of the plant as tenacious of life, and said that wherever the earth around, even the smallest portion of it, remained moist, the plant would in that part put forth leaves when again supplied with sufficient water.

This plant is not only extremely curious, but valuable to the natives, who, at certain seasons of the year, gather it as an article of food, the fleshy root when cooked yielding a farinaceous and nutritive substance resembling the Yam. Hence its native name, *Ouviandrano*, literally water-Yam, or Yam of the water. *Ouvi* in the Malagasy and Polynesian languages signifying Yam, and *rano* in the former signifying water.

We are also enabled by Mr. Ellis to give the following extract from that gentleman's Madagascar Journal:—"But the great charm of this plant to an admirer of nature consists in the extreme delicacy of the texture of its almost transparent leaves, and their graceful manner of floating upon the water. When examined they appear to be composed of fine and even threads placed at equal distances, so as to resemble the most exact and delicate needlework. Many of the leaves exceed a foot in length; but as in growing they rise to the surface of the water, they may be seen of all sizes, down from this to the most minute, as when first emerging from the earth they appear of fairy-like dimensions, and thin as the finest gossamer. Although so transparent as to have obtained the name of Lace-plant, these leaves are surprisingly crisp and firm to the touch. When seen in the water they lie lightly one above another without confusion, and they are easily distinguishable as separate leaves, in consequence of the great variety of colour which they assume, from the dark olive of the older leaves through all the intermediate shades of a rich grass-green, and even of a pale and delicate yellow."

CUCUMBER DISEASE.

In the early part of the present year some remarks were offered by the Rev. M. J. Berkeley and other correspondents on this troublesome disease, and having had to contend against it myself from the day I entered my present situation to the present time, perhaps my experience on the subject may not be without interest to those who have been or may be similarly troubled. I may remark that the disease has been very prevalent in this county for some years past, both with Cucumbers and Melons. One of my neighbours, a first class cultivator, lost, in dung pits and frames, six crops of Melons in succession, and another showed me fruit nearly half grown, two-thirds of which were black, and looked just as if it had been parboiled. These also were grown on dung beds; in fact, as far as I have observed, the disease appears much more troublesome to cope with in dung beds than where the plants are grown in pots, or have their roots confined within a certain prescribed limit. I have not to complain of the loss of any fruit worth notice, which I attribute to not allowing the plants to overbear themselves at any time; but my plants have, first by flagging, then by specking, and lastly by dying round the margin of the leaves, without any direct or, to an ordinary observer, appreciable cause, worn at times an aspect, and given much more trouble than was by any means agreeable.

Mr. Berkeley, I perceive, inclines to the belief that the disease is constitutional, and hence has recommended particular caution to be observed in saving seed from healthy plants. The convictions of a gentleman who has devoted so much attention to vegetable diseases demand great respect, but my experience leads me to an opposite conclusion. I may remark that I have grown this season 25 varieties of Cucumbers, some from seed 12 years old, and others from seed from China, France, Germany, and several parts of England, Scotland, and Wales, and yet in every instance the plants have been more or less diseased. Some kinds of Melons I could not induce to grow at all, such as the Egyptian Green Flesh, Bromham Hall, Windsor Prize, Jones's Green Flesh, and several others of that class; but from the Trentham Hybrid, Hybrid Cashmere, Hoosainee, and Ispahan, I have cut fine handsome fruit, some weighing as much as 10 lbs. each, yet in all cases the plants were diseased. I have inquired of friends who gave me the seeds, but not one of them knew what the disease was—a strong fact I think against its being "constitutional."

For my own part, I feel more disposed to attribute it to improper soil, and perhaps in some instances it is increased in its virulence by the injudicious use of over-stimulating liquid manures. In this locality a really good loam for horticultural purposes is difficult to meet with, most of the soil being strongly impregnated with oxide of iron, and others with magnesian limestone; in fact, it is just the soil in which, for years past, I have found all soft-wooded plants the most subject to that troublesome gangrenous disease called "spot," and which has been like a pest among Calceolarias and Geraniums to the London nurserymen. Whether by the influence of the iron on magnesia any chemical change inimical to vegetable growth takes place I cannot say; but this I know, if manure-water rich in stable urine and soot is used, the disease is much increased, while lime-water, on the contrary, as effectually checks its virulence. Indeed lime-water has been my sheet-anchor, and, though those I have recommended it to have not succeeded so well as myself, still I think their want of success is more attributable to the difficulty of applying it in sufficient quantity to dung-beds or plants growing in open soil than to plants in pots. But to more practical details—

At the time I took the charge of this place two houses of Cucumbers for the winter supply were in a very bad state, indeed, so bad, that with the exception of two plants in one of the houses, I found it quite impossible to recover them. On making inquiries I found the disease had been troublesome for several years, and that the soil in which the plants were then planted had been used for Cucumbers several times before, merely having a little fresh compost added with each fresh lot of plants. I also found that the leaf-mould which it contained bore evidence of being formed partly from evergreen leaves and branches, as Laurel, Holly, &c.; and with the exception of mould from slowly decomposed Grass, I believe there is nothing more injurious to soft-wooded plants than leaf-mould from evergreen trees. Finding it, however, quite hopeless to expect anything from the old plants, I had one house cleared out, and the soil not being such bad looking stuff, I had it removed to an adjoining house for French Beans. About two-thirds of the bed were covered, the other portion having been previously filled with a different soil. The Beans were planted, being all from the same sowing, but I could not get those in the Cucumber soil into healthy growth. I had the mould removed from about the roots and replaced with fresh soil; then the plants progressed a little, but as soon as the roots got to the old soil they then came to a stand-still, and at last I was obliged to remove them altogether, and renew the bed with fresh soil. The plants in the other part of the bed grew as well as could be desired, and from that part of the bed renewed with fresh soil a magnificent crop was produced. Again, in re-arranging the Cucumber house for a fresh crop, a little of the best soil was mixed with dung and put in the bottom of the bed. Some plants were then turned out in prepared compost in bottomless pots (Seakale pots reversed); they progressed splendidly till they got into crop, and then the roots having penetrated into the old soil they gradually began to fail. Between the pots the bed was filled up with fresh loam for Melons; they also made very satisfactory progress, but as the roots got into the old soil they likewise showed a disease. Thirdly, in the second Cucumber house some of the bottomless pots, filled with prepared compost, were plunged in the old bed. The plants here grew with unusual vigour, but again the old soil was inimical to success, and as the roots got into it the plants decreased in health.

Thus I think, considering the fact that Cucumbers in the same soil had failed more than once before; that French Beans refused positively to grow at all in it; that where the soil was used as a mixture the plants became diseased; that where the roots of plants in pots, previously in rude health, got into it, they showed the disease immediately; and, finally, that seed from the same packets in other places produced plants as healthy as need be, I am justified in concluding that in my case the disease was attributable to the soil and to that only.

Some of the old plants which I found have, when taken up, showed the nasty excrescences on the roots as described by Mr. Berkeley from Mr. Bailey's (of Nuneham) specimens; but I have noticed nothing of the sort in the summer grown plants, neither have the leaves of my plants presented much of the want of chlorophyll, at least not until they had flagged several times and the leaves were beginning to turn yellow. At first I thought that the soil was deficient in nutriment, and hence I resorted to stimulating manures, especially soot-water or liquid manure, in which soot was the principal ingredient; but with badly diseased plants that certainly increased it. With fresh soil and half-decayed manure mixed with soot, I also found the plants much diseased. For the prevention of the disease I believe nothing is found so effective as pure well annealed turfy soil, intermixed with good leaf-mould and thoroughly decomposed old cow-dung, or the dung of a spent Mushroom bed; avoid soot and charcoal by all means, and prepare your manure-water from fresh cow-dung, to which a very small portion of common salt (1 ounce to 30 gallons) may be advantageously added, and clear the whole with a lump of lime before using it. I also fancy, though I have had no means of trying it, that superphosphate of lime would be beneficial; I have always found superphosphate one of the most useful concentrated manures—for Pines it is not to be equalled. As a further preventive, if I were growing Cucumbers in dung beds or pits I should put my plants in pots or boxes, and then I think, with a judicious use of lime water, and by growing the plants as hardy as possible something like ordinary success might be insured.

In conclusion, after growing as before stated 25 varieties of Cucumbers this season, including all the newest kinds, such as Ipswich Standard, Star of the West, General Canrobert, Sir Colin Campbell, Ne Plus Ultra, and many more, I am confirmed in an opinion expressed many years ago that these great Cucumbers are comparatively worthless, and that several of the short kinds—the true Syon House for instance—will produce in a given time a much greater length of serviceable fruit than any of the long kinds. Besides, they are fit to eat, and I cannot say that much for some of the long varieties. Ipswich Standard, though fine in form, is coarse in flavour; Star of the West, thick, soft, and watery; General Canrobert, ribby and uneatable: and Sir Colin, not much better. The best long kind which I have grown for length, quality, and crop, is "Floud's Long Hybrid," raised by Mr. Floud, gr. to R. Fothergill, Esq., Aberdare, South Wales. It bears very profusely, showing three and four fruit at almost every joint, and brings more good fruit to perfection at the same time than any long kind I ever cultivated. At the time Messrs. Rendle's fruit of Star of the West were noticed in the *Chronicle* I had fruit of Floud's Hybrid, the same length and not quite half the thickness; indeed I have had it upwards of 20 inches in length, and not more than an inch in diameter. For the regular daily supply of a family from year's-end to year's-end, and for superiority of flavour, I believe the true Syon House and Lord Kenyon's stand unsurpassed. I have two black spined varieties, capital bearers, and from which 20 feet of fruit have been cut at a time from a single plant (the same thing has been done scores of times with the variety of Syon House my father used to grow). One of them is rather short, rarely exceeding 10 inches in length, but the other averages about 1 foot, carries a beautiful bloom, and is as near perfection as need be for a gentleman's table, where flavour is of much more importance than almost fabulous length. Such at any rate is my hobby in relation to Cucumbers, but far be it from my wish to prevent others growing the long kinds if they think proper to do so. *W. P. Ayres, Whittlebury Lodge, Oct* 30.

THE RESUSCITATION OF SEEDS.

The Memoranda in the last Number of the *Gardeners' Chronicle*, communicated by your correspondent "C.," are interesting as connected with some important questions of geographical botany now under discussion. The phenomena mentioned of the sudden ascendancy acquired by Clover over Gramineæ in certain pastures, and of its being again overtopped by the Grasses after a few years, and the frequent substitution of one kind of tree for another after a forest has been cut down, are traced to their right causes. They depend on a principle recognised in the most recent works on the subject. Where several species of plants are crowded together, if, during the age or season when they are in full growth, circumstances of soil, situation, &c., are peculiarly suitable to one and less favourable to the others, that one will obtain the predominance, to the gradual diminution or even total extinction of the others. This principle acquires great practical importance, as treated by "C.," in the search after the best mode of treatment for the improvement of natural pastures, by the encouragement of good nutritive species and the expulsion of hurtful or unproductive plants. On a larger scale it may also be applied to the improvement of young forests.

The instance quoted of a bulb having vegetated after having lain for 2000 years in the hand of a mummy, is incapable of sufficient authentication to be made the subject of physiological argument. Such a fact would be too much in opposition to the results of universal experience of the limits of the vitality of bulbs, not to suggest the idea of one of the tricks played by the manufacturers of mummies or other impostors, always ready to make a profit of the credulity of travellers in Egypt as elsewhere.

The case of the Charlock quoted by "C." is one of the numerous instances of the sudden appearance of that weed under circumstances which seem unaccountable, except on the supposition that the seed was, as he says, buried in the ground awaiting its day. This is a very general belief adopted by many eminent physiologists; and yet it is only a supposition, hitherto unsupported by any convincing proof, and doubted by many who are aware how numerous and effective are the causes of destruction to which seeds buried in the ground, without immediately germinating, are exposed. As I certainly strongly partake of these doubts, my object in addressing you is to suggest some experiments which might tend to solve them on the one side or on the other.

If I understand your correspondent right, the Charlock seed on the spot he mentions has been completely got rid of in the surface soil to the depth of about 4 inches, but if the subsoil is turned up to the additional depth of 2 inches, it produces an abundant crop from seed supposed to be contained in it. This would be a peculiarly favourable opportunity for ascertaining whether the seed does in fact exist there. Suppose the 4 inches surface soil were carefully removed from a given space, say a square yard, another 2 inches of the subsoil taken up and carefully washed, then Charlock seeds ought to be there found. Some two or three seeds in that mass of soil might indeed be overlooked, but for every good seed there must, under those circumstances, be so many that have lost their germinating power, that they must present themselves in considerable numbers. If similar researches were repeated at different times in different localities, we should soon obtain important data positive or negative. The results of the few partial examinations I have this summer been enabled to make in cultivated lands have been all negative as far as they went.

Another very useful experiment as to the duration of vitality in buried seeds, would be artificially to bury seeds of Charlock or any other plant most strongly sus-

pected of turning up in the same manner—to bury them in large quantities at various depths in marked spots of ground, selecting fresh gathered fully ripe seeds, such as are naturally shed, and leaving them exposed to the various vicissitudes of drought or moisture, heat or cold, to which they would be naturally subject; and, after the first two or three years, to take up a portion every year and ascertain their state, to observe how many will have escaped the natural tendency in the moist earth to germinate or rot, as well as the ravages of insects or other causes of destruction.

As, however, the main fact, the sudden appearance of large quantities of Charlock or other plants on newly turned up soil, where none had been previously observed, cannot be denied, it may be asked if the seed had not long been lying buried in the ground, where could it have come from? It is, however, very seldom that all the facts which might afford a more plausible solution to this question are known. Charlock is a weed exceedingly common in cultivated lands all over the country, and often inadvertently sown with grain or other seed. Conspicuous as it is when in flower in considerable quantities, a few plants scattered about, especially when in seed, would attract no notice. A single plant may ripen 500 to 1000 good seeds. In ordinary cases, as the average quantity of Charlock in the country is about the same, year after year, 999 out of these thousand seeds, or their produce, must perish before coming to perfection. But if the soil is turned up at the moment the plant has shed its seed almost every one of the seeds may germinate, and the progeny of some half a dozen plants, unobserved the previous year, may cover an acre of ground. There are so many ways in which seeds are known to be rapidly dispersed over cultivated lands, that there is much to be disproved before we can be convinced of any extraordinary longevity in seeds, under circumstances which are known rather to promote germination or destruction than to preserve their dormant vitality. *G. B.*

MEMORANDA

Intended to show some instances in which the agency of man has been brought into play in the production of plants, of insects, of birds, and also on a more extended scale, on localities and on climates; and to show that however these effects may appear permanent, they originate in taking advantage of those laws to which the Almighty Power has subjected all alike—plants, insects, animals, localities, climates, and man himself.

(*Continued from p.* 725.)

SECONDLY, OF INSECTS.

1. Every one may see in a piece of decayed cheese two marked kinds of insects, the hopper and the mite, the hopper existing in the moist portions, the mite in the dry portions of the same cheese. Every one may, at his pleasure, produce and alternate this effect by making an incision, and thus confining a supply of moisture to a distant part of a cheese, and by keeping the cheese at a high temperature without a general supply of moisture. Here man plays with two kinds of insects in different stages of existence, the annular hopper and the more highly organised mite.

2. It is a well known fact, that if a small quantity of water be taken from a clear puddle below a bush, and be carefully placed in a clean phial, and, if the phial be well corked and be kept at a summer heat, although the water appear perfectly bright and pellucid to the human unaided eye, yet in course of two or three months a number of gnats, or mosquitoes, or midges, as the case may turn out, will make their appearance, will exist for a time, and die rapidly, in proportion as this period is more or less precocious, and the means of sustaining their life are wanting.

3. The following circumstance occurred in the spring of 1819 to 1820:—Bow Church stands in the midst of the turnpike road from London to Romford, &c. The churchyard is of very small extent, and had become so much raised above the high road on all sides, that it was decided to lower it, and to sell the earth. The earth was black rich mould, such as a farmer could broadcast. A farmer who bought it applied it to such purpose on a field of young Wheat, which just greened the ground. The field was in Layton, near Walwood House. At the time the mould was spread broadcast, the wind was so high that a considerable portion of it was carried over an adjoining field, which was in the occupancy of a different person. The genial weather and rains of spring came on—everywhere the crops looked well, when the Wheat over which the mould had been cast gradually disappeared. The astonished farmer proceeded to his field, and was surprised to find that not only his field but that of his neighbour were covered by bushels (the word of the farmer) of flat snails, of about the size of a sixpence, having a broad white band on their lower side. The farmer was dismayed. But the weather changed soon, to unusually dry. An extraordinary fœtor proceeded from the Wheat field, which led the farmer to examine it again, when he found all the snails were dead, and that the smell proceeded from them. Some of these shells were given to me in this state, and the donor added that they extended over at least 12 acres, and must have amounted to millions upon millions. The ultimate effect upon the Wheat was highly beneficial. I happened to be on a visit at Layton at the time; I examined the devoured Wheat, and found traces of the shells throughout; I put some by, but unfortunately was hurried away without making any memoranda. The shells were lost in my hurry, so that the circumstance rests only on a tenacious memory.*

* From a sketch communicated by our correspondent it would seem that this snail was some flat Helix in the way of *H. virgata*.

But the case is important as showing that the ova of the snail were accumulated in the dark places of the churchyard, where portions would have become food for some of the insect tribes; and a vast proportion would, like the mummy, have rested inert until the vital principle had been called into play. Removal, the being spread broadcast, and the genial showers and warmth of spring, called that principle into play, and produced a limited existence, which was put an end to suddenly by the want of that support which they had produced.

To sum up, here we have millions of snails brought into momentary existence by the ignorant activity of man. We have gnats, mosquitoes, and midges hurried into precocious existence by the curiosity of man; and here we have, in the hopper, the mite, and the cheese, the evidence of the power of man to play with and influence vitality in insects as suits his pleasure. *C.*

(*To be continued.*)

Home Correspondence.

Growing Pears in Paper Bags.—In the spring you published an account furnished by a French gentleman, to the effect that if Pears as soon as they were set were enclosed in paper bags, and allowed to remain in them until within three weeks of ripeness, they would not be gritty. Being fond of experiments I bagged one Pear on almost every tree. As, however, I grow no gritty variety except the Rousselet de Rheims, my garden is insufficient to test the truth of the asserted fact. But the bagged Rousselet did not seem freer from grit than its neighbours. As to such other varieties as have already ripened and are eaten, Marie Louise was neither improved nor injured, but in every other instance the flavour was deteriorated. I ought, however, to mention that in consequence of the number of blackbirds, I was obliged to put on gauze bags immediately on taking off the paper ones. But though the experiment has been so far unsatisfactory, it is not without useful results. I have a handsome pyramidal tree of Glou Morceau, which for years past has never borne a single good fruit. They are always blackened, speckled and cracky. This is owing, I believe, to the coldness of my situation. But the one bagged specimen has this year swollen into a most beautiful Pear, externally all one can desire. The same result has followed on an espalier Passe Colmar. Assuming that an ungenial climate is the cause of these defects in Pears, is it not possible that by bagging the tender sorts in the spring, and uncovering them after midsummer, we may combine external beauty with internal perfection and flavour?—at any rate some of your readers may like to try the experiment next year. *G. S.*

State of the Weather at Callton Mor, Argyleshire, during October, 1855:—

—*J. Russell.*

British Oaks.—I rejoice to see by your remarks at p. 728 that there is some chance that your correspondents will, from their personal knowledge, enable you to solve the difficult question at issue between Q. pedunculata and Q. sessiliflora. On that account I the less regret that I trespassed upon you with the query which you answered at p. 696, which had I seen, as I since have, the editorial remark at the foot of the notice of "Rufus," 1844, p. 53 *c*, I should not have done. I have to thank you for much forbearance and courtesy in the answers to the questions with which I have from time to time troubled you, and to regret that I am unable to enrol myself among those correspondents who have a personal knowledge of the properties of the two species. I was driven to make inquiries by observing that the young British Oaks planted by my predecessor within the last 20 years promised not to grow into timber so fine as those planted at an earlier date. I then became aware of the existence of two species of British Oaks, but it was not till last autumn that I saw a growing tree of Q. sessiliflora, nor have I at this moment, except three small seedlings from the Horticultural Gardens, a single tree of Q. sessiliflora growing on my land. I observe in a communication, 1848, p. 135 *c*, that "Mr. Andrew Knight, who was well acquainted with the qualities of both varieties, always maintained that the timber of Q. pedunculata was the firmest and best of the two." Are you aware if Mr. Knight has left this opinion, and the reasons thereof, anywhere on record? In a leader 1842, p. 723, is the following excellent advice:—"A sickly sessile fruited tree will yield acorns producing seedlings with a much worse constitution than the general run of stalk-fruited Oaks; and so, also, a very vigorous Oak of the latter kind may bear acorns whose offspring will exceed in powers of growth the average specimens of the sessile fruited. Planters, then, should take the utmost care to ensure a supply of seedling Oaks from trees remarkable for their large size and healthy state." Should this advice have been seen and adopted by any nurseryman I much wish he would state in your columns where the parent Oak of the trees which he advertises may be seen or heard of. And I would suggest to noblemen and gentlemen, or their stewards, on whose estates any forest giants are yet to be found, that an advertisement in your journal, stating the size of the tree, and its locality, and that sealed bags containing warranted Acorns therefrom would be delivered at a railway station in London at per peck, would probably produce applications to exchange acorns for money, the effects of which would be visible in the country for centuries to come. Again, having more than once profited by the liberality of your correspondents, who now and then offer seeds or specimens of rare native plants to those who will send them stamped covers—and having thereby incurred debts of sundry days' work in harvest, some of which I have been enabled to pay by a system of exchange, while some are still due—I would suggest to such as may have access to a giant Oak that an offer of acorns would be apt to produce covers in abundance, and with them bags for containing the acorns, and postage stamps, if required to pay the cost of collection. I am myself determined that as soon as I am by any means enabled to plant Oaks that may be called the Sons of the Giant, I will no longer plant the nameless produce of a nurseryman's seed bed. Lastly, if you will have the kindness to look at the charter of the Royal Agricultural Society, which is printed in the appendix to one of their early volumes, which is probably within your reach but is not within mine at this moment, you will find, if I mistake not, that the growth of timber trees or of woods is one of the objects of encouragement for the Society, but I question whether, if you look through the 15 or 16 volumes of the Journal of the Society, you will find a single essay or treatise having the improvement of timber for its object, and certainly no prize has yet been recommended by the Journal Committee to be offered for any such object. *Diss.*

Yeast.—A few weeks ago I sent you an old receipt for making yeast. The following appeared in the *Times* of Oct. 22d; I have tried it, and can confirm "D. S. Y.'s" testimony as to its excellence:—"Monday morning boil 2 oz. of the best Hops in 4 quarts of water for half an hour, strain it, and let the liquor cool down to new milk warmth; then put in a small handful of salt and half a pound of brown sugar, beat up 1 lb. of the best flour, with some of the liquor, and then mix all well together. On Wednesday add 3 lbs. of Potatoes boiled, and then mashed, to stand till Thursday, then strain it and put it into bottles and it is ready for use. N.B. It must be stirred frequently while it is making, and kept near the fire. Before using shake the bottle well up. It will keep in a cool place for two months, and is best at the latter part of the time. The beauty of this yeast is that it ferments spontaneously, not requiring the aid of other yeast, and if care be taken to let it ferment well in the earthen bowl in which it is made, you may cork it up tight when bottled. I put mine into Seltzer-water bottles, and this quantity fills four. I have used it now for many months, and never had lighter bread than it affords without any failure." *M. N.*

Cucumber Growing (see p. 727).—Observing that Mr. Massey, of Kirby Hall, doubts my veracity respecting the Cucumbers I grew, I send you a statement of the quantity, together with the length and dates when cut, and I will vouch for the truth of it, the plant being a last year's cutting. *Thos. Pollington, Bradwell Grove.* [Our correspondent has sent a *daily* account of his cutting, which account tallies with his statement.]

Result of Applying Sulphur to Hops during the period of their Growth.—Here we have two things to consider; 1st, whether the sulphur can be used profitably; and secondly, whether Hops so grown can obtain an average market price. I am now in a position to answer both satisfactorily. Some time since you published a notice of mine on the state of two Hop grounds in close proximity, the one to the other, in the parish of Bapchild, Kent. In that article I ventured to predict the result, which, though not strictly borne out, was yet sufficiently approximate, as the following details will confirm. On the portion or garden where sulphur was used, at little more than 40*s.* per acre cost, the 6 acres produced 69 cwt., or at the rate of 13 cwt. 3 quarters 6 lbs. per acre; whereas the adjoining 3 acres, where the mould was equally rife, and no sulphur used, produced together only 12 cwt. or 4 cwt. per acre. This surely must convince the most sceptical. Now as to the effect of the factors' manifesto; these Hops were so clean and good that they obtained more than the average price of the neighbourhood. Does not this tell us that if we were careful to watch for and destroy this parasite,

we need not have as many acres of Hops in plant to produce the same quantity? Then so many more acres of land of the best quality would be free for Wheat or other crops. *W. Masters, Exotic Nursery, Canterbury.*

Luminous Lycopodium.—They have at Kew a most curious Lycopodium, lately come from Jamaica (not, I believe, sent on account of its property). It is a common looking species of the Helveticum group; green as others by day, but as evening comes on gradually appearing white to the eye—not pure white—but the sickly white of a bleached plant, distinguishable at once by this circumstance when it is too dark to see the form or outline. Mr. Smith detected this property, which can have nothing to do with the effect produced on the so-called Lycopodium cæsium by the rays of light making that plant iridescent, like shot-silk. *H. R.*

Double Blossomed Peach.—The fruiting of this Peach is by no means unusual. A tree of it in the gardens at Redleaf has this year produced upwards of eight dozen very fine fruit, which ripened perfectly, and were certainly very juicy and eatable, but not such as would please a connoisseur in such matters. *J. C.*

Vitality of Seeds.—Reading the memoranda of "C." on the appearance of different species of plants under different treatment of the ground, has brought to mind a singular instance of the appearance of Charlock on newly turned up soil which occurred to me many years ago. I was deepening a pond in an old pasture, but which was supplied by the drainage of adjoining arable land. The soil which I took out was chiefly strong yellow clay to the depth of perhaps 18 inches, and the bottom was laid uppermost. In the ensuing summer the hill of clay was covered with Charlock as thickly as Mustard sown for the table. In what manner could these seeds have been deposited at the depth of some inches below the bottom of the pond, and retained their vitality? I am aware that the springing up of this weed on the soil thrown out of the bottom of ditches is an everyday occurrence, but this instance appeared to me a very remarkable one. *J. G., Bury St. Edmunds.*

Subterranean Irrigation.—If Mr. Wilkins or any other person will look into M'Intosh's "Practical Gardener," for 1827 or 1828, I forget which, they will find this method of manuring recommended for the cultivation of Celery, and from that date I have followed it myself in various ways and with various liquids. I grew Grapes by it for six years at the late Archibald Corbett's, Esq., at Walthamstow, in 1842, and I made new Vine borders upon the same system at Thos. Moxon's, Esq., at Low Leyton, but I do not know whether that gentleman carried the plan out, as I left shortly after, and am now working a house on the same principle, which has been so worked for the last eight years. Now I cannot help thinking that these remarks, added to the evidence you have furnished, are sufficient to prove that this mode of manuring has little novelty about it, and that Mr. Wilkins has no right to tax the public for a system that is neither new nor his own. *Wm. Havers, Gardener, 29, Adelaide Road, Hampstead.*

——The Potato referred to in your account of my experiments whose produce was 101 Potatoes weighing 24 lbs. first originated in 1853, from one set grown on this new system, and then produced 9 lbs. In 1854 one Potato from the same stock on the same system yielded 15 lbs. This year, 1855, one set from the same stock on the same improved system in only 8 inches of earth produced the 101 Potatoes just mentioned. Another singular fact is that where I put solid manure or road sweepings (where the fly had rested), even under sand, I found the grub worm, but no grub where sand only and liquid manure were used. I have seen to-day some exceedingly good drain tiles for my purpose made of road sweepings, and the patentee says he will provide a cheap concrete for any extent of land, which will guarantee my system to answer. My flower arrangement I am sure you will be pleased with. I have flowers growing in schedaliers (qy. chandeliers) standards, and other contrivances, supplied with the most filthy liquid, but from which no offensive smell can be discovered even in a drawing-room. I intend to take up my Mangel Wurzel roots, &c., on Wednesday next, Nov. 14, at 10 minutes past one o'clock, P.M., and I hope that many of your readers and others will attend to see weight against weight, or the new and old systems compared. *Edward Wilkins, Experimental Gardens, Reading.*

Heywood House Pits.—Your Truro correspondent (see p. 725) is mistaken in supposing that the rearrangement of these pits originated from a design of Mr. Glendinning; the fact is, the alteration arose from continual vexation and disappointment, nor was I aware until I read "C.'s" communication that Mr. Glendinning had furnished a plan of the kind for the *Gardeners' Chronicle.* The pits under consideration, in their original state, were designed by Mr. Mills, given to me, and heated by Burbidge and Healy, and I can now say, after much experience, that the fundamental principles were violated, which precluded the possibility of the arrangement accomplishing a tithe part of what was affirmed it would effect; they were, in fact, perfectly useless for Cucumber cultivation during winter. After several alterations the diffusion of heat has been rendered more satisfactory, principally through the admission of external air at the lowest level, which produced circulation, and an increase of warmth. The improved plan has been published, and attracted the attention of Mr. Phillpotts, who was then just beginning his experiments, and I cannot but express the pleasure I feel in knowing that his success has been so complete. *A. Cramb, Gardener to the Right Hon. Earl Ducie, Tortworth Court, Gloucestershire.*

Management of Roses in Beds (see p. 727).—I have not at this moment an opportunity of referring to what I said respecting the autumn manuring of Roses; but as far as my recollection serves me I stated that careful transplanting and highly manuring at this—the proper season—are all that is requisite to produce or maintain an abundant bloom. As regards my reasons for recommending autumn for the purpose, one at least must be evident, as it is the only time when manure can be applied in that manner: another, and with me a powerful one, is that the plants then transplanted have already formed bundles of new strong healthy roots, which make the most of the nutriment placed within their reach. Where pegged down to cover the entire soil and topdressing—the only method of manuring available—I think the reasons for its autumn application become apparent. As a manure it must have time to reach and benefit the roots; as a mulching it does much to keep the soil kindly by preventing it from being bleached or sodden by the rains of winter, and as a protector it will greatly tend to keep the more tender sorts in good health, by sheltering the junction of the stock and Rose, and for this the 2 or 3 inches recommended will be ample, provided they have been budded or grafted (which suits some sorts better), as they assuredly ought to be, close to the ground; and, lastly, the said manure after conferring all these benefits will have become less unsightly as the season for appearances becomes of more importance. I may add that to insure success under any circumstances perfect drainage is indispensable; therefore if the beds are the usual pits dug out of gross or other consolidated ground, manuring in autumn or any other season may be dispensed with; this case being altogether hopeless, as the said pits or beds act as drainage to the surrounding surface; consequently during the rainy season they are little better adapted for the culture of permanent plants than so many ponds would be. *J. M., Folkestone.*

Shell Rain in the Isle of Wight.—In replying to the queries of "C. D" (see p. 726), I cannot perhaps do better than take them separately in the order in which they stand:—1. "Were any of the shells living?" Yes, many that came under my observation were alive. And it may be interesting to add, that a lady connected with the establishment at Osborne having collected a number of the shells, placed them upon a Cabbage leaf, over which she inverted a large tumbler glass; the tiny creatures soon gave unmistakable signs of their vitality by their voracity. 2. "Over how wide an area did they fall?" I cannot tell the exact space over which they fell. I may state, however, that it extended at least over 400 square yards of surface. 3. "During how long a time are they believed to have fallen?" To this question I can give no satisfactory answer. I was not on the spot at the time when they fell. Nor was I acquainted with so singular and interesting a fact as a shower of shells until my attention was drawn to it by Miss Skerrett, of her Majesty's household, some time after. Owing to what I gleaned from that lady I became concerned to know more about them, but the answers to my inquiries were so vague and unsatisfactory as to be of no particular value. 4. "At what hour and on what day?" I cannot learn from any source the hour they are supposed to have fallen. They were observed as early as 8 or 9 o'clock in the morning. The day, to the best of my recollection, was Oct. 1st—Monday; unfortunately I made no memorandum thereof. There had been very heavy storms flying about for several days. The storm, however, which in all probability took up, hurled forward, and so unceremoniously scattered the numerous little shells over the court-yard and along the pavement of the palace at Osborne, was doubtless the one which broke over here early in the morning of the above-named day, as early as 5 or 6 o'clock. 5. "Did only one kind of shell fall?" The specimens I have are all identical. A friend of mine, however, told me to-day there were two kinds of shells, of the truth of which I have had as yet no ocular demonstration. I am sorry I cannot give "C. D." more definite information regarding the shells at present;—I may learn something more respecting them when the Court returns to Osborne. The foregoing statements I hope will prove so far satisfactory to "C. D." as to induce him to venture a probability as to the locality in which the storm might have found them. If "C. D." would like a few of the little Zua shells, I shall be happy to forward some to his address, if sent. I have no living shells. *C. Winchester, Osborne.*

Societies.

British Pomological, *Nov.* 5.—W. Stephens, Esq., in the chair, succeeded by Mr. Osborn, of Fulham. The fruits brought together on this occasion consisted chiefly of Apples and Pears, of which there was a large display, a few Pine Apples, Grapes, and Plums. From the Royal Gardens at Frogmore was a collection of ripe Pears, which were sent to show what varieties are now in use there. Among them were fine specimens of Marie Louise, Beurré Diel, Glou Morceau, Knight's Monarch, very fine from a south wall, and quite ripe; Van Mons Leon le Clerc, well grown, but not very high flavoured; Beurré Bosc, B. Capiaumont, a variety which some call "a Pear for the people;" Comte de Lamy; Seckle large and highly coloured; the old Moor Fowl Egg, Brown Beurré, Bacon's Incomparable, Forelle or Trout Pear, Duchesse de Angoulême, and a small new Pear named "Saxton Seedling," which closely resembled the old Crassane in shape and colour. It had a white melting flesh, was very juicy, sweet, and sugary, and was altogether considered to be one of the best flavoured Pears exhibited. The above were nearly all from curved wire trellises, with which the borders along the sides of the principal walks at Frogmore are furnished. From the same garden also came 32 varieties of Seedling Apples, many of them very promising sorts. Among them were several fine-looking Golden Pippins, which, however, upon trial proved inferior to the old favourite Apple of that name. Some of them, however, might be worth growing on account of their reputed hardiness and free-bearing qualities, in both of which they were stated to have the advantage of the old Golden Pippin. No. 152 was much approved of; it is a small flat Apple, not unlike the Downton Nonpareil, with a pale yellow skin, thickly over-spread with thin flakes of soft russet and brown specks on the sunny side. Its flesh was fine-grained, breaking, sugary and rich, and the tree which produced this fruit is said to be hardy and very prolific. Shilling's Seedling, of which some specimens were present, was reported not to be so good as the Ribston. Examples were exhibited of Beurré Clairgeau, which proved better flavoured than the specimen of this handsome Pear furnished by Mr. Wells, of Redleaf, but still they were reported to be too flat and watery for this to rank as a first-class Pear. A well grown specimen of the Sabine Pear, a little known variety, was shown by Mr. Ingram, of Belvoir Castle, where it is reported to be a very useful kind. Mr. Rivers showed some Pears, among which were Laure de Glymes, a rather coarse sort, musky and not melting; Colmar Navez, stated by Dr. Van Mons to be one of the finest of all Pears, but, in this instance, watery and possessed of little richness; and a striped St. Germain from under glass; also a Pavie de Pompone, which in France is said to reach 1 lb. in weight, and to be good eaten in autumn with wine and sugar. From Mr. Ward, of Reading, came fine specimens of Louise Bonne of Jersey, Marie Louise, and other Pears, from pyramids in strong loam on a cold subsoil. Mr. Spencer produced handsome examples of Black Prince and smooth Cayenne Pine Apples, two very fine bunches of Muscat of Alexandria Grapes, and a seedling called the Bowood Muscat, apparently a very fine variety, which was said to be a free setter, but in this instance unripe, and therefore no correct opinion of its merits could be formed. Its berries are Pear-shaped, and remarkable for their size, and the bunches appeared to be shorter and wider in the shoulders than those of the common Muscat. From Mr. Turner, of Streatham, came an extremely handsome bunch of Black Barbarossa Grapes, weighing 4 lbs. 12½ oz. The berries were quite black and covered with a fine bloom. Mr. Taylor (from Mrs. Webber's), stated that he has had this Grape in perfection as late as the 28th of April, and that its true flavour is not acquired before the beginning of January. Its merits as a late Grape, therefore, require no comment. Of other fruits, chiefly Pears and Apples, collections of which were exhibited by Messrs. Paul, Whiting, De Jonghe, McEwen, Thoyts, Wintle, and Dr. Davies, we may have something to say hereafter, many of them not being at present in a state to admit of their true characters being correctly determined. Twelve new members were elected.

Notices of Books.

An Elementary Atlas of History and Geography from the commencement of the Christian Era to the present time. By the Rev. J. S. Brewer. The maps compiled by E. Weller, F.R.G.S. 8vo, Longmans.

This is a valuable addition to the materials now applicable to educational purposes, and one that was much needed. Not that it in any way supersedes Spruner's admirable *Atlas antiquus* on which it is founded, but it is better suited to young readers, and more convenient for purposes of study. It begins by representing the nations and limits of the Roman century in the fourth century, by a map copied from Spruner, and it proceeds to illustrate in fifteen other maps Roman Britain, the migration of the Barbarians, Saxon England, Europe in the 9th century, the 10th, the 12th, the 14th, 15th, 16th, 17th, and 18th centuries, during the French revolution, &c. &c.

The fault of the book is that it does not include Asia antiqua. We could also have wished for a better arrangement of colours in marking the limits of countries. Green and blue for instance should never be in contact, for they resemble each other too nearly even by daylight, and by candlelight are undistinguishable We should prefer in all cases HARD BLACK boundary lines to any possible combination of colour.

Stanford's Map of the Roads between Odessa, Nicholaieff, and Simferopol, (4*s.*), is a most welcome publication. Embracing, as it does, the present great scene of naval and military operations it is indispensable to those who would understand the movements of the troops and navy of the allies. It includes the whole of the Crimea west of the Tchatir Dagh mountain, namely Simpheropol, Eupatoria, Perekop, Aleshki, Kherson, Nicholaieff as far westward as Odessa, together with all the soundings along the whole coast line. To this are added plans of Odessa itself, and Nicholaieff on a large scale. The

map is excellently drawn, upon the scale of 7 miles to an inch, and has been compiled from materials of indisputable authenticity.

The Hand Place-book (Blackie & Co.) is a curiosity, but a useful one. In a volume 2½ inches wide, 3¾ long, and 1 inch thick it tells the reader the county, area, population of 15,000 places in Great Britain and Ireland, with a great deal more statistical information which it is very convenient to be able to refer to.

Garden Memoranda.

HORTICULTURAL SOCIETY.—*Sale of Orchids and other Plants*.—The following are among the more remarkable prices realised by Mr. Stevens on this occasion. Lot 150, Phalænopsis amabilis, the magnificent specimen which Mr. Fortune sent home from the Philippines, 63*l.* 5*s.* (Duke of Devonshire); Lot 300, Lælia superbiens, still attached to the block of wood on which it was found growing in the forests of Guatemala, and probably the finest specimen of a living Orchid in Europe, having 220 pseudo-bulbs, and being 17 feet in circumference, 36*l.* 15*s.* (— Fairrie, Esq., Liverpool); Lot 241, Dendrobium speciosum, a very fine plant, with 124 pseudo-bulbs, and measuring 4½ feet in diameter, 10*l.* (Duke of Devonshire); Lot 50, Trichopilia coccinea, Anæctochilus xanthophyllus, and Saccolabium guttatum, 19*l.*; Lot 53, an Aerides, 19*l.* 10*s.*; Lot 130, Vanda tricolor, a handsome specimen of a fine variety, 11*l.*; Lot 296, Lælia anceps, 10*l.*; Lot 230, Cattleya Skinneri, 9*l.*; Lot 236, Lycaste Skinneri, 8*l.* 10*s.*; Lot 240, Cælogyne cristata, 8*l.* 10*s.*; Lot 34, Cattleya maxima, 9*l.*; Lot 44, Angræcum eburneum, a very fine plant, 7*l.* 15*s.*; Lot 51, Aerides Roxburghi, the Ceylon variety, 5*l.*; Lot 86, Lælia anceps and Renanthera coccinea, 6*l.* 15*s.*; Lot 96, two unnamed Aerides, 4*l.* 10*s.*; Lot 101, Sophronitis cernua, 3*l.* 7*s.* 6*d.*; Lot 110, a very fine plant of the large flowered variety of Oncidium ampliatum, 4*l.* 10*s.*; Lot 129, the best variety of Oncidium guttatum, 4*l.* 10*s.*; Lot 176, Odontoglossum grande, and Dinema polybulbon, 4*l.* 5*s.*; Lot 191, Cattleya pallida, a fine specimen, 5*l.* 5*s.*; Lot 200, Lycaste aromatica and Trichopilia suavis, 5*l.*; Lot 203, Sobralia, a dwarf variety of S. macrantha, 3*l.* 5*s.*; Lot 210, Cattleya labiata atropurpurea, 4*l.* 15*s.*; Lot 214, Maxillaria rufescens and Lælia Perrini, 5*l.*; Lot 221, Masdevallia coccinea, most rare and beautiful, 6*l.*; Lot 249, Oncidium pulvinatum, and Blandy's variety of Dendrobium nobile, 4*l.*; Lot 251, the rare and magnificent Epidendrum myrianthum, 4*l.* 15*s.*; Lot 293, Oncidium Skinneri, a very fine plant, 4*l.*; Lot 19, Brasavola Digbyana, 3*l.*; Lot 30, Lælia acuminata, 3*l.* 10*s.*; Lot 90, L. erubescens, 2*l.* 12*s.* 6*d.*; Lot 49, Aerides odoratum, 2*l.* 12*s.*; Lot 116, Cattleya crispa, 2*l.* 15*s.*; Lot 144, Barkeria spectabilis and Skinneri, 2*l.*; Lot 223, Oncidium varicosum, 2*l.* 10*s.*; Lot 243, Dendrobium album and Miltonia Russelliana, 2*l.*; Lot 259, two unnamed Aerides Eria sp., Dendrobium ruscifolium, and Bolbophyllum, 2*l.* 8*s.*; Lot 260, Epidendrum coriifolium, very rare; Cælogyne fuliginosa and Oncidium bicallosum, 2*l.*; Lot 12, Phyllocactus anguliger, a fine specimen, 2*l.* 2*s.*; Lot 28, Delabechea australis, the rare Australian Bottle tree, and Antiaris toxicaria, the deadly Upas tree of Java, 3*l.*; Lot 212, Myristica moschata, the true Nutmeg tree, 2*l.* 12*s.* 6*d.*; Lot 218, the very rare yellow dwarf Jaffna Cocoa-nut, from Ceylon, 6*l.* 15*s.*; Lot 208, the green dwarf Jaffna Cocoa-nut, 6*l.*; Lot 148, Ceroxylon Andicola, the Wax Palm, 4*l.* 15*s.*; Lot 283, a magnificent specimen of the tree Fern, Cibotium Schiedeanum, 12*l.*; Lot 284, a small specimen of the same, 2*l.* 12*s.* 6*d.*; Lot 286, Araucaria Cooki, 5*l.* 15*s.*; Lot 288, A. Bidwilli, 5*l.* 15*s.*; Lot. 287, the rare Dammara ovata, 4*l.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Flowers have now become scarce out of doors, and will be more valued here in consequence; and every exertion should be used to keep this house well furnished during the winter months. It is not so important, however, at this season that only handsome well-grown specimens should be introduced, as it is when flowers are more abundant elsewhere, and almost any gay-looking plant, however common, will be very acceptable in winter. But the use of such things is only tolerable where accommodation is insufficient to grow a proper quantity of our best winter flowering plants, and where there is a necessity for resorting to the use of common things, every exertion should be used to secure neat, trim, well-flowered specimens. For as this class of plants is generally looked upon as being only valuable while in flower, it is a very common practice to bestow but little attention upon them in the way of staking, &c., before placing them in the conservatory. Let Japan Lilies that have done flowering be removed to where they can be kept dry; a cool vinery, where they will have plenty of light and air, will be a suitable place for them until the foliage decays, &c.; for, although these fine plants are hardy, and submit to almost any treatment, those who grow them in perfection are very careful to well ripen the bulbs in autumn.

FORCING DEPARTMENT.

PINERIES.—Plants swelling their fruit, and those in bloom should be assisted by a rather warm temperature, but excess of moisture in the atmosphere must be avoided at this dull season, particularly where the plants are in bloom, or the fruit approaching maturity. Use strong clean manure-water in a tepid state for plants swelling fruit, but do not get the soil too wet. The temperature for the growing stock should now be regulated very much by circumstances; keeping them growing gently where it can be done without drawing or weakening the foliage. Keep the soil about the roots in as equable a state as to moisture as possible, for letting the soil get too dry at this season often results in the plants showing fruit prematurely in spring, and the same is true with regard to the bottom-heat, which must also be carefully attended to, keeping it moderate but as regular as can possibly be done. VINERIES.—Where forcing is commenced about this time a rather higher and moister temperature will be necessary to induce the buds to start than would be the case at a more natural season. There is no better means of securing abundance of moisture and a gentle warmth than by placing a moderate quantity of stable manure on the inside border, and turning this, &c., as may be required; but where the forcing houses are visited by the family, and expected to be neat and orderly, this method is out of the question, and the syringe and whatever other means of a less objectionable character may be at command, must be used instead. The night temperature, to begin with, should range about 50° by fire-heat, raising it to 60° by day, or to 70° with the assistance of the sun. Also endeavour to secure a little warmth for the roots in the outside border, and if fermenting materials are used, watch these narrowly, and endeavour by timely additions and frequent turnings to secure a regular gentle warmth of 60° or 65° at a foot below the surface of the soil. And if fermenting materials are used, there will be a great saving of labour, &c., by thatching these with a good coat of something to throw off wet, and preserve them from the weather. If plants in pots or boxes are used for forcing at this season, they should be placed in a mild bottom-heat, so as to excite a healthy root action, which will cause them to break more freely and in less time than can be done without bottom-heat.

FLOWER GARDEN AND SHRUBBERIES.

The few flowers that may remain on the bedding out plants in even the most favoured localities are not worth preserving any longer, and the beds should be cleared at once so as to allow of getting them nicely trimmed up for the winter. Where the extent of ground occupied by "bedding out plants" in summer is considerable, it is not always convenient to find spring flowering bulbs to plant the whole of it with, and where this is the case, very much may be done towards producing a cheerful effect by a judicious use of small evergreens of a formal or neat habit of growth. These can be prepared in the reserve garden, to which they must of course be removed every summer, and as they have to be shifted twice every season they require no particular trouble to remove them with perfect safety; and beyond the labour of moving them to and from the flower-garden, and a few waterings after their spring shift, they involve but little labour or expense. For this purpose we prefer those that are perfectly hardy, and of a formal habit of growth, or can be readily cut into any desired form, such for instance as Arbor-vitæ, Cypresses, Junipers, Yews, Tree Box, &c., and Laurustinus and the old Mezereon, and some other Daphnes for their flowers. The winter-flowering Heaths are also very suitable, as are many other plants which might be mentioned; but we have indicated the kind of selection which we think the best adapted for the purpose. We do not, however, mean to recommend planting the beds closely in winter with such things, for this would require a very heavy stock, and involve a serious amount of labour, and all would produce no very striking result. These should be planted so as to mark in the most distinct manner the outline of the garden and principal figures. The beds can be much more cheaply planted, and to better purpose, with such things as the early-blooming Phloxes, Anemones, Tulips, Crocuses, Snowdrops, Scillas, Gentians, and many other spring-blooming plants, which are familiar enough to every gardener. These involve no expense, after a sufficient stock of them has been obtained, beyond the labour necessary to remove them to and from the flower garden, and to keep the ground clean in summer about such of them as require a place in the reserve garden; and with a good stock of these, and a judicious use of a moderate quantity of small formal evergreens, very much might be done to improve the ordinary winter and spring appearance of the flower-garden.

HARDY FRUIT AND KITCHEN GARDEN.

The Strawberries in pots should now be placed in their winter quarters. The common practice of stacking up the pots on their sides in sloping ridges is somewhat troublesome, and quite unnecessary for the protection of the plants. If the pots are placed in lines, at a proper distance apart to allow sufficient space for the foliage, and the spaces between the pots filled with coal ashes or dry Fern, placing a slight covering of the latter, or clean straw, upon the surface of the pots under the leaves, the plants will winter equally well or better than in ridges, and will present a neater appearance without involving half the labour. Care should be observed, however, to place the pots upon a thoroughly drained surface, for frost is comparatively harmless in the absence of moisture; therefore a few inches of coal ashes or lime rubbish should be placed under the pots. The best situation, however, for the portion of the plants intended for forcing first, is a spare cold frame, or near the glass in a cool Peach-house, as they will be safer here than under any system of protection out of doors, and as their roots will be preserved in an active state, very little forcing will be necessary to excite them at the proper time. The fruit stores will still require careful attention, and the fruit must be frequently looked over, removing any that are found to be tainted with decay. Many of the best autumn Pears will now be getting ripe, and it will add greatly to the interest of the fruit room if a portion of each of the sorts fit for use can be placed in a conspicuous situation, and correctly named. The late keeping kinds of Pears and Apples should be stored in a place by themselves, where they can be kept cool, and excluded as much as possible from the light and air, for these are apt to lose their briskness, and become very much shrivelled when kept in the ordinary fruit room.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Nov. 8, 1855, as observed at the Horticultural Gardens.

Nov.		Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth. 1 foot deep.	Temperature. Of the Earth. 2 feet deep.	Wind	Rain

The highest temperature during the above period occurred on the 12th 1841—therm. 63 deg.; and the lowest on the 16th, 1841—therm. 15 deg.

Notices to Correspondents.

BOOKS: *W H.* No English book contains the information you seek. For Conifers consult Carrière Traité général des Conifères; for other trees Selby's British Forest Trees or Loudon's Arboretum Britannicum.—*W O.* A new edition of Loudon's Encyclopædia of Gardening has been published this year, as you will see by referring to our review of it at p. 76 of our current volume.‡

HOLCUS SACCHARATUS: *J P M.* Apply to Mr. John Henderson, Wellington Nursery, St. John's Wood, London. We doubt whether it can be turned to profit in this country.

IRON GREENHOUSES: *B and J.* Your plants are attacked by the soot fungus, Torula fumago, a terrible pest. Its presence is owing—not to the iron roof of your house—but to want of ventilation. It should be watched, and at its first appearance washed with fresh made lime water, or soft soap and water, or dusted with sulphur.

NAMES OF FRUITS: *P H.* 1, Hollandbury; 2, Ribston Pippin; 3, Golden Noble; 4, Beauty of Kent; 5, Fearn's Pippin; 6, Reinette du Canada; 9, Dutch Mignonne; 10, Over ripe, probably Summer Thorle; Brabant Bellefleur; 13, Broom Park; 14, Hacon's Incomparable.—*Eneas.* Your Apple is the Waltham Abbey Seedling; the Pear is Van Mons' Léon le Clerc.—*D D, Dulwich.* 1, Golden Reinette; 2, Passe Colmar; 3, Easter Beurré; 4, Napoleon; 5, Beurré Rance.—*A.* 2, Buchanan's Spring Beurré; 3, Bellissime d'Hiver; 5, Beurré d'Aremberg; 6, worthless; 9, Glou Morceau; 10, Ne Plus Meuris; 12, Brabant Bellefleur; 14, Scarlet Crofton; 15, Kirke's Lord Nelson; 16, Blenheim Pippin; 17, appears to be the Dutch Mignonne.—*L Q.* 1, Hormead Pearmain; 4, Manks Codlin; 6, 10, Alexander; 7, 19, Yorkshire Greening; 8, 16, 20, Dumelow's Seedling; 12, Hunt House; 15, Cockle Pippin; 17, Rhode Island Greening; 18, London Pippin; 22, King of the Pippins; 23, Dutch Mignonne; 25, Hollandbury; 27, French Crab; 28, Cockle Pippin. Pears: 29, Seckel; 31. Burgermeester; 32, Hessel; 33, Flemish Beauty; 34, Crassane.

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Sylvanus.* Your fungus is a very rare species, *Hydnum graveolens*, Delastre. It has been found in Wales by Mr. Ralfs, but we believe by no one else in Great Britain. *M. J. B.*—*W G.* 1, Stipa pennata; 2, Arundo Epigejos.—*T Corder.* Centaurea solstitialis and Silene conica.

PAULOVNIA: *H C.* From the appearance of the piece of shoot sent, we think there is no doubt that the wood of your tree is sufficiently ripe to enable it to stand the winter in Warwickshire unprotected.‡

PEARS: *Sub.* Of the two sorts you mention we prefer the Marie Louise.‡

SEEDS FOR NEW ZEALAND: *H C C.* Pack all your tree seeds in tolerably dry loam rammed tightly into a strong wooden box. Do it thus. Put in a layer of loam 3 inches deep; then a layer of seeds one course deep; then loam enough to cover them; then another course of seeds; at last let there be 3 inches at least of loam over all and as much all round the sides. Rub the Whitethorn berries in water till the pulp is removed; drain them of superfluous water, and then pack them as before.

VINES: *Subscriber.* It is a good plan to chamber a Vine border, provided different sorts of Vines are to be grown side by side; because some are much coarser growers than others, and will rob their neighbours. When each Vine has its roots in a different brick division this is impossible. There is no other use in the practice, and therefore to apply it to a house of all Hamburghs or all Muscats would be to throw money away.

WOODS AND FORESTS: *J J.* There must be some very great public interest to serve when we interfere. Moreover, we happen to know that your statements about the New Forest are wholly erroneous.

YEW TREES: *South Derbyshire.* Move them now. Nothing will be gained by waiting till spring.‡

MISC.: *J R.* 2*s.* 6*d.* or 3*s.* Payment by Post-office order.

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents, the insertion of whose contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

DRAINAGE OF LAND.

MR. J. JOHNSON, DRAINAGE ENGINEER, is desirous to undertake the Drainage of Land by Contract or Commission. Temporary Tileries erected in any part of England, and Drain Pipes manufactured at moderate prices. Every description of Drainage Tools.—Abingdon Street, Westminster.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre.

Mr. HUMBERT (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Offices, 52, Parliament Street, London.
HENRY KER SEYMER, Esq., M.P., *Chairman.*

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.

2. In no case is any investigation of Title necessary.

3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. EQUAL FACILITIES WILL BE AFFORDED IN EITHER CASE.

4. The WHOLE cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.

5. The term of such charge may be fixed by the Landowner, and extended to FIFTY YEARS for LAND Improvements and THIRTY-ONE YEARS for FARM BUILDINGS, whereby the instalments will be kept within such a fair per centage as the occupiers of the improved Lands can afford to pay.

WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe. 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	10	0
2½ „	long 3 „ 3 „		1	14	0
3 „	ditto 3 „ 6 „		2	8	0
3½ „	ditto 3 „ 6 „		2	12	0
4 „	ditto 3 „ 6 „		3	3	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	10	0
2½ in.	long ditto	ditto ditto	2	14	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, London.

GALVANISED WIRE GAME NETTING,
6*d.* PER YARD, 2 FEET WIDE.

BARNARD AND BISHOP, Market Place, Norwich, in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

		Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	... ...	6*d.* per yd.	4½*d.* per yd.
2-inch „ strong, do.	... ...	8 „	6 „
2-inch „ intermediate, do.	... ...	9½ „	7½ „
2-inch „ extra strong, do.	... ...	11 „	9 „
1⅝-inch „ 24 inches wide	... ...	7 „	5½ „
1⅝-inch „ strong, do.	... ...	9 „	7 „
1⅝-inch „ intermediate, do.	... ...	11 „	9 „
1⅝-inch „ extra strong, do.	... ...	13 „	11 „

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10*d.* per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P." and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of CORNE'S Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

The Agricultural Gazette.

SATURDAY, NOVEMBER 10, 1855.

By way of illustrating our remarks last week upon hedgerow fences made at p.713, it may be well to append the following analyses of two hedges in Gloucestershire examined October 20, 1855.

No. 1. A high and broad hedge, which has not been laid for a great many years, consists of the following ingredients, which are taken in successive portions of the length of it.

	Length.—Ft.	In.
Bramble	4	6
Whitethorn, choked with Bramble ...	12	0
Maple	3	0
Blackthorn	6	0
Mealy Guelder Rose	6	0
Maple, in a gap...	9	0
Dog Rose	5	0
Blackthorn	7	0
Whitethorn	4	0
Dog Rose and Bramble	6	0
Ash	3	0
Whitethorn	4	0

Whitethorn	10	0
Bramble...	10	0
Willow	6	0
Bramble...	5	0
Briar	3	6
Total	180	0

These hedges are full of gaps and weak places, and they show the curious fact that, although ori-

ginally planted with Whitethorn (Quicks), they now present nearly half of plants other than Whitethorn, all of which are much inferior in value for fences, a fact abundantly proved by the examples in question, as it would be impossible to confine sheep or cattle within their bounds without patching each time it were attempted to be done.

We pursue our remarks on the Natural History of the Turnip Crop :—

However careful we may have been in the growth or selection of seed, and whatever labour we may have expended in the preparation of the soil and the committal of the seed to the earth, still from the first moment that the cotyledon leaves make their appearance above the ground the Turnip plant is liable to the attacks of enemies, and as in the very early stage of growth the Turnip flea, skipjack, or flea beetle (*Haltica nemorum*) is the first as it is the worst enemy of the embryo Turnip, we shall devote the following observations to an illustration of a few points in its natural history. The more important facts connected with this creature may be briefly tabulated as follows :—

1st. The Turnip flea is an exceedingly small insect of the beetle tribe, doing great mischief on account of its vast numbers and the early stage of growth at which they attack the Turnips.

2d. These insects are of an exceedingly active habit, jumping with a smart spring from the plants on which they are settled, even upon a shadow impinging upon them, hence their name of Turnip flea.

3d. Dry sunshiny weather highly favours their ravages.

4th. They live upon all the species of plants belonging to the natural order Cruciferæ, showing, however, an increasing preference for different species as they approach nearer the Turnip, and leaving all species for the Turnip itself.

5. The pupa state is carried on in the soil, the last brood being hatched in spring, from which follow five others in the course of the year.

6. They appear to have the power of smelling food afar off, as their migrations to great distances are carried on against the wind.

Now an attentive consideration of the above facts in the natural history of these creatures would lead to the inference of the inutility of single and isolated efforts to stop their injuries. If, however, a simultaneous crusade be carried out against them we shall then have reason to hope for success, and this, as it appears to us, can be best followed out by an universal acting upon the following principles, all of which have indeed been repeatedly acted upon, but with partial success, from only partial employment.

1st. The encouragement of insectivorous birds.
2d. The destruction of all cruciferous weeds.
3d. The destruction of the earlier broods.
4th. The adoption of expedients in sowing.

1st. During the present season most farmers have had to sow much of their Turnip crop twice and even thrice to get a plant, and so great has been the scourge of insects this summer that every one expresses surprise, seeing that the winter of 1854-5 was so severe: the popular notion being that hard winters must necessarily check the development of insects. If, however, we consider what care is taken in the preservation of insect life, and the great tenacity of life in its earlier stages, our native insects being well prepared against our climate, we shall see that if they become frost-bound for a long period that this does not necessarily kill them, whilst it precludes the attacks of the birds, their natural enemies, who more especially during an open winter feed sumptuously upon the dainty fare provided for them in eggs and larvæ of various kinds of insects. It is in this way that a too great exuberance of insect life is checked; but while the birds are starving for want of food, these little creatures, wrapped up in their winter cerements, and lying with dormant appetites, escape, and so come forth in increased numbers on the first accession of open sunshiny weather. This, while it is a contradiction to a popular fallacy which supposes hard winters to be so highly prejudicial to insect life, leads us to look upon birds as the chief natural controllers of the over-development of these creatures, and as a consequence should impel us to extend to them a large measure of protection. Any one who has seen how industriously the rook follows the ploughman, especially in the early part of the year before the winter eggs are hatched, may form some notion of the good done to the farmer by this family of birds—especially if the fact be borne in mind that the destruction of one egg *then* may prevent an increase which would afterwards have proceeded in a most rapid process of geometrical progression.

2d. It is a fact well known that weeds of various kinds, besides being prejudicial by occupying space and appropriating the food designed for our crops, afford at the same time food and protection to innumerable kinds of insects, and this is especially so in the case before us. As a law, certain families of plants, and sometimes even species are attacked by particular species of insects, and indeed it is usual to find that however many forms of plant an insect may affect, a preference will still be given to one or two in particular; thus though the *Haltica nemorum* will be found in spring on nearly all wild Cruciferæ, yet as soon as Turnips come up above the ground all these are left for the Turnip crop, and hence such cruciferous weeds as—

Sinapis arvensis, Charlock,
" *nigra*, common Mustard,
Barbarea vulgaris, winter Cress,
Capsella Bursa-Pastoris, Shepherd's Purse,
Erysimum Alliaria, Jack by the Hedge;

and a great many species of the same natural order, most of which are troublesome as weeds, offer at the same time food, shelter, and a breeding nidus, in which thousands of the Haltica are augmented until the Turnip is ready for them, when they at once wing their flight, frequently in sufficient numbers to destroy the whole plant in a short space of time, so that the dictum of the poet—

" He doth take my life
" Who takes the means that doth sustain my life,"

is equally true of small creatures as of large; and this consideration should afford us an additional incentive to destroy weeds of every kind.

3d. The remarks just offered show one way of destroying or rather preventing the early broods of these insects; but a study of their natural history has suggested a special method which is worthy of earnest consideration—namely, that of passing over the young plants an apparatus smeared with tar or some unctuous substance in such a manner that when the insects make their spring—which they do the moment a shadow passes over them—they are entangled and destroyed. For this purpose we would recommend an implement made as follows:—A flat board about 4 feet long, and wide enough to take as much as two rows of Turnips at a time, to be provided with two light wheels, elevating the machine sufficiently just to escape the plant, and two bent handles by which it is held. This on being smeared below with tar, and used every two or three days during the critical period in the life of the young plant, will destroy myriads of these little pests, and do much towards saving a crop.

Now, if every farmer used this there is little doubt but that the mischief from the Turnip flea would be much mitigated, and it must be remembered that by thus destroying them one year we lessen their chances of increase for the next. Still simple as the apparatus recommended appears to be, and little as is the work that is involved in using it, any plan that can be devised to prevent the necessity of the repeated going over the whole of the crop in the manner indicated is much to be desired; would it not therefore be well to meet all the contingencies in the natural history of the Haltica in the following manner? Let each Turnip grower plant in some convenient spot about a quarter of an acre of Turnips perhaps a month before his field crops are sown, the result of which would be to collect all the insects from the wilder Crucifers to small isolated patches where they could readily be dealt with on the plan just explained. We can answer from repeated trials that such a patch in districts affected by the Haltica is immediately attacked, whether in the field or the garden; and if a simultaneous effort were thus made, we feel assured farmers would not have to deal with this creature in a serious way *for ever;* for by all working to the same end there is no reason why even minute creatures should not be exterminated as well as those of a larger kind.*

4th. The various expedients in sowing which have been adopted to prevent the ravages of this insect have been recommended from consideration of its presumed instincts and habits. Among these that of sowing if possible before rain, or with a water drill, in order to get a plant as quickly as possible, deserves attention, for doubtless a wet season at the time of the coming up of the Turnip is much to the advantage of the crop, inasmuch as the activity and locomotion of the insect is retarded, and not only so, but its breeding also, so that the plant can thus make good way under the most favourable circumstances and get strength before the arrival of the enemy; but it is by no means true that the Haltica attacks only the cotyledon or first leaves, for it not only lays eggs in, but feeds on the rough or secondary leaves; still any expedient that can be adopted to secure the first leaves from early injury is of great advantage, as if injured the strength of the plant is gone, and it cannot make head by developing the secondary leaves.

The preference shown by the insect for one form of plant before another may be observed in cases where the Swedish has become accidentally mixed with a crop of the common Turnip, the former usually escaping to a greater or less extent the injury done to the latter. This would indicate the advisability of sowing alternate rows of Swedes and common Turnip, with the avowed object of destroying the latter to save the former; and, again, in the case of common Turnips it may be worthy of observation whether the White Mustard is not preferred to it, and, if so, this would do for the alternation of rows. In fact much observation is still required in order to arrive at all the facts of the case before us, but whatever may be the result of future inquiries we cannot for the present adopt a better plan than that which will *destroy* our enemy, to which end the expedients which can be adopted in sowing seem to be very inadequate. Here then in dealing with the *Haltica nemorum* observations tend to the following conclusions :—

1st, That by frequent ploughings and the encouraging of insectivorous birds the parents of the year's produce of insect life are materially lessened; 2dly, That by destroying Cruciferous weeds we get rid of the spring breeding places of the first broods; and 3dly, By the adoption of plans recommended for the destruction of the latter ones, the enemy may be destroyed before his favourite food is ready for him.

These expedients, however, are such as require to be adopted by all, and considering the enormity of the evil and the cost and heavy losses caused by even such a minute creature as the Turnip flea beetle, it might be further recommended that a Society of Observers should be formed to notice, report, and discuss upon the subject, which is no trifling one, in order, if necessary, to influence the universal adoption of such remedial measures as may be deemed necessary.

* We believe a plan similar to this was first proposed by that excellent entomologist Mr. Curtis as a means of saving individual crops, but if universally followed its effects would be universal.

LABOURERS' WAGES IN IRELAND.

Our Secretary, as one of the Poor Law Commissioners, has been lately called over the coals by a Roman Catholic priest for their annual report to the lord lieutenant, this report having stated that the pauper population of the poor-houses had greatly diminished during the last year, and that there is every reason to hope that this decrease is connected with a material improvement in the condition of the labouring classes, arising from a higher rate of wages and a more continuous state of employment; that able-bodied labourers can now obtain 1s. a day for each day's work, the decrease in the agricultural labourers having been caused by an emigration of some of that class.

The priest states that the population of Ireland ought, but for unjust and landlord legislation, to be from 12 to 16 millions, and that it is not so much kept down by emigration as by the want of proper nourishment, clothing, and lodging; that from these causes alone hundreds of thousands annually perish under 15 years of age (he might have added that the growth and strength of the survivors are much deteriorated by them); that these wants are consequent on the insufficient wages paid by farmers and other employers. Without admitting for a moment the justice of attributing this state of the people to the "oppressive and inhuman treatment" of the Irish landlords towards the tenant farmers and labourers, as asserted by the priest, in denying the means of support to the Irish people, all who know Ireland must acknowledge the truth of this statement of their sufferings and deprivations as still existent. On the philanthropist, on the patriot, and on the political economist this state of things in so fair and naturally productive a portion of the empire lays claim to consideration, nor, as an agricultural country deriving all her resources from the product of the land, should it be without interest to the landed proprietary.

How landlord legislation or landlord influence can cause a low labour market I think the priest would be puzzled to show, and, indeed, I think, excepting in some few instances, he would find it difficult to prove that the landlords of Ireland are oppressive or inhuman; certainly their rents, although felt too high under the present agricultural economy, for any rent would be so, are not excessive, compared with England and Scotland, neither are the local or general taxes; yet the wages of agricultural labour are plainly too low for, not the comfortable but the most sordid support of the labourer having a family, and yet, low as these wages are, the farmer finds them a burden he can scarcely meet. But if the priest has allowed his feelings to carry him astray, surely the report of the Poor Law Commissioners does not savour of sound judgment. There is improvement certainly, for when the worst has been reached amendment must succeed; there is certainly improvement in wages in the increase from 6*d.* or 8*d.* a day to 1*s.*, and there is a more regular employment from the diminished number of labourers from emigration, yet the number is still more diminished, I am afraid, from the effects of the late famine, but it is very doubtful "that there is a material improvement in the condition of the labouring classes," except in the case of single men, with whom the higher wages tell, for the labourer with a family was probably better off in days of yore at 8*d.* a day with the Potato ridge to go to, the rent of which was, in part at least, liquidated by the gentleman he hospitably

entertained in his kitchen on the refuse from that ridge, than he is now with 1*s.* a day, and no recourse but to a high market, where that 1*s.* is barely sufficient to supply him with Indian meal, leaving him nothing for condiment. The fact is, he was formerly a capitalist to the amount of his year's provision; he had his own seed, he paid at the highest 5*l.* an acre for his manured Potato ground, which, at a moderate average, would yield him six tons of Potatoes: this would give him 2½ stones a day—about enough for the support of a small family, and the labour of half his time or three days in the week paid the rent of it.

The rate of wages has then increased, but with this increase the expense of subsistence has more than kept pace. It is, however, to be expected that gradually a return to conacred Potatoes will obtain and, if they come to be depended on, this small increase in wages will tell in favour of the labourer, and then the prophecy, for it is yet only a prophecy, of the Poor Law Commissioners will be realised.

But why cannot the farmer afford his labourers wages approaching somewhat to those of England and Scotland with the markets of those countries open to him, and his home market perhaps not lower than the markets of country towns in England and Scotland, with lower rents and less taxes, with a superior soil to work on? We cannot with the priest lay it to the door of the landlords or legislation; we all know how few are the ills this can cure, and it is rather sins of omission that we may charge to landlords than commission. They very rarely provide the necessary homestead accommodation, and they are not sufficiently watchful in preventing the deterioration of their lands at the expiration of leases, so that the incoming tenant to land that has fallen into the landlord's hands is at cost, but then leases in effect seldom expire, for a tenant who can and does pay his rent is scarcely ever called upon to surrender his holding; indeed, it is a very common and certainly an indulgent practice to allow a tenant who can no longer pay his rent to dispose of his farm to another who will pay up the arrear, and for a few years make a better hand of it. Very few landlords press hardly on industrious tenants, and very many assist them. A farmer in Ireland with capital and intelligence instead of being injuriously interfered with by his landlord is very agreeably situated, for he is unshackled and uncontrolled in the entire management of it, and has as free and unrestrained use of the land as though he were proprietor of it; his crops are not injured by his landlord's game, for there is but little. It is not then from landlord interference that he is unable to pay better wages to his labourers; nor is it to be imputed, as too commonly it is, to a reckless expenditure on his part, for whatever may have been the character of an Irishman in former days, it now perhaps approaches too near to a parsimonious one; the days of a riotous hospitality are extinct. In Irish rural life the public-house is not regularly frequented as it is in England; the newspaper although read with avidity is not found there; the peasant does not go there to spend his evening in the enjoyment of politics in a pot; he falls in, accidentally meets a friend—it need not be a very intimate one—treats him to a glass; the treat must be returned, and very frequently it ends in intoxication—sometimes in kisses, at others in blows; but the excess of the evening rarely interrupts the labour of the next day. But why cannot the farmer pay higher wages to his labourers? It is not the legislature, it is not the landlord, it is not always poverty, for the rich and the poor equally grudge the labourer his reward; the labourer in return grudges his labour; this has become a habit and a mutual complaint, and cannot be quickly broken into by a liberal employer or an honest labourer: but an all prevailing cause, I think, is to be found in the little estimation of labour, in the under manufacture of ground, and in the small returns afforded by ignorant, deficient, and erroneous cultivation; the mildness of our green winters very much precludes the necessity for the confinement of stock or the raising of winter food for them, a very small breadth of land is therefore under cattle crops, and very little more manure is made than the Potato crop uses up; nothing then can be grown as intermediate with grain crops, and the consequence is grain crops are grown in succession till they do not pay the rent and labour of the ground they stand on; this exhausted and dirty ground is then left waste, as they very properly call it, for three or four years till it recovers some fertility. In the meanwhile it just keeps alive some wretched kind of stock, while its rent and taxes must be defrayed out of the productive land. Can we wonder then that the farmer cannot afford to pay higher wages to his labourers? *J. M. Goodiff, Scrably.*

ON STORING TURNIPS.

There are only two places on a farm where Turnips can be conveniently stored—that is, at the homestead, and in the field; and as each plan must be worked on a different form, I shall here notice them separately.

1st. *Storing at the Homestead.*—I prefer storing as many here as will last for six or eight weeks. The store may be erected in any convenient place about the stackyard, or as near the byres as possible; of wood, of an oblong shape, from 6 to 7 feet wide, to give room enough for a cart, and 4 feet high. The sides consist of two rows of posts, pitted in the ground about 6 feet apart, and made close between with backs of trees, or any old wood that may be at hand: for the sake of convenience, the store should be erected piecemeal, as the process of filling it goes on. Where wood is scarce, the Turnips may be laid down in an oblong ridge, about 7 or 8 feet wide at the base, and sloped off to the top on an angle of 45 degrees; the whole should then be thatched over with 6 inches deep of straw: old thatch from the ricks might answer well enough for this purpose, fixed down with wooden spars and straw ropes. In stores of this sort the keeping of the Turnips depends much on the state of the atmosphere shortly after storing. I have sometimes seen a week or two of misty soft weather prove hurtful in heating the Turnips; but some wooden ventilators, placed at regular intervals in the heap, are likely to prevent such an occurrence. Another safeguard is to make the heaps small. These two modes of storing involve about the same expense—8*s.* an acre, exclusive of carting, which depends on the distance, and in no case have I taken it into account. I should not, however, like to risk large quantities of Turnips in this description of stores, and, for spring use, I have always stored them in the soil, where they keep better, and lose less of their specific gravity. I have tried them on the steelyard before and after being stored in the soil for five months, and found the loss in weight to be very small. Not so with the thatched stores, particularly in a very dry windy season, and when left standing till spring. I then found the loss in point of weight to be very considerable. It is therefore desirable that all Turnips for spring use should be stored in the soil; and I shall next describe the modes I have used in doing so.

2nd. *Storing in the soil.*—Take a space of twelve drills wide, from end to end of the field, and pull the two centre drills, throwing the Turnips aside; along these drills turn out a heavy plough-furrow, first in the one direction and then the other, thus clearing a hollow from 10 to 12 inches deep. Into this hollow throw the twelve drills of Turnips, and trim them up in a uniform ridge, when a double turn of the plough, with little assistance from the spade, will cover them sufficiently from frost and vermin. In this way I have found Turnips keep better, and less loss of weight, than in any other way I have tried. The only objection to this plan is the length of time occupied in taking them up, and in wet weather it is difficult to get them anything clean. Another plan I have frequently adopted is to pull the twelve drills, and lay them in three rows, of four drills each, which can be done without hindrance in the process of pulling; then collect them into the centre row in round heaps of about one cart-load each,—and where the crop is good, the distance will not be far to bring the Turnips into heaps of that size: a slight covering of mould, from 3 to 4 inches deep, put on by the spade, will in general be found sufficient protection. The roots keep well in this way; and as they can be taken up more speedily, and cleaner, than from the last-mentioned stores, I am most in favour of this plan. The former mode costs 9*s.*, and the latter 9*s.* 6*d.* per acre. The cost of storing per acre, in either way, will to some extent depend on the nature of the crop and the rate of wages at the time; but the foresaid prices are an average of what I have paid by contract for several years back, when the work was performed by men, and if it could be done by boys and women for 10*d.* or 1*s.* per day, the expense might be somewhat lessened. But as labourers of that sort are often difficult to obtain, and the season for storing short and precarious, it is perhaps better to do the work by contract at once, and have it finished in due time, even at a small additional expense.

I now proceed to the second division of the subject—viz., the results deducible from observation and experiment, in order to test by experiment the comparative feeding properties of Turnips stored in November, and those drawn from the field during the winter and spring months as required. At the end of November, 1854, the necessary quantity for the experiment was stored in the field in heaps or pits, as before described. They were of the best Golden Yellow variety, of a deep orange colour, and in point of quality may be classed next to the Swedish Turnip. On the 28th January, 1855, I had eight cattle, coming two years old, crosses between the Aberdeen and short-horned breeds, selected for the experiment. They were weighed on the steelyard, and divided into two lots, as nearly equal in weight and quality as the circumstances would permit. One lot was then tied up on the stored Turnips, and the other on the same kind of Turnips pulled and drawn from the field, load by load, as the cattle consumed them, all clear of tops and tails. The stored Turnips were also brought from the field as required in the same manner. The feeding-byre was roomy and well ventilated, and contained four double stalls, two for each lot, so that the animals were kept perfectly separate, and enjoyed the same freedom, comfort, and air—the byre being, as nearly as possible, kept at a temperature of 48° Fahr. Both lots of cattle received equal quantities of Turnips daily, nearly as many as they could eat, with Oat straw *ad libitum*, for a period of 84 days, when it was found they had consumed 28¼ tons of Turnips, or an average of 95 lbs. per day to each beast. From the 20th October till they were tied up, both lots of cattle were fed in loose sheds, four and four together, on headed Turnips and straw; the first six weeks on White Globes, and the rest of the time on Golden Yellows. I might have tied them up earlier, but certain circumstances prevented this. Up to the time the experiment commenced the weather happened to be soft and fresh; and in that case, and at that season of the year, it is likely that little difference would have arisen in feeding on Turnips from the stores or from the field. The experiment, however, just began with the bad weather, and continued through two months of very severe frost and snow and a month of dry windy spring weather, both of which were surely well suited for testing the effects of stored Turnips. A reference to the following table will show the result of the experiment, and strongly indicate that the period of trial was quite long enough for the unfortunate animals that were fed from the fields from day to day.

Table showing the results of four cattle fed on stored Turnips, and the same number fed on Turnips drawn from the field as required, during a period of 84 days.

Lots.	No.	Description of Turnips.	Weight on January 28.			Weight on February 25.			Weight on March 25.			Weight on April 22.			Increase of weight during the experiment.			Increase of weight on each lot in experiment.

		Balance in favour of stored Turnips																1	0	7

The cattle were always weighed at the same hour of the day, and immediately before being fed, at 1 o'clock p.m. The Turnips were grown on good sharp black soil, chiefly with farm-yard dung, and yielded nearly 20 tons of Bulbs per acre, fresh and free from disease. It may be expected that the animals would have increased more in weight in three months' time, but it must be remembered that young growing cattle do not gain weight in the same ratio as they do size. The above table gives results sufficiently favourable to prove the propriety of Turnip storing, showing an increase of animal weight of four young cattle, in the space of three months, of 119 lbs. in favour of the stored Turnips. Besides this, the healthy appearance of the cattle in lot No. I. presented a striking contrast to those of No. II., being sleek and fresh in their coats, and better down in the bellies; whilst No. II. were dry in their coats and lanky in appearance. Altogether there was a marked difference of appearance between the two lots, such as a stranger acquainted with cattle would easily perceive on entering the door of the feeding-byre; and I believed lot No. II. to be farther back than the difference of weight indicated. By the damage done to the unstored Turnips, in pulling them from under the snow, and the mischief by vermin, &c., lot No. II. had 1 ton more Turnips, wasted and destroyed, in order to supply them with the same quantity as given to No. 1., being equal to the produce of 8 poles of land, or one-twentieth part of an acre, which, at 7*l.* per acre, would be an item of 7*s.*—fully adequate to store three-fourths of an acre of Turnips. *Prize Essay by Mr. Porter in the Highland Society's Transactions.*

Home Correspondence.

Dairy Produce.—Having seen in your Paper different accounts of the quantity of dairy produce from several of your correspondents, and lately "Devonshire" stating the quantity of butter made in a year from one cow to be 13 dozen, I will give the produce of three cows from March 1st, 1851, to March 1st, 1852:—Weight of butter 714 lb., skimmed milk, sold at three imperial pints for 1*d.*, 24*l.* The cows were fed on Grass and hay only. *Anon.*

J. D. Piper's Balance Sheet, 1854.—The 10th year of Wheat after Wheat, without ploughing or digging.

All this on ground not at all calculated to grow Wheat, but very much inclined to grow Thistles, Twitch Grass, Black Grass, Coltsfoot, Simson, Bell or Land bine, Cats Tails, and wild Oats; besides about 100,000 Ash trees (at least they would be if I did not hoe them up), per acre. There are also 50 timber and other trees to the acre. *J. D. Piper, Colne Engaine.*—This is a very fine story Mr. J. D. P., but "your field is a garden." Very well! I grant it is, and if every large farmer would

divide his large fields into small ones, say one or two acres each, and cause 50 timber and other trees to grow between all the divisions, he would have just as good a garden as J. D. P.

Garden Plants as Food for Horses, Cattle, &c.—Your correspondent's remarks upon the Everlasting Pea being likely to afford food for horses are worthy of consideration. I find these animals at Grass will eat it; but then the fact of having only a very limited quantity to experiment with cannot be very conclusive, and although this plant with me grows from 6 to 8 feet high, it is no result to base a general estimation of what a crop would be if the plants were grown at suitable distances over a field. In the spring of 1853, I raised from seed two plants, which however grew that year about 18 inches high, with perhaps three or four stems each plant. These came up strongly, and grew vigorously the next year, running up into a shrub and attaining a height of at least 6 feet, bloomed and seeded profusely. Well-fed poultry eat the Pea, but not voraciously. This season the Pea has been offered to young golden pheasants, which devoured them more readily. Yet I think there is a plant which possesses better qualities, and is greatly preferred by both horses and poultry than the Everlasting Pea—I refer to the Jerusalem Artichoke (*Helianthus tuberosus*). In 1854 were planted in a part of a horse pasture about 100 roots and well railed round. After they grew up the wind enabled the horses to get a taste, and such was their fondness for them that the fence was broken down by them, when the stems were all eaten off to within 18 inches of the ground, that is, devouring at least 3 feet of the top. This fence was repaired and the stems branched out, when the horses, by incessant rocking the rails, broke in again, and in a very short time consumed the whole. As might be expected the crop of tubers was not great, and these in size were small. This last week I have taken from the garden stems upwards of 7 feet high, and given them to two horses; these stems were at the root end about an inch in diameter; at first the leaves and about 3½ feet at the top of the stem was eaten greedily, but afterwards were returned to and munched up to within 18 or 20 inches of the rooty and woody end. I have since cut up a few stems with a knife into about inch lengths, and find that then the whole is eaten: It would no doubt soften if scalded or boiled, and might thus be made very available. I may say that the horses have very little to do, are in a most excellent pasture with abundance of Grass, get very little corn or hay; yet these Jerusalem Artichoke leaves and stems would be a change of food, and too sanguine a deduction should not be hastily drawn from so limited a trial. These same horses, however, last year eat the dried leaves and part of the tops of the dried stems which were cut down after they were dead and dry. The tubers are much relished by both horses, poultry, and golden pheasants. In conclusion I may state my belief is that the Jerusalem Artichoke might be made very valuable as a food for horses, and the stems could be cut up in the ordinary chaff-cutter, and might afterwards be bruised. If the stems were chiefly looked to for a crop they might be cut down during the summer when young, and not so woody, and they would branch out again for a second cutting. It would be futile to estimate the probable production of such a crop if grown in quantities from the small patches they are now raised in in gardens. Holcus saccharatus thus sown last May in the garden in a bed 10 feet by 4 feet is now 5 to 6 feet high, with a stem better than half an inch thick at the root end. Horses are fond of both the leaves and stem, and I think even if grown in considerable breadth would produce a heavy crop of horse food. A few plants cut down less than two months ago have sent up young shoots; it has not shot any spike yet, although it is found enveloped in the top leaves. *Weardale.*

The Mole.—Allow me to beg a corner of your agricultural paper to speak in favour of a very useful but persecuted and proscribed race of beings—the sheep master and park-keeper's best friends—namely, the moles. On the sheep walk or park the mole should never be destroyed, for where this has been done the sheep have been subject to that tiresome and infectious complaint the foot-rot, as well as more subject to diseased lungs, commonly called the rot; and deer are also very liable to the same complaints as sheep. Even in wet meadows the moles do good service by draining the ground, and if the loose earth they throw up during the winter be dispersed and bush-harrowed in the latter end of April or beginning of May, it will not be offensive to the eye or the scythe, as little or none will be thrown up during the summer. In lawns and gardens they are mischievous, and must be got rid of; but in other places they are of the greatest service, not only in draining the ground but in destroying the wireworm and May bugs. No educated farmer would destroy a mole, except in lawns, gardens, or arable fields. *Talpa.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Monthly Council, *November 7.*—Lord Portman, President, in the chair. The names of 42 candidates for election at the next meeting were read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, reported that the current cash-balance in the hands of the bankers was 1048*l.* He also laid before the Council the Committee's monthly report on the accounts of the Society, along with the usual quarterly balance-sheets.

Carlisle Meeting.—Mr. Simpson, Senior Steward of Cattle, and Mr. Fisher Hobbs, Senior Steward of Implements, made reports connected with their respective departments at that meeting.

Trial of Reaping-Machines.—Mr. Raymond Barker moved, and Sir John Shelley seconded, a cordial vote of thanks to Mr. Miles, M.P., for the liberality with which he had placed his crops, as well as his men and horses, at the service of the Society, for the subsequent trial of the reaping-machines selected at the Carlisle meeting; and for the kind hospitality with which he received at Leigh Court on that occasion the various officers of the Society connected with that trial.—Mr. Miles acknowledged the compliment so handsomely paid him by the Council, and he expressed the satisfaction it would at all times give to promote in any way the objects and welfare of the Society.

Chelmsford Meeting.—Mr. Fisher Hobbs, as connected with the local authorities, called the attention of the Council to the necessity of every requisite arrangement being made by the Eastern Counties Railway Company for the accommodation of visitors, and the reception of stock and implements at the Chelmsford station.

Paris Show.—Mr. Evelyn Denison, M.P., English Commissioner at the Paris Exhibition for Agricultural Implements and Machinery, transmitted an interesting report of the results of the trials, and of the very important step which, he considered, had been taken in France by the change of duty on English agricultural machinery imported into that country.

Mr. Herbert, Consul-General of France in England, transmitted to the Council a supply of the prize-sheets of the exhibitions of breeding stock, and of agricultural implements and products, to be held at Paris in 1856 and 1857: these prize-sheets containing new and enlarged classes for the different breeds of English live stock. The Consul-General has further favoured the Council by stating that by the imperial decree of the 29th of August last, officially published at great length in all its details in the *Moniteur*, and modifying the import duties of machinery, implements, &c., the following rates have been fixed for *agricultural* implements:—

Agricultural machines (not including steam-engines)	15 francs per 100 kilog.
Reaping-machines	120 francs per 100 kilog

(Or, in English value, 6*s.* per cwt. for the first class, and 48*s.* per cwt. for the second).

Mr. Miles, M.P., took that opportunity of briefly stating the satisfactory results of the Society's deputation to Paris, of which he, as the President of the Society, had been the head. As soon as the details were completed he would lay the report before the Council.

Trustee.—On the motion of Mr. Milward, seconded by Mr. Jonas Webb, Lord Berners was unanimously elected one of the Trustees of the Society, to supply the vacancy created by the lamented decease of Mr. Pusey.

Mr. Pusey.—On the motion of Lord Portman, seconded by Colonel Challoner and Mr. Raymond Barker, the following resolution was carried unanimously:

"That a letter be written to the family of the late Philip Pusey, Esq., expressing the gratitude of the Royal Agricultural Society of England for his services as Chairman of the Journal Committee; and their great sorrow for his early death. That it be engrossed on vellum, and signed by the President, with the seal of the Society attached."

Implement Makers.—On the motion of Mr. Ransome, seconded by Mr. Garrett, a conference between a certain number of the Implement Manufacturers, who were exhibitors at Carlisle, and the Implement Committee of the Society, on certain points affecting the future regulations of the implement-department at the Society's country meetings, was granted by the Council, and fixed to be held on Wednesday, the 5th of December, at 1 o'clock.

Numerous communications, received from the Foreign Office, were referred to Prof. Way; and for these, and other miscellaneous communications, the thanks of the Council were ordered, when the Council adjourned to their Monthly Council on the 5th of December, and a Special Council (for any overstanding monthly business) on the 12th of December.

Peterborough.—Mr. Whitwell in noticing the present prices of corn, said the farmers could not help the prices being what they were. Who could say that there was any holding back of corn at the present time? Who could say that there were any artificial prices of corn at this moment? With regard to the crops of this year, although there was a slight failure in the fens and on the light soils, he considered there would be sufficient corn to maintain the country. There was a deficiency abroad, and it was that which had caused the present high prices of corn. In reference to the operation of free trade, he did not think it had done any harm to the farmer. There might be some little distress amongst them still; but, generally speaking they had now recovered from the distress they had suffered some time ago. Reference was then made to the necessity existing in farming for intellectual ability. There was not a single department in agriculture which did not tax the mental energies of the farmer, to the utmost. Take the breeding of stock, for instance. How many things were to be looked at and considered, if any one would succeed in that department. Then, as to manures. Why, they were regularly besieged with all manner of things which were offered to them as manures; and they needed to be very careful, or they would be greatly cajoled out of their money for all sorts of stuff. Then, again, as to machinery. He did not wish to offend their mechanical friends who were present, but really if they went into the shops of those gentlemen, they would try to persuade them that a whole shop-full of machinery was absolutely necessary to them. Machinery was necessary—if the farmer would supersede manual labour, he must have it. By its means the farmer was now rivalling the manufacturer, not only in the excellent manner in which they dressed and turned out their corn, but in the precision with which they did their business. After referring to the landlord, tenant, and labourer, Mr. Whitwell remarked that they were all learners in an inexhaustible study. If they took one step forward, they found they had two more to take; but they must press on, and continue to advance.—Mr. Bird gave the meeting a short account of what he had seen in a journey through France and Belgium during the summer. He did not think the farmers of England need fear anything from their continental neighbours. In Belgium he found farming was middling, but in France it was very indifferent. He saw very few horses in the fields; the work appeared to be done mostly with the old cow or a few beasts here and there, but rarely any horses. He also observed that there were very few men engaged in husbandry, chiefly women being employed, and the work was continued Sunday and working day. He saw ploughing, carting, &c., going on on the Sabbath just as on other days. Mr. Bird visited the Paris exhibition, and spoke to a gentlemen he met there about the English machines. That gentleman told him that they could not do much with the French, as the English machines were too complicated for them, they could not manage them. As to stock Mr. Bird saw very few. In a journey of 800 miles he did not see 800 sheep, and not 40 beasts; he did not know how they kept them during the winter, for in his journey of about 1000 miles he did not meet with an acre of Swedes—he saw about a rood. He thought he liked old England best, for as soon as he got here he found quite a different state of things. But he must say—and he lamented to say—that there was still a great deal of land in this country which might be greatly improved; a large quantity of land here might, he believed, be made to produce much more than it did. He did not think that Englishmen were idle, but they must do more than they had done, and keep their lands clean, and they would have better crops.—Mr. Yeoman must refer to a remark of Mr. Whitwell's. That gentlemen had said that the farmers had been trampled upon, but he did not say how or by whom. Having said what he did, Mr. Whitwell ought to have gone further. Now, if a man entered upon any business, he ought first to ascertain upon what terms he was to take it. So a farmer, on taking a farm, should first see what were his prospects. If he took a farm, supposing that Wheat was going to maintain an average price of from 80*s.* to 84*s.* per quarter, he would find himself very much mistaken, and he would be to blame to take a farm on such terms. Again, if he thought his landlord would take advantage of the high prices of corn and raise his rent, he ought to have a lease. A man ought to have unbounded confidence in his landlord, and if he had not, the farmer was to blame. He thought the fairest way was to take the average price of corn for a number of years, and base the rent on that *datum.* They knew that a short time since Wheat was selling at a low price, but now it fetched a high price; and he would ask, if the landlord did not lower his rents when corn was low, why should he raise them now corn was high? He expressed his opinion that the interests of the landlord and the tenant were identical, and sat down amid much cheering.—Mr. Whitwell had referred not to landlords, but to free trade, when he said the farmers had been trampled upon. While he was himself a free-trader, yet he thought the farmers had been trampled upon by the suddenness with which the change had taken place.

Watlington.—At the late annual meeting of this Society, the Rev. J. Clutterbuck spoke as follows:—There never was a time—at least, within his own recollection—when there was more necessity for forcing the productiveness of the soil to the fullest extent than there was at the present moment. A great moral obligation was therefore resting upon them, as men, as Englishmen, and as British farmers; and he really did believe the farmers were at the present time doing their utmost to increase the productiveness of the earth, and he believed that, in doing so, they were not only looking at it through the narrow view of their own pecuniary self-interest, but that they had at heart the great interest of the people of this country. A little time ago—a time that was in the lively remembrance of all present—the agricultural interest passed through a phase of considerable depression. There was a time when the agriculturists of this country were wont to be told that people did not care whether he produced corn or not, for they knew who would; but he would like to know if any man dared now to put aside the diligence and intelligence of the agricultural community. He said no man would do so. If they looked at France, what would they find? They would see that the all-absorbing subject in that country at the present time—one which almost rose above the general joy of the people at the capture of the Malakoff and the fate of Sebastopol—was with reference to the necessary supply of food during the coming winter, because, according to the official returns published in the *Moniteur*—which spoke not like a

newspaper in England, but emanating from the great source of power in that country must be regarded as a declaration of what was likely to occur, so far as human calculations could go—and from that statement, issued on the authority of the French Goverment, it appeared that there would this year be a deficiency in their production amounting to at least one-tenth of the wants of the population, and the question arose how was that deficiency to be supplied? This was a subject which created great anxiety in France; and they said, "We must stop all exports, and do our best to promote imports from every quarter." That was the state of things now in France—in a country from which we were a little time ago drawing a large portion of our supply. He was only too glad that, under the pressure of that news from France, the English markets had not risen so much as might reasonably have been expected. In saying that, it was not that he did not wish the agriculturists might not continue to receive full prices for their corn, but he was sure that they would all be ready and willing to acknowledge that there might be prices of corn which were too high. He said, then, that there was a great obligation resting on the British farmer. No man twitted them by saying that they could do without them, but they patted him on the back, and called him a downright good fellow. The farmer had gone through a time of trial—he had shown that he was not to be beaten—and that with an increase of difficulties his energies had been called forth; and he (Mr. Clutterbuck) believed there never was a time in which the British agriculturist stood higher than he did at the present moment.

Reviews.

Agricultural Statistics: A Lecture delivered at Thorner. By John Hannam, Secretary to the Yorkshire Agricultural Society. Longman.

As the subject on which Mr. Hannam here writes has within the last few days reoccupied further attention, we may refer to this pamphlet as a successful discussion of the grounds on which statistical inquiries into the food supply of a country may be defended—if defence be necessary.

"The people of this great country," says Mr. Hannam, "(and lamentable hath been the result in the sister country,) have been taught to shut their eyes, and open their mouths, and see what Providence would send them; while the farmer has visited the markets, with no more idea of the supply he must compete with, or the price that his commodity was really worth, than if he were vending his produce in the planet Jupiter.

"No one ventures to deny the important uses which information of this sort would serve. The politician laments his ignorance of the real extent of the resources of agriculture; the land owner is similarly in the dark as to the true position of the interest in which he has so large a stake; the minister admits the value of the information which such facts convey. Yet, still, we have them not. Legislation, however, has gone on. The man profoundly ignorant of the annual wealth produced by agriculture, speaks with the greatest confidence of its high importance, or its absolute insignificance, to the general welfare of the country, as the case may be, and without the slightest misgiving as to the truth of his opinion, declares that England is not an agricultural country, and ought never to grow a blade of corn; or that its agriculture is at once its pride and its profit—alike the producer of the materials of art, and the source of the physical power which manipulates those materials. In fact, ask in St. Stephen's, What is our growth of food? and mark the answer. Let Mr. Hoskyns reply. 'You can be told,' says he, 'every bale of calico that leaves the country; every box of gloves or yard of lace that enters it; you can hear how much tea, coffee, sugar, and tobacco is consumed in the United Kingdom; but what is the growth and what is the consumption of corn? The nearest weathercock might be appealed to with about as much expectation of a steady answer as the sources which exist, and are usually taken as the data for calculation. Guess what you please, between 12 and 25 millions of quarters per annum, and you will have some statistician or other on your side. 'Nihil sic impar sibi,' might be taken as the motto of all.'"

Again:—

"It is, however, principally from its influence upon the price of agricultural produce, that the system recommends itself to the farmer and the public. To both, the sudden fluctuations in price are injurious; they benefit few, and injure the many. The farmer who sells regularly seldom obtains the maximum price; while the speculator waits for it. A variation in prices is in accordance with the nature of things. Crops are affected by many things beyond the farmers' control. The vicissitudes of seed-time and harvest, unfavourable climates, blights, insects, affect the amount of produce. Bad crops are not always the consequence of bad farming. Consequently it is proper that the consumer should assist in meeting these losses by an increase of price.

"This is legitimate rise and fall, springing from real demand and supply. By the absence of any statistics, speculative 'ups and downs' are encouraged. The market is open to be moved by any rumour; and when there is a real cause for a rise in the price, the poorer farmer has too frequently sold his produce. He learns that our crops cannot supply the markets, when it is too late. Agricultural Statistics, then, would enable him to attain to a reasonable approximation to the quantity forthcoming; and he would fix a price accordingly. The population of the country being determined, its wants are easily determined. Only let us know the comparative quantity of grain sown; its probable yield in comparison with the previous year; and we should soon—with the information we possess, and allowance being made for the supply from abroad, and the increase of demand at home—fix what should be the year's price of corn. And if we have confidence in our knowledge, we shall expect what to a certainty will happen, to realise our price. The true facts of the market may not, at first, be understood by all. Hence, the year's price will not always be attained immediately. But a few years will make the whole population, when they see the returns, able to predict the range of prices. Happy certainty! How different now! From want of real data, the grower is made a speculator; and, without information, he gambles in the dark; while his best customers,—the capitalist, the miller, and the corn-dealer,—are prevented from trading, further than from hand to mouth, for immediate demand."

Mr. Hannam relates his own experience on this point:—

"As a case in point, I may mention, that during the harvest of 1846 I bought by auction a stack-yard for upwards of 600*l.*; and, in order to realise a small profit by eating the straw with cattle, I commenced thrashing immediately and regularly during the winter. My first sale was White Wheat, at 16*s.* 6*d.* per three bushels, or 44*s.* per quarter. My last sale was the tail Wheat, at 32*s.* per load, or 85*s.* per quarter. Having no statistics to appeal to, I could form no reason for imagining short supplies; and thus, by realising 60*l.* for eatage, I lost 600*l.* in the price of the grain."

Independently of the national and commercial value of statistical information on our agricultural products there are the advantages to the agriculturist himself derivable from a knowledge of the farm practice of the whole country.

"Thus," says Mr. Hannam, "even the returns which have been made of the statistics of Scotland, and of this district of Yorkshire, which are just published, present features of interest to the farmer. For example, we learn that the acreage of crops in Scotland is as follows:

Wheat ...	168,266	
Barley ...	207,507	
Oats ...	932,994	
Rye	3,809	
Bere ...	18,118	
Turnip Seed	1,429	1,332,073
Beans ...	37,702	
Peas ...	6,169	
Tares ...	13,442	
Flax ...	6.670	63,983
Turnips ...	433,915	
Potatoes ...	143,032	
Mangold ...	1,946	
Carrots ...	1,218	580,111

Fallow ...	26,128	26,128

From this we gather that in each year there are 1,332,000 acres in white crop in Scotland, while in Turnips and fallow there are 606,000 acres, and in seeds 1,400,000, or a total of 2,006,000 acres fit for a crop the ensuing year, independent of 26,000 acres of Bean and Pea stubbles; a state of cropping which certainly illustrates the high position hitherto claimed for Scotch agriculture. There is no cross cropping! If, however, we take half the seeds in rotation, say 700,000, which is as much as would be ploughed in one year—by adding it to 600,000 acres of Turnip and fallow land, we have 1,300,000 acres of the quantity of land fit for sowing. And this is the exact quantity which the statistics show us is sown.

"It is clear, therefore, that at least 700,000 acres remain under Grass every year, after the full crop of white corn is sown. The great quantity of seeds which stand for two years, indicate that the soil is not naturally fertile. Upon good soil, crops of corn can be grown on one year seeds. It would on such be a great loss to lose a year, and by that means make the next grain crop too luxuriant to be safe. This great breadth of Clover and seeds, however, perhaps partially arises from the large proportion of such which is mown for hay and for seed. While this quantity is kept up, it is quite evident that the fertility of the farm is safe. It will not diminish, but it does not increase. Nevertheless, by mowing less, and by grazing with sheep for one year only, along with the use of artificial food upon the land, and a still more liberal employment of portable fertilisers—Scotland may exhibit it in her returns, a much larger average of Wheat, as well as an increased average of bushels per acre, that she shows at present. Indeed, it is clear that the soil upon which grain crops can be safely grown after two years seeds, upon the system of one year old seeds, will bear the addition of artificial food and manure. And by regulating this application judiciously, an increased breadth of grain will be grown; and, in many instances, an increased quantity per acre obtained at the same time. The total acreage of Wheat grown in Scotland, and the average per acre of the crop—both much less than was anticipated—justify this reasoning. The fact of 26,000 acres of bare fallow being all that Scotland has of her arable soil unproductive, is a triumphant proof of her agricultural energy. How it tells of Scottish perseverance!

"Contemporary with this, the statistics of a division of this county—the one in which we are residing—have been published. Thus we learn that we have in this division of the West Riding 615,000 acres, which is in crop as follows:—

Wheat	78,549	
Barley ...	45,650	
Oats	29,336	
Rye	1,488	155,023
Beans and Peas	12,895	
Vetches... ...	2.194	15,089
Turnips	40,492	
Mangold ...	528	
Carrots ...	127	
Cabbage ...	2.692	43,839
Bare Fallow	24,041	24,041
Clover, &c. ...	48,046	48,046
Permnt. Pas.	148,655	
Meadow ...	26,000	
Sheep walks...	7.156	181,811

Houses, roads, fences ...	14,526	
Waste	14,611	
Wood	26,622	
Commons ...	40,471	
Farms less than 2 acres	5,140	
Not accounted for	30,633	131,805
Horses	21,229	
Colts	6,342	
Milk cows... ...	30,386	
Calves	17,995	
Cattle...	27,703	
Tups	4,052	
Ewes	93,388	
Lambs	100,109	
Sheep	65,431	
Swine	36,626	

"If we subject these figures to the same analysis as those of Scotland, we find that there are 286,000 acres under the plough, of which we have 155,000 in white or cereal crops, and 81,885 in green crops; in Pulse, 15,089; and in open fallow, 24,041; or altogether (considering Pulse crops to be intermediate or preparatory), 131,015 acres, strictly speaking fit to sow with white crop. We have thus an excess of 24,018 acres of white crop over the green crop and the Pulse crop combined.

"It is clear, therefore, there are many stubble crops growing in the district. It is true we are near large towns, and the heavy supply of manure may justify, in some measure, an expectation of more white crops than usual. But this excess is much too great to be thus explained; and arises as follow:—We have, in this district, 24,000 acres of open fallow-land, which we may set down as principally unfit for Turnips. This land is generally managed on the three course system; and will represent 72,000 acres of land, the principal portion of which requires draining. Two-thirds of this, therefore, will be in grain crop, *i.e.*, 48,000 instead of 36,000 acres.

Hence from ...	286,000 acres, the total arable land,
Deduct	72,000 acres, the quantity farmed on the three-course shift,
And we have ...	214,000 acres of arable land, which is farmed on the four-course shift.
And again, from	155,000 acres of grain crop, the total in the district,
Deduct	48,000 the acres in grain belonging to the 72,000 acres,
And we have ...	107,000 acres of grain growing on the 214,000 acres which is cultivated on the four-course shift.

And this is exactly half the total quantity of arable land—a most satisfactory position as regards cultivation, so far as the four-course land is concerned.

"Interesting as these comparisons are, and satisfactory as our position may seem, whether we compare the compare the yield per acre or the rotation, upon the land which is drained and under the four-course shift, the fact that out of 3,400,000 acres of arable land in Scotland, we only find 26,000 acres in bare fallow, while in a district of this county containing 700,000 acres, we find 24,000 in fallow, is a startling and significant one."

We recommend any who may have been startled by the speech of Mr. Packe upon the subject to read the lecture of Mr. Hannam.

Miscellaneous.

Irish Agricultural Statistics.—As compared with 1854, we have in 1855 an increase of 34,225 statute acres in Wheat; in Oats, 72,657 acres; and a decrease in Barley, Bere, and Rye, of 19,589 acres; or a total increase in cereals of 87,293 statute acres; and of meadow and Clover, an increase of 53,873 acres; but in Flax we have a decrease of 54,297. In green crops, from the operations last spring, we were not prepared for the announcement of a decrease of 8131 acres of Potatoes in the present year, as compared with 1854, but such seems to be the case. In Turnips there is an increase of 37,327 acres, but a decrease of 3683 acres of all other green crops, in which are included Mangold Wurzel, Beet root, Carrots, Parsnips, Cabbage, Vetches, and Rape, so that in 1855 we have, including grain and green crops, a total increase of 112,382 acres under tillage as compared with 1854. Considering our present state of affairs, being shut out from Russia for a large portion of the Flax necessary for our manufactures, the decrease in the Flax crops is much to be regretted, and in some degree unaccountable; but we strongly suspect the fault does not lie in any inability in our soil or our farmers to produce that crop, but may, in some degree, be attributed to the difficulty experienced in getting a sale for it in districts remote from markets, and in the fall in prices which took place within the last year, and therefore our farmers turned their attention to crops more marketable and consequently, more valuable, and until manufactories are brought within a reasonable distance of the producers, a practical stimulus will not be given to the cultivation of this crop. In the abstract which we present our readers, showing the quantity of live stock in Ireland in 1855, as compared with that of 1854, we find the total increase in horses of various ages amounts to 9607; in cattle, 58,715; in sheep, a decrease of 123,748; and in

pigs also a decrease of 168,325. As a matter of course, when considering the two returns and the large acreable increase in tillage of 112,382 acres, we must be prepared to hear of a corresponding decrease in stock; this accounts for the decrease in sheep, and also for the increase in horses, for we observe that while there is an increase of 3950 agricultural horses, there is a decrease of 1932 of those used for traffic and manufactures, and only 201 of an increase of those kept for amusement or recreation, the rest of the increase being in the young stock. Should the war continue, we must expect a further increase of tillage, and a decrease amongst the live stock, principally amongst the sheep, but we would entreat our agricultural friends not to overdo the thing, as, should a peace ensue, which we hope there will, they will not find it so easy to return to pastoral affairs—besides the land will have suffered some degree of exhaustion—to preserve an equitable balance between their stock and tillage lands, will in the long run pay best, and not only preserve their farms in a high state of fertility, but increase it. *Irish Farmers' Gazette.*

Calendar of Operations.

OCTOBER AND NOVEMBER.

FORFARSHIRE GLENS, *October* 31.—The fact that the grain produce of the country is deficient is already well enough known, so we need not dwell upon it further than to state, that this highland district is no exception to the general rule. What was sent us is now all secured, not however without some deterioration; a considerable portion was still exposed when the weather became unsettled early in October, and was less or more injured either on the stock or stack. The deficiency of straw is at present more apparent, and also more immediately felt than the deficiency of corn, an anticipated shortcoming of fodder having had a depressing influence upon the cattle markets; on wintering stock graziers' profits have been reduced to a low figure, and in some cases annihilated. The produce of Grass, like that of corn, was deficient, and in consequence cattle gained less during the season than usual. Potatoes are an abundant crop, and of excellent quality, and at present are selling at a very moderate rate, viz., 50*s*. per ton; all who can would do well to fill the bunker now, as such a low figure is not likely to continue, with Oatmeal at 2*s*. 4*d*. per stone, and the 4 lbs. loaf at 9½*d*. Turnips are a full crop; the bulbs are sound and bulky, and with favourable weather will still swell considerably. A seeming abundance of this crop has had an exhilarating effect upon the sheep sales, which have terminated satisfactorily. Aged black-faced wethers have brought fully 5 per cent. over last year's prices, and may be quoted at about 30*s*. a head, although some crack lots have exceeded that figure by two or three shillings. For rearing black-faced wethers our glens are unrivalled, and it becomes matter of local regret, as well as of public loss, when any of them are set apart for a less beneficial object. Spare ewes have gone at about last year's rates, these varying, of course, greatly according to quality. The flocks in general are in average condition, and are now being washed and put in trim for wintering. Many receipts for washing have been offered to the public—some of them of value, many more worthless, but none are equal to tobacco juice, when the genuine article can be got, for at once killing the vermin, cleaning and soothing the skin, and promoting the growth of wool. The topics of greatest local interest at present are the high rates promised for farms and paid for produce. So soon as a farm is put into the market, men come forward and bid fearlessly, and some think foolishly, rents far exceeding anything ever before paid for the same land. If it be true that we can only estimate the future from our experience of the past, many who are now taking farms are either knaves or fools; knaves who have nothing to lose, and who, getting into a farm, get into credit, and for a time move in a position in society which they were never fitted to occupy, or who expect, when prices fall, to work upon the sympathies of their landlords for a reduction of rent to suit the altered times; or fools, who, without calculation, run and bid extravagant rents because others do so. If landlords will choose the highest bidders as their tenants, without regard to character, they ought at least to hold them to their bargain, such a course being the most consistent for themselves to follow, and ultimately the most conducive to the general good, otherwise in such a competition the man who honestly intends to fulfil his obligations has no fair chance. It is to be hoped that a speedy and successful termination of the war will introduce a better state of things, and that the allied nations will commemorate their success by a treaty recognising free commercial intercourse with each other, and inviting all nations to join in it who are willing to trade on terms of mutual reciprocity. *S.*

FARM NEAR HEXHAM: *Nov.* 5.—The latter part of the month which has just closed has been cold, wet, and stormy, while the early part of it was fine, of which advantage was taken for lifting Potatoes, sowing Wheat on bare fallow, and cleaning fallows for next year. The Potato crop has been good, but with rather more small among them than usual from the check they received by the frost in September, and in some instances they are a little tainted. Enough of the corn crop has now been threshed to show that both in quantity and quality it is below an average. During the early part of the month we succeeded in making some progress with the cleaning of our fallows, and the rains came very seasonably for enabling us to plough our Clover leas for Wheat. The weather however still continues broken, which rather hinders sowing. Cattle and sheep have all been on Turnips for some time, the former in the yards, and the latter on the fields. Our stocks are still turned out during the day, getting a feed of Turnips at night, and tops on the Grass during the day, not that we like the system, but to eke out our Turnips, which are rather a short crop, and bid fair to be very high priced ere the winter is over.

Notices to Correspondents.

CLAY BURNING: "B" would very much oblige many inquiring correspondents if he would be kind enough to describe the *method of burning the clay*, by which he effected so great an improvement in his land.

COAL-ASH: *D S.* Coals vary exceedingly in the quantity of ash they contain, and they cannot be classified as containing much or little respectively, according to the designation you specify; for north country coals vary between 2 and 10 per cent, Newcastle coals between 2 and 9, Lancashire coals between 2 and 11, and Welsh coals between 1½ and 10—the differences being according to the particular bed or mine from which the specimens are taken. Coal ash is generally so mixed with imperfectly burned material, that it is to be considered useful chiefly for its influence on the texture of the soil.

DRAINING WITH PEAT: *Amberley Weald.* Mr. Smith, of Deanston, used peats cut with a curved spade, so that the successive spits when dried became horse-shoe tiles fit for use.

TO MAKE SUPERPHOSPHATE OF LIME: *Cor.* Place 5 cwts. (or 12 bushels bones) on an earthen floor, surrounded by a rim of ashes; pour on as much water as the bones will suck up, and then pour on 2 cwts. of sulphuric acid; it will boil somewhat violently for a while; when this has subsided it will get tolerably solid, and the ashes and all may be shovelled up together, and will be fit for drilling in a day or two.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the frame work, but covered with Galvanised Iron Sashes, with excellent strong glass, and all completed for 1*s*. 3*d*. per foot super. Hundreds of references can be given, and Printed Price Lists sent.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY,
KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THIS *is the Original Patent for Important Improvements in Stable Fittings, Hay-box, Manger, and Water-trough as one fixture*, including a method surpassing all others for conveying the straps and halter-weights to the back of the fitting to prevent the horse being cast in the stall. Stable Fittings of every description, plain, enamelled, or galvanised. Also the newly invented Loose Box Fittings, Surface Gutters with moveable cover-plates, Stable Posts, Ramps, Sills, and all kinds of Stable Furniture in stock.

JAMES BARTON, Iron Founder, &c., 370, Oxford Street, London, MANUFACTURER OF KITE'S PATENT VENTILATING AND SMOKE-CURING CHIMNEY CAPS, patronised by her Most Gracious Majesty (200 on Buckingham Palace). In use also on St. James's Palace, Windsor Castle, Government Offices, &c. &c. Zinc, 30*s*. each; cast iron 35*s*. each; the latter as durable as the building itself. Illustrations and testimonials forwarded on receipt of two postage stamps. Address BARTON'S Iron Works, 370, Oxford Street, London.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. The same prices charged at all the Establishments.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d*. each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s*. per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

LANDSCAPE GARDENING,

COMBINING ALL THE MODERN IMPROVEMENTS IN THE CONSTRUCTION, BUILDING HEATING, and VENTILATING HOT-HOUSES, CONSERVATORIES, PINE PITS, and every other kind of Garden structure, by a practical Gardener and Horticultural Builder of 25 years' experience as HEAD GARDENER to his Grace the late DUKE OF NORTHUMBERLAND, at Syon House, and her Majesty's Royal Gardens, Windsor, Kew, &c. Designs and estimates furnished for Garden establishments. Every description of Horticultural Erections, Churches, and other public and private buildings effectually warmed and ventilated, and the success guaranteed, by a newly invented corrugated and perforated boiler and heating apparatus on application to

J. W. THOMSON, F.L.H.S., Hothouse Builder, Landscape Gardener, and Garden Architect, Exotic Nursery, King Street, Hammersmith.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

COTTAM AND HALLEN

HAVE made important additions to their original Invention of PATENT ENAMELLED MANGER RACK AND WATER TROUGH AT ONE FIXTURE, the main features of which are shown in the above engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c.; forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS. They contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders, from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges.

1st,—From the frequency and extent of his purchases; and

2dly,—From those purchases being made exclusively for cash.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are ON SHOW over his SIXTEEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz., from 12*s.* 6*d.* (two light) to 16*l.* 16*s.*

LAMPS OF ALL SORTS AND PATTERNS.—WILLIAM S. BURTON invites attention to his season's SHOW of LAMPS. It embraces the Moderateur (the best Parisian specimens of which have been carefully culled), Argand, Solar, Camphine, Palmer's Magnum, and other lamps for candles; and comprises an assortment which, considered either as to extent, price, or pattern, is perfectly unrivalled.

Pure Colza Oil, 5*s.* 6*d.* per gallon.
Palmer's Candles, 9*d.*, 9½*d.*, and 10*d.* per lb.
Patent Camphine, 3*s.* 10*d.* per gallon.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 80 years have been held in constant and increasing public estimation as the purest farinæ of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6*d.* and 1*s.*; and Family Canisters, at 2*s.*, 5*s.*, and 10*s.* each.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—ROSALIE COUPELLE'S CRINUTRIAR is guaranteed to produce Whiskers, Moustachios, &c., in a few weeks, and restore the Hair from whatever cause, strengthen it, prevent its falling off, and effectually check greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness. Sold by all Chemists, price 2*s.*, or sent free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN—"Through using it I have an excellent moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

DR. DE JONGH'S
LIGHT BROWN COD LIVER OIL.

TESTIMONIAL from DR. LETHEBY,

Professor of Chemistry and Toxicology in the Medical College of the London Hospital, Medical Officer of Health to the City of London, Chemical Referee to the Corporation of London, &c., &c., &c.

"I have frequently had occasion to analyse the Cod Liver Oil which is sold at your establishment. I mean that variety which is prepared for medicinal use in the Loffoden Isles, Norway, and sent into commerce with the sanction of Dr. DE JONGH, of the Hague.

"In all cases I have found it possessing the same set of properties, among which the presence of cholaic compounds and of iodine in a state of organic combination are the most remarkable; in fact, the Oil corresponds in all its characters with that named 'Huile brune,' and described as the best variety in the masterly treatise of Dr. DE JONGH.

"IT IS, I BELIEVE, UNIVERSALLY ACKNOWLEDGED THAT THIS DESCRIPTION OF OIL HAS GREAT THERAPEUTICAL POWER; AND, FROM MY INVESTIGATIONS, I HAVE NO DOUBT OF ITS BEING A PURE AND UNADULTERATED ARTICLE.

"College Laboratory, London Hospital, Sept. 24, 1855."

Sold ONLY in bottles, capsuled and labelled with Dr. DE JONGH's Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH's sole Consignees; and by most respectable Chemists in town and country.

Half-pints (10 oz.), 2*s.* 6*d.*; Pints (20 oz.), 4*s.* 9*d.*; Quarts 40 oz.), 9*s.*: IMPERIAL MEASURE.

COLDS, COUGHS, ASTHMA, INFLUENZA, and DISEASES of the CHEST and LUNGS, arise chiefly from alternations of Temperature. Painful and troublesome as these diseases are, they may be speedily and effectually removed by the judicious use of

SPENCER'S PULMONIC ELIXIR.

SPENCER'S PULMONIC ELIXIR is admirably adapted to promote expectoration, ease the breathing, loosen the phlegm, abate fever, and allay the tickling sensation which occasions the cough, without tightening the chest; and for all temporary and local affections—such as wheezing, irritation of the throat, palpitation of the heart, hoarseness of the voice, influenza, &c—it affords immediate relief. While in more chronic disorders, as periodical coughs or inveterate asthma, it is equally valuable in its effects, although, of course, a longer perseverance in the use of the article is required.

*** Ask for SPENCER'S PULMONIC ELIXIR.

Prepared only by T. Roberts & Co., Crane Court, Fleet Street, London; and sold wholesale and retail by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in the Kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each. *** The bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

HOLLOWAY'S OINTMENT AND PILLS EFFICACIOUS REMEDIES FOR BAD LEGS.—Mr. H. Jones, of the Blue Boar, Llanerchyonedd, had a very bad leg, completely covered with wounds, to cure which he tried all available remedies for more than six months, but without success at last. A clergyman recommended him to try HOLLOWAY'S Ointment and Pills. After using them for a short time, the wounds began to heal, and in a few weeks his leg was perfectly cured, in gratitude for which Mr. Jones will answer any inquiries about it.—Sold by all Medicine Vendors throughout the world; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODS, Malta.

TO BE SOLD, the LEASE of about 6 Acres of the best LAND in Middlesex, about four miles west of Hyde Park Corner, just fit for a Nurseryman or Florist. Coming in about 200*l.* The present proprietor declining the business.—Apply to Mr. SWAINS, The Lodge, Notting Hill.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

FLORISTS' BUSINESS.

TO BE SOLD, the NURSERY GROUND, GREENHOUSES, &c., of the late Mr. HENRY GROOM, at Clapham Rise, Surrey, and the Goodwill of the well-established Business to be sold by Private Contract. The Premises (exclusive of a strip of ground held rent free, subject to six months' notice) are held at the low yearly rent of 80*l.* for an unexpired term of 36 years from Michaelmas 1855, and comprise 3¼ acres. Front entrance in the Clapham Road, and back entrance in the Bedford Road. The Buildings consist of a handsome Show-house in the front, and Greenhouses, Hothouse, Pits, Sheds, &c. The house adjoining, late in the occupation of Mr. Groom, is not comprised in the Lease, but may be rented.—The Premises may be viewed on application, and further information obtained of Messrs. PROTHEROE & MORRIS, American Nursery, Leytonstone, Essex; and of Messrs. BARNES & BERNARD, Solicitors, No. 2, Great Winchester Street, London.

Sales by Auction.

A CONSIGNMENT FROM MR. JEAN VERSCHAFFELT OF GHENT.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on MONDAY, 12th November, at 1 o'clock precisely, 1000 CAMELLIAS, well set with bloom; 500 Azalea indica, 400 Rose Trees, 20 fine Standard Bays, 200 Kalmias, 200 Pear Trees, 200 hardy Azaleas, 400 Lelium lancifolium, and other Bulbs.—May be viewed on the morning of Sale, and Catalogues had.

ORCHIDS—IMPORTED AND ESTABLISHED.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on WEDNESDAY, 14th November, at One o'clock precisely, an importation of ORCHIDS from Panama, including fine specimens of Oncidium ampliatum major, Trichopilia coniida, Epidendrum bicornutum, a new Sobralia, &c. The established plants consist of Aerides affine, Maculosum major, Odontoglossum purpureum, virens, superba, Cattleya labiata, Calanthe masuca, Cymbidium eburneum, Saccolabium guttatum and retusum, Trichopilia sp. new, Vanda Jenkinsoni and tricolor, &c. A small importation from Jamaica of Oncidium pulchellum, Broughtonia sanguinea, &c.—May be viewed on the morning of Sale and Catalogues had.

ORCHIDS.

THE VERY SPLENDID COLLECTION OF J. H. SCHROEDER, Esq.

MR. J. C. STEVENS is favoured with instructions to sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 20th November, and following day, this most valuable collection of ORCHIDS, which includes magnificent Specimen Plants of the latest and best varieties of Aerides, Vandas, Saccolabiums, Dendrobiums, Cattleyas, and many very rare and almost unique species in admirable condition.—May be viewed on the mornings of Sale, and Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, November 16th, at 12 o'clock, a first class collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemones, Crocus, Tulips, Snowdrops, Ranunculuses, Gladiolus, &c.; also a selected assortment of fine Standard and Dwarf Roses, including Hybrids, Bourbons, Chinas, Noisettes, &c; and American Plants, comprising Hybrid Rhododendrons; Ghent and other Azaleas, Kalmias, Andromeda floribunda, beautifully furnished with bloom buds.—On view the morning of Sale. Catalogues may be had at the Mart; and the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to Sell by Auction, without reserve, on the premises opposite the Railway Station, Blackheath, by order of Mr. Hatley (the ground being required for building), on MONDAY, November 19th, and following day, at 11 o'clock each day, the valuable NURSERY STOCK, consisting of Laurels, from 3 to 6 feet; fine Chinese Arbor-vitæ, 3 to 6 feet; handsome Deodars, 3 to 8 feet; large Fan and other Yews, 4 to 10 feet; Aucuba Berberis, variegated and green; Hollies, Laurustines, Sweet Bays, Lilacs, Mountain Ash; Standard and Trained Fruit Trees, Gooseberries and Currants; about 1500 yards of strong Box-edging, about 300 capital Camellias, well set with bloom; Rhododendrons, Azaleas, Standard and Dwarf Roses, Pinus, Cryptomerias, &c., &c.—May be viewed prior to the sale, and Catalogues had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CHOICE TULIPS.

MESSRS. PROTHEROE AND MORRIS are instructed to offer for unreserved Sale by Auction at the Mart, Bartholomew Lane, on FRIDAY, November 23d, at 12 o'clock, by order of the Proprietor, Mr. GEORGE OUTAIN, of Stoke-upon-Trent, Staffordshire, the whole of his select and costly bed of TULIPS. The Proprietor has spared neither trouble nor expense in selecting the best varieties and of the finest strains; and the present is such an opportunity to amateurs to enrich their collection with scarce and valuable varieties as does not often occur. In Roses there are Scarnell's Bijou, Lac, Eliza Cook, Mary Ann, Camuse de Craix. The Byblœmens comprise Golahams, Fanny Kemble, Napoleon, Lord Nelson, Salvator Rosa, Wallace, Thalia, Maid of Athens, Nora Creina, Parmegiano, Pandora, Duc de Bordeaux. Amongst the Bizarres will be found Pompe Funèbre, Duke of Devonshire, Vivid, Leonidas, Milton, Everard, &c. In addition to these there are many newly broken flowers from the Seedlings of Slater's and Norman's, and the best selected varieties from the celebrated Chellaston Seedlings.—Catalogues may be had at the Mart; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CONCLUDING SALES THIS SEASON.

MR. HASLAM will Sell by Auction, at the Mart, on TUESDAY, November 13, and three following days, a Choice Selection of Standard and other Roses, Dutch Bulbs, several varieties of British Orchids, including Lizard, &c. Also some first class Pinks, Pansies, &c.; a large quantity of Shrubs, Fruit Trees, &c.—Catalogues at the Mart, and of the Auctioneer Epping, Essex.

Annual Sale of TIMBER at Cassiobury, Watford, comprising 480 Ash, most of them clean grown Trees, and of unusually large dimensions, 300 Alder, 50 Oak, 25 Elm, 630 Fir, and a few Lime, Willow, and Birch.

MR. HUMBERT will Sell by Auction, at the Rose and Crown Inn, Watford, on WEDNESDAY, November 14th, at 2 o'clock, an unusually fine lot of Ash, comprising 480 Trees; also 50 Oak, 300 Alder, 630 Fir, and some Willow, Birch, Lime, and others.—May now be viewed, and Catalogues may be had at the Inns in the neighbourhood, and free by post of Mr. HUMBERT, Land Agent, Watford.

NURSERY GROUNDS, UXBRIDGE ROAD, EALING.

MESSRS. KING AND SON are instructed by Mr. R. S. Mountjoy, who is relinquishing the Nursery business, to Sell by Auction on the Premises, on WEDNESDAY, THURSDAY, and FRIDAY next, at 12 o'clock precisely each day, the Valuable Nursery Stock in fine condition, which is worthy the attention of noblemen and gentlemen as well as the trade, comprising Evergreens and Shrubs, 500 Camellia japonicas, Rhododendrons, Azaleas, Kalmias, Berberis, &c. Fruit Trees in collection, Standard and Dwarf Roses of the choicest kinds, Herbaceous Plants, &c. Catalogues had on the Premises, at the Inns in the neighbourhood, and at the Offices of Messrs. KING & SON, Estate Agents, Surveyors, Valuers, &c., Brentford.

MAIDENHEAD.

MR. J. WILLMER will Sell by Auction on the Premises, CHRISTIE'S Nursery, Maidenhead, on MONDAY, November 12, and two following days, at 12 o'clock each day, the whole of the Nursery Stock, comprising Taxodia sempervirens, Cryptomeria japonica, Juniperus Bedfordiana, Piptanthus Nepalensis, Cedrus deodora, Cedar of Lebanon, Pinus excelsa, Araucaria imbricata, Pinus Cembra, Laurels (Portugal), English and Irish Yews, striped and green Hollies, Chinese Arbor-vitæ, Red Cedar, Phillyrea, Standard and Dwarf Roses, Scotch Spruce and Larch, Fir Oaks, Limes, Birch, Acacia, Sycamore, Plane, Laburnum, Poplars, &c.; Seakale and Asparagus Plants; Standard and Dwarf Fruit Trees; Greenhouse Plants; Greenhouses, Pits, Lights, Garden Pots, &c.—May be viewed one week prior to the Sale, and Catalogues had (6*d.* each, returnable to purchasers) on the Premises, and of the Auctioneer, Sunbury, Middlesex.

This day is published, price 2s. 6d.,

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth. Established 1786.

WEST OF ENGLAND HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENT.—*The* PROPRIETORS *have during the past summer considerably enlarged their Offices and Seed Warehouses at a considerable expense, so as to be enabled to execute all orders with regularity and dispatch.*

With increased exertion, redoubled energies, and more assistants, they hope to give the greatest satisfaction to all who honour them with commands.

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

TO THE TRADE.

NEW PURE WHITE COLLINSIA.—The price of this new and beautiful Annual can be had on application.
J. G. WAITE, Seed Merchant, 181, High Holborn, London.

NEW RHUBARB, EARLY RED EMPEROR.—The stalks of this variety are as large as the Victoria, very high in colour, red throughout, good forcer, and very prolific. Price 18s. per dozen.
J. G. WAITE, Seed Merchant, 181, High Holborn, London.

NEW VICTORIA RASPBERRY, twice the size of Falstaff, and a good bearer, price 6s. per dozen Canes, or 40s. per hundred.
J. G. WAITE, Seed Merchant, 181, High Holborn, London.

WAITE'S DANIEL O'ROURKE PEAS.—The best Early Pea in cultivation can be supplied in any quantity, and price had on application to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

TO PINE GROWERS.
LIVERPOOL IS THE BEST MARKET.
FORWARD TO GEORGE TAYLOR, JUN., FRUIT SALESMAN, The Grand Stand, St. John's Market, Liverpool.
Terms—CASH.

FRUIT TREES IN POTS.

JOHN AND CHARLES LEE have the finest stock of the above ever yet offered, consisting of—

PEACHES	APRICOTS	CHERRIES
NECTARINES	PLUMS	APPLES

and PEARS.
All warranted to bear good crops the first season.
Nursery and Seed Establishment, Hammersmith.

VINES FROM EYES.

JOHN AND CHARLES LEE beg to offer a very superior stock of all the leading kinds of VINES, both for planting out and for fruiting in pots.
Nursery and Seed Establishment, Hammersmith.

AZALEA INDICA.

JOHN AND CHARLES LEE beg to offer good Plants of the most select kinds of AZALEA INDICA, well set with buds, at 18s., 30s., and 42s. per dozen.
Nursery and Seed Establishment, Hammersmith.

AZALEA INDICA LEEANA.

JOHN AND CHARLES LEE are now prepared to send out this fine Seedling, which for habit of growth and substance of petal, combined with perfect shape and purity, is decidedly the best white Azalea yet out. It has gained Certificates wherever exhibited. Price 21s.; a few extra strong plants at 42s.—Nursery and Seed Establishment, Hammersmith.

NEW VARIEGATED GERANIUM—MRS. LENNOX.

JOHN AND CHARLES LEE are now sending out this novelty, which is a decided improvement on The Mountain of Light. It is of much more vigorous growth than that variety, the margin of the foliage is of a purer white, and in other respects it possesses the same good qualities. Price 7s. 6d.
Nursery and Seed Establishment, Hammersmith.

ISAAC DAVIES can supply the following in large quantities at reduced prices:—APPLE TREES of all the best kinds, 4 feet in the stem, two to four years grafted; WEEPING ASH, ELM, and MOUNTAIN ASH, with stout straight stems 8 to 11 feet high, and large bushy heads.
Larkfield Nursery, Wavertree, near Liverpool.

THOMAS BELL, SEEDSMAN, Wigan, Lancashire, has for sale TRUE LANCASHIRE FLUKE POTATOES, 4s. 9d. per bushel, of 80 lbs., or 6l. 6s. per ton. YORK REGENTS, 4s. 3d per bushel. RED DOWNS, 4s. 6d. per bushel.

DUTCH FLOWERING BULBS.

JAMES CARTER AND CO.'S CATALOGUE OF DUTCH AND CAPE BULBS, the most comprehensive and select published, will be forwarded *free of charge* and *post paid*, upon application to address at foot. *The Bulbs are as usual of first-rate quality.*
JAMES CARTER & Co., 238, High Holborn, London.

R. PARKER begs to inform his friends and patrons that his PRICED CATALOGUE of DUTCH BULBS is now ready, and will be forwarded post free upon application.
Paradise Nursery, Hornsey Road, Holloway.

BASS AND BROWN'S new AUTUMN CATALOGUE, comprising a considerable portion of descriptive and useful information for purchasers, will be sent free by post for three penny stamps, or gratis to their customers, who may not have received them.
Seed and Horticultural Establishment, Sudbury, Suffolk.

ROSE CATALOGUE.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to announce that their New CATALOGUE of ROSES for 1855 and 1856 is now ready, and may be had on application.

VINES FOR FRUITING IN POTS.

MESSRS. J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to announce that they have a very choice selection of the best sorts of VINES from eyes grown in 12 and 15-inch pots, Price 5s. and 7s. 6d each.
N.B. Strong Vines for planting out, 3s. 6d. each.—Nov. 17.

SCARLET RHODODENDRONS.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer fine bushy Plants of the above 2 to 3 feet high, in Pots, well set with Flower buds.—Price 10s. 6d. each.

WILLIAM WOOD AND SON can with great confidence recommend their superior stock of fine DWARF HYBRID PERPETUAL ROSES in 4-inch pots, for Forcing, at 24s. per dozen.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

NEW CHRYSANTHEMUMS.

JOHN SALTER begs to inform his friends that his unrivalled Collection of Chrysanthemums is now in bloom, including many seedlings, among which is ALFRED SALTER, the finest light flower in cultivation. A visit to the winter garden will amply repay those amateurs who may honour him with their patronage.—Versailles Nursery, William Street, near Hammersmith Turnpike.

EDWARD P. FRANCIS offers to the Trade strong MANETTI STOCKS, well established in big 60 pots for Grafting. Price on application. Rose Lists forwarded as usual.
Rose Nurseries, Hertford.

LENNOX T. DAVIS has SCARLET HYBRID RHODODENDRONS (with or without flower buds), IRISH YEWS, PERNETTYAS, HARDY HEATHS, &c., and other Shrubs, to offer cheap and in quantity. Prices on application; delivered at Belfast.
Ogle's Grove Nursery, Hillsborough, Co. Down.

HARDY HEATHS.

WATERER AND GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to WATERER & GODFREY, Knap Hill Nursery, Woking, Surrey.

OSAGE ORANGE (MACLURA AURANTIACA).

MESSRS. MORRISON AND SON have to offer about 50,000 Plants (5 to 6 inches high) of this fine new Hedge Plant (see *Gardeners' Chronicle*, May 13, 1854), price 10s. per 100. Price to the trade on application. Railways to all parts of the kingdom.—Nurseries, Mountcoffer, Banff, N.B.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.
☞ The Catalogue describes the colours of the Rhododendrons.
The American Nursery, Bagshot, Surrey.—Nov. 17.

AMERICAN PLANTS.

WATERER AND GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.
Knap Hill Nursery, Woking, Surrey.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.
American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway where conveyances may be had.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERS, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.
G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

BERNARD SAUNDERS, NURSERYMAN and FLORIST, Cæsarean Nurseries, Jersey, respectfully informs Amateurs and Florists that he has a good Stock of Yellow and White ground PICOTEES to offer for sale this season, at 2s. 6d. per pair, orders for which will be thankfully received and promptly executed. Also a small quantity of well ripened Seed of the PHORMIUM TENAX or NEW ZEALAND FLAX at 2s. 6d. per packet of 60 Seeds.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, which they will forward to any part.

	s.	d.
25 Azaleas, new hardy Belgian varieties, one of a sort, by name, on their own roots	20	0

Chrysanthemums, new Pompone and show vars., per doz.	8	0
6 new sorts Mimulus, very fine early flowering	6	0
Cinerarias, fine sorts, to flower early, per dozen.. ...	12	0

Hyacinths, Crocus, Tulips, and Dutch Bulbs of all kinds.
New Conservatories and Gardens furnished in any part of the kingdom on very reasonable terms.

FRUIT TREES.

Fine standard and dwarf-trained Apricots, Peaches, Nectarines, Pears, Plums, and Cherries, 3s. each, or, per dozen	30	0
Fine Apples, Figs, Medlars, Quinces, and Walnuts, each	2	0
Fine Gooseberries, Currants, and Raspberries, per doz.	3	0
Filberts, new, thin shelled, and red skinned, per dozen	4	0
Strong Vines from eyes, and layers in pots, per dozen...	18	0
Peaches, Nectarines, Apricots, and Cherries, grown for pot culture, per dozen	18	0

A large stock of fine Transplanted Scotch, Larch, and Spruce Firs, also Evergreen Shrubs of all kinds.

Albion Nursery, Stoke Newington, London, Nov. 17.

WATERER AND GODFREY respectfully invite the attention of parties engaged in Planting to their fine Stock of the following HARDY ORNAMENTAL TREES, &c.

Araucaria imbricata, 2, 3, 4, 5, 6, 7, and 8 feet high, in quantities, all stocky well grown plants; the larger sizes especially it would be difficult to match.

Cedrus Deodara, 1½, 2, 3, 4, and 5 feet, by the thousand; do. a fine lot of larger, 6, 7, and 8 feet; do. some magnificent Trees, 10 to 15 feet. These are all in a famous condition for Transplanting, having been annually removed.

Cedars of Lebanon, 3, 4, 5, and 6 feet; do. a few splendid Trees, 10 and 12 feet.

Cedars Red Virginian, 5 to 8 feet.

Cedars, variegated white, 2, 3, and 4 feet, one of the handsomest variegated plants we know. We have a large stock. It is extensively planted at Elvaston Castle.

Cryptomeria japonica, fine plants, 4 to 7 feet.

Cupressus macrocarpa or Lambertiana, 3, 4, 5, 6, 7, and 8 feet. Nothing can be handsomer than some of the specimens of this fine hardy plant.

Juniper, Chinese, 2, 3, 4, and 5 feet; a fine lot of large plants, 6 to 8 feet.

Do. Irish, upright, 3, 4, 5, and 6 feet; do. larger, up to 8 and 10 feet. Our stock of the two last mentioned Junipers we believe to be quite unequalled, the Irish especially; the larger sizes are perfect columns.

Do. recurva, 3, 4, 5, up to 8 feet.

Do. hispanica or thurifera, 2, 3, and 4 feet.

Abies Douglasi, 2, 3, and 4 feet. A fine lot of large and very handsome plants, 7, 8, 10, and 12 feet.

Picea nobilis, several hundreds of nice plants, 1½ to 2 feet, well grown, and with good lead. None are grafted. A few taller specimens up to 6 feet.

Do. Nordmanniana, a large quantity of remarkably handsome plants, 1½, 2, 3, and 4 feet. Nothing can exceed the vigour of these plants, and all from seed.

Do. Pinsapo, magnificent plants, 4 to 7 feet high, in perfect health.

Pinus insignis, 1½ to 3 feet; a few good specimens up to 7 feet.
" Lambertiana, from seed, 4, 5, and 6 feet.
" Cembra, 3, 4, 5, up to 10 feet.
" Montezumæ, fine plants, 4 and 5 feet.
" macrocarpa, 2 and 3 feet, from seed.

Weeping Larch, clean, stems good, heads 7 feet high.

The following 10 varieties form a very singular group. They are of dwarf habits; the well known Abies Clanbraziliana may be taken as the type of the whole. We believe our collection to be quite unique, and, we may add, most interesting.

Pinus strobus pumila (the dwarf Weymouth).
" sylvestris pumila (the dwarf Scotch).

Abies Clanbraziliana	Abies pumila	All dwarf varieties of the Spruce Fir.
" compacta	" diffusa	
" pygmæa	" Gregori	

Picea pectinata pygmæa (the dwarf Silver Fir), Hudsoni.

Yew, common English, 3, 4, 5, 6, and 7 feet, in large quantities.

Do. upright, Irish, 4, 5, 6, and 7 feet; some splendid plants, 8 to 12 feet.

Do. Dovaston or Weeping, a great many fine plants, worked on straight stems, 7, 8, and 10 feet high, with good heads.

Do. adpressa, 2 and 3 feet.

Do. do., worked on common Yew, as standards.

Do. gold striped, 1½ to 2 feet, by the thousand.

Do. do., a splendid lot of plants, 4 to 6 feet.

Do. do., worked as standards on the common Yew, 8 to 10 ft. high.

Do. do., worked on Irish Yews, 6, 7, and 8 feet high.

Do. elegantissima, or new gold striped; a large quantity, 1½ to 2½ feet, and also worked as standards on the common and Irish Yews. We may safely assert our stock of Golden Yews is unsurpassed.

Do. yellow berried (true), very beautiful when in fruit as we have it, 1½ to 3 feet.

Libocedrus chilensis, 2 to 3 feet, very handsome and bushy.

Thuja Wareana, fine bushes, 3, 4, 5, 6, and 8 feet. This is one of the most useful, and, at the same time, ornamental hardy plants we possess.

Do. American, for hedges, doubtless the very best, 4, 5, and 6 feet.

Do. aurea, or Golden Arbor-vitæ. This plant originated at this Nursery; it has now, as it deserves, become a universal favourite. Our stock of it enables us to offer a choice of many hundred fine specimens, from 1½ to 3 and 4 feet high, and as much through—in fact, perfect globes.

Wellingtonia gigantea, a few of the finest plants in the country, being near 1½ feet high, and as much wide.

Hollies variegated, by the thousand, 2, 3, and 4 feet high. Some splendid Plants, 10 to 15 feet high.

We may here remark with reference to the large specimens alluded to in this Advertisement that every one of them is in a condition to transplant, and travel any distance with perfect safety. They have one and all been annually removed in our Nursery, and in soliciting a personal inspection of our stock, we believe we are justified in stating it offers a choice which is to be found in but few establishments of its kind in this country.

The Nursery may be reached in 40 minutes by Train from the Waterloo Station; and the South Western Railway Company having a Branch on to the North Western, enables us to send plants to all parts, in trucks throughout, without packing and other extensive additions.

Knap Hill Nursery, Woking, Surrey.

MESSRS. E. G. HENDERSON AND SON beg to announce that they have now received their noted collection of HYACINTHS in excellent condition, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with, Catalogues of which, together with their Plant and Seed Lists, will be forwarded post free on application.

CUCUMBER HENDERSON'S NAPOLEON III., in packets, 3s. and 5s. 6d each.

CALCEOLARIA, CINERARIA, and PRIMULA SEED of first quality, 2s. 6d. and 5s. per packet.

FUCHSIAS.—Banks' Favourite, 10s. 6d.; Prince of Wales, 10s. 6d.

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (PAMPAS GRASS).—E. G. H. & SON having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2s. 6d. each, 25s. per dozen, or 7l. 10s. per 100.

Wellington Nursery, St. John's Wood.

JOHN HARRISON begs to offer to the Trade the under-named Plants, and to inform his friends and the public that his CATALOGUE OF ROSES for the present season contains the most superb Roses in cultivation; and as a guide to amateurs and parties not acquainted with Roses, the best show varieties are marked with an asterisk. J. H. has competed within this last five years at nearly one hundred different exhibitions open to the United Kingdom, and with but one solitary instance, has invariably taken the first prizes for collections of Roses.

Fastalf Raspberry Canes, 6s. per 100, or 50s. per 1000.
Northumberland Fillbasket, do., 10s. per 100, or 90s. per 1000.
White Antwerp, do., 12s. per 100.
Victoria Currants, 1 yr. old, 8s.; 2 yr., strong, 12s. per 100.
Houghton Castle Currants, 1 year 8s. per 100, or 2 years 12s.
Black of sorts, 1 year, 8s., or 2 years, fine, 10s. per 100.
Royal Albert Rhubarb, 30s. per 100.
Victoria do. true, 25s. to 30s. per 100.
Manetti Rose Stocks, 10s. per 100, or 80s. per 1000.
Ditto do. extra strong for half-standards, 20s. per 100.
Ditto in 6-inch pots, 1 year, fit for working, 60s. per 100.
Duchess of Norfolk Rose, 30s. per dozen, or 10l. per 100.
Delphinium Barlowi, strong sorts, 30s. per 100.

Nursery, Darlington, Nov. 17.

BASS AND BROWN beg to offer the following from their Catalogue just published, which cannot fail to afford full satisfaction to purchasers, for strong growth and superiority of sorts :—

	s.	d.
ROSES.—100 dwarfs in 100 very superior varieties ...	60	0
" 100 " 50 ditto ditto	45	0

HARDY CLIMBING PLANTS, 20 fine sorts	20	0
HARDY FLOWERING ORNAMENTAL SHRUBS, 20 fine vars.	12	0
20 fine newer vars.	24	0
PEACHES, NECTARINES, APRICOTS, and PLUMS, two and three year trained plants, fine and well grown, per dozen ... ... 42s. to	60	0
STRAWBERRIES, in 20 newest & best vars. *See Catalogue*		
GOOSEBERRIES, finest prize sorts, 25 vars. for	10	6
RHUBARB.—Bailey's Early Monarch, each 2s. 6d.; Salt's Crimson Perfection, each 7s. 6d.; the two best early varieties grown.		
Royal Albert, Linnæus, and Victoria Giant, per dozen	7	6
Grayson's Giant Asparagus, fine, per 1000, 30s.; per 100	3	6
Seakale, strong for forcing, per 100	10	0
Fine Standard, pyramidal, dwarf, and trained Fruit Trees. *See Catalogue.*		
CAMELLIAS, choice assortments, per dozen ... 30s. to	60	0

BULBS AND FLOWER ROOTS.

CHOICE IMPORTED DUTCH HYACINTHS, in separate colours, per dozen	3	0
Fine named varieties, per dozen ... ... 6s. &	9	0
Extra superb varieties, per dozen	15	0
ANEMONES, 50 superb named double varieties	12	6
Splendid mixed, per 100	6	0
Splendid double mixed scarlets, per 100	10	0
Mixed semi-double Russian vars., fine, per lb. ...	6	0
" fine new single, per lb.	4	0
La Brillante Eclatante, extra single bright scarlet, per 100	7	6
GLADIOLUS, 50 splendid vars., early and late	50	0
The following beautiful new early dwarf vars. which flower July and August (for descriptions *see Catalogue*), viz., British Queen, 5s.; Eclipse, 7s. 6d.; Masterpiece, 3s. 6d.; Rachel Maria, 2s. 6d.; Sudbury Beauty, 5s.; Theodore, 7s. 6d.		
The above 6 fine and striking varieties for	25	0
EARLY TULIPS, beautiful for pots or open borders, flower a month before the late sorts, 30 fine vars., the best in cultivation	7	6
DOUBLE TULIPS, fine for borders, 10 best vars., 6 of each	10	0
ENGLISH IRIS, 40 splendid and distinct vars.	21	0
Ditto per dozen, 4s. to 7s. 6d.; fine mixed, per 100 ...	10	0
IRIS GERMANICA, flower in May, very beautiful, 40 fine vars. of rich and varied colours	45	0
20 fine ditto 15s; 20 vars. best selection	35	0
Fine mixed, per 100, 18s.; best mixed, per dozen ...	5	0
IRIS PUMILÆ, early and very dwarf, 10 fine vars. ...	10	0
LILIUM, a superb collection of upwards of 30 vars. *See Catalogue.*		
CYCLAMEN, in 10 fine vars. *See Catalogue.*		
IXIAS and SPARAXIS, finest vars. *See Catalogue.*		
TRITONEA AUREA, a splendid orange Cape bulb (24s. per dozen), each 2s. 6d.		

Also an extensive Collection of other Roots.

CATALOGUES, containing much descriptive and useful information supplied for three penny stamps, or gratis to purchasers.

Post Office Orders payable to BASS & BROWN, or to STEPHEN BROWN. Goods carriage free (not under 20s.) to all the London termini, and all stations on the London and Norwich Colchester Line. Plants gratis with orders of 40s. and upwards.

Seed and Horticultural Establishment, Sudbury, Suffolk.

GERMAN FLOWER AND VEGETABLE SEEDS.

MESSRS. PLATZ AND SON, SEED GROWERS, Erfurt, Prussia, respectfully inform the Trade that their Catalogue for 1856 contains more new and choice articles than have ever been offered. Early applications are solicited through their Agent, Mr. ROBERT KENNEDY, Bedford Conservatory, Covent Garden, London.

EARLY FLOWERS, ADAPTED FOR BLOOMING IN DOORS, AND IN THE BORDERS IN WINTER AND EARLY SPRING.

CLARK AND CO., SEEDSMEN and FLORISTS, beg respectfully to intimate to the nobility, gentry, and the public that they have imported a STOCK of DUTCH and other FLOWER BULBS, of the finest possible quality, and take the liberty of offering the following assortment for 10s., viz.:—Half a dozen best Hyacinths for glasses, half a dozen good Hyacinths for pots, 50 Crocuses (four separate colours), 50 large Double Snowdrops, half a dozen Double Van Thol Tulips, half a dozen early Van Thol Tulips, one dozen Double White Sweet-scented Narcissus, half a dozen Double Jonquils, one dozen Winter Aconites, 12 splendid mixed Tulips, and one dozen beautiful mixed Double Anemones.—86, High Street, Borough, about 30 doors from London-Bridge Railway Terminus.

ORNAMENTAL TREES.

TO BE SOLD CHEAP, several Thousand Large CEMBRA PINES, from 3 to 4 feet high, and as many IRISH YEWS. Samples of 12 of either will be delivered free at the Scotch Wharf in London, including package, for 1l. They are admirably adapted for Ornamenting Noblemen's Grounds, Public Parks, Cemeteries, &c., and are worthy of immediate attention, as the proprietor is retiring from business, and has also a large collection of fine specimens of Nepaul, Chinese, Californian, North American, and North of Europe Plants—all reared in a hardy climate.—Apply to Mr. JAMES ROY, Ferry Hill, Aberdeen.

SPLENDID NEW RHUBARB—SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of RHUBARB is now ready for distribution; it is universally allowed to be the most early, prolific, and delicious variety ever offered to the public. See *Gardeners' Chronicle*, June 11, 1853:—"Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—ED.

Certificates of merit were awarded for specimens exhibited at the meeting of the Horticultural Society, Regent Street, London, June 20, 1853; at Nottingham, May 24, 1854; at Derby Midland, May 25, 1854; at Ormskirk, Lancashire, August 30, 1854.—Price 3s. 6d. per root, three for 10s., and six for 1l. A few two-year-old Plants at 5s. each.

Orders addressed to ROBERT SALT, Longton, Staffordshire, or the following Agents will have immediate attention:—Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess & Kent, Penkhull, Staffordshire; Messrs. Francis & Arthur Dickson, 106, Eastgate Street, Chester; Messrs. James Dickson & Sons, 102, Eastgate Street, Chester; Mr. Salsbury, Melbourne, Derbyshire. A liberal discount allowed to the Trade. —A Post-office Order from unknown correspondents.

Longton, Nov. 17.

A NEW SEEDLING APPLE FROM THE RIBSTON PIPPIN.

STEPHEN SHILLING begs to offer to gentlemen and the trade Trees of his entirely new Apple named OMER PACHA, it being a first-rate hardy grower, strong compact habit, early and productive bearer. Fruit excellent flavour (dessert), ripe in November, keeps until May. Respectable testimonials given from those who have tasted the fruit. Strong plants supplied at 5s. 6d. each, or 60s. per dozen. The usual discount to the trade where one dozen or more are taken. Early application is requested as the stock is limited; all orders carefully and promptly attended to. Fruit of the above can be seen at the office of the *Gardeners' Chronicle*, the British Pomological Society's Rooms, 20, Bedford Street, Covent Garden, Messrs. Nutting & Son, 46, Cheapside, Messrs. Sutton & Sons, Reading, Mr. C. Turner, Royal Nursery, Slough, and at the North Warnborough Nursery, near Odiham, Hants.

NEW HARDY PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer the following New HARDY PLANTS:

RHODODENDRON MADAME WAGNER (hardy) ... 15s. 0d.
" PRINCE CAMILLE DE ROHAN (hardy) ... 7 6
WEIGELIA MIDDENDORFI.—N.B. This splendid Weigelia has been sold already *twice* under wrong names. The one I offer here is *warranted the true species*. Good Plants each 12 0

A. VERSCHAFFELT begs to inform Amateurs and the Trade that he has just published a new PLANT LIST, containing the English and Continental Novelties.

His Catalogue may be obtained on application of his Agent, Mr. R. SILBERRAD, 5, Harp Lane, Great Tower Street, London.

IRON BUILDING AND ROOFING WORKS.

GAS STREET AND BERKELEY STREET, BIRMINGHAM.

JOHN HENDERSON PORTER, ENGINEER and CONTRACTOR, Patentee of a new system of constructing (cheaply and expeditiously, by ordinary labourers) Portable Buildings and Sheds—formed of ordinary planks or boards—peculiarly suitable for Farm purposes. A Model Shed has recently been erected in the Agricultural Department of the Crystal Palace at Sydenham. Corrugated and Galvanised Iron Roofs and Roofing Plates, Eaves, Gutters, Rain-water Pipes, Tanks, Fences, &c.—London Office, 1, Riches Court, Lime Street.

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late STEPHENSON & PEILL), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.

HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4s. 9d. each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5s. 3d. each.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

GRAPE VINES FROM EYES.

R. GLENDINNING respectfully begs to offer an extensive collection of all the principal kinds of GRAPE VINES in pots extra strong, either for forcing in the pots or planting out.

PEACHES and NECTARINES, established in pots two and three years, full of blossom buds, and will doubtless produce fine crops the next season; also strong FIGS in pots.

A large and extensive assortment of trained Peaches, Nectarines, Apricots, Plums, Cherries, Pears, and Apples, in fine health.

R. G. would particularly direct attention to his very large collection of Pears for Pyramidal Training. They are from 5 to 7 feet high, and grown especially for the purpose, with abundance of short shoots. The Horticultural Society's nomenclature has been adopted with all the Fruit Trees; they may, therefore, be relied upon as correct.—Catalogues of the above and all other Nursery Stock may be had on application.

Chiswick Nursery, London.

WHEAT FOR WINTER SEEDING.

WILLIAM BARNES invites the attention of his patrons and friends to that well-known and much esteemed species called the OLD LAMMAS or Winter Wheat, and which he warrants the true original without admixture of any sort, and perfectly clean. This Wheat has been grown by himself on light black soil, and the character of it remains permanent, having no tendency to degenerate or liability to disease. It may be sown on the coldest description of clay and heavy land, and as late as the last week in December with the almost certain prospect of affording a good return.—For further particulars, address WILLIAM BARNES, the Elms Farm, Spalding, Lincolnshire.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

DENYER'S NEW PROLIFIC GREEN MARROW PEA.—A fine variety for succeeding the first early Crops. Very hardy, and one of the greatest cropping Peas in cultivation. It obtained the first prize at the Hastings and also at the St. Leonard's Horticultural Exhibitions.

From the Dean of Battle.—"The sample of Peas you sent me surpasses in beauty of colour and richness of flavour any that I have ever met with."

From Mr. Waters, Gardener to Lady Webster, Battle Abbey.—"I have examined the growing stock of your new Pea, and find it crops abundantly, the pods being a good length, very broad, and well filled. It is also a fine flavoured and beautifully green-coloured Pea."

From Mr. Bunyard, Maidstone.—"My opinion of the new Pea is, that it is a distinct sort, a good cropper, and for colour I do not know its equal."

From Mr. Parks, late Nurseryman and Seedsman, Dartford, Kent.—"I am much pleased with your new Pea. It certainly is a very fine cropper. The Peas are large, and the pods completely filled. It will when known become a superior Pea for market.'

Price 3*s.* 6*d.* per quart. Post Office orders payable to WILLIAM DENYER, Seedsman, Battle, Sussex. May also be had through the London and other seedsmen.

NEW OR RARE PLANTS AT REDUCED PRICES.

MESSRS. WILLIAM ROLLISSON AND SONS are now prepared to offer the annexed:—

TYDÆA ELEGANS.—A most beautiful plant from New Grenada, with bright scarlet flowers; 10*s.* 6*d.* each.

BEGONIA CHRYSOLEUCA.—A distinct new species semi-creeper, the blossoms are yellow, tipped with white; 15*s.* each.

COLEUS BLUMEI PECTINATUS.—A very distinct variety, the foliage is variegated similar to Coleus Blumei, but the leaves are beautifully laciniated; 5*s.* each.

MANDIROLA ROEZLI.—An extremely handsome gesneraceous plant producing fine spikes of lilac-coloured blossoms; 15*s.* each.

VACCINIUM ERYTHRINA.—A truly magnificent plant sent us by our collector Mr. John Henshall; the flowers are produced in bunches, of a bright crimson colour; 31*s.* 6*d.* each.

ARAUCARIA COOKI.—Handsome well formed seedling plants; 84*s.* each.

AUBRIETIA MOOREANA.—A new and distinct beautiful flowering Alpine plant; 5*s.* each.

MANDIROLA LANATA.—A pretty gesneraceous plant, of a delicate violet colour inside the mouth of the blossoms, and shaded lilac outside; 15*s.* each.

ORTHOSIPHON SPICATUS.—This plant has been recently introduced from Ocana, and is a great acquisition, its foliage being deliciously fragrant; its blossoms are large and white; 10*s.* 6*d.* each.

BEGONIA SPLENDIDA.—This exquisite plant has been discovered and sent us by our collector Mr. John Henshall, during his researches in the Indian Archipelago; as an ornamental plant it is unequalled; 21*s.* each.

LASIANDRA HOIBRENKI.—This is a very distinct and handsome plant, with very large beautiful blue flowers, and pretty ornamental foliage.

PASSIFLORA ALBA-NIGRA.—As the name implies, this is a very distinct new greenhouse climber.

ERICA ÆMULA.—A very beautiful hybrid, in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour.

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent, whose name it bears; it is a very compact grower and excellent in habit, with tubular blossoms of a fiery scarlet colour.

ERYTHRINA COTTYANA, a superb variety, producing immense spikes of blossom, with flowers of a very rich deep scarlet colour; 5*s.* each.

ERYTHRINA BELLANGERI.—The free flowering character of this plant renders it a great acquisition. Cuttings struck in the spring blossom profusely through the summer, which is not generally the case with the other sorts, as they do not usually flower until the second year after being propagated; 5*s.* each.

RHOPALA ORGANENSIS, an exquisite ornamental Stove Plant, far exceeding in beauty any other sort in this family; 31*s.* 6*d.* each.

The Nurseries, Tooting, London.

ROSES, HOLLYHOCKS, CONIFERS.
(WHOLESALE AND RETAIL.)

A. PAUL AND SON beg to inform their Patrons and the Trade generally, that owing to extended experience and improved systems of culture, their ROSES, HOLLYHOCKS, and CONIFEROUS PLANTS are this season unusually fine.

Nurseries, Cheshunt, Herts (13 miles N.E. of London).

SUPERB DWARF HYBRID PERPETUAL ROSES BUDDED ON SIX-INCH STEMS.

WILLIAM WOOD AND SON respectfully solicit attention to their very extensive and splendid stock of the above. The plants are vigorous, and expressly suited for potting or forcing; they are also very eligible for grouping, consisting of all the leading kinds, and will be supplied at 12*s.* to 18*s.* per doz. Catalogues may be had on application.

N.B. A very liberal allowance to the Trade.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

DAHLIA INCOMPARABLE (ABLITT'S).

THOMAS BARNES having purchased the surplus Stock of the above, which was but partially let out last spring, is enabled to offer fine roots at the following prices, viz., 5*s.*, 7*s.* 6*d.*, and 10*s.* 6*d.* each. Colour rich ruby crimson, of first-rate shape, shown in all T. B.'s stands, as also the raiser's.

T. B. has also a few roots of his splendid Dahlia WARRIOR. Deep crimson, shaded, 10*s.* 6*d.* each, with all the leading varieties of other raisers.—Dane Croft Nurseries, Stowmarket.

VINES FROM EYES.—THE TRUE BLACK BARBAROSSA.

JOHN BUTCHER can supply fine Fruiting Plants of the above splendid late Grape. As a mark of its excellent qualities prizes have been awarded J. B. by the Horticultural Society of London, at the following meetings:—Oct. 19th, 1852; Oct. 18th, 1853; Jan. 21st, 1854; Feb. 6th, 1855. Also fine Plants of the following varieties on sale, price on application:—Black Abercairney, Champion, Esperione, Hamburgh's, Warner's Mill Hill and Victoria Prince, Muscadel, West's St. Peter's, Oldaker, White Muscat of Alexandria, Cannon Hall Muscat, Tokay (Lord Denbigh's), Frontignan, Syrian, Chasselas Musque, Malvaise or Grove End Sweetwater, Red Frontignan or Grizzly, Poonah.—Royal Nursery, Stratford-on-Avon.—Nov. 17.

TO PLANTERS AND THE TRADE.

HAY, SANGSTER, AND CO., will Sell the following cheap, as the ground must be cleared:—

Strong Standard Dwarf and Dwarf Trained PEARS,
Do. do. do. GREENGAGE and VICTORIA PLUMS,
Do. do. and half Standard MULBERRY,
Do. do. and Dwarf Trained CHERRIES, RHUBARB,
PRINCE of WALES, PRINCE ALBERT, and VICTORIA
Strong two years' SEAKALE and ASPARAGUS,
EVERGREEN OAKS, in pots, 3 to 5 feet.

18 and 19, Cumberland Place, Newington Butts, London.

PEARS GRAFTED ON THE QUINCE AS PYRAMIDAL SHAPED TREES.

J. AND J. FRASER beg to announce that their Priced List of the above is now published, and may be had post free on application.

J. & J. F. have sold a large number of these Trees for the last three years, and have received numerous letters from gentlemen in the country speaking in very high terms of their productiveness. They can therefore recommend them with greater confidence to the notice of their friends and the public in general.

Lea Bridge Road, Essex.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 17, 1855.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Nov. 20—Horticultural ..... 2 P.M.

OUR readers will not have forgotten the statements made last winter and spring respecting a certain CHINESE YAM, or DIOSCOREA BATATAS, sent to France from Shanghae by M. DE MONTIGNY, and recommended as an equivalent to the Potato. At that time no experience worth mentioning had been gained in this country respecting this plant, the whole of our information about it having come from France. But a considerable number of tubers having been dispersed through the country, we are now in a position to report some results. This, indeed, has been already done by a correspondent or two, but their experiments appear to have been conducted under unfavourable circumstances, and their statements are too conflicting to form any conclusion upon. It therefore is the more satisfactory to be able to produce evidence of what may be done under favourable circumstances when skilful management is employed.

Mr. JOHN HENDERSON, lately of Kingskerswell, and now of the Wellington Nursery, St. John's Wood, has produced to us five tubers, of which the following are the weights and dimensions.

	Weight.		Length.	Circumference at the widest part.
	lb.	oz.	inches.	inches.
No. 1	1	2	21	6¾
„ 2	0	4½	16	4
„ 3	0	9½	14½	3¾
„ 4	0	6	14	4½
„ 5	0	3	13	3½

No. 1 was as fine as the French tubers exhibited in Regent Street last winter, and demonstrated the possibility of producing a crop of the Yam in this country. By what means these tubers were obtained is related in the following statement, with which Mr. HENDERSON has favoured us.

"In the latter part of April I caused a quantity of small tubers (like those sent out to the public) to be planted in pots and placed on a gentle hotbed. Others were planted the middle of May and placed in a cold frame. The greater part of the former soon made their appearance above the mould, and commenced growing rapidly, and by the third week in May they had attained from 4 to 6 inches in height. These, including what had not started, were then placed in a cold pit to be hardened off. By the second week in June those which had been placed in a cold frame, and also the tubers that had not previously made any growth on heat now began to push. I then chose some of the most vigorous from each lot, and caused them to be planted under various conditions and aspects—some on a western border against a wall, some in open beds, and others on the different heaps of mould and compost used for potting, such as peat, loam, decayed manure, &c. Some of the plants were allowed to trail on the ground, some were sticked with 3-feet stakes, and others were trained against the wall. On the 1st inst. I caused the crop to be taken up, and the result has been that the tubers raised on heat have not succeeded well, but appear to have gradually dwindled away, or only made sufficient growth to form tubers of very insignificant size; whereas, those brought on in cold appear to have experienced no check whatever, but to have grown strongly from the first. The generality of the tubers planted, as I have already observed, were similar to those sent out in the spring, *i. e.*, no larger than Marrowfat Peas; yet these have produced new tubers averaging 12 inches in length, and weighing from 5 oz. to 6 oz. each, with the exception of one which weighed nearly 1½ oz. when planted, and which has now produced a fresh tuber weighing more than a pound.

"Although it would appear, when we take into consideration the small size of the sets planted, that these returns are large, yet I am aware that there are many who think differently, and consider that small as the sets were, they ought to have produced tubers averaging at least a pound each; but have any of these parties ever attempted to raise a crop of Potatoes from such small sets? In the first place, it is questionable whether a Potato the size of a Pea could be preserved with any vitality in it till the middle of May. But allowing such to be the case, would the produce equal that of the Dioscorea? I have reason to believe that it would be less by at least one-half.

"From the experiments made by myself, and in which I am fully confirmed by others, there can be no doubt that the Dioscorea, to be successfully cultivated, ought never to be brought into contact with artificial heat, but should be planted in the open ground in the same manner as a Potato, only with this difference, that as the tuber of the Dioscorea is evidently so much hardier than that of the Potato, it matters little whether the planting takes place early or late in the spring. For my own part, I am so convinced of its hardiness that I have caused many of my tubers to be replanted in order to stand the winter; nor do I purpose giving them any protection.

"From trials already made this Yam appears to flourish best in peat and sandy soils, but it will doubtless succeed in most descriptions of earth; many of the tubers, however, when taken up were found to have penetrated into clay with detriment to them.

"I have, therefore, no hesitation in saying that, when we have a sufficient stock in the county to enable us to plant sets as large as those usually employed in Potato planting, the produce will be an average weight of a pound each, and that in situations where the soil is deep and otherwise suitable, it will be even greater than this.

"From the experiments already made, and without entering into its supposed value for the manufacture of starch, for distillation, &c., I think I need scarcely point out its evident adaptability to the soil and climate of Ireland, where the former is generally of a deep and peaty nature, and the latter considerably milder than our own. For were it not for our winter, which checks its growth, the tubers would undoubtedly continue to increase to an enormous size.

"With respect to whether the plants should be staked or allowed to trail upon the ground, when taken up I found but little difference in either case; but I would decidedly recommend their being planted on ridges, and those as high as possible, as by this means it may be grown with advantage on extremely shallow ground, and the taking up the produce will be thereby facilitated. The plants also might then be allowed to fall over the sides of the ridges."

The other experiment was tried in the garden of the Horticultural Society, under the direction of Mr. GORDON, by Mr. HENRY NUTT, a clever young gardener there, whose account we also give in his own words:—

"Two plants of this Yam were presented by M. Decaisne, of Paris, to the Horticultural Society in July, 1854. When received one was planted in the open ground and protected by a hand-glass. The other was planted in the orchard-house. The former grew well, but the latter from the first began to die down. Both tubers were taken up in autumn, potted, and placed in a cold Vinery. That from the orchard-house

being a forked one, I took one part off, and cut it up indiscriminately into 20 small pieces, about the size of horse Beans; I planted each piece in a 3-inch pot, placed them in a little heat, and every one grew.

"Early in the spring of 1855 the two old plants or tubers were placed in a little heat, where they soon pushed three or four strong shoots, which I reduced to one to each plant; the shoots taken off I struck as cuttings. During the winter of 1854 and 1855 young tubers or seeds of this Dioscorea were received and grown in the propagating house. In March they were nice plants in 8-inch pots. I put them with the two old plants and kept them growing slowly on in a temperature (by night) just sufficient to keep frost out. Several of the last-named plants, and likewise some of those I raised from cuttings, were distributed to Fellows of the Society. The others that remained, and the two old plants, were planted out, at the foot of a Vine border the first week in June, 1855. The soil in which they were planted was dug a spit and a half deep and mixed with a good dressing of leafmould and peat. Each plant was covered with a hand glass, except those struck from pieces of old tubers, which were planted four under a glass; the glasses were kept on all the season, but were tilted up on the north side from the first week after planting out. Out of nine of the plants raised in the propagating house four or five of them never made a leaf after being planted out (which I can account for in no other way than that the young tubers had reached the bottom of their pots, and had turned again when I planted them out). Notwithstanding this, however, their tubers continued to increase in size. The other four produced good sized tubers, the heaviest of which weighed 11 oz. The two old plants grew very fast, and I trained the stems both inside and outside the glasses (*i. e.*, pegged them down) and covered the axil of each leaf with leaf-mould. When I took them up I found that tubers had formed at the axils of the leaves, where the shoots had been pegged down; varying in size from 2 to 6 inches in length. At each of the old plants there were also two or three large tubers, which had gone straight down to the bottom of the border, and then turned under the drainage of the Vines. Out of eight of the young plants propagated from pieces of old tuber, four of them likewise sent down tubers to the bottom of the border; but they were very slender, the heaviest of them did not weigh more than 4 oz. It may be worth mentioning that where the first Dioscorea was planted out in 1854, a piece of the tuber was left in the ground. at a depth of 18 inches, and that it sent up a stem this summer; this I uncovered to the bottom, and I found that the new tuber commences to form at the top of the old one, and grows downwards; for to the depth of the old tuber there was nothing but stem.

"In the cultivation of this Yam we should therefore apparently plant shallow on a deep heavy soil, trenched some months beforehand. We should also force less and plant much earlier in the season. This last point, however, I expect must be determined by experience. I may add that on stems not pegged down little bulbs had formed at the axils of the leaves about the size of Peas."

The inference we draw from these explicit relations of two experiments tried by competent persons is undoubtedly in favour of the climate of England being good enough for the Chinese Yam. Nor is our opinion at all altered by the knowledge that many have wholly failed in growing it, a circumstance sufficiently explained by the badness of the sets which were planted, or by mistakes as to the way in which the crop requires to be managed.

Those who are desirous of seeing the roots produced under the circumstances here explained, will have the opportunity of doing so at the autumn meeting of the Horticultural Society on Tuesday next in Regent Street.

It will have been remarked that the question of the comparative value of the *Quercus sessiliflora* and *Quercus pedunculata* has once more been raised by some of our correspondents. Certainly there is no inquiry whatever of greater national importance, affecting as it does the value of the staple produce of our English forests. Nevertheless it is one regarding which our supineness is unparalleled. Is it not possible to prove, by irresistible evidence, the respective qualities of these our two British Oaks? and to set at rest the conflicting testimony, if that, indeed, can be called testimony which is for the most part hearsay, or mere tradition—in a matter which most seriously concerns the landed property of these kingdoms.

According to A, our valuable Oak is all produced by *Quercus pedunculata*. According to B, the finest Oak is, or was, that of *Quercus sessiliflora*. B asserts that the latter grows much faster and forms a finer tree than the former; but A, while admitting the fact, replies that the badness of its quality renders its rate of growth unimportant.

Our columns have from the very establishment of the *Gardeners' Chronicle* been open to this inquiry, and contain numerous statements and counter-statements, out of which it seems impossible to select the truth. These discrepancies probably arise in some cases from the real distinctions between the two Oaks being misunderstood. It is thought that all Oaks with stalkless acorns belong to *Q. sessiliflora*, whereas *Q. pedunculata* itself has sometimes its acorns in the same state. The true character of *Q. sessiliflora* is to have long-stalked leaves and short-stalked or stalkless acorns. On the other hand *Q. pedunculata* has short-stalked or stalkless leaves, and long-stalked acorns. It is indeed in the leaves that the means of distinguishing the two kinds exists, even better than in the acorns. Those of *Q. sessiliflora* have always long yellow stalks, while the leaves of *Q. pedunculata* either have no stalks at all, or if there be stalks they are either green or red. The timber of the first, which has very uniform and fine medullary rays, is called Chesnut by uninformed persons; that of the second, which has many very large medullary rays, mixed with the smaller ones, is the common Oak of the timber merchants.

It is time that this question should be finally settled, and we earnestly invite the co-operation of our numerous readers in bringing it to issue. The inquiry is of rather more importance than the proper form of a Tulip, or even than the quality of a Plum; and should engage the earnest attention of country gentlemen, through whom alone the truth can be ascertained. We earnestly invite their communications wherever they have certain personal knowledge of the real facts of the case.

New Plants.

148. Dendrobium cumulatum.

D. *cumulatum* (Stachyobium) racemis densis lateralibus, petalis obovatis obtusis sepalis multò majoribus, mento sepalis æquali angusto incurvo acutiusculo labelli glabri ungue lineari pone basin unidentato laminâ oblongâ obtusâ.

A most beautiful addition to our collections. We first received a specimen in September last from Mr. Charles Junkermann, who found it growing in the garden of Mr. F. Coventry, of Shirley, near Southampton, and who describes the plant as having a dark stem covered here and there with Vanilla-scented blossoms. Since that time we have also had it from Mr. C. B. Warner. It appears to have been bought at one of Mr. Skinner's sales; but its real history is unknown to us.

The flowers are nearly 2 inches long, with the delicate pink colour and transparent texture for which *Dendrobium transparens* is so remarkable. They grow in lateral compact clusters, five or six together, in the same manner as in *D. aduncum*. The depth of colour in them varies; Mr. Warner's specimens having been very much darker than those from Mr. Coventry, and moreover having the delicate lip itself freckled with rose-colour. The leaves have not been seen by us. The species must stand next *D. aduncum*, from which it differs in its large flowers, incurved acute chin, and perfectly hairless obtuse lip. There is more than one nearly allied unpublished species in our possession from Java, whence this perhaps has come.

149. Rondeletia anomala.

R. *anomala*; viridi-pubescens, foliis ovatis acuminatis breviter petiolatis, glandulis quibusdam stipularum loco, capitulis terminalibus trifloris, calycis laciniis linearibus foliaceis glandulis interjectis, corollæ tubo duplò longiore filiformi limbo 5-partito reflexo laciniis retusis: faucis annulo lineari intus villoso.

A beautiful Guatemala hothouse shrub, lately raised from seeds by the Horticultural Society, to which they had been presented by its generous and indefatigable correspondent G. U. Skinner, Esq. The plant has something the appearance of a Bouvardia; the flowers are of the richest vermilion red, with a yellow eye, about the size and form of R. odorata, but with the orifice of the tube closed by yellow hairs. What is very remarkable this shrub has no stipules, instead of which there is a line of minute shining glands, others like which also appear about three together, between the leafy lobes of the calyx. Flowering in November this plant must be regarded as one of the most brilliant species which even Mr. Skinner has been able to add to our gardens.

VEGETABLE PATHOLOGY.—No. XCV.

379. Exostosis.* (*Knaurs.*) The Beech, Hornbeam, Sycamore, Oak, Hawthorn, and some other trees are subject to a very curious affection, indicated by the production of hard lumps of wood entirely disconnected with the common central column, surrounded by the bark, and causing it to project more or less decidedly, according to their size. They vary from the size of a Pea to some inches in diameter, and are remarkable for the wavy lines with which their surface everywhere is marked. The origin of these bodies was very obscure till Trécul studied them, and it is to his memoir in the 20th volume of the third series of the "Annales des Sciences Naturelles" that we are indebted for the following information. It does not appear that they are due to the puncture of an insect, but they seem to arise from some peculiar constitutional condition of the particular plant on which they are formed.

380. In order to ascertain the origin of these bodies it is necessary to examine them in a very early stage of growth. At a later period the traces of their primary condition and their relation to the wood are in general so masked as to make it almost impossible to arrive at any satisfactory conclusion. It will be seen as we proceed that Dutrochet's theory that Knaurs are from the first altogether independent of the part of the tree on which they grow without any terminal bud, that they are in fact mere latent embryos and not true buds at all, is perfectly untenable. The important bearing of the case on the theory of the formation of wood from tissue descending from the buds, will not escape the notice of any well instructed botanist, though it has little connection with our present subject. Now in every case where a sufficiently young Knaur is under observation, there is no difficulty in ascertaining the presence of a terminal bud, which is always at some early period of growth connected by a fibro-vascular system with the woody axis upon which it is seated. It is far more easy to ascertain this connection in the Hornbeam than in the Beech, because traces of the original formation remain a longer time, and in fact are seldom entirely obliterated. Little buds in the former case may be seen to creep on the surface of the bark, assuming a very peculiar form which may be compared with the shoot of some Jungermannia, or a crawling scaly Annelid. They are sometimes very small, not exceeding $\frac{3}{8}$ of an inch in length, and a sixth of these dimensions in breadth, composed of two ranks of little imbricated scales separated by a longitudinal furrow. Though of such small dimensions they are often of considerable age; and if they are carefully removed so as to take with them a few layers of bark, their point of origin will be found not to correspond with the apparent point of attachment to the bark, that is with that of the scales which are furthest from the top of the bud, but immediately below the summit itself, or the youngest scales, so that the buds only apparently creep over the surface of the bark. The scales, in fact, as fast as they are formed are pushed backwards, together with the thin bark to which they are attached. And as this rejection of the old scales cannot take place without the rupture of the tissues of the bark, though they were at first disposed all round the bud they are thrust back on the side opposite to the rupture, and thus a furrow is formed which runs through the whole series of scales. Occasionally the scales are thrown back on two sides of the bud, and then they form two series, making a more or less acute angle with each other. Sometimes these buds are attached immediately to the wood itself which is more prominent at the point of attachment, a method of which we shall have more to say in the next article, but in other instances the wood itself of the bud increases so as to form within the bark a distinct nodule, which at last loses all attachment, and appears under the guise of a true Knaur. As it increases, a considerable pressure is exercised on the bark, which in turn as it increases in thickness lifts up the nodule, and finally ruptures the fibro-vascular bundle by which it was attached, so as to leave it quite free. It no longer depends upon any nutritive matter derived from the growing surface of the axis, but it has its own system of bark and wood, and receives all its nutriment from the bark in which it is enveloped, and that already elaborated. It has no need therefore, like a parasite, of any system by which the juices it receives may be elaborated, and in consequence the bud to which it owed its first origin may become entirely abortive without any detriment to the growth, and thus all trace be lost of its ancient connection with the axis, or of the bud to which it owed its first origin. In Paulownia imperialis, M. Trécul has observed a Knaur supported by two peduncles, as if it had arisen from the union of two buds.

381. After a time the bark which covers the Knaurs is apt to decay, and if the injury extends down to the nodule itself, its further development must be confined to the side nearest to the axis. The decay may be continued to such an extent as to leave merely a ring of wood instead of a globose nodule. The Knaurs occasionally, though freely developed above, adhere permanently by a strong peduncle to the wood.

382. Though the bud for the most part decays, this is not universally the case, nor does it always remain in a rudimentary state. Dr. Lindley has figured a branch springing from a Poplar Knaur in his "Theory of Horticulture." A less marked instance is illustrated by Trécul, though of considerable interest, inasmuch as the bud which had been for years semi-dormant has at length assumed a more active vitality, and has in consequence been more perfectly developed. In the Olive, Knaurs are so prone to develope their buds that they are used for propagation under the name of *uovoli*. The clavus of the Olive mentioned by Ré is probably the same thing. Mr. Lowe has, at my request, in vain inquired after such an affection at Madeira, so that it should seem to be local. Neither could he hear anything of the callosities on the roots described by the same author, Molina says that they do not occur in Chili. *M. J. B.*

* ἐξόστωσις, projection of bones, as of the cheek bone. Trécul considers it a sort of ligneous hypertrophy.

WASP PAPER.

It is well known that wasps and hornets make their combs and the outer covering of their nests of a structure called by the name of wasp or hornet paper, quite different from that which bees make use of. To those of your readers who are less familiar with this subject the following observations on the nature of the substance which goes by this name may not be without interest.

I may premise that a wasp's nest is made of a case of paper of this kind, inside which the comb is fastened horizontally in stages, not vertically like bees' comb. The uppermost stage is connected with the outer case, and the lower are hung successively one from the other to the number of five or more. The cells are hexagonal

like bees' cells, but they are single, with the opening downwards, not set end to end as in honeycomb. The upper surface is rough, dark, and uneven, corresponding to the blind ends of the cells. The lower presents the open orifices of the cells all invested with more or less of the same mucous secretion with which the cells are lined and the larger cells are prolonged, and which is the cement used for holding the component particles of the wood together. This mucus is soluble in an alkaline menstruum, insoluble in water, alcohol, or ether, differing thus chemically from the secretion with which bees make their cells.

The paper is made by all on the same general plan—namely, in ribbons varying in width from about one-sixteenth of an inch upwards. The ribbons are fastened together into a sheet, the fastening being of a less compact texture than the ribbon itself. The cells are made in this same way, apparently three sides of the hexagon being made continuously. The disposition of the various materials of which the sheets of paper are made leads to the inference that each wasp, of the social species, has its own working place, and itself makes up the materials which it brings home, going on building where it had left off, and then returning to the same place for more similar materials. The difference of material in various parts is much more apparent in the nest of the social than in that of the solitary wasp.

The cells are made of a single thickness, coated on each side with a layer of mucus, by which also the interstices of the woodwork are filled. The case consists of sheets of paper, laid one over the other, most numerous at the top whence they begin, but laid with no great regularity. Apparently the whole nest is made on a definite plan, the size of the whole being calculated from the first to the probable requirements of the colony. But on this point some observations are needed, which might be readily and safely made with a telescope on the tree wasp's nest.

The common wasp which builds in the ground uses for this purpose fragments of wood. The pulp formed by boiling the paper of this species in a solution of caustic potash, displays under the microscope little fragments of wood, where several short fibres are held together by medullary rays. Apparently the wood is decayed; the comparatively large size of the fragments and the absence of discolouration on boiling in liquor potassæ favour this opinion. The wood is used by this species only as rubble, quite differently to the practice of the tree wasp.

Hornet paper differs only from this in the larger size of the fragments, and generally coarser structure and more friable texture. The nests, so far as I have been able to ascertain, are made on the same general plan; but my knowledge on this point is very incomplete. The usual seat of the nest, namely, the hollow of a decayed tree, renders an outer case less needful to these insects than to the tree wasps.

Tree wasp paper, disintegrated by boiling liquor potassæ, presents only filaments or vegetable fibres under the microscope. Here are no fragments or medullary rays, only fibres which are fitted into one another; and, as this paper blackens on boiling in an alkaline solution, it may be inferred that live fibres, still containing the vegetable juices, were employed. The texture is much stronger and more compact than that of the ground wasp's nest, and mucus is not so largely used. I have succeeded, indeed, in making a paper of tolerable tenacity from the pulp of wasp paper of this kind after the mucus had been removed.

I believe that the different nature of the materials which they employ, and the different manner in which they work them up, would alone establish an essential difference between the ground and tree wasp. It would be curious to ascertain whether any difference exists in the structure of the jaws of these species corresponding with the difference of their habits. Perhaps I may have opportunities of investigating this point next year. The only appreciable distinction of texture between the nests of the solitary and social tree wasp is the greater delicacy and uniformity of the solitary nest. The materials of both are the same. *Brighton.*

ENTOMOLOGY.

THE CHRYSANTHEMUM FIELD BUG.

Flowers, the beauty of which, in the eye of the artistic cultivator, consists in the almost mathematical correctness of the outline and in the perfectly even development of the petals and stamens, must of course be rendered worthless if either of these conditions be wanting, since it cannot be denied that (although it may be a matter of questionable taste to distort by cultivation the outline of a naturally irregular flowered species, such as a Viola, into a perfectly regular circle) many flowers, especially composite ones, are circularly developed upon mathematical principles, and therefore the truer their development the more even will be their form and growth; and we presume it is an unquestionable axiom in æsthetics that what is true to nature cannot be false in taste.

These remarks are offered by way of answer to the observations which we have heard as to the unnecessary care bestowed by florists on their favourite flowers, with the view of their becoming perfect in outline and development. Now the Chrysanthemum is one of those flowers which nature has determined should be of a perfectly circular outline, and with regularly developed petals, but it very often happens that the choicest flowers of this kind will not bloom true and regular, owing to the want of development of some of the petals. Various causes doubtless exist capable of producing such an annoying result, not only arising from the growth of the plant itself but also from the condition of the atmosphere and other external circumstances. I have reason however to believe that the chief agent in the matter is a little active winged field bug, which throughout the month of October, whilst the Chrysanthemum buds are in their full growth, may be seen seated on them in the sunshine, with its sucker deeply immersed in the bud, from which it extracts its nourishment; at the same time materially affecting the growth of the particular parts of the bud which the insect has thus attacked.

This little insect is generally to be found either seated on the top of the buds or among their clustered stems; it is very wary, and at the approach of the hand either immediately flies off or hides itself on the under or opposite side of the bud. It is, with its wings closed, about a quarter of an inch long, and is of a dull ochreous colour, tinged with reddish or with greenish, so as to be somewhat variable in its hue. The upper surface of its body is glossy, so that it is rather an agreeable object than otherwise, when viewed in the sun sitting in the midst of a bud of which the bursting petals begin to disclose their tints. It is of a longish, oval, and rather depressed form; the head is triangular, with chesnut eyes; the antennæ are about two-thirds the length of the entire body, the second joint is not thicker than the basal one, the third and fourth are rather more slender. The thorax is rather strongly punctured; it is at its hind part nearly three times as broad as the head, with its lateral margins straight and oblique; near its fore margin are two small raised spaces placed transversely. The scutellum has two small black pointed spots at its base. The wing covers are like thin horn, both in colour and substance, so as somewhat to show the colours of the body through them; they are slightly clouded with brown about the middle, and with several small dark dots beyond the middle; the apical membrane is rather dusky, with the vein which traverses it in an oval form, more transparent. The legs are long and slender, pale dirty buff, the hind thighs with a dusky ring near the tips. The body of the male is dark blackish, with a reddish tinge at the extremity; that of the female is greenish buff. The latter sex has a long groove down the greater part of the under side of the abdomen, which contains the instrument by which she deposits her eggs in plants.

We do not know either the earlier or later history of the species, and can only conjecture that some of the females

as soon as the dull cold weather of November approaches, hide themselves among the foliage of hedge rows or adjacent plants where they remain till spring, when they deposit their eggs on the young stems or upon the newly developed leaves of the Chrysanthemum and other plants suitable for the food of their progeny, which resemble their parents in all respects except in wanting wings and wing covers. We must not omit to add that the instrument by which the mischief to the Chrysanthemum buds is produced is the four-jointed sucker attached to the under side of the head, its length being nearly that of the antennæ, and the interior of its sheath being furnished with several long and very delicate bristles which it thrusts into the buds, thus causing the sap to flow upwards along the tubular sheath into the head of the insect. We may further mention that the insect is much less active in dull weather, when it may be easily caught with the fingers. In this manner in five minutes I captured sufficient specimens for my own and friends' cabinets. The species belongs to the order Hemiptera, sub-order Heteroptera, family Capsidæ, and genus Phytocoris, being closely allied to the Potato bug, whose portrait we gave in this Paper some time ago; and although it is very difficult to determine the very numerous species of this group, we believe our insect to be the Cimex campestris of Linnæus.

Since the above was written we learn from Mr. Salter, of the Versailles Nursery, whose success in cultivating the Chrysanthemum is so well known, that the ravages of this insect are much more injurious than I had imagined, and that it is chiefly to its attacks on the very young buds in August and September that so many of them wither off in the centre. He adds that one eminent French grower of these flowers has informed him that from this cause he has scarcely a single bloom this year. *J. O. W.*

MEMORANDA.

Intended to show some instances in which the agency of man has been brought into play in the production of plants, of insects, of birds, and also on a more extended scale, on localities and on climates; and to show that however these effects may appear permanent, they originate in taking advantage of those laws to which the Almighty Power has subjected all alike—plants, insects, animals, localities, climates, and man himself.

(*Concluded from p. 742.*)

THIRDLY—OF BIRDS.

1. Some years ago an apparatus for hatching birds by steam was a show in London. An establishment now exists on the road to Richmond for the purpose of supplying the markets with poultry when out of season. The mother is thus set aside, and the ingenuity of man provides a substitute.

2. Again, the cottagers of Weston Tourville and its neighbourhood, by care and high feeding, have brought a peculiarly fine breed of white ducks so forward as to constitute a most important dish at the tables of the wealthy Londoners early in spring, when ducks in the state of nature have scarcely commenced laying. The cottager first finds a hen or a duck which is fed highly, and which thus becomes ready to sit out of season. The young brood is from the first carefully enclosed on the floor of the cottage; new broods are added until the floor is divided into many enclosures, each teeming with its brood of young ducks. They are now carefully attended, are fed with barley meal and greaves (the fibrous part of the fat, which remains after it is melted); they thrive, grow much beyond the ordinary breed, and become an important source of revenue to the cottagers. Here the ingenuity of man is made to minister to the wants of man; but the young ducks, if left to themselves, would revert to the state of nature.

FOURTHLY.

On a more extended scale the ingenuity of man, as shown by Colonel Nichols, Royal Marines, in the collection of water on the solitary island of Ascension, in the midst of the ocean, has been rarely equalled. A scanty supply was procured formerly for watering ships, when the quick perception of the Governor led him to notice the rapidity with which a kind of Moss overran the bare rock. Fully aware of the hygrometrical quality of plants he took advantage of it by planting the Moss wherever there was a trace of soil. By means of spouts the water was conveyed to the most convenient spots until he procured a most ample supply, daily on the increase, in proportion as his Moss extended more and more.

In like manner the agency of man, with or without his intention or knowledge, works important changes both in the climate of individual spots and in large districts. For instance: One of my uncles had an estate in Virginia, very near to the bank of the James river. The house was situated on an elevated plain. The course of the river, and the miasma which arose from or were conveyed by it, were shut out from the house by a dense and abruptly sloping wood. At about a mile and a half from the estate his nearest neighbour had a house similarly situated. Unfortunately the neighbour cut down a portion of the wood between his house and the river. He thus let in the dry wind of the southern parts of the United States which rushes to the higher temperature of the Gulf Stream, bearing along with it pestilence and death. The result was that the neighbour lost several members of his family, and many slaves, and that the estate was deserted, while that of my uncle remained healthy.

In like manner, in the mountainous parts of Kandy, Island of Ceylon, where every portion of land which can be irrigated is so, and every streamlet is carefully collected in tanks for the purpose, there is an old fort at Nalunda. This fort had proved the grave equally of European, Malay, Bengalee, and African. At last an intelligent native pointed out that it was situated in a line in which the tank and the irrigated paddy fields were placed—that is, between the north-east, or the direction of the dry wind, and the fort; so that the fort being on elevated ground was so placed as to catch every atom of miasma. He pointed out that the natives always placed themselves on a level with the tank; that the tanks were always constructed to the north-eastward of the paddy field; and that the dwellings of the natives were erected to the north-eastward in the midst of wood. He suggested that the fort should be abandoned and that the post-master should be removed to a point to the north-eastward in the midst of wood, which rose above his dwelling.

The result was that we had the gratification of finding the rest-house perfectly healthy, to find the half-caste post-master in the perfect enjoyment of life, and above all I walked about with the intelligent Modeliar (the highest native *employé*) and heard him point out with delight the result of his suggestion.

In the neighbourhood of Charleston, South Carolina, we have an instance in a wide district of the effects of the industry of man being turned, by neglect, into a source of pestilence rarely exceeded. Carolina Rice is produced on the deltas of the Charles and Savannah rivers, and their tributaries. It formerly bore so high a price as to induce the growers to take advantage of every difference of level to construct tanks for irrigation. During the war of independence the district was perfectly healthy. The construction of tanks increased, until East Indian Rice was imported, and caused the price to become so low as not to repay the expense of keeping up some of these tanks. Tank after

tank was abandoned, until the dank profusion of decaying and decayed vegetation generated pestilence to such a degree, that in 1824 I was told that no white man, during certain parts of the year, dare sleep a single night beyond the walls of Charleston.

A similar result has occurred in the northern part of Ceylon, which abounds with the remains of tanks, some of gigantic dimensions. There, as at Charleston, the neglected tanks first commenced the depopulation of the district. But in Ceylon inroads of the Malabars from the continental coast, combined with that fell scourge the small pox, have reduced the population to its present low, very low state, and to make the country so unhealthy, that when two of us were about to join a shooting excursion from Colombo, and to visit the ancient capital of the island, now in ruins, our comrades tried to dissuade us by saying "that we should leave our bones in the jungle."

On looking back at the foregoing we find instances of the power of man—in the White Clover, in the Charlock, in the Yellow Pine, the Scotch Fir, the white Cedar, and the Hickory, &c.; in the bulb taken from the hand of a mummy; over the mite and the hopper, over mosquitoes, gnats, or midges, over the snails at Layton; in substituting steam for a mother, and in taking advantage of high feeding to accelerate the production of young, and thus to make the ingenuity of man minister to the wants of man. We also see man exerting his intellect in drawing condensed moisture from the clouds in the Island of Ascension—showing his ignorance by letting in pestilence and death over his healthy home in Virginia—and his intelligence by depriving miasma of its prey in the fort of Nalunda.

We find in the neighbourhood of Charleston, South Carolina, and in Ceylon, man busied in forming tanks, the sources of plenty and abundance. We see him as an economist in America, or oppressed and a martyr to the most dire disease in Ceylon, abandon those sources of plenty and abundance, and we see large districts converted into pestilential morasses.

But we see throughout, that in every instance beings are subject to universal laws; and, although man in his blindness cannot see nor trace the workings of the Almighty, and although the ingenuity, the perseverance, the comprehension of man may do much, still those laws are universal, and creation is the province of the Creator. He alone asserts this power. He exerts it when and in what manner He pleases. *I. J. C.*

Home Correspondence.

Vitality of Seeds.—Several statements have been published on the number of years during which seeds preserved in a dry state have retained their power of germinating, but much less seems to be known in regard to seeds lying naturally near the surface of the ground; therefore you may, perhaps, think the following case, though very far from a striking one, worth publishing. An arable field 15 years ago was laid down in pasture; nine years ago last spring, a portion was deeply ploughed up and planted with trees, and in the succeeding summer, as far as I can trust my memory, plenty of Charlock, which abounds in this neighbourhood, came up; but if my memory plays me false the case will prove so much the stronger. From being badly ploughed the whole of the land in the course of the year became covered with Grass and coarse weeds, and has remained so ever since, and the trees have now grown up. It is very improbable, from the well-known habits of the Charlock, that it could have grown in the little wood after the first year or two; and though almost daily visiting it I have not noticed a plant. But this spring I had some Thorn bushes pulled up, and it was so done that not more than one or two (I speak after comparison) hand's breadth of earth was turned up. To my surprise in July I happened to observe on one of the little patches of earth no less than six dwarf Charlock plants in flower; on each of two other patches three plants; and on the fourth one plant. This made me on July 21st have three separate plots of ground, each 2 feet square, in different rather open parts of the wood, cleared of thick Grass and Weeds, and dug one spit deep. By August 1st many seedlings had come up, and several of them seemed to be cruciferous plants; so I marked with little sticks 11 of them on one of the beds; six on the second bed; and five on the third bed; two or three died, all the rest grew up and proved to be Charlock. I can state positively that no Charlock was growing near these beds; and I do not believe there was any within a quarter of a mile, as the little wood is surrounded by Grass land. Now, to my mind, this seems good evidence that the Charlock seed had retained its vitality within a spit's depth of the surface during at least eight or nine years. In most cases, when plants spring up unexpectedly, as when a wood has been burnt down, it is not possible to feel sure (as has been remarked to me by Dr. Hooker) that the seeds had not been strewed about during the last year or two by birds or other means. Had the several Charlock plants come up on one spot alone, I should have thought that some accident had brought a pod there, and that I had overlooked during the previous years a few Charlock plants, but it seems to me improbable in the highest degree that on each of the 6 plants, taken by simple hazard, several (in one of the cases 11) seeds should have been dropped by some unknown agency, having been brought from a quarter of a mile distance. But if when the land was ploughed, 9 years ago (or when arable, 15 years ago) the whole was, as I believe, almost covered by Charlock, the seed would have been scattered everywhere, ready to spring up at whatever point the land might subsequently be stirred up. I will only further remark that the power in seeds of retaining their vitality when buried in damp soil may well be an element in preserving the species, and, therefore, that seeds may be specially endowed with this capacity; whereas, the power of retaining vitality in a dry and artificial condition must be an indirect, and in one sense accidental, quality in seeds of little or no use to the species. *Charles Darwin, Down, Nov.* 13.

Cucumbers.—In his remarks on new Cucumbers, Mr. W. P. Ayres gives the following description of my "Ipswich Standard." "Though fine in form," he says, "it is coarse in flavour." Now, having sent out this variety with a good character and professing to be "a bit of a judge" in such matters, although differing in opinion from Mr. Ayres I trust you will allow me to say a few words in reply. I have no hesitation in repeating that my "Ispwich Standard," well grown, is perfect in form, solid, and crisp; the taste being neither sweet nor bitter, but exactly that agreeable Cucumbry flavour which is so desirable in all first-rate fruit of the kind. This opinion is confirmed by numerous testimonials which I have received from gentlemen's gardeners who have discarded all other varieties. Market gardeners who never thought of show fruit have this year astonished themselves by winning for the first time prizes with this Cucumber. Others have made more money of their crop than they ever did before, while some have struck cuttings, planted ridges, and had in that way an excellent crop of handsome fruit from 12 to 18 inches in length. For the sake of a little friendly competition I should be proud to enter my thorough-bred favourite against Mr. Ayres's whole collection, but they must be judged by parties who know the difference between fine and coarse-flavoured fruit, and who are also aware that the Sion House and Kenyon's Favourite do not represent the qualifications of a perfect Cucumber; at least, such is my opinion. *Thomas Wild, Ipswich.*

Double-blossomed Peach.—You mention (see p. 726), relative to this Peach, that the fruit seldom ripens; and when it does, it is valueless. I beg to inform you that I have some trees which ripen the fruit generally every year; and although the fruit is not very palatable from the tree, it makes a most excellent preserve, when preserved in brandy, &c. *George Palmer, Nazing Park, Waltham Cross.*

The Yapanna, a Madagascar plant used against Diarrhœa.—May I trouble you to examine a specimen or two of a plant from Madagascar. The specimens I am sorry to say are all imperfect, but I send the best; they may be enough to enable you to identify the plant. They were brought in the dried state by an intelligent captain of a ship trading between this port and the West Indies. The captain says that being ill when he touched at Madagascar of some painful affection of the bowels with diarrhœa, an infusion of this plant was administered to him with very rapid success, and that it was the great remedy in the island for colics and all such affections: being so rapidly cured, he begged a small parcel of the wonderful herb to bring to Europe with him for the benefit of the faculty at home. The native name was Yapanna or Japanna. It appears to possess a good deal of astringency. This is the sum of the information I have been able to gather. If you can inform me of its name and its relations in the natural system it would be a satisfaction. *Dennis Embleton, M.D., 39, Northumberland Street, Newcastle-on-Tyne.* [The plant sent us consists of two or three twigs of some herbaceous plant, with the leaves attached, but neither flower nor fruit is present. There is therefore no means of identifying it with certainty, and we can only say that it looks very like some Jussiæa, such as J. repens, or Ludwigia jussiæoides, both found in the Mascaren Islands. Of their qualities we know nothing, but the order of Onagrads in which botanists place them is scarcely more than mucilaginous. We should add that it is also possible that the specimens may belong to some Lythrad like Ammannia vesicatoria, in which case the supposed astringency of the Yapanna may be expected to occur.]

The Osborne Shell Shower.—Your correspondent "C. D." will no doubt follow up the pertinent questions which he put to Mr. Winchester by an exposition of the cause of his inquiries, viz. (what I dare say will astonish Mr. Winchester), that the shells never fell from the clouds at all. Nothing can be more clear than the whole story, more particularly since Mr. W.'s remarks of last week. Zua lubrica, the shell in question, is one (in certain situations) of our most common terrestrial mollusks; it exists in thousands among the moss-grown flowers of our woods and forests, and gladly avails itself of stones, under which it takes refuge from the cruel designs of naturalists, or the more natural instincts of its many-winged enemies. And yet how many people ever saw a Zua lubrica? Probably not one in every 10,000 inhabitants of the realm. It is one of the common things which pass onward, generation after generation, unnoticed and unknown. The English are not, as a people, deeply conversant with nature, except as it appears to them in those groups of beauty which touch the coldest and most unimaginative mind at such seasons of the year as the present. Of the great families of living things in the world they know little or nothing. Were it not so, we should not have so many of those wonderful stories which recount how toads have lived for ages in the middle of a rock or an old tree; how small vipers run down their mamma's throats for refuge; or how frogs and mollusks are showered down upon us from above. Now, it is the nature of Zua lubrica to crawl out upon provendering excursions after rainy weather; it is necessary that it should comfort the inward snail, and from its mossy or rocky retreat on the memorable day recounted by Mr. Winchester the mollusks about Osborne were especially hungry, and wandered about that hospitable mansion in quest of food. For the first time in her life one of the ladies of her Majesty's household beheld one, two—hundreds, nay, countless thousands of these hungry young roving mollusks. "Where could they come from? How hungry they must be! poor little things! I have been in fields, gardens, woods, and even to sea, and I never did see this little creature before; it must have fallen from the clouds!" And thus in the course of half an hour the entire household at Osborne is in possession of the wonderful story, good Mr. Winchester sends off a paragraph to the *Gardeners' Chronicle*, and from one end of the kingdom to the other it is most religiously believed that a shower of shells did actually fall at Osborne on the day mentioned. This is the usual history of these tales. No one is to blame. Each told or recorded what they each and severally believed to be true. One of your correspondents, "C. D.," with a laudable desire to elicit truth, puts one or two questions, and the whole matter is blown to the winds. The only thing Mr. Winchester really knew was, that they were alive because they eat Cabbages. Will he be kind enough to go and search in the neighbourhood of Osborne among moss and stones, and he will find hundreds of Zua lubrica that will do the same? If he will be careful in his search he will find scores of snails that he never saw before. But they did not fall from the clouds, neither were they lifted bodily by a storm and removed from one locality to another; they have fed thus since the great convulsion of Nature which separated the island from the mainland, and they will remain until their destiny is fulfilled, and no longer. *C. R. Bree, Stricklands, Stowmarket, Nov.* 13.

Subterranean Irrigation; Woolmer "Forest."—I feel great pleasure in observing that my former communication has been the means of prompting a minute and interesting notice of Mr. Wilkins's experimental garden at Reading. May I be again permitted to make a few remarks on the benefits probably to be derived from the adoption of this system in certain localities. Look, for instance, at the immense extent of the south downs? what would not those downs produce which now barely feed a few sheep, were they, or great parts of them, brought into cultivation under this system? We will not stop to consider them, however, but will endeavour to get a step or two nearer the metropolis. As you leave these downs in the rear, you step at once into "The Royal Forest of Woolmer, a tract of 7 miles in length, by 2½ in breadth." Yes, a royal forest, but a forest of what? Why a royal forest of flints and Furze, a land of sandstone and shingle, a region of "Yarn" and heather—or, in one word, a primeval waste, over whose hillsides desolation reigneth paramount. Such is or rather such was the condition of this domain the last time I saw it, with the exception of a straggling plantation of Pines that did not appear to be at all extensive. It will thus be seen that this immense extent of country, within 50 miles of London, is at the present time laying almost wholly idle and unproductive; and it will not require any very profound calculations to prove that in its present condition it is a dead loss to the state, and a next to useless addition to the crown lands. I should venture to suggest that if Government were to form a company for the purpose of building upon and bringing into cultivation this extensive district under Mr Wilkins's system, the benefits to be derived from it would be almost incalculable; and instead of its being, as it now is, one of the most barren, worthless, and uncivilised portions of the country, it might be made one of the most smiling and productive. It consists principally of wide undulating slopes and extensive table-lands; added to this, it has several lakes of various dimensions within its limits. Altogether it would be, in my opinion, a most eligible situation for carrying out the system of subsoil irrigation with beneficial effect. It may be asked, supposing the Government could be prevailed to give this barren waste into the hands of an enterprising company, what would be the results? We may reasonably suppose that they should be something like the following, namely, that the company would build houses from the labourer's cottage up to the ordinary farmhouse, with a proportionate amount of land duly prepared attached to each; together with barns, sheds, and all things requisite or appertaining to the system, and for which a moderate rental should be expected. I am myself not only perfectly convinced that this plan would be most profitable and remunerative, but that these residences would be eagerly sought after, and from the competition even perhaps difficult to obtain. Under this system then, and in this particular district, we may hope to see a return of that good time—

> "Ere England's griefs began,
> When every rood of ground maintained its man."

And it is also worthy of remark that the labour attending this mode of cultivation is trifling compared to that of the old system, the soil itself requiring none of that care, labour, and attention so essential to the welfare of all land cultivated in the ordinary manner. The crops of the neighbouring farmers on this light soil may be parched up or partially ruined, but the new man has nothing to fear. The excessive drought or heat are but the means of renovating and bringing quicker to per-

fection his crops; whereas, those in his neighbours' fields are suffering severely, or are at any rate being greatly retarded for the want of proper moisture and nutriment. I can likewise conceive that a more general adoption of this system upon the labourer's allotment principle would be the means of preventing a great deal of that snarling spirit of discontent so peculiarly prevalent in many of those agricultural districts where, if I may so term it, both the farmers and their labourers have scarcely emerged from a state of semi-barbarism. I could say more on this subject, but I must not attempt to trespass further on your pages at present. It may be worth while, however, to add, that I am not in any way interested in the results of this system beyond that interest which we all ought to feel in any undertaking which may tend to promote the welfare of our countrymen. *J. H. C., Strathfieldsaye.* [Our correspondent does not seem to be aware that the propriety of selling Woolmer forest has long been under consideration. Mr. Drummond's committee adverted to that circumstance, while they admitted its unsuitableness for the growth of timber. Its revenue for the year ending March 31, 1854, was 739*l.* 9*s.* 6*d.*, while its expenditure amounted to 601*l.* 19*s.* 4*d.*]

Larch Trees.—I shall esteem it a favour if any of your practical subscribers would kindly inform me the proper distance they consider a plantation of Larch Firs of about 45 years' growth should be left apart to grow to the greatest profit per acre, and whether or not they advise the trees being primed up. *R. G. C., Brighton.*

Poplar Timber.—It was observed by a correspondent in your paper that the "Black Italian Poplar is a valuable wood." I wish much to know in what its value consists. I planted many of them about 40 years ago, being then told they would be as valuable as Oak at half the age. I find them very useful in repairs, and roofs for cattle sheds, and such like buildings, and have lately roofed one cart-house with Larch and another with Poplar, each of my own planting, and time will show which is the most durable. I have sold Larch of my own planting for building at 10*d.* and 1*s.* per foot, but have not been able to get more than 6*d.* for Poplar. In making new plantations, therefore, I have more encouragement to plant Larch than Poplar, to say nothing of the superior beauty of the former. *L. C. K.*

Societies.

Entomological, *Nov.* 5.—J. Curtis, Esq., F.L.S., President, in the Chair. This was a special meeting called in pursuance of a requisition signed by certain members of the Society, for the purpose of taking the opinion of the Society as to the advisability of the admission of non-paying associates; upon balloting for the introduction of such a class of members it was however found that a majority of the members present were opposed to such a step. Subsequently the ordinary business of the Society was proceeded with by the secretary, who announced a considerable number of donations to the library from various continental and English societies and naturalists. Mr. Stainton exhibited several very rare moths of the family Noctuidæ from Brighton, including a very fine species, Phlogophora empyrea, new to this country, of which several specimens had been caught by the sugaring process; also a specimen of Polyommatus Agestis marked above like P. Artaxerxes. Mr. Newman exhibited the curious Australian moth, Entometa obliqua, which had been reared in this country by Mr. Oxley. Also a mass of silk of the size of a boy's marble, spun by myriads of a small mite of the genus Tatranychus, allied to the red spider of the hot-houses. Mr. S. Stevens exhibited several interesting Microlepidoptera, from the coast of Hampshire, including a new British Tortrix; also a fine series of longicorn and other beetles, sent from Borneo by Mr. Wallace. He also mentioned the excellent effects produced by immersing greasy insects in camphine and benzoine, and also in a newly patented fluid sold as rectified Borneote of Petroline. Mr. Westwood exhibited a specimen of the rare Velleius dilatatus which had infested a common beehive; also specimens of Hypera Rumicis with its curious cocoon, reared by Professor Henslow. Mr. Winter exhibited a specimen of the hitherto unique Eunomos Almaria; and Mr. Foxcroft a large collection of insects of all orders, which he had formed in Scotland during the past summer. Mr. Syme exhibited the rare beetle Spherites glabratus, found in fungi in Kincardineshire; Dr. Power, a specimen of Notiophilus rufipes, and an abnormal female of Hydrophorus picipes; and the Rev. Hamlet Clark a new British Hydrophorus. Letters were read from Mr. Allis and Mr. John Hogg, F.R.S., on the occurrence of vast numbers of moths during the preceding season, notwithstanding the severity of the winter, and also a note from Mr. Haliday on the British Ink Gall fly.

Linnæan: *Nov.* 6.—The President in the chair. H. Deane, Esq., was elected a Fellow. Numerous donations to the library and museum were announced, including an extensive collection of the dried plants of the Upper Himalaya and Thibet, presented by Drs. Hooker and Thompson. Mr. T. S. Ralph exhibited specimens of the male and female Katepo (pronounced kär-tä-po), or poisonous spider of New Zealand, together with their nest, and microscopic preparations of their skin. Mr. Westwood presented a specimen of the internal densely interlacing fibre of the fruit of a species of Luffa, called the Trowel Gourd; it had formed part of a cargo imported from the West Indies for the purpose of paper making. The following communications were read:—1. Extract from a letter to Mr. R. Kippist, from Mr. T. S. Ralph, giving some account of the poisonous spider of New Zealand alluded to above. These spiders, which are met with under the low bushes which exist on the sand hills along shore, build their retreat under the branches of the shrubs close to the ground, and make no regular web, but irregular galleries of webbing, entangled with bits of leaves and minute fragments of wood. Judging by the remains of beetles' wings, their principal food appears to consist of insects of that class. Their nests are round, and contain from 50 to 60 eggs. The young when hatched are different in appearance from the full-grown spider; they are white, dotted with about six pairs of black dots along the body, the legs banded with black. The next stage presents a white or grey-white body, with a beautiful orange coloured angulated band the whole length of the back, and having smaller black bands on each side. The full-grown spider is of a beautiful black, the golden band exchanged for one of orange-red, and as the next coats come on the red band ceases to be marked at the thoracic end of the back. The female has a larger and rounder body. The insect is reputed to be venomous by the natives, who will not touch one on any account. Mr. Ralph had made an experiment on this point by putting a lively unhurt mouse into a white glass bottle with a fine katepo, and by shaking had induced the spider to bite the mouse; one bite was on the tail, a second on the paw of the animal; the last it resented by biting the spider, which died immediately. The mouse was supplied with air, and was found dead within 18 hours. 2. Notice of an Esquimaux Curlew, obtained at Durris, Kincardineshire, by J. Longmuir, jun., Esq. 3. Memorandum accompanying a flowering specimen of Holcus saccharatus [Sorghum saccharatum] exhibited to the meeting. This specimen was upwards of 9 feet high. The plant had been raised in a closed case in January last, and was planted out when about a foot high, on a warm bank in Mr. Ward's garden, where it had recently developed its inflorescence.

Notices of Books.

Mr. Septimus Piesse has collected into a handsome volume (Longmans, 12mo), with numerous additions, those interesting papers on the *Art of Perfumery*, which appeared in the columns of the *Gardeners' Chronicle* some years ago. He has introduced several woodcuts, and gives in an Appendix of about 50 pages translations of a variety of foreign scientific papers relating to the subject of his own volume. Much of the matter is curious; all interesting to the lovers of fragrant essences, to whose favour we heartily commend the little book. Mr. Piesse's account of Pomatums is as good an illustration of his style as a very short extract will enable us to give:—

"The name of pomatum is derived from pomum, an Apple, because it was originally made by macerating over-ripe Apples in grease. If an Apple be stuck all over with spice, such as Cloves, then exposed to the air for a few days, and afterwards macerated in purified melted lard, or any other fatty matter, the grease will become perfumed. Repeating the operation with the same grease several times, produces real 'pomatum.' According to a recipe published more than a century ago the form given is:—'Kid's grease, an orange sliced, pippins, a glass of rose-water, and half a glass of white wine, boiled and strained, and at last sprinkled with oil of sweet Almonds.' The author, Dr. Quincy, observes, that 'the Apple is of no significance at all in the recipe,' and, like many authors of the present day, concludes that the reader is as well acquainted with the subject as the writer, and therefore considers that the weights or bulk of the materials in his recipe are likewise of no significance. According to ancient writers, unguent, pomatum, ointment, are synonymous titles for medicated and perfumed greases. Among biblical interpreters, the significant word is mostly rendered 'ointment;' thus we have in Prov. xxvii. 9, 'Ointment and perfume rejoice the heart;' in Eccles. ix. 8, 'Let thy head lack no ointment.' Perfumers, acting upon their own or Dr. Quincy's advice, pay no regard to the Apples in the preparation of pomatum, but make it by perfuming lard or suet, or a mixture of wax, spermaceti, and oil; or some of them are all blended, to produce a particular result, according to the name that it bears. The most important thing to consider in the manufacture of pomatum, &c., is to start off with a perfectly inodorous grease, whatever that grease may be."

And then he goes on to tell how all sorts of pomades, from Circassian cream to bears' grease, are to be made. Good housekeepers may thus learn how to dispense with the perfumer's shop.

Books on Ferns multiply, as might be expected from the growing taste for these beautiful and easily cultivated plants. Mr. John Sowerby has commenced a work on *The Fern Allies*, that is to say Equisetums, Lycopods, &c., upon the plan of his Ferns of Great Britain, to be completed in about 6 parts, at 3*s.* a part coloured, and 1*s.* 6*d.* partly coloured. Mr. Johnson is the author of the letterpress. We have the first part before us and can say that it forms a very good supplement to the other work just mentioned, and is full of useful information. We also see that Mr. Lowe has commenced a periodical issue of *A Natural History of Ferns, British and Exotic.* Each number contains 4 coloured plates executed in lithotint, and several woodcuts—all for a shilling. The execution of the work is remarkably good for such a price. It would, however, be advisable that more attention should be paid to orthography. Nothochlæna is mis-spelled Nothochlœna, catanense cataneuse, eminens eminens. This is the more regretted because the class of buyers into whose hands the work may be expected to fall, are not likely to detect such errors, but will implicitly trust to Mr. Lowe's authority.

Garden Memoranda.

Belvoir Castle, the Seat of his Grace the Duke of Rutland.—Belvoir Castle occupies a commanding situation on the spur of a range of maristone hills, on the north-eastern confines of the county of Leicestershire. The Norman ancestors of the house of Manners exercised feudal sway over the wide domains attached to the lordship of Belvoir, and their ancient stronghold was by its natural position and strength well calculated to overawe the scarcely subjugated people. The ancient castle was destroyed by fire about 40 years ago, and the present Norman-Gothic castle erected in its place; and it now stands no longer a terror and menace to its neighbours, but a beautiful and picturesque object, in a landscape replete with the characteristic beauties of English scenery.

The approach from the south-east is by an avenue of Beech trees, succeeded by Cedars of Lebanon; a very striking view of the castle is obtained from the avenue. The river Devan, artificially enlarged, runs through the domain, and is crossed by a handsome stone bridge. On approaching the castle, the road passes through the wood which encompasses it; fine Rhododendrons and other evergreens border the road, and, intermixed with forest trees, produce an excellent effect.

The castle is surrounded by terraces, of which the north is the most considerable and commanding. The view from this terrace is extensive and varied; on the north-east the richly cultivated vale of Belvoir lies extended to the view. Upwards of 20 villages with their church towers and slender spires—distributed over the landscape—seen from the castle, form pleasing features of life and interest; the latter not lessened by the fact that the whole of these rural and peaceful spots are on the Belvoir estate. To the south of the castle the scenery changes, the country assumes a boldly undulated character, and presents rich masses of wood and broad glimpses of Grass land, the whole forming a scene of striking beauty. The castle is readily accessible to visitors, the interior arrangements are remarkable for convenience and comfort, which are not always associated with grandeur, but which, in this instance, perfect taste and excellent judgment have so happily united. The picture gallery has some fine examples of the old masters. The Regent's gallery, the drawing-room, and dining-room are remarkable instances of refined taste, conjoined with regal magnificence.

On the south side of the castle are three terraces, one rising above the other; the middle terrace is devoted to flowers and is laid out with considerable skill and effect; the garden is now being replanted and the soil renewed. The elevated position of the garden, with the advantages of shelter afforded by the castle, make it a desirable spot for many interesting plants impatient of the humid climate of our vallies—Escallonia macrantha, Ceanothus rigidus, Myrtles, and other small evergreens, have successfully withstood the severity of the winter of last season.

The enclosed pleasure ground about the castle is of limited extent; one broad walk reaches round the castle, from which branch minor walks leading to the stable, dairy, &c. A very pretty flower garden is situated at the foot of the glacis, but separated by a belt of evergreens; the flower beds are laid out on turf, and are devoted to the usual bedding plants in summer, and in the autumn are filled with spring blossoming plants; an edging of Crocus, followed by Hepaticas, double Primroses, Scillas, Hyacinths, and Narcissus in successive rows occupy one set of beds, while in other beds are massed Scillas, Hyacinths, double Lilac Primroses, and Hepaticas. A portion of the garden is devoted permanently to plants calculated to render a garden gay at a cheerless season—the bright berried Pernettias, hardy Ericas, Daphnes, the winter blooming Jasminum, the old Sanguinaria canadensis, Adonis vernalis, winter Hellebore, Anemone appenina, Myosotis intermedia, the charming little Veronica alpestris, which covers the ground with its green compact foliage like a carpet. The elegant little Saxifrages oppositifolia major and minor, Aubrietia deltoides, double Primroses, Orobus vernus, Arabis verna, with a profusion of bulbs, render the garden gay at a very early season. It is held desirable here to secure every hardy and early flowering plant; such plants from the prevailing fashion of bedding for summer decoration are but too often excluded from ordinary gardens. An opening in the wood on the hill side exhibits some splendid specimens of Silver Fir; towards the bottom of the slope flower beds are laid out. Statues of heathen divinities are arranged on pedestals about the garden, and elegant vases assist in its embellishment. Access is obtained to the lower garden by a flight of stone steps on one side, guarded by a stone balustrade surmounted by vases, and on the other by steps winding round a picturesque summer house. Entering the wooded hill by a walk called the Duke's Walk (which reaches round

the hill a distance of nearly three miles), we arrive at a garden formed on the slope of the hill facing the south; from this secluded but elevated spot the opening affords a splendid view of a richly varied sylvan landscape; the garden is embowered in evergreen and deciduous trees of large growth—an enormous standard Portugal Laurel and several fine specimens of Hemlock Spruce being particularly conspicuous. The garden is prettily laid out in beds and borders, and is kept gay winter and summer. Myrtles stand the winter in this favoured spot. A beautifully grown Araucaria imbricata, 30 feet in height, and a Cunninghamia stand on each side of a flight of steps, and help to give character and effect to the garden. In pursuing the walk many fine views of the castle and the surrounding scenery are obtained; summer-houses, rustic seats, and grottos, are placed at intervals throughout the walk. The mausoleum is situated on a hill near the castle, but its proximity is concealed by trees. The approach is through a deep cutting, overhung with lofty trees, the banks of the cutting are lined with stone and overgrown with Ivy. On entering the enclosed ground we approach the mausoleum by a flagged pathway which passes through a sombre grove of Yew trees. The mausoleum is a plain Norman-Gothic structure; it contains a very fine monument to the late Duchess by Wyatt. Cypresses and Evergreens are planted about the building, and give an appropriate gloom and solemnity to it.

We shall next week give some account of the kitchen garden at Belvoir.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The summer flowering twiners, as Passion-flowers, Tacsonias, Mandevilla, &c., which usually become rather unsightly by this season, should be cut back rather freely, as also any others that will bear this treatment, so as to afford the plants underneath every possible ray of light. The shade afforded by luxuriant twiners may be rather beneficial to plants in bloom in the house when the sun is powerful; but not a spray that can be spared should be left to obstruct the light after dull cloudy weather sets in. Acacias, and other winter-flowering plants, having been subjected to a period of comparatively dry treatment, to ensure their blooming profusely, should now be liberally supplied with water at the root, in order to get them into flower during the dull season, when they will be much more esteemed than in spring, when flowers are becoming plentiful. Manure water, if it can be used without annoyance to the family, should be given frequently to Chrysanthemums, especially in the case of plants to which it has been liberally applied during their growing season, for these will bloom but poorly if their supply of manure-water must be withheld. Give air freely on every favourable opportunity, avoiding cold draughts against plants that have been brought from a warm house, and guard against damp by using gentle fires with a little top-air on wet days. Let pot specimens in bloom be frequently re-arranged, so as to make the most of these, for the finest specimens become too familiar to be interesting when allowed to remain too long in one place. Cold Pits.—Get straw shutters, or whatever covering it may be intended to use here prepared without delay. Straw shutters, if well made, are somewhat expensive in the first instance, but we believe them to be the most efficient of any kind of covering in use, and taking into account the time they last they are, perhaps, as cheap as any. Expose the stock here freely to air on every favourable opportunity, so as to check growth and get the wood firm, in which state the plants will be less liable to suffer from the confinement which may soon be necessary than if kept close and coddled with too much warmth and moisture now. Very little water will be required at the root, but look over the stock every few days, withholding water until it is absolutely wanted, and then giving a moderate soaking, which is the only safe method of watering at this season. If green-fly makes its appearance on any of the soft-wooded things apply tobacco smoke at once, and see that this pest is extirpated at once, otherwise it will disfigure if not ruin the plants upon which it is allowed to harbour. Heaths and other things subject to the attacks of mildew must be closely watched, and sulphur applied the moment that the enemy is perceived, but neither this nor green-fly will be very troublesome, unless the plants are kept too close and damp; therefore be careful to keep the stock rather dry, giving plenty of air whenever this can be done with safety.

FORCING DEPARTMENT.

Pineries.—The trying period for those who have to winter their young stock in pits heated by fermenting materials has now arrived, for with sunless weather, such as is common at this season, it is a very difficult matter to preserve Pines in a healthy state, where warmth must be accompanied by excessive moisture. Keep the linings sufficiently strong to maintain the temperature at about 65°, which will allow of giving air rather freely on fine days, and a little must also be given in all states of the weather, when doing so does not cause the glass to sink under 55°. There should be no attempt made at inducing growth with the present amount of light, but the linings should be kept rather strong, so as to be prepared against the occurrence of severe weather, and also to allow of giving sufficient air to prevent excess of moisture. See that efficient coverings are prepared previous to the occurrence of sharp frost, and endeavour to keep the bottom-heat steady at about 75°, and the soil in a rather dry state. This system of Pine growing is now, however, but little practised, and it would be economy on the part of those who adopt it to supersede it at once by means of a hot-water apparatus.

FLOWER GARDEN AND SHRUBBERIES.

Choice plants in the borders intended to be protected for the winter by slightly covering the roots, &c., should be seen to at once. Moss, when it can be obtained in good thick flakey pieces is, perhaps, the best article that can be used for this purpose; but unless it can be procured in pieces of some thickness, it is not so good as spent tan, coal ashes, or half decayed leaves. Also see to getting Fuchsias, and such things as are usually protected for the winter by covering, secured against frost before it is too late. Dry Fern is an excellent material for covering the stems, &c., of plants that require a slight protection in winter, and is, doubtless, the least objectionable as regards colour of anything at command; but this is not easily procured in many neighbourhoods, and probably the best substitute is straw that has been exposed to the weather sufficiently long to darken its colour. Choice sorts of Hollyhocks, of which there is not a sufficient stock of well established young plants in pots should be taken up, potted, and placed under glass for the winter; for these cannot, with safety, be trusted to the mercies of a severe winter, and plants taken up and potted now, and wintered in a cool house, will be exceedingly useful for furnishing cuttings; and these, if got in early in spring, will make splendid plants for next season. Where alterations are in hand, push these forward with all possible dispatch while the weather continues favourable for out-door operations. Be very careful to secure transplanted things against the wind, especially plants of any size, which should never be left until they are properly staked or otherwise made fast, for when this is put off it frequently happens that the roots get injured through the plants being rocked about by the wind. Get any projected alterations among the shrubbery or herbaceous borders done in readiness for cleaning up as soon as the leaves are down; also get ground intended to be planted with Dahlias and Hollyhocks next season deeply trenched and ridged up so as to expose the soil as much as possible to the weather, putting in plenty of good rotten manure, especially where the Hollyhocks are to stand, for these require a deep rich soil.

HARDY FRUIT AND KITCHEN GARDEN.

A sowing of Peas and Beans to afford the chance of a very early crop should be made at once, choosing the most sheltered bit of ground at command, which should also be of a light dry nature. In favoured localities it is usual to sow somewhat earlier in the month, but we have seldom seen any advantage result from sowing before the 20th, and have frequently had those put in early in the month cut up, while those planted later survived the winter uninjured. In the event of such a winter occurring as the last two, these will be destroyed as a matter of course, but neither the labour nor the expense of the seed, which will be the only loss, is of much account, and we have frequently had first-rate crops from November sowings, and they are certainly much less trouble than raising the plants under glass in spring. Use an early hardy sort, such as the Daniel O'Rourke. The forcing of Seakale and Rhubarb must now be attended to; and, provided there is a good stock of strong roots, a supply of these will be easily kept up. Where there is room to spare in the Mushroom-house, this forms a very suitable and convenient place for forcing these. The roots should be placed on a slight bed of warm dung, filling up the spaces between them with old tan, or the soil and manure mixed from an old Mushroom bed, giving a good watering to wash it in amongst the roots. The bottom-heat should not be allowed to exceed 70°, as too much heat is not favourable to securing strong growth, and, except for the first crop, it may be dispensed with altogether. Take advantage of wet days for making fresh Mushroom beds, and clearing out those that are spent; also collect and prepare droppings for forming fresh beds, by spreading them in any shed, and turning them every day until they are sufficiently dried to prevent excessive fermentation after putting up. Clear up all decaying leaves, &c., and stir the surface of the soil on dry days among growing crops, as Cabbage, Spinach, &c.; also get all vacant ground manured and ridged up as quickly as possible, in order that it may be exposed to the influence of the winter. Get the late crops of Celery closely earthed up the first dry day, and attend to securing a late supply of Lettuce and Endive.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the week ending Nov. 15, 1855, as observed at the Horticultural Gardens.

Satur. 24	47.5	32.6	40.0	9	0.62	4	5	2	2	3	7	3	3

The highest temperature during the above period occurred on the 20th, 1844, 21st, 1828, and 1833—therm. 59 deg.; and the lowest on the 18th, 1851—therm. 16 deg.

Notices to Correspondents.

Books: *R R S.* Errington on the Peach will doubtless answer your purpose.‡

Cuba Bast. *Bath.* This is not the produce of a Tilia, nor is it known of what other plant? It comes from the Havannah, but is said to be imported to that place from some other country, some say from Ceylon.

Fences: *L C K.* We advise you to form your fence with squared Larch posts, pierced with strong wire, and painted dark green or grey; unless, indeed, you prefer iron uprights, through which the wires are strained. They will look very neatly, if well done. The inquiry about Poplar wood is to be found in another column. For your lawn take the following Conifers, viz., Deodar, Cryptomeria, Cupressus macrocarpa, and Goveniana, Pinus insignis and Lindleyana, Juniperus sinensis, male and female.

Ferns: *O P.* Phegopteris is, we apprehend, so called from φηγὸς a Beech tree, and therefore its English name should be the Beech Fern, as indeed it is often, though not always, called. Why Thelypteris is not called the Lady Fern or female Fern, we cannot say, unless to avoid the chance of its being confounded with the Filix fœmina. Both names have the same meaning, as you are aware, the first being Greek for the second. As to the nomenclature, that employed by Mr. Moore in his Nature-printed Ferns should be taken as the standard in this country.

Insects: *J S.* Your grubs are those of the common Cockchafer.‡

Lawns: *W P.* A layer of fine cinder ashes about an inch thick spread over the ground immediately under the turf of your new lawn will doubtless prove useful in keeping worms from coming to the surface. Should they, however, be troublesome even after that precaution, an excellent remedy for the evil is lime-water; *i. e.* fresh burnt lime put into water and allowed to stand till the lime has settled to the bottom, and then the water used in a clear state.‡

Melon Pits: *C S F H.* An excellent description of pit is that figured in our volume for 1844. If you intend building a good brick pit, it would be better to heat it with hot water in 4-inch iron pipes than employ tan, which you would find would soon be overrun with woodlice, and to which we would certainly prefer stable dung and leaves. Hot water, though more expense at first, would be found cheapest in the end, to say nothing of the other advantages which attend its employment. We know of no garden near London in which the Melon and Cucumber pits are heated with tan, and we do not think it a good material for the purpose. As to kinds of Melons, the Beechwood and Bromham Hall are both excellent varieties; and as regards Cucumbers, Cuthill's Black Spine will doubtless answer your purpose perfectly.‡

Names of Fruits: *W D.* 1, Passe Colmar; 2, Beurré Diel; 3, Beurré Rance; 4, Althorp Crassane; 5, Napoléon; 6, Urbaniste; 7, Bezi de Caissoy.—*J B D.* 1, Scarlet Nonpareil; 2, Boston Russet; 5, 19, Blenheim Pippin; 6, Alexander; 3, Ribston Pippin; 10, Kerry Pippin; 11, Sturmer Pippin; 12, New Rock Pippin; 14, Tulip Apple; 15, 21, 23, Cornish Gilliflower; 16, Nonsuch; 17, Crofton; 18, Old Nonpareil; 27, Mank's Codlin. 1, Brown Beurré; 2, Easter Beurré; 3, Beurré Rance; 4, Urbaniste; 5, King Edward's; 6, Beurré de Capiaumont; 7, Crassane; 8, 9, Beurré d'Aremberg; 10, Passe Colmar; 11, Glout Morceau; 12, Winter Nelis; 16, Catillac; 17, Althorp Crassane.—*A M D.* 3, Kerry Pippin; 4, Blenheim Pippin; 5, 7, 9, Dumelow's Seedling; 6, Kirke's Lord Nelson; 8, Court of Wick; 10, Ribston Pippin; 12, Royal Russet; 13, 18, Hall Door; 14, Wyken Pippin; 15, Syke House Russet; 16, Golden Russet; 17, White Winter Colville; 22, Braddick's Nonpareil; 23, Nonsuch. The large Apple unnumbered is the Alexander. 2, Aston Town; 3, Crassane; 4, Old Colmar; 5, probably Broom Park; 7, Beurré Rance; 8, St. Germain.—*G W.* 1, Old Nonpareil; 2, Marie Louise; 3, French Crab; 4, Crimson Queening; 5, King of the Pippins.—*S B.* Your Pear is the Knight's Monarch, but is more round than usual.—*H J O.* 5, Autumn Colmar or De Bavay; 7, Beurré de Capiaumont 8, Bezi d'Heri, (stewing); 21, Crassane; 25, Winter Nelis; 31, Doyenné Blanc.—*G R P.* 1, Althorp Crassane; 2, Buchanan's Spring Beurré; 3, Beurré de Capiaumont; 4, Passe Colmar; 5, Louise Bonne (of Jersey); 6, Beurré Diel; 7, like Colmar d'Aremberg; 9, probably Zepherin Grégoire; 10, Forelle; 11, Marie Louise.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*R J.* Adiantum macrophyllum. You will find a figure of it in the 6th part of Lowe's "Natural History of Ferns."—*F P.* The leaves which you have sent us are certainly not those of Pinus Sabiniana.‡—*Amos N. Syton.* When a proper name follows that of a plant, such name refers to some author who has published the plant. Thus Gladiolus blandus, *Gretry*, means that some one of the name of Gretry has described G. blandus. You must seek for the meaning of the Latin names of plants in a Latin dictionary or a botanical glossary. A French kilogramme is equal to nearly 274 lbs. English, as you will see if you look at the very full tables of French and English weights and measures printed in a former volume, and now to be had separately. As to the names of foreign florists' flowers, they are generally in French or Dutch, and their meaning is to be found by reference to those languages. When dictionaries do not contain the words the latter may be assumed to be the names of growers or raisers. We hope this answer is what you want; but really your writing is in some cases hopelessly illegible.

Misc.: *W F G F.* Address Mr. M'Glashen, sculptor, Cannon Mills, Edinburgh. Your other inquiry has been sent to Mr. Fleming, from whom you will doubtless have an answer next week.—*S P.* Any person, whether a Fellow of the Horticultural Society or not, will be allowed to exhibit fruit at 21, Regent Street, on the 20th inst. Pine Apples are not cut at these meetings, unless special instructions to do so are given by the exhibitors or owners of them. Pavetta borbonica may doubtless be struck from cuttings; whether the plants of it now in the country are all seedlings or not we are unable to say.‡

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents the insertion of whose contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than any other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton. at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepar[illegible] outh for the pursuits of Agriculture, Engineering, Mining, Mar[illegible]actures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

DRAINAGE OF LAND.

MR. J. JOHNSON, DRAINAGE ENGINEER, is desirous to undertake the Drainage of Land by Contract or Commission. Temporary Tileries erected in any part of England, and Drain Pipes manufactured at moderate prices. Every description of Drainage Tools.—Abingdon Street, Westminster.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre.

Mr. HUMBERT (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Offices, 52, Parliament Street, London.
HENRY KER SEYMER, Esq., M.P., *Chairman.*

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.
2. In no case is any investigation of Title necessary.
3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. EQUAL FACILITIES WILL BE AFFORDED IN EITHER CASE.
4. The WHOLE cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.
5. The term of such charge may be fixed by the Landowner, and extended to FIFTY YEARS for LAND Improvements and THIRTY-ONE YEARS for FARM BUILDINGS, whereby the instalments will be kept within such a fair per centage as the occupiers of the improved Lands can afford to pay.

WILLIAM CLIFFORD, Sec.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill: Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of CORNE'S Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

The Agricultural Gazette.

SATURDAY, NOVEMBER 17, 1855.

WE print in another column portions of several letters on the all-important subject of our food supply. They have been elicited by Mr. CAIRD's estimate published in the *Times*. The general impression is that Mr. CAIRD has exceeded the truth, and that we are more dependent on extraneous sources of supply than he imagines. But it is of very little use to publish general estimates of the country's produce. That is a subject upon which we know nothing confidently.

Few amongst us can do more than form an opinion of the crop in their own immediate neighbourhood. And instead of giving any further statements on the produce of the country generally, we have applied to correspondents of this Paper in all the principal arable districts of the country, and hope in the course of the next few weeks to give opinions of the produce in detail, which will be all the more trustworthy that each will refer only to the neighbourhood in which it is written.

Meanwhile, the state of uncertainty which prevails upon the subject—singularly illustrated by the differences of opinion prevalent among men who are deemed authorities—is in its effects a loud protest against the faulty doctrines urged by Mr. PACKE on agricultural statistics.

AT the meeting of the Central Farmers' Club last week, Mr. WALLIS, of Overstone, Northamptonshire, brought together a large quantity of timely and very useful information upon STALL-FEEDING. The subject for discussion related to feeding cattle more especially on arable land, and where economy in the consumption of hay is an important consideration: and the gentleman who read the opening paper adopted the plan first, we believe, followed systematically by Mr. HARKNESS, Secretary to the Royal Agricultural Society of Ireland, of describing the experience of many others under the various circumstances obtaining in different parts of the country. Thus, letters were read from Mr. RAMSAY, of Newcastle-on-Tyne; Mr. LISTER, of Dunsa Bank, near Richmond, Yorkshire; Mr. CLARK, of Plasworth, Durham; Mr. KAY, of Darlington; Mr. DONKIN, of Bywell, Northumberland; Mr. COTTINGHAM, of Wrangford, Suffolk; Mr. BRIGGS, of Wakefield; Mr. KEARY, of Holkham; and many others in Bedfordshire, Oxfordshire, Cheshire, &c.

So extensive an experience is sure in one or other of its parts to fit the circumstances of whoever reads it, and the paper by Mr. WALLIS is thus a most useful contribution to a history of its subject. The following passages are condensed from some of the reports which he brought forward:—

(1) Mr. CLARK, of Durham, places his cattle in hemmels or small yards, two in each, towards the end of October, and then they are bedded daily and fed in shelter.

"They are fed with White Globe Turnips and Oat straw about six weeks; after that time with Swedish Turnips and Oat straw, until about four or six weeks from the finish I commence giving them half a bushel of Barley and Pea-meal per week with the Turnips, increasing the quantity of meal a little each week. The cattle are fed four times each day with Turnips, cut into slices three-fourths of an inch thick, always having straw to eat. The feeding troughs are cleaned out every day. The average quantity of Turnips consumed per day by each animal is about 150 lbs. I cannot state the weight which each animal gathers per month, as I have no means of weighing them; but I generally have them about five months, and each animal makes from 5*l.* to 6*l.*, according to circumstances, some seasons more and others less."

(2) Mr. KAY, of Darlington, follows apparently the same plan. When the green food loses quality he gives his cattle Pea or Barley-meal to keep them in a progressive state, but not with the idea of any profit to be derived from the cattle, or to the improvement of the manure, in both cases the return not being equal to the first cost, but merely for the purpose of retaining the beef already acquired.

"Cake I never use, as it is a well-known fact that a great part of the cost has to be charged to the manure, which can, I think, be more economically improved or increased by the purchase of artificial manures, either phosphates or ammoniacal, whichever may be considered most adapted to the particular crop."

(3) Mr. LAYCOCK, of Lintz Hall, who farms to only a limited extent, sends a short report of his method of feeding.

"I adopted in 1848 the box system of feeding. The manure is entirely preserved from waste, both liquid and solid. The cattle are easily kept clean, and I think the animals thrive better than under any other system. My mode of feeding is for an ox, say 60 stones, 14 lbs. per stone—

8 feeds cut Swedes per day, 63 lbs. each = 12 cwt. per week, 7*s.* per ton	4*s.* 2½*d.*
2 lbs. crushed Linseed per day, steamed and mixed with steamed chaff	1 10½
Attendance each beast	0 6
	6 7

"Each beast produces, including the litter, 5¾ cwt. of manure per week, which, at 7*s.* 6*d.* per ton, is equal to 2*s.* 2*d.* per week. This pays for the Linseed and attendance, and I get clear 7*s.* per ton for the Turnips."

(4) Mr. COTTINGHAM, of Wrangford, buys 130 or 140 good old beasts in the spring costing from 13*l.* to 20*l.* apiece, and keeps them in the yards until May, when they are turned out to marsh.

"They are all kept in the yards about six or eight weeks upon 1 to 2 bushels of Mangold each per day, according to the quantity of roots I happen to have. I cut the roots with GARDNER's cutter, the same size as for sheep. In addition to the roots, I give each bullock a quarter of a peck of Pea, Bean, or Barleymeal, whichever is the cheapest, and 1 peck of straw chaff, roots and all mixed up together. The 16 best bullocks have 4 lbs. of cake also. All the lot have straw to pick over. About the middle of May all the beasts are sent to marsh. Three lots of them come home into the yards the first of October, the others this week. I divide them into lots of about 15 or 16, and put them loose into yards (about 18 to 20 yards square). The yards have good wide hovels to the north and east. They have all the white Turnips they will eat, cut into slices about three-quarters of an inch thick, until the Swedes are fit to begin. When the Swedes are finished they have Mangold. The best beasts I give 6 lbs. of cake and half a peck of meal, with 1 peck of straw chaff each per day. I never have any hay for cattle, only for the horses."

In none of these cases is hay used, and Mr. WALLIS gives it for his opinion that, if 1 lb. of powdered cake be mixed with as much cut straw as a beast will consume in a day, the chaff being first slightly wetted, or the cake mixed with water, and then mixed with the chaff, it will be found nearly, if not quite, as nutritious as chaff composed of equal parts of hay and straw.

(3). Mr. KEARY, of Holkham, writes that he has reared 40 calves a year, selling them fat at three years old, and during that time no long hay has been used. He adds:—

"My present system of feeding young store stock is this: The roots or Turnips are cut into thin slices with a MUDIE's slicer, and then mixed up with good sweet Wheat-straw chaff, moistened with a mixture of coarse molasses and water in the following proportions: to 1 lb. of coarse molasses put 1½ gallon of water, and this will moisten about 1½ bushel of straw. I add, according to the age of the animal, bran for young calves, and Rape-cake for young steers, about 2 lbs. per head, and Linseed cake about 3 lbs. or 4 lbs. per head for older steers,

just preparing to be fattened. The great use and advantage of the straw and treacle is, that it saves roots; and I rarely give more than 1 bushel of roots to young steers, and 1½ bushel to two-year-olds. The molasses sweetens and softens the straw, and they eat it with great avidity when used to it. In some seasons I have kept lean steers healthy and in as good condition as I wished by 1 lb. of molasses mixed as above in about 2 bushels or 3 perhaps of cut straw, and about 3 lbs. of Rape-cake per day. For fattening oxen, I do not think it right to make this mixture. I have tried it, and find that they do better by a change of food, viz., ½ bushel of Turnips at 6 A.M., another ½ bushel before 8 o'clock, and at that hour a feed of cake at the rate of ½ peck per head, mixed up with a small quantity of cut hay (about a peck), and as much cut Wheat straw as they will eat; towards noon, say 11 o'clock, feed with Turnips again, and about 4 o'clock in the afternoon, and then rack up at night with oatmeal and beanmeal ¼ peck of each, mixed with cut hay and straw, as in the morning feed."

These letters sufficiently prove that hay is not necessary for fattening cattle, and our own experience perfectly corroborates this statement. On an arable farm, where no hay was made, 80 to 100 head of cattle were fattened annually. Roots cut in slices given twice a day, about 80 lbs. apiece, and straw chaff moistened with hot Linseed soup, and dusted over with beanmeal, given twice a day, were sufficient feeding. The cattle thus had 80 lbs. of green food, 10 or 12 lbs. of straw, 1½ lb. of Linseed, and 3 lbs. of beanmeal each daily, and they fattened rapidly.

A great deal of useful information was given in the discussion which followed Mr. WALLIS's paper, and to some of it we shall hereafter direct the attention of our readers.

MR. CAIRD'S ESTIMATE OF THE HARVEST.

Mr. Caird calculates on the addition of a fourth from increased breadth, favourable seed time, and liberal use of guano. 1st. As to increased breadth, was not the 1854 breadth so large that that of 1855 scarcely exceeded it? 2d. Did not 1854 enjoy as good a seed and harvest time as 1855? 3d. If guano was more liberally used, was not its use in 1855 more requisite from the severe spring than in 1854? From a limited observation I am inclined to think that in the west of England and in the south the increase in breadth of 1855 over that of 1854 was not considerable. The increase of breadth in both seasons over 1853 is doubtless great, but 1854 had a large breadth. Next, the seed time and harvest of both seasons were equally good, better never known; and lastly, the winter of 1855 season was so severe that on the light lands where guano or some top-dressing was not used, the Wheat crop was next akin to a failure. Judging from this neighbourhood the clays in 1854 had a bad crop, in 1855 a good one; and *vice versâ* as to the light lands. Of this there are striking instances; even where doctored with guano, &c., the Wheats, although they recovered in burthen on the light lands, never recovered in yield; and, instead of good corn, a thin chested light consumptive looking grain is the result. On the clays, however, without any doctoring at all a heavy good yield is found. Where coarse Wheats are grown, as Rivett's (advertised as Payne's Defiance) as much as 40 bushels to the acre and upwards have been grown on land let at 10*s.* an acre, whilst the delicate "velvet-eared" white Wheats on lands let at 30*s.* made a sorry sample in weight and quality, and the yield does not average 24 bushels, besides tail. In scarce times, the growth of the coarse Wheats is much to be encouraged as one mode of increasing produce on poor lands, if not on rich. And Rivett's (well baked) makes bread by no means to be despised, and the best of ship biscuits for the Crimea. The statistics of the soil are essential, as the basis of corn statistics, and we ought to know how much light land there is, and how much heavy, and then a general average could be better arrived at. The mixture of Barley with Wheat is also to be encouraged. In the districts of Holsworthy and Stratton, in Cornwall, the bread is extremely good, and yet if one half is not Barley at least one third is. The oven has a deal to do with it, and those used in that country made at the Bideford potteries are the cleanliest and best in use. They are made of earthenware, at a cost of 9*s.* 6*d.* to 1*l.*, according to size, and surpass the ordinary brick oven in economy of fuel, and even heat. Their general use is fast gaining ground. At Barnstaple, and generally in North Devon, the admixture of Barley is increased, and there the household bread is less palateable but certainly better than that mixed with alum and London bakers' compound. The "navvie" requires meat and the best and finest Wheaten flour, and those who will work like a "navvie" have a right perhaps to use it. But let not only the sedentary Londoner but the mechanics generally leave off the use of "firsts," and condescend to seconds baked at home. And if they find their children healthier, as they assuredly will do, they will also find their flour bill considerably less; and if Wheat should continue to rise, try a little Barley, at any rate do not reject the Revett's. Who knows to what extent a general economy of this kind might benefit the community? *Simplex.*

In your Paper of Monday last is a letter by Mr. Caird on the late harvest, in which are the following passages: "If we suppose that only one-fourth of the usual breadth of Barley land was sown with Wheat, that, on the four course system, would add one-fourth to the average breadth of land under Wheat. . . . There will remain little more than 1,000,000 quarters of Wheat for which we shall be dependent on foreign supply. . . . The result of this estimate is mainly governed by the supposed increased breadth of land sown with Wheat last season. . . . If my estimate should prove accurate, the present price of Wheat is not likely to be maintained." I now propose to examine what this estimate is worth. Barley land and Wheat land are two very different things. There is a great quantity of land growing Wheat which will not grow Barley. The proportions may be two to one, or still greater. Yet Mr. Caird assumes that they are equal, and that one-fourth of the Barley land having been sown with Wheat, that crop was thereby increased one-fourth. And conceding as a fact that one-fourth of the Barley land was sown with Wheat (which many will deny), it does not follow that the yield of Wheat was increased in a like proportion, because Barley land is just that kind of land upon which the extreme severity of last winter acted most prejudicially. As to the price not being maintained, my information leads me to an opposite conclusion. I think it will be higher. How does it appear that substituting Wheat for Barley can reduce the price of the former in any material degree? The breadth of Barley being reduced, the crop would be reduced in proportion. By the action of a natural law the price of Barley would rise, and Wheat would follow. *W. R. Carter, Pickhurst Green, Bromley, Kent, November* 6.

There appears to be no question now that the Wheat crop of this country is deficient, and that we are not likely to receive supplies from abroad of sufficient amount to reduce the price of bread very materially. My present purpose, however, is not to argue on the amount of corn either grown or likely to be imported, but to point out a matter of some importance to the community at large with respect to the manner in which what we have to consume is used by the labouring classes especially; and as the *Gardeners' Chronicle* is circulated amongst a class of people particularly adapted to persuade and induce economy, I have ventured to call their attention to the useful work before them, hoping they may be willing to point out to all classes, but the labourer in particular, the necessity that exists for economy in the use of bread, not only in the quantity as far as is practicable but more particularly in the quality. Being a miller, I am of course in a position to know what description of bread forms the staple food of the people, and I am surprised to find that up to this time no lower description than good household bread is at all saleable. To point out more fully the saving in adopting the use of a coarser article, I need only tell those persons who are unacquainted with the business of a miller that to make a sack of flour of a quality sufficiently good for the bread I have just spoken of, there is a loss to the consumption of the country of at least a stone of flour in every quarter of Wheat ground. This we call sharps, which are, strange to say, at the present moment almost unsaleable, either alone or mixed with a proportion of better flour. For coarse bread that it is both useful and wholesome I can prove from the fact that when the 4 lb. loaf was as low as 4*d.*, the poor people eagerly bought it up, and even used it mixed with Barley; if the low price of wages, which was, I imagine, the cause of the demand for it, then made it eatable, why should it not now be consumed when there is evident cause for every one to economise the consumption of flour? Since harvest I have done all in my power to get the bakers to sell it, but up to the present time to no purpose; in two instances this week I have had it returned.

There is just one argument in favour of the use of good bread — other articles of food, such as meat, cheese, butter, &c., are all very dear, and perhaps little of those come now to the share of the working man; bread, then, is his real staff of life, and if he is to do a good day's work he must be well fed. So much for the labourer himself, but he is not the only consumer by any means; how about those five young "brats?" — they eat the larger share of the weekly supply, and are called upon to do no work; cannot some, if not all, their share be of a coarser description? This requires looking into: we are called upon as farmers to pay high wages to the labourers, and most cheerfully have the farmers responded to the call, but if the extra pay is only to be spent in what really has now become a luxury, it is really doing no good; the family, in fact, who spend the whole in extravagant articles of food when they might save, are making a bad return to the employees, by being applicants to the unions for relief immediately any bad weather or other cause throws them out of work, whereas economy would enable them to lay by for a few days of lost work, and enable them to avoid debt and dependence on poor rates, a tax which it is by no means necessary to increase; all other burdens are daily becoming heavier, and although there is a prevailing idea that farmers are earning great profits, I beg, without giving vent to an agricultural grumble, to inform those persons that it is not all gold that glitters, the price of Wheat is not the index of the pounds per acre, which latter are likely, in many instances this year, to be inadequate to the increased expenses we are called upon to pay.

A good wholesome loaf of bread may be made from a mixture of household flour and sharps, and can be sold by the baker at 1½*d.* under the quality of bread now used, and it is of better quality far than what they (the labourers) voluntarily consumed some three years since. Without wishing to advocate any undue interference with the affairs of the labourer, I cannot help thinking that there might and ought to be some change made as pointed out; and no better class of persons, I am persuaded, exist than the readers of the *Gardeners' Chronicle* to persuade the lower classes to make the alteration. *A Miller.*

The following are extracts from the correspondence of the *Times* on the subject:—

"Mr. Caird says that during last autumn every acre that could be got ready was sown with Wheat, and when spring came Wheat was substituted for Barley wherever it was practicable; and he adds that if we suppose only one-fourth of the usual breadth of Barley land was sown with Wheat, that on the four-course system would add one-fourth to the breadth of land under Wheat. It is quite true that when land was in high condition, or where the tenant was needy or grasping, this substitution of crops might occasionally be made, but I hold that this could only be done to a very limited extent. Farms in regular course of husbandry can seldom be taken out of that course without ultimate loss to the occupier, and so well is this understood that most good farmers altogether ignore such a practice. I may here state that a land agent of great respectability told me yesterday that on one of the estates under his care, containing over 2000 acres, there were not 5 acres sown with Wheat where Barley should have been. As Barley at this time is only worth about 1*s.* 3*d.* per stone, and Wheat is worth more than twice that rate, one cannot believe there exists any such scarcity of Barley as the supposed reduced quantity of land sown with it should show. I do not therefore think that any very large quantity of Wheat can safely be calculated upon as coming from that source. I am also obliged to differ from Mr. Caird in his estimate of the defect in the yield. Having threshed over 30 acres of Wheat of this year's crop, and most of it very little lodged, I find the deficiency much greater than that assumed by Mr. Caird. From my own observation, and from answers to inquiries among the numerous agriculturists with whom I have discussed this point, I am led to the conclusion that there is at least one-sixth deficiency when the loss in yield and weight is taken into consideration. Mr. Caird quotes the quantities of Wheat delivered in the week ending on the 6th of October in the years 1853, 1854, and 1855, and, finding that the delivery in the latter year is greatly in excess over that of 1853, draws the extraordinary conclusion that therefore a greater breadth of land had been in Wheat. I venture to give a different explanation. Since 1853 locomotive steam threshing machines of great power have been extensively employed, and by their agency large quantities of corn have been threshed and afterwards marketed. Under the old system this could not possibly have been accomplished, as the horses could not have been spared at this season from the other important operations on the farm to work the horse threshing-machine. In my opinion, the employment of this new machine is the chief reason why there has been so great a delivery of Wheat so early in the season. The present crop has one great advantage—it is all perfectly sound; hence it can all be used for human food. There is also a very great crop of Potatoes, and but partially diseased. Barley, too, is in general over an average crop, and, no doubt, a good deal of it will be mixed economically with Wheat, and ground for bread-meal. If the winter prove severe, there will, I fear, be much privation and suffering among the poor; still I cannot but think it better that the truth should be told and the strictest economy advised, rather than that persons should be lulled into false security by erroneous, though friendly statements.

"H. J. TURNER, Richmond, Yorkshire, Nov. 7."

"I entirely differ from James Caird as to the breadth of land under Wheat being greater than last year or one-fourth more than an average, for, owing to the comparatively small quantity sown in 1852-3, the largest extent of land a proper rotation of crops will allow of was applied to Wheat in 1853-4, and therefore could not again be planted with that grain in 1854-5. I think this is corroborated by the present abundance and relative cheapness of Barley, notwithstanding the cessation of imports, averaging near 20,000 quarters per week since 1846, and although we have now some export to Holland, &c.; likewise a large quantity in some districts is being ground with Wheat. On my own farm, with every desire to sow as much Wheat as possible, I was unable, for the foregoing reason, to plant as many acres (of Wheat) in 1854 as in 1853. As to the yield, I have the last week threshed four fields of Wheat, one of red Lammas, another of Mummy, a third Talavera, the fourth Scotch white, and the average produce is 14 imperial bushels per acre, against 36 bushels per acre last year; and, as I own a travelling steam threshing-machine, I have an opportunity of knowing that my case is not an exception in the neighbourhood. At the same time I freely admit that I know of some good crops in the counties of Worcester, Gloucester, Salop, Northampton, &c., which have been proved to be so on threshing; but in only one instance does the produce amount to within 10 per cent. of what was grown on the same farms last year. James Caird states the deficiency may be made up from America and Egypt, but the export from the latter is prohibited after the 6th January next. The extra quantity returned as sold since harvest I attribute entirely to more pressure having been put by the Excise on their collectors of returns. In one point I fully agree with James Caird —that is, the decrease in consumption in consequence of the high price, and I think his estimate from this cause is less than the reality, which alone may prevent prices going much, if any, higher. *Charles Sturge, of the firm of Joseph and Charles Sturge, Birmingham, 11th month,* 6.

THE KEYTHORPE SYSTEM OF DRAINAGE.

THE ploughing and draining matches in connection with the Leicestershire Agricultural Society took place on the 1st instant on the farm of Lord Berners, at Keythorpe. The local attendance was numerous, notwithstanding the wetness of the weather. As guests of his Lordship at the Hall there were present the following gentlemen from other districts, viz., M. Trehonnais, a celebrated French agriculturist, who is actively engaged in connection with the French Government in the introduction of the English breeds of cattle and English system of cultivation into France; Mr. Mechi, of Tiptree; Mr. Bullock Webster; Mr. Baker, of Writtle; Mr. Wilmot, and Mr. Trimmer, who had been the first to draw public attention to the Keythorpe system of draining, and to explain the principles on which its success depends.

The wetness of the weather afforded a complete test of the efficacy of the system. There had been 48 hours of heavy and incessant rain, and yet upon the strong clay loams of this farm, with a substratum of lias clay, into which in their undrained state a horse would have sunk fetlock deep, there were assembled 26 ploughs in one

field as competitors for ploughing their half acre each, and 23 in another as competitors for ploughing the straightest furrow. One of these fields, containing 20 acres, 1 rood, 23 perches, had been drained in 1851, at an expense for labour of 32*l.* 7*s.* The other, a Clover lea, in which 26 ploughs were assembled, contained 17 acres, 2 roods, 10 perches, and had been drained at a cost for labour of 32*l.* 15*s.* 7*d.*

While the judges were deciding on the merits of the work, the ploughmen and drainers sat down to a substantial dinner at the farm, after which the prizes to the successful candidates and the gratuities to the unsuccessful were distributed by his lordship, accompanied by exhortations and advice as to their moral and religious conduct, which were delivered with much feeling and received apparently with much attention. At the dinner in the Hall, at which upwards of 70 partook of his Lordship's hospitality, after the few toasts of a public nature, "The Queen," "The Royal Family," "The Navy and Army," had been given by Lord Berners, he proceeded to the agricultural toasts, and called for the agricultural remarks which they were intended to elicit. His lordship first proposed the health of Mr. Trimmer, and called upon him for an explanation of the Keythorp system of draining, and the principles on which its success depends. In responding to the toast, Mr. Trimmer briefly pointed out the absurdity of supposing that the variations of soil are dependent on the strata of our geological maps, in which all the superficial accumulations are supposed to be removed, in order that the rock nearest to the surface may be represented as the actual surface, though those superficial accumulations vary in depth from something less than a foot to more than 200 feet. He stated that having long made these superficial accumulations his peculiar geological study he had pointed out in 1837 in a paper on the "Agricultural Geology of Norfolk," published in the Journal of the Royal Agricultural Society of England, that at the junction of the soil and subsoil there are at certain depths a series of natural ridges and furrows which have in general a determinate direction, and he had intimated that they must have an important bearing on questions of drainage and subsoiling. In a lecture delivered some years afterwards before the Royal Agricultural Society, he had pointed out how he considered that the contradictory statements so frequent in the controversy then raging as to the failure or success of deep or of shallow draining, might be reconciled by observing whether the drains crossed or ran between these natural subterranean ridges and furrows. He further stated that Lord Berners, who was present on that occasion, had observed that if what Mr. Trimmer called ridges and furrows were the same as what in Leicestershire they called "clay banks," he could bear testimony to the soundness of these views, as he had for many years been in habit of taking advantage of them in draining operations, and had thereby been able to effect a considerable reduction in the cost. On a subsequent visit to Keythorpe, Mr. Trimmer had found these clay banks to be identical with the natural subterranean ridges and furrows which he had observed in many other localities in England, Wales, and Ireland. In conclusion he adverted to the presence of Mr. Mechi, Mr. Bullock Webster, and Mr. Baker as the respective representatives of deep, of moderately deep, and of shallow draining, and expressed a hope that they would favour the meeting with their views on the Keythorpe system of draining.

Lord Berners then proposed the health of Mr. Bullock Webster, who in returning thanks bore testimony to the efficiency of the drainage at Keythorpe, and adverted to the absurdity of supposing that water can filtrate through a retentive clay as stated by some great draining authorities. He adverted to some peculiar views entertained by Mr. Mechi on this point, and begged to reserve himself for a few further observations when that gentleman should have spoken.

The health of Mr. Baker, of Writtle, having been proposed by Lord Berners, that gentleman returned thanks in a long speech, embracing a great variety of topics, which we are prevented by our plan from noticing, except as far as his observations bore on the Keythorpe system of drainage. He bore testimony to its efficiency as well as to the excellence of the general management of the estate, denied that he was a shallow drainer, as he had been described to be by Mr. Trimmer, though, he contended, that if there was a porous soil only 2 feet deep on an impervious subsoil nothing was gained by carrying the drains into the latter.

Then followed the great speech of the evening, that of M. Trehonnais, who in the most feeling and eloquent terms adverted to the union now happily subsisting between France and England, whose best blood was shed together in the same cause—the cause of freedom and civilisation. He then adverted to the eminence of the British nation in arms, in arts, in science, in commerce, in literature, and, though last not least, in agriculture. He lamented the short-comings of his own country in the latter particular, he referred to his own labours for its improvement, and to the difficulties with which he had to contend from the want in France of a race of trained and skilful rural labourers like those of England. A rev. gentleman, whose name we could not learn, in proposing the health of Lord Berners adverted to his lordship's case of the agricultural labourers on the estate and to the improvement which had taken place of late in their treatment throughout the county, though much yet remained to be done.

Lord Berners having responded with much feeling, then proposed the health of Mr. Mechi, adverting to his labours in the cause of agricultural improvement, his zeal as a bold experimenter, the candour with which he communicated his failures as well as his successes, and the unruffled good temper with which he endured the severest criticisms.

When Mr. Mechi rose to return thanks, he was greeted with applause, second only to that with which M. Trehonnais had been received. He adverted in his usual happy manner to the various agricultural subjects which form the staple of his speeches; he spoke of the success of his own farming operations, the extraordinary profit of which excited some laughter, eulogised all he had seen at Keythorpe, and bore testimony to the efficiency of the drainage there, though he did not touch on the peculiarities upon which the success of the system depends. In the course of the evening the judges of the ploughing and draining, the office-bearers of the society, and several of the farmers made some interesting and valuable remarks on a variety of practical questions, and the meeting broke up under the impression that they had rarely spent a more agreeable evening, or one at which a greater variety of subjects had been discussed without undue prominence being engrossed by any.

Home Correspondence.

Thin Seeding.—It was with much pain I read your stricture on Messrs. Hardy's cultivation of Wheat. Out of almost 100 acres of land, which these men cultivate, and with industry deserving the highest praise, and skill surpassing the age in which they live, you single out two square yards out of 484,000 for comment and condemnation. Now, the highest cultivated piece of ground I know, and the most productive—for the produce is enormous and beyond all expectation—a few years since was a barren waste, the ground having been skinned and skinned until apparently all the vegetable-bearing soil had been carried away. I time after time pressed its cultivation; but was frequently laughed at for so doing by land cultivators. But at length this plot, consisting of 9 acres, was commenced to be cultivated; and now I will challenge the produce, consisting of vegetables only, for quality, quantity, and value, against that of the same quantity of land in this country, and year by year. Now, let me tell you, on this land experiments on a small scale, exactly similar to those made by Messrs. Hardy, are made, and some were made this last year, and with as complete success as Messrs. Hardy's were. That is, some single yards square were marked out, and a single Potato planted in each; and the result has been about a peck of as fine Potatoes as ever were grown from each Potato planted in a square yard. I also know a clergyman, who himself cultivated thoroughly his own garden with his own hands; and his plan throughout is the same as the above. On a visit to him this summer I myself witnessed the fork put under roots, and from 24 to 30 large Potatoes, like flour when roasted or boiled, were turned up from each root from single Potatoes planted, and all the other vegetables in the garden were cultivated on the same plan—that is, every plant grew singly, as I myself also have always planted my cereals, and the produce was equally surprisingly luxuriant. But on the above 9 acres of land I have known the common spring culinary Cabbages, which under common cultivation weigh ½ lb., or 1 lb., or 2 lbs., or 3 lbs. perhaps, weighing 34 lbs. and 36 lbs. each. This day week also I saw a plot of culinary red Carrots being dug up, many of which weighed near 9 lbs. each; and I myself have grown Potatoes for experiment, three of which weighed 10 lbs., and of course on the same plan. But you object to the two square yards of Wheat in the midst of 13,300 square yards, planted chiefly on the Lois-Weedon system, which I believe you approve of. I myself do not approve of this system, believing that it is not adapted for general practice; and, besides, the only examples of it—three only—I have seen, except this one of Messrs. Hardy's, have been failures. But Messrs. Hardy adopted it on 2 acres and three-fourths of the land they cultivate, and I think with complete success. On the 27th July last, the day before my friend Mr. Mechi's gathering, I walked over every rod, or up or down almost every furrow of this land; and I wish you had been with me, and I think if you had you would not afterwards have penned your leading article of the other week;—you would have looked at the whole plot, and not at the two square yards only, though they deserve attention. I observe I do not like the plan because not more than one-third of the land was cultivated with Wheat—the rows being 1, 2, 3, and 4 feet apart—and the rest planted with Potatoes, averaging 2½ feet between each row. Each grain of seed had been planted separately in each row, and I counted on some few roots 40 stalks, each having on it an ear of Wheat; I gathered also, as I walked about the field, several ears, each of which had in it from 90 to 96 grains of fine plump Wheat. I do not know the produce, but it must have been very large indeed, considering that in reality one-third only of the land was cultivated with Wheat. I believe the *Agricultural Gazette* recommends about 1½ bushels of seed per acre, or from 15 to 18 seeds in every square foot of land; whereas, had the whole of the land been planted by Messrs. Hardy on their plan, one grain of seed only would have been put into a square foot of ground. Should the reader smile at this kind of calculation, or even scoff, as many will, I observe there is more in it than meets the eye. For four years in succession—year after year—I myself drilled, with a drill I made, a field with Wheat in rows 12 inches apart, dropping the seeds into the rows singly, seed after seed; I varied the quantity in the rows, but always kept to the same distances between the rows, so that the quantity of seed varied per acre from ½ a peck to 2 pecks an acre. The produce averaged for the four years 44 bushels of beautiful Wheat an acre. I likewise drilled 2 pecks of Barley on an acre, and had 63 bushels of fine malting Barley from 2 pecks of seed, or 252 pecks. I hope therefore, no discouragement will prevent Messrs. Hardy, who are most industrious and very intelligent men, from persevering in their very praiseworthy course. I pronounce them to be public benefactors, and to deserve the support and protection of every well-wisher to his country, and especially of every landed proprietor. *Geo. Wilkins, Parsonage, Wix, Oct. 30.*

Agricultural Improvement and Increased Prolificness.—It is the duty of every wise cultivator, aided by the lights and instructive lessons of analytic chemistry, to strain every effort in order to increase the produce of the land, and thereby to meet, as far as is possible, the emergency of the times, and supply the deficiencies resulting from war. But how bring about those *desiderata?*—that is the question which it is the object of the following hints to solve. The farming mind, we are now told, "is broad awake, and only waiting for farther development and mechanical advances. It is incalculable to what extent our culture might have attained in the late admirable season, could steam appliances have been brought into general use in aid of animal power." This truthful observation points to the deep working and pulverisation of the ground, and these can never be effected without bringing up a good subsoil, to the full depth of 12 or 14 inches. There once were great differences of opinion on this subject, and we frankly admit that it would be sheer folly to work up a hungry gravel or a solid bed of chalk, the former because it is worse than inert, and the latter because it is in itself a capital absorbent drainer, obviating, to a great extent, the necessity of forming artificial drains. Now a good system of thorough drains, made truly level in their gradual fall, constitutes one of the requirements of fertile husbandry. The Isle of Thanet, in Kent, bears out this truth, for there the chalk rock does not only drain the surface earth, but also supplies the roots of plants with moisture by its power of retaining water. These preliminaries being admitted, we are in a position to consider what a thorough preparation of arable land connected with a corresponding system of enrichment really is. The following case in point occurred in our own experience. A plot of ground was trenched as in garden tillage; the surface Grass turf was then thrown at the bottom of each deep trench, upon that the upper soil was deposited, and the subsoil brought to the top. This soil abounded with coarse sandy grit, that caused the more loamy (aluminous) constituents, when wetted, to bind in hard intractable clods. When such a subsoil is met with and brought to a surface it ought to be immediately so enriched with spit farm and f ld-yard dung as to constitute a perfectly rich bed in the first instance. And we may farther add that, as loamy soils invariably fix and hold fast organic and saline manures, a field so treated would be prepared at once for a Turnip crop followed by Wheat. Water, however profuse in quantity, would never wash out the manure; and nothing except the vital energy of successive crops would ever exhaust it. But what is this vital energy, and how can we define it? It is not sensitive—it is not mobile; hence we arrive at the conclusion that it is essentially an attractive force, and if so, there exists but one great agent to which we can refer, and that is electricity. Here also we obtain that which opens to us and explains the fertilising influence of all manures. Analytic chemists have proved to a demonstration that wherever there is decomposition or combination, electricity is called into play; and by this simple fact the great superiority of farm-yard dung is established. This is a fortunate circumstance, since upon every farm a quantity of organic manure is unavoidably produced, and must be used. During its preparation in the dunghill carbonic acid and ammoniacal gases are extricated, but never lost, for that great storehouse the atmosphere first receives and then returns them with interest in fertilising showers. We would, however, employ farm-yard manure in every farm, nor by any means wait till the whole of it be reduced to the condition of black spit dung, but in every case of deep laboration, whether by a steam cultivator or the spade, we would deposit at the bottom of each trench a deep layer of recent manure, the gases rising from which would combine with the covering earth, and be thereby retained by its attracting and fixing power. Something remains to be said of manures in general. They are few in number, among which first and foremost stand the organic products of the farm itself, for the reasons above assigned. Next stands sound and pure guano which comprises soluble phosphates, sulphates, and muriates with alkaline and ammoniacal bases, combined with the finest bone phosphates, urea and some urates, This comprehensive manure combines well with spit-dung, if judiciously intermixed, and is itself a most valuable appliance in many operations. Bone-dust and bones digested in diluted sulphuric acid possess specific qualities; but unless we could prepare from fish a worthy representative of guano at half the price of that wofully adulterated substance, we feel but little inclination to notice the doubtful compounds advertised as "artificial manures." The prosperity of agriculture and the increase of its productions to double their present aggregate amount, are the earnest desire of the writer, and these could certainly be realised under a

system of thorough drainage and deep laboration of the ground. *Veritas.*

Land Drainage.—In your last (p. 732), Mr. Bailey Denton draws attention to what he not inappropriately terms the very extraordinary circumstance of drains recommencing running upon a fall of the barometer without any fall of rain on the surface. An analogous phenomenon is recorded by Prof. Brocklesby, of Hartford, Connecticut, in a paper read before the American Association for the Promotion of Science, which will be found in the (American) "Annual of Scientific Discovery" for 1854. He observed on two occasions that the rising of the surface of the water in a spring near the town of Rutland, in Vermont, was followed by a fall of rain after an interval in one case of two or three days and in the other of 24 hours. The spring rose several inches, and overflowed. "On inquiry it was ascertained from the residents in the vicinity that the phenomenon was one of ordinary occurrence, and that for the last twenty years the approach of rain was indicated by the rising of the spring. Interested by these facts," says the professor, "I sought for others of a like nature, and requested through the public prints information upon this subject from all who happened to possess it, and also upon collateral points which were conceived to have important relation to this phenomenon. I was rewarded by the knowledge of only one additional instance, existing in Concord, Massachusetts, where a spring that supplies a certain brook is said to rise perceptibly before a storm. I have not been able to ascertain the state of the barometer, either at Rutland or at Concord, at the times when the phenomenon in question occurs; nevertheless, I believe the true solution will be found in the diminished atmospheric pressure which exists before a rain. The waters of a spring remain at any given level, because the atmospheric and hydrostatic pressure combined exactly counterbalance the upward force of the jet. The spring will therefore rise either when the force of the jet is increased while the atmospheric pressure continues the same, or when the latter is diminished, while the former remains constant, and the elevation is greatest of all when the decrease in the density of the atmosphere occurs simultaneously with an increase in the strength of the jet. The rising of the water in the instances related cannot, I think, in view of the facts detailed, be fairly attributed to any sudden augmentation of force in the current of the springs, but is to be regarded as the result of diminished atmospheric pressure occurring at the particular times, in perfect accordance with known meteorological laws." On the same grounds we believe the fact stated by Mr. Bailey Denton may be accounted for. If any of your readers are in possession of similar facts they would be doing a service to the cause of science by giving them to the public in your columns. As to Mr. Stephens' statement that a thermometer placed 18 inches below the surface in a drained soil is "not sensibly affected by the change of temperature in the atmosphere;" by "changes" he probably means fluctuations from day to day, as it is well known that the influences of the change of temperature of the atmosphere from the cold of winter to the heat of summer is felt to a depth varying from 60 to 100 feet below the surface of the earth. *B. D. T.*——In the "Cyclopædia of Agriculture" you give a figure and short description of a separator for separating different sizes of grain; further details as to its construction and the price at which it could be made would oblige. [We believe it costs 12*l.* to 15*l.* Apply to any of the chief agricultural implement makers.]

Portable Buildings.—[Mr. Porter, of Gas Street, Birmingham, to whom we referred in connection with corrugated iron roofing, has sent us a description of his method of constructing and erecting portable buildings of ordinary planks or boards, which we publish here as being applicable we think to farmeries and shelter sheds.] This method of constructing portable buildings, of wood or iron, has been carried out on a considerable scale (chiefly in the latter material) for emigrants' houses and stores; but in using corrugated iron plates for the sides and roofs of houses it is necessary, on account of the rapid transmission of heat and cold through the metal, to have an inner lining of non-conducting materials, of a more or less expensive description; and while this answers for buildings of a more important and permanent character, in localities where the ordinary building materials and labour are comparatively dear, it enhances the cost and the bulk of what are required as portable and temporary buildings, to an objectionable degree. It is with the view, therefore, of meeting this objection, that the plank houses are designed, and as they consist of materials so familiar to every one under ordinary systems of construction, little more is needed here than a description of the peculiarities of this method, of which the simplicity is its chief recommendation. It consists, then, mainly in the construction and adaptation of upright grooved posts, formed of wood and metal, in such a manner as to combine cheapness of construction with lightness, strength, and durability. The metal grooves of these posts are fashioned to receive the ends of the planks forming the side walls of the building, and present, in a neat and pleasing form, both on the interior and exterior of the wall, a perfect metal covering to the joints, from the ground to the eaves. The posts are either shod with iron, for driving into the ground, or fitted to a sill of timber, to be laid on a more or less permanent foundation. The planks or boards (having in view a sufficient strength, and an economical arrangement in the spacing of the upright posts) are generally about 1½ inch in thickness, 9 inches in width, 9 feet in length, and weigh about 23 pounds each. These are laid on their edges, one upon another, their ends passing down the metal grooves of the posts; the bottom plank, in some cases, being sunk a few inches into the ground. (When thinner boards are used, it is necessary to employ a greater number of the posts, or to give stiffness by the addition of an intermediate upright of some kind). Where they are not likely to be injured in transit, or the building too often removed, the edges of the planks are "ploughed and tongued," "halved" or "bevilled," otherwise, for the sake of economy, and to avoid the risk of injury by a little rough usage—very likely to occur at the hand of carriers and persons inexperienced as workmen—the edges are left quite plain and the horizontal joints covered with a strip of metallic canvas or asphalted felt, either entirely on the inside, or passing between the edges of the planks, turned upwards on the inside, and downwards on the outside of the wall. The upper and lower planks alone are "fixed" to the posts, and these are secured by screws passing through the metal lips of the grooves. The upper plank is fixed with a space of about 2 inches between it and that next below it. This aperture serves for ventilation (moderated where desired by a strip of canvas or cloth, or of perforated zinc) and admits of the easy adjustment of the lower planks, should they slightly shrink or expand from excessive heat or moisture of climate. Thus it will be seen that with a number of the grooved posts formed exactly alike, and a quantity of planks or boards sawn to a uniform size, and without "fitting" of any kind, the side walls of a house may be rapidly put together by persons totally unaccustomed to ordinary construction or mechanical operations. As regards the roofs, a simple arrangement of boards reaching from the top planks of the walls to a ridge board (supported by light posts or partitions in the centre of the house) and covered with metallic canvas, tarpaulin, or asphalted felt, sent out in rolls of convenient size and weight, will be sufficient in many cases. It may be preferable, in some cases, to have the roofs of corrugated iron, in plates or tiles of convenient size for handling; this material, which is very light and strong, being of more durable nature than the felt covering on boards, and equally well suited for removal and re-fixing. The cost is somewhat greater, and its adoption will be governed by circumstances. Where boarded floors are required the materials are arranged like the other parts of the houses, with a regard to their probability, and to the facility with which they may be put together at their destination. This method of construction, it will be seen at once, is suitable for a variety of purposes, and for none does it appear to be of more value than for farm buildings of various kinds, for fences, and for folding sheep. For the latter purposes, the planks or boards can of course be narrower and fixed at any suitable distances apart. As a means of sheltering sheep, in exposed situations, this kind of fencing may be made very useful. Where timber suitable for the planks or boards already exists upon the estate, it will be necessary only to obtain the "Patent Posts," and the ordinary labourers, assisted perhaps in the more important structures by a carpenter, will find no difficulty in erecting the buildings, the simple construction of which admits of their being as easily taken to pieces, when desired, carried to another site, and re-erected, without injury to the several parts. The want of stabling is very frequently felt by persons having, on short leases, dwelling houses and land without such accommodation, and for which they are unable to make satisfactory arrangements with the landlord. The system of construction here treated of offers a means of supplying that want, in the shape of a cheap temporary building, removable by the tenant at the expiration of his lease; and here it may be well to point out an advantage in this system which may hitherto have escaped notice, viz. the convertible state of the planks or boards, should a building no longer be required, and it be found desirable to dispose of, or to convert to other purposes, the materials of which it is composed. From the description already given of the manner in which the planks are connected with the posts, it will be seen that they are not injured by a number of nails, as in the usual modes of construction, nor are they so slight, or so fixed, as to be injured by warping, or by splitting from shrinkage or swelling. It is scarcely necessary to point out any other of the many purposes for which buildings and sheds of this kind may be adopted with advantage, as they will naturally suggest themselves to those who may be in want of a cheap and ready mode of providing themselves with dwellings, workshops, farm buildings, stables or outbuildings, of a more or less temporary character.

Agricultural Shows.—It appears another class of animals will soon be admitted to compete at agricultural meetings. "Baby shows" were supposed to be imaginary, advertised, and noticed in "Punch" to amuse the public; however, report speaks of such exhibitions becoming fashionable. It will be necessary to place the "babies" on the only list open to them, viz. sucking pigs. Of course their birth, parentage, &c., whether pure Saxon, or a cross of Norman or Celt, will be duly recorded, in order to ascertain the most improved breed. The mothers should also appear in a dress to show off the figure, and produce certificates of marriage, general health, number of children born within a certain period, &c.; a statement should also be made of the nourishment swallowed during the time of feeding the "baby puppy." *Frater.*—P.S. If baby shows are fabulous this may be consigned to the flames. *Falcon.*

Wheat Growing.—There is a notice in your Number of Saturday of a publication by Mr. Cooke on Wheat growing. It appears that he assumes that 48 bushels are to be obtained per acre by proper management and capital, but in stating this assumption you do not go on to quote from his book the way that his end is to be attained. Will you be so good as to inform a subscriber if this is laid down in the work, or if not, can you recommend any publication which would contain such practical advice as to aid in the attainment of such a result as Mr. Cooke supposes to be possible? *S. E.* [Mr. Cooke does not give detailed instructions. These are to be found in systematic works on agriculture. See Blacker on "Small Farms," and O. O. Roberts on "Agricultural Improvement the Antidote to Agricultural Distress."]

Farmers' Clubs.

Haddington, *Oct.* 2.—*The probable causes of frequent failures in winter Wheat, and the best mode of top-dressing that crop.*—Mr. Hope, of Fenton Barns, said, As I am not prepared to admit that failure in winter Wheat is at all the rule in this county, I think the first part of the question would have been better stated by substituting occasional for frequent failure. I maintain that if land is properly drained and filled with manure, and freed from weeds by the cultivation of green crops, good seed Wheat selected and sown in proper season, an abundant crop is as certain as anything else can be in this changeable scene. Doubtless it is exposed from the moment it is sown to the depredation of insects and various kinds of vermin, which devour the seed, the blades, and stems in every part of its progress, and even the grain when it is forming in the ear. The weather also is often detrimental, biting frosts may altogether destroy it, or blight, rust, mildew, and smut may affect the quality and diminish the produce. But experience has shown that much may be done at least to mitigate these evils, if they cannot be altogether prevented. Frost very rarely destroys Wheat on dry land, unless where it has been too early sown, and become what is called "winter proud." Blight or mildew seldom seriously affects the crop when it is thick on the ground, unless vegetation is very rank from the direct application of manures, or from the confined or sheltered position of the ground; but we know that an application of 1½ or 2 cwt. of common salt sown in spring is certain to secure straw of the brightest colour and grain of the finest quality, though in fine seasons this diminishes the produce, which prevents it being recommended for universal adoption. We are all aware, too, that washing the seed in a solution of blue vitriol is a complete check to smut; any one who has crops damaged by this has his own carelessness or laziness alone to blame. Even the ravages of the Wheat midge, which at first sight appear to be almost beyond human control, and which annually give me for a short time more anxiety than all other causes, I feel persuaded, can, to a certain extent at least, be mitigated by sowing only the shortest strawed and quickest blooming varieties. Still, without doubt, there is here and there an occasional failure of winter Wheat, and we often enough see indifferent fields. I frequently observe that a better crop would have been obtained had a more suitable period been selected for sowing the seed, or had the ground been in a somewhat different state. Practical experience alone must teach every farmer what period for sowing is most suitable for his soil and locality, and these vary so much, that no man can venture to dogmatise either on that or the quantity of seed necessary for an acre. Wheat also requires a certain degree of consistency in the soil, in order to produce a full crop. Even heavy soils are better to be damp above so as to work down freely, but there should be no clagging, and the horses' footsteps should be fully obliterated by the harrows, otherwise the blades will be yellow in spring, the straw short and feeble, the heads down, and the crop only a half one; indeed, in these cases it is better to leave the land only half harrowed. The result is pretty much the same, if light land is sown very dry, as then the plants die out in spring from want of consolidation in the soil. Pressure with heavy rollers, aided by topdressing, if promptly done, will generally prove beneficial. From what I have seen, and lately heard, I am inclined to think that on light soils land should not be ploughed at all after a green crop, but that the Wheat should be sown and covered by grubbing lightly; or, if the soil is remarkably light, I would prefer a crop of spring Wheat as the more certain. The occasional cause of injury to Wheat fields in this county, though it was more common 20 years ago than now, was the larvæ of small flies, named, I believe, Chlorops and Oscinus, eating into and destroying the centre stems of the plants in spring. In fields affected by them, the plants die out altogether when they are seized on after ceasing to derive support from the seed; otherwise, they often recover amazingly. Wheat sown after plain fallow is most liable to their attacks. Ploughing in the seed has been sometimes resorted to, to give the plant, it was said, a better hold of the ground. Wheat sends out roots from the seed, but however deep you bury it, when the stem reaches the surface, the coronal roots spread out, and the under roots die off, while the plant is weakened in proportion to the depth of soil it has had to force itself through. From delay in springing, the deep sown may have continued to derive support from the seed when what was nearer the surface might be destroyed from want of it. All the benefit derived from deep seeding may be obtained from late sowing, while, generally speaking, the stronger and more vigorous plants obtained from seed deposited near the surface are the

most to be depended on for a satisfactory crop. I have alluded to rust, mildew, and the Wheat midge, as occasionally diminishing the produce of our fields. I do not think I can add anything more to the hints I have already given in order to mitigate the evils occasioned by them. To get a full crop of Wheat you can scarcely apply too much manure to your previous green crop—the soil should also be free from all weeds. I find the best time for sowing is the last week of October, and all the month of November; but as the season advances, greater care is necessary that the land is not over-wet, and to be more sparing with the harrows when it is at all doubtful. I prefer old seed at first. I drill the most of it, and find that 2 bushels or 8 pecks are enough for a Scotch acre if sown in October, 9 pecks in November, and 10 towards its close; but, if sown broadcast, I would give 3 bushels. With present prices, the saving of seed by drilling is worth attention. In spring I invariably roll all my Wheat, and either hoe it or give it a turn with light harrows. By these means I have almost invariably a fair crop, though some fields will be better than others. In regard to the best mode of top-dressing Wheat, I will simply state my own experience. For a year or two I have topdressed in spring almost the whole of that crop, partly with guano, partly with nitrate of soda and salt, and partly with sulphate of ammonia and salt. Last winter, I stated my views on this subject fully at a meeting of the Highland Society. This year my best crop of Wheat is where it was top-dressed with sulphate of ammonia and salt. Both the guano and nitrate produced too much straw, laying the crop, damaging the quality of the grain, and diminishing the quantity. I might have had a good round sum expended on artificial manures in my pocket, and a more valuable crop of Wheat to sell; but the season has been exceptional, for previously my outlay always paid me. I think I have done such ample justice to all my green crops, that I hope to be relieved of the trouble and expense of top-dressing them in spring. But if any part then appears as if it would be the better for assistance, I will dress it with sulphate of ammonia and salt. This year my friend Mr. Shirriff at Saltcoats has conducted a very interesting experiment, to ascertain the value of different manures as a top-dressing for Wheat. There is a singular difference in the bulk of straw produced, but he has not yet got the separate lots threshed to know the actual produce. I know he intends stating the result to the club; I only wish he had been able to have done so to-day. With these few plain remarks I now leave the subject in your hands.—Mr. R. Scot Skirving said, That the first of the topics which formed the subject of this day's discussion was one upon which he was very anxious to obtain information, as it was apparently shrouded in much darkness and obscurity. It was true, that, as the Chairman had remarked, a failure in winter Wheat, where the crop had been well managed, and the soil generously treated, was the exception, but at the same time instances were more numerous than might generally be supposed. But even if failure occurred once only in a hundred times, the subject would be one well worthy the attention of agriculturists. Failures in autumnal Wheat might, in many instances be accounted for, by being sown at too early or too late a period, by the seed being put into a soil too wet or too dry, or by being sown too thick or too thin; these, and no doubt other well known causes, might account for failure, but there were certainly instances, and these not altogether isolated ones, where fields failed from some cause so subtle as to escape ordinary observation. There was one general cause of danger to winter Wheat, to which for two years the country had been unusually exposed. The cold had been greatly more intense during the last two seasons than during other recent years, the thermometer having fallen to zero, and even below it. Fortunately much of the country was covered with snow, and as this was not equal over the whole ground, perhaps the frost, acting with more force where the snow was less deep, might peculiarly hurt fields, which it caught in some particular condition of dampness. As an example of the arbitrary and unaccountable manner in which these failures occurred, he might instance a failure in a field, belonging to his friend Mr. Reid, who farmed as near him as he happened now to sit. Here was a highly cultivated and well manured field, sown with Wheat after Potatoes, the crop of which was scarcely worth the reaping, thus forming a remarkable contrast to Mr. Reid's other field. Now, he believed Mr. Reid was unable to assign any cause for failure in this field, which might not have caused a similar result in the contiguous field. He knew another instance where a large extent of excellently farmed land had failed, the owner of which was unable to charge himself with any defect or deficiency in the management. The general rules laid down in the speech they had just heard were probably all that skill could at present suggest, but he trusted that future experience might yet discover some antidote or preventative to these remarkable failures in autumnal Wheat. With regard to topdressing he would make but a single observation; like the chairman he had this season largely used sulphate of ammonia, but his experience of it was not nearly so favourable, and he much preferred guano or Rape in autumn. The chairman had said that on account of much of his crop having been too soon "laid" he might have had a better return, and a good round sum in his pocket, had he not (on this exceptional year) purchased so largely. Now, it occurred to him, that this was the real cause of the success of the sulphate of ammonia. It had produced comparatively little effect, and consequently, like homœopathy, had succeeded by doing nothing. Mr. Shepherd, Gleghornie, said that the failures in winter Wheat were not now nearly so frequent as when he came to the county. At that time he used to sow his Wheat early, and failures were frequent—now he delays his sowing to November, December, and even January, and his Wheat is invariably thick in the spring. He mentioned that last year he had sown a large field, part in each of these three months, and the whole was good; nor did he think that frost killed Wheat, unless upon wet land, or with some defective management.

NEWTON ABBOT.—*The Labourer, the Farmer, and the Landlord.*—Mr. Palk, M.P., spoke as follows at a late meeting of the agricultural society here:—One material operation of the war was to impede the introduction of foreign corn into this country, and so to throw on the agriculturists the necessity of increasing the produce of the soil, to provide for the wants of the population. Another result which they would have to contend against was the great demand it created for human life. From every part of the country the young and active man, who in peaceful times would have become a labourer on the soil or a mechanic in the mill, was hurried off to the seat of war; and consequently a want of labour had for some time been felt. He had experienced it himself, and it had been called very seriously to his attention. There was another sad reflection he could not help making—it seemed that the farmer had not now the control over his labourer which he used to have. He had been told by many agriculturists that if they complained of the conduct of a man, or said a word to him, he demanded his day's wages, away he went and left the employer in a disagreeable position. He was satisfied that much of the damage that was supposed to be accidentally done to crops and plant of the farmer was due to the negligence of idle boys. In olden times there was a system—he did not pretend to say it was faultless, but it was attended with most excellent results—he meant the system of apprenticeship. The boy was carefully instructed in his duties by the farmer, while the girl was probably brought up under the eye of the mistress of the house, and both became useful members of society; but he regretted to say there was now a system of taking and dismissing servants without a character. This was a serious matter; for it appeared to him that the character of every man, whether he was the servant in the farm, or one who served his country in the senate—was dear to him and should be given to him. If they withheld from the honest servant the character which he had richly deserved, what recompense did they offer him? It was not the wages that the servant earned, nor the home that the master gave, which was most highly prized, but the hope of rising in his station—a hope which should be an inducement to every man and woman to do well, and which should be encouraged. Another question which had lately attracted much attention amongst those who wished well to the agricultural interest, was that of education—one worthy the attention of every man who had the well-being of his fellow-creatures at heart. The facilities of railroads induced men to travel, and the cheapness of literature gave them a taste for research. It was to the cheapness of literature, the opportunity of mixing with practical men, and of seeing different customs in different countries that the marked improvement in Devon farming was to be attributed. They had introduced a very superior system of cultivation into this county, and many of the innovations they had seen practised in other counties. So much had the necessity for education impressed the minds of those who took a lead in the legislature of this country, that they would see Lord Ebrington had offered a prize, which he (Mr. Palk) hoped would be well contested for, to the farmer's son who was the most proficient in history, geography, and mathematics. The noble lord had undoubtedly given this prize with every desire that it might stimulate the rising industry of the sons of agriculturists. He hoped on Thursday next to have the honour of meeting a large body of agriculturists in his neighbourhood, to show them a system—largely adopted in other counties, but not carried to such an extent as he had attempted to carry it—a system of meadow irrigation. For the last six or seven years, with the assistance of a tenantry, who, he believed, bore a richly-deserved reputation in this county, he had been remodelling some valleys, and turning orchards, hedges, lanes, and horrible holes, as he called them, into what had now become green and fertile meadows; all irrigated under a system that made the most of the running water, the atmosphere, and the sunshine. In conclusion, he asked the society why they did not give prizes for landlords as well as for tenant farmers and labourers? He would most gladly compete. Perhaps they would tell him that they already gave a high prize for landlords, and he admitted it, for where the landlord endeavoured to do his best for the tenantry, there they would find the best and most enterprising of tenants.

Notices to Correspondents.

TURNIPS FOR SEED: *J D.* We have been accustomed to plant in autumn selected tubers in a field not manured but of rich soil. If you have no such land we would plough in over old manure. Plant about 2 feet apart in rows, 3 feet apart if the land is rich.

ERRATUM. In the account of Fisken's plough at page 731, it should have been stated that "the strain upon the anchor furthest from the engine is no greater than the draught of the travelling machine *plus* the slight strain due to the tension, &c., of the light driving-rope," *plus* the draught of this rope, equalling one-eleventh of the draught of the implement. *I. A. C.*

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	10	0
2½ „ long	3 „ 3 „		1	14	0
3 „ ditto	3 „ 6 „		2	8	0
3½ „ ditto	3 „ 6 „		2	12	0
4 „ ditto	3 „ 6 „		3	3	0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	10	0
2½ in. long	ditto	ditto ditto	2	14	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

LIQUID MANURE.

PATENT LIQUID-MANURE DISTRIBUTOR OR WATER-CART, for the Distribution of Guano, &c., warranted not to clog up or otherwise get out of order. It has Waterproof Joints, and will scatter its Liquid from 12 to 15 feet wide. It will work equally well on hilly or on level land without any alteration. It is thoroughly adapted for Drill Crops or Pasture Land, or for Watering Streets.—Full particulars may be obtained of the Patentee, ISAAC JAMES, Tivoli, Cheltenham.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F ROE (late FREEMAN ROE), Hydraulic Engineer, 70, Strand, London.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps. 103, Newgate Street, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c.

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

A SHOW ROOM DEVOTED ENTIRELY TO ARTICLES OF HORTICULTURE.

ILLUSTRATED CATALOGUES UPON APPLICATION.

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.
AGRICULTURAL LIST UPON APPLICATION.
EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK,
EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility Gentry, and the Trade, in most of the counties in England.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark, (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the framework, but covered with Galvanised Iron Sashes, with excellent strong glass, and all completed for 1s. 3d. per foot super. Hundreds of references can be given, and Printed Price Lists sent.

J. OVERALL begs to inform the Nobility, Gentry, Nurserymen, and others requiring Horticultural Buildings, Lights, and Frames, that by intrusting their orders to him, they may depend upon first-class workmanship and good materials at the most economical prices.

J. OVERALL, Horticultural Builder, 16, Shacklewell Lane, near Kingsland, London.

C. STEPHENSON, late STEPHENSON AND SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. The same prices charged at all the Establishments.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST, BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.

Circulars free by post.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS. They contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders, from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges.

1st,—From the frequency and extent of his purchases: and
2dly,—From those purchases being made exclusively for cash.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are ON SHOW over his SIXTEEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz., from 12*s.* 6*d.* (two light) to 16*l.* 16*s.*

LAMPS OF ALL SORTS AND PATTERNS.—WILLIAM S. BURTON invites attention to his season's SHOW of LAMPS. It embraces the Moderateur (the best Parisian specimens of which have been carefully culled), Argand, Solar, Camphine, Palmer's Magnum, and other lamps for candles; and comprises an assortment which, considered either as to extent, price, or pattern, is perfectly unrivalled.

Pure Colza Oil, 5*s.* 6*d.* per gallon.
Palmer's Candles, 10*d.* and 10½*d.* per lb.
Patent Camphine, 3*s.* 10*d.* per gallon.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

NEW LABEL.—In consequence of the great variety of Counterfeit Labels of A. ROWLAND & SONS' MACASSAR OIL, now in circulation, and which so nearly resemble the original as frequently to deceive the unwary—they have employed those eminent artists Messrs. PERKINS, BACON, & Co., who, at great cost, and by a peculiar process of their own, have succeeded in producing from steel "A NEW LABEL," which cannot be forged. It is composed of a section of an engine-turned circle, repeated 130 times, and forms an original lace-work ground, upon which is engraved in white letters, "UNDER THE PATRONAGE OF THE COURTS OF EUROPE," with an embossed profile of Her Majesty "THE QUEEN," lately specially taken for the purpose, and which surmounts the words (also in white letters) "ROWLANDS' MACASSAR OIL, for the growth, restoration, and for beautifying the Human Hair." Under which is the Signature of the Proprietors in Red Ink, "A. ROWLAND & SONS."—Sold by them at 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—ROSALIE COUPELLE'S CRINUTRIAR is guaranteed to produce Whiskers, Moustachios, &c., in a few weeks, and restore the Hair from whatever cause, strengthen it, prevent its falling off, and effectually check greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness. Sold by all Chemists, price 2*s.*, or sent free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN—"Through using it I have an excellent moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 30 years have been held in constant and increasing public estimation as the purest farinæ of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6*d.* and 1*s.*; and Family Canisters, at 2*s.*, 5*s.*, and 10*s.* each.

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

HOLLOWAY'S PILLS FOR THE CURE OF RHEUMATISM ARE FAR SUPERIOR TO ALL OTHER REMEDIES.—Mr. Talbot, Druggist, 40, St. James's Street, Liverpool, states in a letter to Professor Holloway that he is requested by Mr. Jameson, of 23, Norfolk Street, to inform him that for many years he had been afflicted with Asthma and Rheumatism and could obtain no relief from the many remedies he tried, until taking Holloway's Pills, this invaluable medicine speedily cured him, and he wishes the same to be made public for the benefit of others.—Sold by all Medicine Vendors throughout the world; at Prof. HOLLOWAY'S Establishments 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODA, Malta.

TO NURSERYMEN AND OTHERS.

HALSTEAD CEMETERY.—The BURIAL BOARD for the Parish of Halstead, in the County of Essex, hereby give Notice, that they are prepared to receive TENDERS for SHRUBS, &c., for Planting their Cemetery. Forms of Specification with Schedules (price 5*s.*), with all necessary information, may be obtained either at my Office, or at the Office of WILLIAM DAVIDSON, Esq., 36, Great Russell Street, Bloomsbury Square, London, on and after November 13th. All Tenders must be sent in to Mr. DAVIDSON on or before SATURDAY, November 24th. The Board reserve to themselves the right to accept or reject, in the whole or in part, any Tenders submitted to them.

Halstead, Nov. 17. G. P. ARDEN, Clerk to the Board.

WANTED, A COUNTRY FARM HOUSE, completely or partly Furnished, containing a Sitting and three or four Bed-rooms, for a gentleman's occasional residence; with from 15 to 30 Acres of Land, chiefly Garden. Within a reasonable distance of London; vicinity to a Railway Station preferred. To rent from Christmas next.—Address, stating rent and full particulars, to N. E., care of Mr. JOHN MABELEY, Stationer and Printseller, 143, Strand.

TO NURSERYMEN AND FLORISTS.

TO BE LET, the BOWATER NURSERY, Woolwich, situated in the most respectable part of the town, consisting of two Greenhouses, two Bricked Pits, mostly filled with Soft-wooded Plants, also about 1½ acre of Ground, partly covered with Fruit Trees. Coming in very moderate, by valuation or otherwise, as may be agreed on.—Apply at the Shop, where all particulars can be obtained; or by letter, addressed to G. S., as above.

TO BE LET, a NURSERY, in Stockwell Green, comprising Dwelling-house and Seed Shop, ten large Greenhouses, Pits, Frames, &c.—For particulars, apply to Mr. H. R. FRAME, 5, Field Terrace, Lansdowne Grove, Stockwell, Surrey.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

TO BE SOLD, worth the price, a Cast-iron STAND for a CONSERVATORY, in good condition, 24 feet long, 4 feet 6 inches high, upper platform 5 feet wide.—May be seen and price known by applying to W. B. HUNNINGS, Stationer, opposite Bruce Grove, Tottenham.

TO BE SOLD, a FRUITERER and FLORIST'S BUSINESS, having an old and first-rate connection in a commanding situation. Coming in about 500*l.*; a part could remain on approved security, the proprietor wishing to retire.—For particulars apply by letter, prepaid, with real name and address, to A. B., 5, Great Queen Street, Lincoln's Inn.

FARM FOR SALE IN EAST KENT.

TO BE SOLD by Private Contract, a very desirable FREEHOLD FARM, called Wallett's Court, in the Parish of West-Cliff, between Dover and Deal; containing 218 Acres of superior Arable and Pasture Land lying well together, around the house, and abutting for a considerable distance on the main turnpike road, and on two other sides by the high roads to St. Margaret's at Cliff. The Estate contains good brick earth, and is very desirable for building. It has a good residence in a healthy situation, and besides its present value possesses great historical interest. It belonged to Odo, Bishop of Bayeux, in the reign of the Conqueror; was the residence of Edward and his Queen Eleanor; afterwards of Thos. Gibbon, whose son Matthew rebuilt it in 1627. The church is within a minute's walk of the house.—For Particulars apply to Mr. SANDFORD, Martin's Farm, near Dover, Kent.

Sales by Auction.

MESSRS. PROTHEROE AND MORRIS respectfully inform the Public that the Sale of TULIPS, as advertised for the 23d inst., is postponed until the 30th of November.—Leytonstone, Nov. 17.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, 23d November, at 12 o'clock, a first-class collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemonies, Crocus, Tulips, Snowdrops, Ranunculuses, Gladiolus, &c.; also a selected assortment of fine Standard and Dwarf Roses, including Hybrids, Bourbons, Chinas, Noisettes, &c.; and American Plants, comprising Hybrid Rhododendrons; Ghent and other Azaleas, Kalmias, Andromeda floribunda, beautifully furnished with bloom buds.—On view the morning of Sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to Sell by Auction, without reserve, on the premises opposite the Railway Station, Blackheath, by order of Mr. Hally (the ground being required for building), on MONDAY, November 19th, and following day, at 11 o'clock each day, the valuable NURSERY STOCK, consisting of Laurels, from 3 to 6 feet; fine Chinese Arbor-vitæ, 3 to 6 feet; handsome Deodars, 3 to 8 feet; large Fan and other Yews, 4 to 10 feet; Aucuba Berberis, variegated and green; Hollies, Laurustines, Sweet Bays, Lilacs, Mountain Ash; Standard and Trained Fruit Trees, Gooseberries and Currants; about 1500 yards of strong Box-edging, about 300 capital Camellias, well set with bloom; Rhododendrons, Azaleas, Standard and Dwarf Roses, Pinus, Cryptomerias, &c., &c.—May be viewed prior to the sale, and Catalogues had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

THE NATURAL HISTORY of the TINEINA. By H. T. Stainton, assisted by Professor Zeller, and J. W. Douglas.

"Among the curiosities of literature published during the present century, this elaborate contribution to the natural history of insects will hold a distinguished place. The 'Tineina' are a group of microscopic moths, numerous in species, and their habits and transformations are here given on a scale of completeness and extended detail not hitherto reached by naturalists on any subject. The volume before us of eight beautifully executed plates, with 350 pages of letter-press, contains the descriptions of only 24 species, and it will require probably 40 such volumes to complete the work. The principal novelty consists in its being printed in parallel columns in four languages—English, French, German, and Latin."—*Literary Gazette.*

London: Van Voorst, 1, Paternoster Row.

118, Fenchurch Street, London.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. Seeley (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

NETTING for SHEEP-FOLDS, made of COCOA-NUT FIBRE, a material known to possess the most extraordinary durability when exposed to the alternations of weather. It will wear out several sets of tarred hemp netting, and is so light that a herdsman may with ease carry 200 yards of it. 3½ and 7-inch mesh, 6d. per yard. Sold in Nets of 50 and 100 yards long, 48 inches high, by the Manufacturer, W. Cullingford, 1, Edmund Terrace, Ball's Pond Road, Islington, London.

POULTRY, RABBIT, SHEEP & CAT FENCING, HARE or RABBIT NETS, on CORDS, for Covert Shooting, 12 mesh over, 4 feet wide, 2d. per yard; 18 mesh over, 6 feet wide, 3d. per yard; 24 mesh over, 8 feet, 4d. per yard; each edge corded, ½d. per yard extra. Extra stout do., 18 mesh wide, 4d. per yard, suitable for Poultry Fencing. Square mesh Cricketing Net, fix its full width and length, made of stout cord, 3d. to 4d. per square yard; this is the best article made for Fencing against Fowls, Cats, &c., at W. Cullingford's, 1, Edmund Terrace, Ball's Pond Road, London.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 Acres may be cleared for a few shillings.—Gilbert Dyson, Hoo, Rochester.

BLIGHT WASH FOR DESTROYING THE MEALY BUG, GREEN FLY, THRIP, RED SPIDER, &c.—This Wash not only destroys the insect but improves the growth of the plant; now is the season for making, the cost of which is but trifling; it may be used with success both under glass and in the open air. The receipt for making may be had for 2s. 6d. or 30 postage stamps.—Apply to J. M., 4, St. Andrew's Hill, Doctor's Commons, London.

FRENCH MODERATOR LAMPS.—A very large and superior stock now on sale at DEANE, DRAY, and CO.'S (Opening to the Monument), London Bridge.

Established A.D. 1700.

HEAL and SON'S EIDER DOWN QUILTS; also GOOSE DOWN QUILTS, from 8s. 6d. to 24s. List of Prices and Sizes sent free by Post. Heal & Son's Illustrated Catalogue of Bedsteads and Priced List of Bedding also sent post free.—196, Tottenham Court Road.

GENTLEMEN'S DRESS, Morning or Evening, Hunting, Shooting, Court or Official, every description of Paletôt or Overcoat, Servants' Plain or State Liveries, Ladies' Riding Habits, &c., at the lowest prices consistent with genuine and fashionable materials and workmanship.

Alexander Guthrie, 54, New Bond Street, London.

SISAL CIGARS, SISAL CIGARS, SISAL CIGARS!

GOODRICH'S CIGAR, TOBACCO, and SNUFF STORES (Established 1780), removed to 407, Oxford Street, near Soho Square. A Box, containing 14 fine Sisal Cigars for 1s. 9d.; post free for 27 stamps. None are genuine unless signed "H. N. Goodrich."

DIRECT FROM YARMOUTH DURING THE SEASON.

SCOTTISH ARBORICULTURAL SOCIETY.—

The Second Annual General Meeting was held at 6, York Place, Edinburgh, on the 14th inst., Mr. Brown, President, in the chair. Twenty-two new Members were admitted. Prizes were awarded as follows:—Medal to Mr. Rutherford, Buckden, for Essay on Drainage; Medal to Mr. R. Philip, Aldbar, for Essay on Pruning; Medal to Mr. Thomson, Chopwell Wood, for Essay on Stripping and Curing of Oak Bark.

It was resolved that Prizes should be offered (open to all) for the best ESSAYS on each of the following departments of Practical Forestry,—the Essays to be in all cases founded on the experience of the competitors.

I. Thinning (Medal).
II. Planting on Moss Lands (Medal).
III. General Planting (Medal)
IV. Fencing (Medal).
V. Entomology (Medal).
VI. Introduction and Cultivation of the Newer Coniferæ and other Forest Trees, with special reference to the Climate of Great Britain and Ireland (Medal).

It was also agreed to invite communications on any other subjects connected with Forestry, for which Prizes will be awarded in all cases where they are deemed worthy.

All Essays intended for Competition must be given in to the Secretary (Mr. Alexander, 1, Waterloo Place, Edinburgh), not later than 1st August, 1856, each Essay bearing a Motto, and being accompanied by a separate sealed letter bearing the same motto, and containing the name and address of the Author.

Applications from gentlemen desirous of becoming Members may be addressed to the Society's Secretary, from whom copies of the laws and all other information may be obtained.

N.B. The Society's "Transactions" will be sent to Members when ready. James Alexander, Secretary.

1, Waterloo Place, Edinburgh, Nov. 24.

NEW DOUBLE WHITE PETUNIA—"IMPERIAL" (true).

CHARLES TURNER will be able to supply strong Plants after the 1st of January of this beautiful new variety, which is as double as an Oleander, and fragrant. Plants 3s. 6d. each, with a considerable reduction to the trade if a dozen is taken. C. T. begs particularly to recommend it, as it is not only a novelty but also a valuable bedding plant.

Royal Nursery, Slough.

TO THE SEED TRADE.

TO BE SOLD, very handsome large IRISH YEWS, from 4 to 8 feet. Purchasers taking a large number will be liberally dealt with. Prices on application.—Thomas Jackson & Son, Nurseries, Kingston, near London.

FRUIT TREES, GOOSEBERRY & CURRANT BUSHES.

TO BE SOLD, the surplus Stock, comprising Standard Cherries, Plums, Apples, and Pears, from 6 to 12 years' old growth; several thousands Rifleman Gooseberries, and large Red Grape Currants, from 2 to 4 years' old, will be sold for much less than their value.—To view, apply to Mr. Mitton, Lampton, near Hounslow, 1 mile from station.

NEW DAHLIAS FOR 1856.

STEPHEN SHILLING begs to offer to Nurserymen, Florists, &c., the following NEW and SUPERB DAHLIAS, raised by Mr. J. Smith, of the Floral Cottage, Crookham.

HELEN SMITH, yellow ground tipped and shaded with orange, well formed flower, good centre, pronounced to be one of the most constant Dahlias cultivated (raised in 1854). Ground Roots, 42*s*. each; or strong plants in May, at 10*s*. 6*d*. each.

LORD CARDIGAN; crimson purple, fine formed flower, with full centre, highly recommended (raised in 1854.) Ground Roots, 42*s*. each; or strong plants in May, at 10*s*. 6*d*. each. A discount allowed where two or more of the ground roots are taken, or where six or more plants are taken in May. Their having been grown two seasons, and fully proved, can be sent out with confidence as first-rate varieties.

John Edwards, Esq., speaks of Helen Smith in 1354: "Flower highly desirable, good build, pleasing colours, and well formed petals." Mr. Turner, in "The Florist" of September, 1855, says: "The flower is of the Malvina form, and making good outline and centre." Six blooms were exhibited at the Basingstoke Horticultural Show, September, 1855, cut indiscriminately from the plants, no shading or care whatever taken, were "highly commended by the judges," and acknowledged to be the best Dahlia there. "The Florist," for September, 1855, speaks of Lord Cardigan: "Sir F. Bathurst form, deeper in colour and fuller; a deep fine formed flower with full centre."

All orders strictly executed in rotation as received.

North Warnborough Nursery, near Odiham, Hants, Nov. 24.

JOHN HARRISON begs to offer to the Trade the under-named Plants, and to inform his friends and the public that his CATALOGUE OF ROSES for the present season contains the most superb varieties in cultivation; and as a guide to amateurs and parties not acquainted with Roses, the best show varieties are marked with an asterisk. J. H. has competed within this last five years at nearly one hundred different exhibitions open to the United Kingdom, and with but one solitary instance, has invariably taken the first prizes for collections of Roses.

Fastolf Raspberry Canes, 6*s*. per 100, or 50*s*. per 1000.
Magnum Bonum do., 10*s*. per 100.
Northumberland Fillbasket, do., 10*s*. per 100, or 90*s*. per 1000.

Holly, 2 years Seedlings, fine, 7*s*. 6*d*. per 1000.
Elm, Scotch, 2 years Seedlings, from 2*s*. 6*d*. to 3*s*. 6*d*. per 1000.
Giant Asparagus roots, 2 years, 20*s*. per 1000.

Nursery, Darlington, Nov. 24.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

NEW OR RARE PLANTS AT R DUCED PRICES.

MESSRS. WILLIAM ROLLISSON AND SONS are now prepared to offer the annexed:—

TYDÆA ELEGANS.—A most beautiful plant from New Grenada, with bright scarlet flowers; 10*s*. 6*d*. each.

BEGONIA CHRYSOLEUCA.—A distinct new species semi-creeper, the blossoms are yellow, tipped with white; 15*s*. each.

COLEUS BLUMEI PECTINATUS.—A very distinct variety, the foliage is variegated similar to Coleus Blumei, but the leaves are beautifully laciniated; 5*s*. each.

MANDIROLA ROEZLI.—An extremely handsome gesneraceous plant producing fine spikes of lilac-coloured blossoms; 15*s*. each.

VACCINIUM ERYTHRINA.—A truly magnificent plant sent us by our collector Mr. John Henshall; the flowers are produced in bunches, of a bright crimson colour; 31*s*. 6*d*. each.

ARAUCARIA COOKI.—Handsome well formed seedling plants; 84*s*. each.

AUBRIETIA MOOREANA.—A new and distinct beautiful flowering Alpine plant; 5*s*. each.

MANDIROLA LANATA.—A pretty gesneraceous plant, of a delicate violet colour inside the mouth of the blossoms, and shaded lilac outside; 15*s*. each.

ORTHOSIPHON SPICATUS.—This plant has been recently introduced from Ocana, and is a great acquisition, its foliage being deliciously fragrant; its blossoms are large and white; 10*s*. 6*d*. each.

BEGONIA SPLENDIDA.—This exquisite plant has been discovered and sent us by our collector Mr. John Henshall, during his researches in the Indian Archipelago; as an ornamental plant it is unequalled; 21*s*. each.

LASIANDRA HOIBRENKI.—This is a very distinct and handsome plant, with very large beautiful blue flowers, and pretty ornamental foliage; 10*s*. 6*d*. each.

PASSIFLORA ALBA-NIGRA.—As the name implies, this is a very distinct new greenhouse climber; 5*s*. each.

ERICA ÆMULA.—A very beautiful hybrid, in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour; 10*s*. 6*d*. each.

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent, whose name it bears; it is a very compact grower and excellent in habit, with tubular blossoms of a fiery scarlet colour; 21*s*. each.

ERYTHRINA COTTYANA, a superb variety, producing immense spikes of blossom, with flowers of a very rich deep scarlet colour; 5*s*. each.

ERYTHRINA BELLANGERI.—The free flowering character of this plant renders it a great acquisition. Cuttings struck in the spring blossom profusely through the summer, which is not generally the case with the other sorts, as they do not usually flower until the second year after being propagated; 5*s*. each.

RHOPALA ORGANENSIS, an exquisite ornamental Stove Plant, far exceeding in beauty any other sort in this family; 31*s*. 6*d*. each.

The Nurseries, Tooting, London.

SPLENDID NEW RHUBARB—SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of RHUBARB is now ready for distribution; it is universally allowed to be the most early, prolific, and delicious variety ever offered to the public. See *Gardeners' Chronicle*, June 11, 1853:—"Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—ED.

Certificates of merit were awarded for specimens exhibited at the meeting of the Horticultural Society, Regent Street, London, June 20, 1853; at Nottingham, May 24, 1854; at Derby Midland, May 25, 1854; at Ormskirk, Lancashire, August 30, 1854.—Price 3*s*. 6*d*. per root, three for 10*s*., and six for 1*l*. A few two-year-old Plants at 5*s*. each.

Orders addressed to ROBERT SALT, Longton, Staffordshire, or the following Agents will have immediate attention:—Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess & Kent, Penkhull, Staffordshire; Messrs. Francis & Arthur Dickson, 106, Eastgate Street, Chester; Messrs. James Dickson & Sons, 102, Eastgate Street, Chester; Mr. Salsbury, Melbourne, Derbyshire. A liberal discount allowed to the Trade.—A Post-office Order from unknown correspondents.

Longton, Nov. 24.

KINGHORN'S UNEQUALLED NEW SCARLET GERANIUMS.

COUNTESS OF WARWICK.—Beautiful large variegated foliage, white margin, dark horse-shoe, banded with pink, strongly marked, large truss of deep scarlet, the individual flowers of fine form, is of vigorous growth, proved to grow and flower well planted out. Received a certificate at the Royal Botanic Exhibition. Plants in May, 10*s*. 6*d*.

ANNIE.—This is a decided improvement on "The Flower of the Day" and "Silver King," possessing fine large trusses of bright scarlet, the foliage large and flat, margined with pure white, does well planted out, has produced leaves 4⅜ inches over, very free grower. Plants in May, 10*s*. 6*d*.

GENERAL PELISSIER.—This noble Geranium has been the admiration of all who have seen it, either in pots or bedded out, throwing its numerous globular trusses of orange scarlet flowers, well above the foliage, on strong white flower-stalks, flowers of fine form, with white eye; is of compact vigorous growth, leaves medium size, with dark green margin, distinct horse-shoe, paler green in centre. The best scarlet Geranium ever offered, flowers very free and perfect in the smallest pot. Was awarded a first-class certificate at the National Floricultural Society. Plants in May, 10*s*. 6*d*.

F. R. KINGHORN begs to state that this is the first time that he has advertised any of his numerous seedlings to be sent out by himself, and would most respectfully assure those who may not have seen the above at the exhibitions of the Royal Botanic, Horticultural, Crystal Palace, and National Floricultural Societies, that they are very superior to his former seedlings, "The Flower of the Day," "Attraction," "Silver King," or "Cerise Unique," &c., and that he has the greatest confidence in recommending them, both as pot and flower-garden plants. He may also state that they were noticed very favourably by all the leading periodicals in their reports of the several exhibitions. The usual discount to the trade. A remittance will be required from unknown correspondents.

St. Margaret's Gardens, Isleworth, Middlesex, Nov. 24.

CHOICE PLANTS, ETC.

YOUELL AND Co. beg respectfully to call attention to the following, which they are now sending out in fine strong plants:—

AZALEA, varieties of Indica, comprising the following and other equally choice kinds, good bushy plants in large and small 48 sized pots, at 12*s*. and 15*s*. per dozen, viz.: Aurantia elegans, Exquisite, Fulgens grandiflora, Constance, Prince Albert, Murrayana, ignescens, Lateritia grandiflora, Conqueror, Emily, Decora, Rosea punctata, carminata.

CAMELLIAS, in choice new kinds, without bud, 21*s*. per dozen.

EPACRIS, of finest varieties, bushy plants in 48's, 12*s*. per doz.; smaller ditto, 9*s*.

GLOXINIAS, a very choice collection of all the new varieties, strong bulbs, 18*s*. per dozen.

GREENHOUSE PLANTS, in 50 best kinds, for 50*s*.

EUGENIA UGNI, a new Myrtaceous of easy cultivation, producing delicious fruit now being used for dessert, good plants, 2*s*. 6*d*. each.

CINERARIAS, a choice collection of all the best kinds, 9*s*. per doz.

PHLOXES, a selection of all the new and handsomest varieties of this much admired flower, 9*s*. per dozen.

PHLOX, Countess of Home (Downie & Laird), fine strong plants of this, the finest Phlox yet offered, 5*s*. each.

PANSIES, a fine collection of all the new and first-rate flowers, 9*s*. per dozen.

HYACINTHS, very fine double and single red, white, blue, and yellow, by name, 9*s*. per dozen; extra fine ditto, 12*s*. per doz. These comprise the varieties so highly recommended in the *Gardeners' Chronicle* of the 21st July, 1855.

DEUTZIA GRACILIS, fine strong plants for forcing, 9*s*. per doz.

LILY OF THE VALLEY, strong for forcing, 5*s*. per 100.

PÆONIES, a choice collection of 20 new varieties for 20*s*.

ROCKETS, double crimson (strong), 9*s*. per dozen; the old double pure white ditto, 3*s*. per dozen.

HERBACEOUS PLANTS, a very extensive and select collection of the handsomest kinds including those adapted for rock work, 6*s*. per dozen; 30*s*. per 100.

CHOICE FRUITS, WARRANTED TRUE TO NAME.

APPLES,	Standard,	in best selection,	good heads,	9*s*.	per dozen.
"	Dwarf	ditto	ditto	6*s*.	"
"	Trained	ditto	ditto	30*s*.	"
PEARS,	Standard	ditto	ditto	12*s*.	"
"	Dwarf	ditto	ditto	8*s*.	"
"	Trained	ditto	ditto	30*s*.	"
PLUMS,	Dwarf	ditto	ditto	9*s*.	"
"	Trained	ditto	ditto	36*s*.	"
PEACHES,	dwarf trained,	in fine strong plants,		36*s*. to 60*s*.	"
NECTARINES,	Dwarf trained		ditto	36*s*. to 60*s*.	"
APRICOTS,	ditto		ditto	36*s*. to 60*s*.	"
CHERRIES,	standard,	in fine variety,	ditto	12*s*.	"
"	dwarf	ditto	ditto	9*s*.	"
"	trained	ditto	ditto	36*s*. to 42*s*.	"

GOOSEBERRIES, 25 of the finest varieties by name (good bushes) selected for size and flavour, 30*s*. per 100; 4*s*. per doz.

CURRANTS, improved large White Dutch, Black Naples, Raby Castle (red), large Red Grape, Ogden's Black, and Fox's Red Grape, 4*s*. per dozen; Knight's Sweet Red, Knight's large Red, Cherry Red, large and fine, and Wilmot's White Grape, 6*s*. per dozen: these are the most desirable kinds in cultivation, and are highly recommended.

RASPBERRY FASTOLFF (TRUE), strong well-rooted canes, 15*s*. per 100; Large White Raspberry, 24*s*. per 100; New Monthly Fruiting, 20*s*. per 100; Belle de Fontenay, 6*s*. per doz.

ASPARAGUS,	Giant, 2 years	2*s*. 6*d*.		per 100.
"	" 3 years	3	6	"
"	" extra strong, for forcing	5	0	"
RHUBARB,	Myatt's Victoria	8	0	per doz.
"	" Linnæus	8	0	"
"	Mitchell's Royal Albert	8	0	"
"	Hawke's Champagne, new & fine, 2*s*. each	18	0	"
SEAKALE,	strong, 2 years	6	0	per 100
"	extra for forcing	10	0	"

All Orders of 2*l*. and upwards are delivered Carriage free to London, Newcastle, and Hull, as well as to any Railway Station within 150 miles of the Nursery.

Royal Nursery, Great Yarmouth, Norfolk.

ERICAS.

MESSRS. YOUELL AND CO. beg to submit the following list of choice ERICAS, which can be supplied in good bushy and healthy plants, in large and small 48s, at 12*s*. per dozen:—

ERICAS.—Aggregata, ampullacea, ampullacea carnumbrata, ampullacea rubra, aristata major, Archeriana, Bandoniana, bicolor, Cavendishi, cerinthoides, cer. coronata, Cliffordi, coloransa, Coventryana, daphnoidea, Devoniana, depressa, denticulata moschata, echiflora, elata, Eweriana, eximia, exurgens coccinea, gracilis, Hartnelli, hyemalis, hybrida, hyacinthiflora, Linnæoides nova, L. superba, metulæflora bicolor, ovata, perspicua nana, pinifolia discolor, princeps, propendens, p. tubiflora, pyriformis, primuloides, rubens, retorta major, Shannoniana, Shannoniana (Turnbull), Sindryana, splendens, tricolor, tri. rubra, umbellata, ventricosa alba, v. alba tincta, v. breviflora, v. carnea, v. coruscans, v. curta ruba, v. densa carnea, v. dependens coccinea, v. fasciculata longiflora, v. f. rosea, v. f. superba, v. globosa, v. hirsuta, v. magniflora, v. perspicuoides, v. superba, v. tumida, v. tenuiflora, Vernonia, Ver. superba, verticillata, vestita tenuiflora, v. coccinea, v. c. tenuiflora, v. rosea, viridiflora, Westcotti, Westphalingi, Wilmorea superba, Walkeri.

The above are well grown, and of a suitable size for making specimens. The usual discount to the trade when taken per 100.

All orders of 2*l*. and upwards are delivered carriage free to London, Newcastle, and Hull, as well as to any Railway Station within 150 miles of the Nursery.

Royal Nursery, Great Yarmouth, Norfolk.

WATERER AND GODFREY respectfully invite the attention of parties engaged in Planting to their fine Stock of the following HARDY ORNAMENTAL TREES, &c.

Araucaria imbricata, 2, 3, 4, 5, 6, 7, and 8 feet high, in quantities, all stocky well grown plants; the larger sizes especially it would be difficult to match.

Cedrus Deodara, 1½, 2, 3, 4, and 5 feet, by the thousand; do. a fine lot of larger, 6, 7, and 8 feet; do. some magnificent Trees, 10 to 15 feet. These are all in a famous condition for Transplanting, having been annually removed.

Cedars of Lebanon, 3, 4, 5, and 6 feet; do. a few splendid Trees, 10 and 12 feet.

Cedars Red Virginian, 5 to 8 feet.

Cedars, variegated white, 2, 3, and 4 feet, one of the handsomest variegated plants we know. We have a large stock. It is extensively planted at Elvaston Castle.

Cryptomeria japonica, fine plants, 4 to 7 feet.

Cupressus macrocarpa or Lambertiana, 3, 4, 5, 6, 7, and 8 feet. Nothing can be handsomer than some of the specimens of this fine hardy plant.

Juniper, Chinese, 2, 3, 4, and 5 feet; a fine lot of large plants, 6 to 8 feet.

Do. Irish, upright, 3, 4, 5, and 6 feet; do. larger, up to 8 and 10 feet. Our stock of the two last mentioned Junipers we believe to be quite unequalled, the Irish especially; the larger sizes are perfect columns.

Do. recurva, 3, 4, 5, up to 8 feet.

Do. hispanica or thurifera, 2, 3, and 4 feet.

Abies Douglasi, 2, 3, and 4 feet. A fine lot of large and very handsome plants, 7, 8, 10, and 12 feet.

Picea nobilis, several hundreds of nice plants, 1½ to 2 feet, well grown, and with good lead. None are grafted. A few taller specimens up to 6 feet.

Do. Nordmanniana, a large quantity of remarkably handsome plants, 1½, 2, 3, and 4 feet. Nothing can exceed the vigour of these plants, and all from seed.

Do. Pinsapo, magnificent plants, 4 to 7 feet high, in perfect health.

Pinus insignis, 1½ to 3 feet; a few good specimens up to 7 feet.
" Lambertiana, from seed, 4, 5, and 6 feet.
" Cembra, 3, 4, 5, up to 10 feet.
" Montezumæ, fine plants, 4 and 5 feet.
" macrocarpa, 2 and 3 feet, from seed.

Weeping Larch, clean, stems good, heads 7 feet high.

The following 10 varieties form a very singular group. They are of dwarf habits; the well known Abies Clanbraziliana may be taken as the type of the whole. We believe our collection to be quite unique, and, we may add, most interesting.

Pinus strobus pumila (the dwarf Weymouth).
" sylvestris pumila (the dwarf Scotch).

Abies Clanbraziliana	Abies pumila	All dwarf varieties of the Spruce Fir.
" compacta	" diffusa	
" pygmæa	" Gregori	

Picea pectinata pygmæa (the dwarf Silver Fir), Hudsoni.

Yew, common English, 3, 4, 5, 6, and 7 feet, in large quantities.

Do. upright, Irish, 4, 5, 6, and 7 feet; some splendid plants, 8 to 12 feet.

Do. Dovaston or Weeping, a great many fine plants, worked on straight stems, 7, 8, and 10 feet high, with good heads.

Do. adpressa, 2 and 3 feet.

Do. do., worked on common Yew, as standards.

Do. gold striped, 1½ to 2 feet, by the thousand.

Do. do., a splendid lot of plants, 4 to 6 feet.

Do. do., worked as standards on the common Yew, 8 to 10 ft. high.

Do. do., worked on Irish Yews, 6, 7, and 8 feet high.

Do. elegantissima, or new gold striped; a large quantity, 1½ to 2½ feet, and also worked as standards on the common and Irish Yews. We may safely assert our stock of Golden Yews is unsurpassed.

Do. yellow berried (true), very beautiful when in fruit as we have it, 1½ to 3 feet.

Libocedrus chilensis, 2 to 3 feet, very handsome and bushy.

Thuja Weareana, fine bushes, 3, 4, 5, 6, and 8 feet. This is one of the most useful, and, at the same time, ornamental hardy plants we possess.

Do. American, for hedges, doubtless the very best, 4, 5, and 6 feet.

Do. aurea, or Golden Arbor-vitæ. This plant originated at this Nursery; it has now, as it deserves, become a universal favourite. Our stock of it enables us to offer a choice of many hundred fine specimens, from 1½ to 3 and 4 feet high, and as much through—in fact, perfect globes.

Wellingtonia gigantea, a few of the finest plants in the country, being near 1¼ feet high, and as much wide.

Hollies variegated, by the thousand, 2, 3, and 4 feet high. Some splendid Plants, 10 to 15 feet high.

We may here remark with reference to the large specimens alluded to in this Advertisement that every one of them is in a condition to transplant, and travel any distance with perfect safety. They have one and all been annually removed in our Nursery, and in soliciting a personal inspection of our stock, we believe we are justified in stating it offers a choice which is to be found in but few establishments of its kind in this country.

The Nursery may be reached in 40 minutes by Train from the Waterloo Station; and the South Western Railway Company having a Branch on to the North Western, enables us to send plants to all parts, in trucks throughout, without packing and other extensive additions.

Knap Hill Nursery, Woking, Surrey.

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1*d*. per square foot. CROGGON'S Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to CROGGON & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

ROSES, HOLLYHOCKS, CONIFERS.
(Wholesale and Retail.)

A. PAUL and SON beg to inform their Patrons and the Trade generally, that owing to extended experience and improved systems of culture, their ROSES, HOLLYHOCKS, and CONIFEROUS PLANTS are this season unusually fine.

Nurseries, Cheshunt, Herts (13 miles N.E. of London).

CAULIFLOWER BROCCOLI SEED.—The Advertiser has a quantity of Cauliflower Broccoli Seed for sale, of the variety called "Dilcock's Bride," true, which he will dispose of either together or in lots to the trade. For further particulars apply to Mr. Geo. Taylor, Jun., Greengrocer, Great Charlotte Street, Liverpool; or to Mr. E. F. Fairbairn, Florist, Eden Town Nursery, near Carlisle; either of whom are authorised to sell it.—Not to be repeated.

BERNARD SAUNDERS, Nurseryman and Florist, Cæsarean Nurseries, Jersey, respectfully informs Amateurs and Florists that he has a good Stock of Yellow and White-ground PICOTEES to offer for sale this season, at 2s. 6d. per pair; orders for which will be thankfully received and promptly executed. Also a small quantity of well ripened Seed of the PHORMIUM TENAX or NEW ZEALAND FLAX at 2s. 6d. per packet of 60 Seeds.

TOWER NURSERY, HEATHFIELD.

WILLIAM MITCHELL respectfully announces to the Nobility, Gentry, and Public generally that he has purchased the entire STOCK of the above Nursery, late in the occupation of H. Barton, deceased, and hopes by strict attention to merit their patronage and support.

W. M. begs to announce that he has a fine healthy stock of Evergreen, Deciduous, and Flowering Shrubs; also Fruit and Forest Trees of every description.—Nov. 24.

AMERICAN PLANTS.

WATERER and GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.

Knap Hill Nursery, Woking, Surrey.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.

American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway, where conveyances may be had.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERS, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

EARLY FLOWERS, Adapted for Blooming in Doors, and in the Borders in Winter and Early Spring.

CLARK and CO., Seedsmen and Florists, beg respectfully to intimate to the nobility, gentry, and the public that they have imported a STOCK of DUTCH and other FLOWER BULBS, of the finest possible quality, and take the liberty of offering the following assortment for 10s., viz.:—Half a dozen best Hyacinths for glasses, half a dozen good Hyacinths for pots, 50 Crocuses (four separate colours), 50 large Double Snowdrops, half a dozen Double Van Thol Tulips, half a dozen early Van Thol Tulips, one dozen Double White Sweet-scented Narcissus, half a dozen Double Jonquils, one dozen Winter Aconites, 12 splendid mixed Tulips, and one dozen beautiful mixed Double Anemones.—86, High Street, Borough, about 30 doors from London-Bridge Railway Terminus.

IMPORTANT TO NURSERYMEN.

WANTED IMMEDIATELY, the Under-mentioned Plants, &c.:—Hardy Heaths: 50 Herbacea carnea, 50 Vulgaris pumila, 50 Vulgaris pygmæa, 50 Vagans alba, 50 Vagans rubra, 50 Mediterranea nana; these not to be less than 12 inches through. 100 Rhododendron Catawbiense, dwarf var. and well set with bloom; 100 Rhod. ferrugineum; 100 ditto hirsutum, dwarf, well set with bloom, with heads not less than 12 inches through; 100 Andromeda floribunda, not less than 12 inches; 100 Berberis Aquifolium, not less than 12 inches; 100 Alyssum saxatile, 4000 Snowdrops (double), 2000 Crocus of sorts.—Address, stating price, &c., to John Wightman, Gardener to Sir Robert Peel, Bart., Drayton Manor, near Tamworth.

MESSRS. E. G. HENDERSON and SON beg to announce that they have now received their noted collection of HYACINTHS in excellent condition, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with, Catalogues of which, together with their Plant and Seed Lists, will be forwarded post free on application.

CUCUMBER Henderson's NAPOLEON III., in packets, 3s. and 5s. 6d each.

CALCEOLARIA, CINERARIA, and PRIMULA SEED of first quality, 2s. 6d. and 5s. per packet.

FUCHSIAS.—Banks' Favourite, 10s. 6d.; Prince of Wales, 10s. 6d.

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (Pampas Grass).—E. G. H. & Son having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2s. 6d. each, 25s. per dozen, or 7l. 10s. per 100.

Wellington Nursery, St. John's Wood.

DENYER'S NEW PROLIFIC GREEN MARROW PEA.—A fine variety for succeeding the first early Crops. Very hardy, and one of the greatest cropping Peas in cultivation. It obtained the first prize at the Hastings and also at the St. Leonard's Horticultural Exhibitions.

From the Dean of Battle.—"The sample of Peas you sent me surpasses in beauty of colour and richness of flavour any that I have ever met with."

From Mr. Waters, Gardener to Lady Webster, Battle Abbey.—"I have examined the growing stock of your new Pea, and find it crops abundantly, the pods being a good length, very broad, and well filled. It is also a fine flavoured and beautifully green-coloured Pea."

From Mr. Bunyard, Maidstone.—"My opinion of the new Pea is, that it is a distinct sort, a good cropper, and for colour I do not know its equal."

From Mr. Parks, late Nurseryman and Seedsman, Dartford, Kent.—"I am much pleased with your new Pea. It certainly is a very fine cropper. The Peas are large, and the pods completely filled. It will when known become a superior Pea for market."

Price 3s. 6d. per quart. Post Office orders payable to William Denyer, Seedsman, Battle, Sussex. May also be had through the London and other seedsmen.

NEW VARIEGATED GERANIUM—MRS. LENNOX.

JOHN and CHARLES LEE are now sending out this novelty, which is a decided improvement on The Mountain of Light. It is of much more vigorous growth than that variety, the margin of the foliage is of a purer white, and in other respects it possesses the same good qualities. Price 7s. 6d.

Nursery and Seed Establishment, Hammersmith.

FRUIT TREES IN POTS.

JOHN and CHARLES LEE have the finest stock of the above ever yet offered, consisting of—

PEACHES	APRICOTS	CHERRIES
NECTARINES	PLUMS	APPLES

and PEARS.

All warranted to bear good crops the first season.

Nursery and Seed Establishment, Hammersmith.

SUPERB DWARF HYBRID PERPETUAL ROSES BUDDED ON SIX-INCH STEMS.

WILLIAM WOOD and SON respectfully solicit attention to their very extensive and splendid stock of the above. The plants are vigorous, and expressly suited for potting or forcing; they are also very eligible for grouping, consisting of all the leading kinds, and will be supplied at 12s. to 18s. per doz. Catalogues may be had on application.

N.B. A very liberal allowance to the Trade.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

FANCY DAHLIA.

WALTERS'S "COCKATOO" has proved the best in its class, and the most ornamental Garden Plant of all the Fancy Dahlias. May be had in ground roots at 10s., and pot roots at 5s. each.

CYCLAMENS, Flowering Plants, sweet-scented, at 1s. 6d. each, 15s. per dozen, 5s. per 100.

HYBRID PERPETUAL ROSES, extra fine, 10s. per dozen.

Samuel Walters, Hilperton, Trowbridge, Wilts.

TO PLANTERS AND THE TRADE.

HAY, SANGSTER, and CO., will Sell the following cheap, as the ground must be cleared:—

Strong Standard Dwarf and Dwarf Trained PEARS,
Do. do. do. GREENGAGE and VICTORIA PLUMS,
Do. do. and half Standard MULBERRY,
Do. do. and Dwarf Trained CHERRIES, [RHUBARB,
PRINCE of WALES, PRINCE ALBERT, and VICTORIA
Strong two years' SEAKALE and ASPARAGUS,
EVERGREEN OAKS, in pots, 3 to 5 feet.

18 and 19, Cumberland Place, Newington Butts, London.

NEW ROSES.

J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine Standards of the following beautiful NEW ROSES:—

	s.	d.		s.	d.
Belle Lyonnais	5s.	0d.	Vicomtesse Laure de Gironde	5	0
Comtesse d'Orleans ...	5	0	Madame Masson	7	6
„ Vaillant	5	0	„ Theodore	5	0
General Jacqueminot ...	3	6	„ Cambacères	5	0
Gloire de France	3	0	„ Vidot	7	6
„ de Vitry	5	0	„ Hector Jacquin ...	3	6
Madame Guinoiseau ...	3	6	Lord Raglan	5	0
Mademoiselle Aline Gibbon	3	0	Madame Place	5	0
Prince de la Moskowa...	5	0	Panaché d'Orleans	5	0
Sir John Franklin ...	3	6	Prince Leon	3	6
Souvenir de Madame Lille	3	6	Triomphe de Paris	3	6
			Gloire de Dijon (Tea) ...	3	6

Melanie Willermoz (Tea) ... ... 3s. 6d.

For a full description of the above see Catalogue, which may be had on application.—Nov. 24.

PEARS GRAFTED ON THE QUINCE AS PYRAMIDAL SHAPED TREES.

J. and J. FRASER beg to announce that their Priced List of the above is now published, and may be had post free on application.

J. & J. F. have sold a large number of these Trees for the last three years, and have received numerous letters from gentlemen in the country speaking in very high terms of their productiveness. They can therefore recommend them with greater confidence to the notice of their friends and the public in general.

Lea Bridge Road, Essex.

TREE CARNATIONS.
"Flowering Winter and Summer."

YOUELL and CO. have now to offer a fine stock of all the best varieties of the above deservedly favourite class, which cannot be too strongly recommended, not only for their fragrance, but the brilliant display they afford during the autumn and winter months, either in the Greenhouse, Conservatory, or open Garden. In Bouquets they are unsurpassed. Strong plants in pots, 18s. per dozen.

They also beg to call attention to the following:—

CARNATIONS AND PICOTEES.

Our collection of the above is probably the most extensive in Europe, having for a series of years bestowed our special attention to their cultivation upon an extent that enables us to offer—

The choicest varieties by name at 18s. and 24s. per dozen pairs.
Fine mixed border ditto ... ... 9s. „
Fine old Clove Carnations ... ... 12s. „
True White ditto ... ... 18s. „
Pinks, comprising all the new first-class show flowers, 9s. and 12s. per dozen pairs.

All orders of 2l. and upwards are delivered, carriage free, to London, Newcastle, and Hull, as well as to any Railway Station within 150 miles of the Nursery.

Royal Nursery, Great Yarmouth, Norfolk.

OLDENBURG NECTARINE.

MESSRS. VEITCH and SON, of the Exeter and Chelsea Nurseries, having received the stock of the above valuable NECTARINE from the raiser, Mr. Madge, gr. to Miss Fanshawe, of Torquay, respectfully announce that they are now prepared to supply good trees on the following terms:—

MAIDEN TREES, ... 2s. 6d.
DWARF TRAINED ... 10s. 6d. and 15 0
With one over on three to the Trade.

A few extra-sized Dwarf-trained, and Trees in pots for Orchard Houses, at 21s. each.

The OLDENBURG is believed to be a cross between the Elruge and White Nectarines; fruit of it exhibited on the 2d of October last, at a meeting of the Pomological Society, elicited the following very favourable report, which appeared in the "Cottage Gardener," on the 9th of that month:—"The most interesting part of the exhibition was the examination of a new Peach and Nectarine from Messrs. Veitch & Son, of Exeter and Chelsea. The Nectarine, which was called the Oldenburg, was one of a very superior quality, and contrasted considerably with the five specimens of Stanwick in the same collection, which were very inferior in flavour. The Oldenburg is a medium-sized fruit, somewhat similar in size to the Elruge. It is ovate in shape, and very much covered with very dark red, except where shaded by the leaves when it is pale yellow. The flesh separates freely from the stone, is very melting and juicy, with a rich sugary and vinous flavour; it is yellowish white throughout, and even at the stone there is not the slightest trace of red. The fruit seems to keep well after being gathered, and shows a disposition to shrivel without decaying."

Nurseries, Exeter and Chelsea.

NEW ROSES.

WILLIAM WOOD and SON have again much pleasure in recommending their beautiful Seedling Rose, the Perpetual DUCHESS OF NORFOLK; the colour is a very rich vivid crimson, the underside of the petals shaded with lively pink, giving the flowers an exquisite shell-like appearance.

Price for Standards, or Dwarfs 3s. 6d. each.

Williams' Evergreen Climbing Rose, 1s. 6d. each—This Rose is a seedling from the Ayrshire Splendens fertilised with the Yellow Tea Rose; its flowers are creamy white, deliciously sweet-scented.

N.B. The New Rose Catalogue and Supplement may be had on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

GOOD SEEDS, CARRIAGE FREE.
Seeds Direct from the Growers the most certain means of Preventing Disappointment.

SUTTON and SONS, Seed Growers, Reading, Berks, *can supply every kind of* GARDEN SEEDS *and* FARM SEEDS *of genuine and superior quality, warranted all of the growth of* 1855.

Horticulturists and Agriculturists residing in the most remote parts of the kingdom, can procure good Seeds at very moderate prices from this Establishment.—For particulars, apply to

Sutton & Sons, Seed Growers, Reading, Berks.

THE BEST TWELVE HYACINTHS FOR POTS OR GLASSES.

	s.	d.
The best 12 HYACINTHS (by name) imported ...	9s.	0d.
Fine Double do. for open ground, mixed	4	0
TULIPS, fine mixed, early for pots or borders, per 100	6	0
ANEMONES, fine double mixed	5	0

And all other BULBOUS FLOWER ROOTS at low prices, as per Catalogue. *Carriage free, except parcels under 20s. value.*

John Sutton & Sons, Seed Growers, Reading, Berks.

WEST OF ENGLAND HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENT.—*The* Proprietors *have during the past summer considerably enlarged their Offices and Seed Warehouses at a considerable expense, so as to be enabled to execute all orders with regularity and dispatch.*

With increased exertion, redoubled energies, and more assistants, they hope to give the greatest satisfaction to all who honour them with commands.

William E. Rendle & Co., Seed Merchants, Plymouth.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 24, 1855.

One of the questions most frequently put to us is "Where can a good cheap microscope be had?" and it has been one of those most difficult to answer. No country has cheaper microscopes than this, but they are bad; no country has better instruments, but they are costly. Goodness and cheapness are a rare combination, and in fine optical instruments have been hitherto so incompatible that we have been in a manner compelled to refer our inquirers to Paris, Berlin, or Vienna instead of London. It gives us great pleasure to say that this difficulty is removed. We have now before us a microscope manufactured by Smith and Beck, of No. 6, Coleman Street, which may be had for ten pounds, having excellent construction combined with good mechanical arrangements, in which latter respect the cheap microscopes made in Paris by Nachez are defective.

The instrument in question is called "the educational microscope." It has good movements, a solid stand, so as to prevent unsteadiness, an inch and a quarter inch object glass, two oculars or eye-pieces of different power, and such apparatus as is indispensable to the student. Beyond this it is not necessary to go, in order to gain a knowledge of those common things of which the mass of mankind is so helplessly ignorant. Provided the lenses are *good*, an objective with an inch focus is all that a student needs for large objects, and he can never want one more powerful than a quarter inch until he gets far beyond the status of a student.

We venture to draw attention to this instrument of Smith and Beck's, because the microscope has now become almost as necessary as eyes themselves to a large number of men, who are nevertheless debarred from the possession of a good one by their insufficient means; while a bad one is not worth the having at any price. Every one has the word adulteration in his mouth; lectures are given on adulterated food; books are written on adulterated objects of commerce; prosecutions are instituted because of adulterated articles of excise. In all these cases the naked eye is powerless. It is only when armed with the magical powers of an achromatic lens that fraud becomes palpable to the senses. There is not a gardener who does not read of cells, and woody tubes, and spiral vessels; of starch cells and gum cells; of stomates and epidermis. Without a microscope what idea can he form of these bodies?—and yet, since they constitute the wondrous mechanism of a plant, to know nothing certainly of their nature is to know nothing distinctly of those workings in the life of a plant with which he has to deal, and with which he should be familiar. With microscopes costing from 20l. to 120l. men of that class must remain ignorant; but when the price is reduced to 10l. there arises a possibility that a good instrument may form a part of very humble educa-

tional establishments. In how many gardeners' reading rooms, for example, can it be found at present? We fear in none.

It will be observed that in the microscope now brought under notice none of the refinements, or luxuries, of optical science are introduced. There is no polarising apparatus, no eighth and tenth objectives, no variety of oculars, no camera lucida, no micrometers, none of the hundred and one ingenious contrivances with which a microscopical philosopher, or, as the lovers of new words delight to call him, histologist, supplies himself. And we think so much the better; the ordinary observer does not want to be a philosopher, he has no ambition to penetrate the depths of visual obscurity; all he needs is to gain such power in his eyes as will enable him to see distinctly that which is certain; and on which the phænomena of life essentially depend. Cytoblasts, cistomes, and protoplasm; nuclear, fissiparous or circumferential development; and the origin of those things which he knows only by their action when of perfect growth, are matters with which he need not concern himself. We think, indeed, that it is better not to put into the hands of a young student the means of inquiry into such subjects; he is easily led away into their pursuit, in which he cannot succeed, instead of fixing his attention upon simpler but far more important matters; and thus his time is unprofitably consumed. How desirable, for example, it is that a gardener should have the clearest possible knowledge of the structure of the mildew plants which ravage his crops, and of the tissues among which they develope, and of the bodies by which they are multiplied. But in what way is he concerned to know how the mycelium (spawn) was originally formed, or by what means the spores (seeds) are generated in their cells? How useful it is to have a certain knowledge of the structure of the greenfly, and the scale, with which he is eternally at war, and to see with his own eyes their mode of feeding and of multiplying; but it is a waste of time for him to count the eggs in their bodies, or to strain his eyesight in looking for the exact structure of their ocelli, hairs, or wing nerves. How advantageous again is it to know how the pollen is formed, and by what marvellous contrivances it is able to operate upon the seed, producing hybrids on the one hand, and legitimate offspring on the other. But of what earthly importance to him is it to ascertain the shape of the cells on the surface of a pollen grain, or of how many layers, one, two, three, or four, its skin consists? What he really wants to see the microscope before us will show him. What it will not show him he may very safely remain in ignorance of.

One day last March we took an opportunity of pointing out the disgraceful state of the Cutlery supplied to Gardeners. We told how it was soft as lead, or hard as flint, no-tempered or ill-tempered, bending like a hoop or snapping like glass; and we presumed to ask the makers whether they intended to force us to the United States or Canada for our pruning knives as well as our axes.

How just were these complaints all are aware; and we repeat that at that time neither we, nor any one whom we knew, had an idea where to purchase a knife worthy the name, except at an exorbitant price. It is with no little satisfaction that we have now to withdraw the charges then made against the whole cutlery trade, and to announce that one firm has proved to our satisfaction that they can and will meet the wants of horticulture.

In June last Messrs. Saynor and Cooke, of the Paxton Works, Sheffield, sent us a set of pruning and budding knives for trial. Three of each were given to as many working gardeners; the same number to experienced master gardeners; the rest we tried ourselves. In every case they were found to be all that could be desired; as is seen by the following reports:—

1. In the pruning knife the steel is good, bears sharpening to an edge that cuts a hair like a razor, and maintains it very well. The budding knife is well finished as regards workmanship, and is made of excellent steel.

2. The large clasp knife is a most excellent one. The budding knife is a very good blade; and if not so good in quality as the large knife, is still very superior to *the best* kinds obtained in the ordinary shops.

3. Saynor's budding knife is a good knife for budding and all light purposes, but will not stand rough work. The large clasp knife is a good handy and useful knife.

4. The large clasp knife is a remarkable good one, the best knife I have had for a long time. The small knife for cutting is better than any we have had lately, but is not so good as the large one.

5. I don't know how knives are to be of better quality than the clasp and budder you gave me.

6. That was a famous good knife, sir. I wish a poor man could always get such a thing; for I have been a good many shillings out of pocket by the rascally rubbish bought in the shops.

Our own trials confirm these reports, except that we found the budding knives as good as the others if used only for the light work for which they are made. Rough work they will not stand, and for rough work they should not be used. Either ought to be sold at from 1*s.* 6*d.* to 2*s.* 6*d.* a-piece, according to their pattern.

Some of the reporters objected to the form of the knives furnished to them; and with reason, for they happened to get patterns that were ill-suited to the work they had to do. A woodman does not like a Peach-pruner; that is not to be expected. But we should say that among the 10 or 12 patterns in the sample which we received, there was every form except one, which any workman can require. To that one we would call attention. What is required for most purposes is a knife that is strong, stiff, slightly curved, thin at the back near the point, and not hooked; in short, formed like the accompanying cut, which represents a famous blade in our possession, made for the late Thomas Andrew Knight. It is exactly one-tenth of an inch thick at the back, which thins away to the point from about the middle. The edge is just curved enough to prevent its slipping when making a strong cut; and in order not to diminish the strength of the back, the slope forwards towards the edge does not begin at the back itself, but about a tenth of an inch within it. This form has the additional advantage of rendering the blade a better wedge than the ordinary knives. We have used it for all sorts of work for many years. It will insert a bud, prune a wall tree, make a graft, or sever a stout branch at a single draw—that is to say, if the operator knows how to make a clean drawn cut. It is possible that the care necessary in grinding such a blade into proper proportions may render it more expensive than ordinary pruning knives, but it is well worth the additional cost, and we recommend it to the notice of Messrs. Saynor & Cooke.

VEGETABLE PATHOLOGY.—No. XCVI.

383. Exostosis.—(2. *Warts*).—In our last article attention was drawn to the fact that the woody matter proper to the imperfectly developed buds from which Knaurs are generated is not always deposited separately, so as to nestle within the bark and ultimately to become perfectly free from all attachment to the axis, but from the first is applied to the axis itself, so that a little more or less irregular cone is formed upon it, rendering the surface uneven wherever one of these buds occurs. Now if a multitude of such buds are produced on a given area a protuberance will gradually be formed, which may in process of time acquire a considerable size. In the Elm, for instance, warts some feet in circumference are not unfrequent, and in consequence of their complicated knotty structure are sought after by the cabinet-maker for veneering, and in fact produce articles of furniture of extreme beauty.*

384. The warts however are not always, in the first instance, due to the simple production of adventitious imperfectly developed buds. They frequently commence where a branch has been cut off. In the lapse of years the wound is closed over, the successive layers of bark leaving a cushion-like swelling over the spot. Buds are formed in these young layers, forming numerous impediments to the descending course of the sap, which is delayed in its progress at the base of each bud. Fibro-vascular tissue is generated, which follows the tortuous course of the sap, and is more abundantly deposited in consequence of its longer detention. That portion of the trunk, therefore, grows more rapidly, and the result is a convex mass projecting beyond the general surface, consisting internally of highly complicated tissue.

It is evident that such masses are due partly to the proper tissue of the semi-latent buds, and partly to the true tissue of the trunk, for the buds are often sunk like little craters of eruption in the tips of the cones, the tissue of which in such instances could not be derived from the buds themselves. In some cases the buds themselves may die, and so ultimately be inclosed in the tissue proper to the trunk, in which case there will be little dead nuclei, from which decay may spread in every direction, and in consequence of which the wood of such productions is seldom perfectly sound, causing considerable annoyance to the artificer.

385. Swellings of a very similar appearance are not always due to this cause. In the Birch, for instance, excrescences occur of a comparatively large size in proportion to the branch on which they are developed, without any appearance of buds, consisting of unusually large concentric layers, with the general surface corrugated. These layers are developed round a central nucleus which appears to be due to the puncture of some insect, which has stimulated the tissues and produced extreme hypertrophy, as in the formation of galls. No external aperture, however, appears, and we must be contented, therefore, for the present, with a simple conjecture. A beautiful specimen of such a branch is represented in the memoir of Trécul quoted above.

386. Protuberances of the same nature exist occasionally also on the roots of trees. In the Ash, for instance, they occur of large size, projecting greatly beyond the true surface of the root.† The cause of them is as obscure as of the warts just mentioned, and may either consist in some external injury or in constitutional derangement. True galls, however, occur on roots, as in the Oak, but in these the presence of larvæ at once settles the point.‡

387. Warts of a different character often occur on the small twigs of Birch trees, in which the buds are developed, and in consequence the mass has the appearance of birds' nests suspended amongst the branches. The cause of their formation is, I believe, unknown, but it is very possible that they may be of insect origin. Such productions are not confined to Birch trees. It is probable that the curious variety of Scotch Fir known under the name of Pinus Clanbrassiliana has been raised by cuttings from such a mass, and I believe that cuttings of the Birch-nests retain their fine twiggy character when grafted. It is said by Loudon that trees in a boggy soil are far more liable to produce these twiggy tufts, but we have seen them abundantly on trees planted in very dry ground on a gentle declivity. The knots on the trunk are for the most part free from twigs. It is possible, however, that the origin of both may be the same, the only difference consisting in the development of a number of adventitious buds in the one case, while in the other no buds are produced. The *witch-knots* in the Elm which look like masses of entangled cord are probably of the same character.

* In consequence of its close and intricate texture the wood of these knots takes a high polish, insomuch that no one from mere acquaintance with the general appearance of furniture made from Elm would recognise the relation. Pollard Oaks, from the development of numerous twigs on the surface, sometimes afford a highly ornamental material, of a somewhat similar character, for veneering. Elms which have been frequently pruned yield beautiful wood, and the Bird's Eye Maple probably owes its qualities to the production of numerous adventitious buds on the surface of the trunk. In France, indeed, Elms are purposely lopped, and repeatedly headed to produce knotted wood. The twisted Elm, or as it is called in some parts of the country, locked Elm, arises from a different cause.

† I regret that I am not able from personal analysis to describe these more closely, as I have parted with the magnificent specimen which came into my hands some years since. The external appearance was very like that of the Birch wart figured by Trécul.

‡ I have had no opportunity of examining the diseases called by Ré Pinguedo and Teda in the Fig and Pine respectively, nor are the descriptions which he gives circumstantial enough to lead to any safe conclusion. Whether they are of a nature similar to the radical swellings mentioned above, or simple cases of hypertrophy, induced as Ré supposes by excessive nutriment, is very doubtful. In the former case decay soon takes place; in the latter abundant resin is deposited, and the tendency to accumulate the secretion is gradually communicated to the trunk.

FAIRY RINGS.

There are few plants more mysterious in their workings or more marvellous in their works than fungi. It would scarcely be credited that the contemptible threads of the Merulius or dry rot would so completely destroy the woody fibre of timber as to render the best British Oak as brittle as the earth from which it sprung; and when we look at the fairy ring in the pasture field we marvel to see how inadequate to all appearance the means are that nature employs to bring about such important ends; a few white threads or a little mouldiness are all that we are able to detect as the perfect plant in full working order, and yet from this laboratory, with a rapidity like magic, the Agaricus sends forth its fruit white as the Lily and fragrant enough to be inviting, but of such surpassing excellence to the palate as to have scarcely a rival in the vegetable kingdom.

That Mushrooms should be obtained from a bed of the richest manure is not so much to be wondered at, any more than that the highly-flavoured Onion or the Celery plant should be found luxuriating in rich mud; but when in the middle of a very poor pasture field we find a green spot, not in the form of a dot as if some manure had been dropped there, but in the shape of a regular ring, there is no denying the fact that the Agaricus is regularly rotting down the ungenial earth, and tilling himself a garden, extending his holding where first he has been planted, and as occasion offers sending up his fruit, and finally scattering his spores to produce dots and fairy rings to the end of time.

But it is not to the production of Mushrooms that I would now beg leave to call attention, but to the beautifully green herbage that arises from the soil where the Agaricus is subduing the materials beneath.

Having had occasion to manure a pasture field with artificial manure and requiring some ingredient to give it bulk, a quantity of old Mushroom dung and soil was sown with it, and although there had always been fairy rings in the field they had hitherto attracted little attention, but when this stimulant was added the rings not only assumed an unwonted greenness but produced an early and abundant crop of Mushrooms.

Now, since common salt and certain other salts are well known to stimulate the growth of Agarics, and since the spawn of this powerful plant is so cheap and moreover so active in its operation, would it not be worth while to put these two ideas together and set them to work upon some very poor upland pasture, just to till the land a little where the Grass has scarcely the power to subdue the stubborn materials? A heap of soil and dung fermenting so slightly as scarcely to be perceptibly warm, would in a few days (say 21), if spawned, become so impregnated with the spawn of the common Mushroom that it would not only produce Mushrooms where it lies, but if broken into innumerable pieces, and preserved from drenching wet, would retain its vital powers to an unknown period, and this heap of manure (say 10 tons) could be impregnated with about 1 peck of common brick spawn, the value of which at the ordinary market price from the nurserymen would be about 1*s.* 3*d.*

That a field should be spawned, or in other words, planted with Agarics, would only be doing on a large scale what is done every day on a small scale, and although in some cases it might not be desirable to impregnate Grass land with fairy rings on account of the patched and spotty appearance that it would give to it, still there is many a lone hill side and stubborn clay field that would take no harm from such a powerful decomposer as the Agaric passing his fairy ring through it; and should the seasons prove mild, the produce of Mushrooms alone, independent of the Grass, would be no mean recompense for the little outlay at starting; and, once established, the salt and wood ashes would stimulate the plant, not only to send up its Mushroom fruits, but to extend itself more rapidly, and thereby make green the pasture for sheep and horned cattle. *Alexander Forsyth, St. Mary's Church, Torquay.*

THE VINE DISEASE IN PORTUGAL.

We have received the following report from Messrs. Forrester & Sons, of Crutched Friars:—

The disease has been general in every part of Portugal, since the year 1853; and during the present year, its ravages have produced almost a total extermination of the fruit. From the river Minho to the Tagus, but especially in the wine districts of the Bairada, Bucellas, and Lisbon, it may without exaggeration be declared that scarcely a perfect bunch of Grapes was produced this year; and that at the vintage season, instead of the vineyards being thronged with cheerful people gathering the fruit, in many parts we observed that goats, hogs, and cattle were feeding on the Vines. There is literally no wine for the ordinary consumption of the Portuguese people, neither is there wine in any of these extensive districts for distillation.

The stocks of old Lisbon wines are much reduced, and their value increased, at the lowest calculation, 100 per cent. Of Figuiera wines the stocks are altogether exhausted, and the same may be said of the Muscat wines of St. Ubes. South of the Tagus, in the provinces of the Alemtejo and Algarve, the Grapes were likewise destroyed. In the port wine districts the Grape disease developed itself in the month of July, and destroyed, between that month and the middle of August, about one half of the fruit, and the heavy rains in the month of September nearly completed the destruction of the remainder; so that according to our senior's calculation, not more than 8000 pipes of wine, and those of most inferior quality, were obtained. The wines accumulated in the Alto-Douro (or Wine-Company's district), consist principally of the vintages of 1854, and may be estimated at 6000 to 8000 pipes. These, without reference to their quality, cost the holders about three times the price paid for the superior wines of the vintage of 1851. The total stock of wines on the 1st of October last, for exportation in Villa Nova, hardly amounted to the one year's production of the port wine vintage of 1847. Of this stock a very large proportion consists of wines of the vintages 1850, 1852, and 1854, which, notwithstanding their very doubtful quality, cost the holders more than double the price at which far better wines were shipped from Oporto four or five years ago.

Choice old wines in general stock may be estimated at about 10,000 pipes, the average value of which in the Oporto market rules from 50*l.* to 80*l.* per pipe. This peculiar and limited stock of old ports, it is perhaps unnecessary to remark, can never be increased in quantity, but must daily increase in value, such wines being from 5 to 20 years old. Of vintage wines, for shipment as such (and these are principally of the year 1853), the quantity cannot be estimated at more than 15,000 pipes. The stock of brandy in Villa Nova on the 1st of October last, was reduced to one-fourth of an average quantity, and its value increased four-fold. As Alto-Douro wine growers, our own individual stock (with the exception of our choice wines of vintage 1853), is almost reduced to our reserves of former years. We, therefore, for the present, limit ourselves to the shipment of our ports of vintage 1853, and to the sale of our assorted stock of wines in bond.

As there were no Grapes in 1854 and 1855 worth our making into wine (either on account of their inferior quality or their high price), of course we did not venture to purchase wines made of such Grapes by others; preferring to continue to limit our business in ports, to wines exclusively of our own making. The distress in the wine districts of Portugal may be more easily imagined than described; and more especially so in the rugged and rocky mountains of the port wine demarcation, which being an exceptional territory—adapted almost exclusively to the cultivation of the Vine and the Olive, is incapable of producing corn. From this narration of facts the wine merchants of this country will be able to form their own opinion as to what may be the probable future state of the port wine trade.

We learn that a Silver Medal of the First Class has been awarded to Messrs. Forrester for their port wines exhibited in the Universal Exhibition at Paris.

Home Correspondence.

Effect of Salt-water on the Germination of Seeds.—As you have published notices by Mr. Berkeley and myself on the length of time seeds can withstand immersion in sea-water, you may perhaps like to hear, without minute details, the final results of my experiments. The seed of Capsicum, after 137 days' immersion, came up well, for 30 out of 56 planted germinated, and I think more would have grown with time. Of Celery only 6 out of some hundreds came up after the same period of immersion. One single Canary seed grew after 120 days, and some Oats half germinated after 120; both Oats and Canary seed came up pretty well after only 100 days. Spinach germinated well after 120 days. Seed of Onions, Vegetable Marrow, Beet, Orache and Potatoes, and one seed of Ageratum mexicanum grew after 100 days. A few, and but very few, seed of Lettuce, Carrot, Cress, and Radish came up after 85 days' immersion. It is remarkable how differently varieties of the same species have withstood the ill effects of the salt water; thus, seed of the "Mammoth White Broccoli" came up excellently after 11 days, but was killed by 22 days' immersion; "early Cauliflower" survived this period, but was killed by 36 days; "Cattell's Cabbage" survived the 36 days, but was killed by 50 days; and now I have seed of the wild Cabbage from Tenby growing so vigorously after 50 days, that I am sure that it will survive a considerably longer period. But the seed of the wild Cabbage was fresh, and some facts show me that quite fresh seed withstands the salt water better than old, though very good seed. With respect to an important point in my former communication of May 26th, permit me to cry *peccavi*; having often heard of plants and bushes having been seen floating some little distance from land, I assumed—and in doing this I committed a scientific sin—that plants with ripe seed or fruit would float at least for some weeks. I always meant to try this, and I have now done so with sorrowful result; for having put in salt-water between 30 and 40 herbaceous plants and branches with ripe seed of various orders, I have found that all (with the exception of the fruit of evergreens) sink within a month, and most of them within 14 days. So that, as far as I can see, my experiments are of little or no use (excepting perhaps as negative evidence) in regard to the distribution of plants by the drifting of their seeds across the sea. Can any of your readers explain the following sentence by Linnæus, pointed out to me by Dr. Hooker, "Fundus maris semina non destruit"? Why does Linnæus say that the bottom of the sea does not destroy seeds? The seeds which are often washed by the Gulf Stream to the shores of Norway, with which Linnæus was well acquainted, float, as I have lately tried. Did he imagine that seeds were drifted along the bottom of the ocean? This does not seem probable, from the currents of the sea, at least many of them, being superficial. *Charles Darwin, Down, Nov.* 21.—P.S. In my communication on Charlock seed lately printed by you, there is a misprint of "6 plants" for "6 plots of ground," which makes nonsense of the sentence.

The Late Winter in South Devon.—I have not given my experience of the past winter until now, because it seemed doubtful what plants would ultimately recover or yield to the effects of the cold. Among the latter is a magnificent Eucalyptus glabra, which was the pride of my shrubbery; it was more than 50 feet high, with a trunk upwards of 3 feet in circumference. It never lost a leaf from frost before, and was covered with flower buds, but must, I fear, be numbered with the dead, for though it has thrown out numerous weak shoots from the main stem, they are all withered. Eucalyptus radiata, a few yards off, about 30 feet high, is unscathed, as is a fine Acacia dealbata, still taller, which braved the frost and bloomed beautifully; it is now a mass of flower buds, and is one of the most graceful trees I ever beheld. A smaller plant of this species has also survived, yet Acacia mœsta, against a south wall, is all but dead. The Indian Rhododendrons and hybrids did well, and flowered finely, especially Arboreum roseum, and a fine variety of Cinnamomeum. A large plant of Dracæna indivisa appeared unaffected by the winter, but declined during the summer, and is now quite dead. The Chusan Palm is evidently quite hardy. One plant of Phillipodendron regium, in a shrubbery border sheltered from the east, is unhurt; while another trained against an east wall was much injured. On a south wall the Chinese Clerodendron fœtidum has proved perfectly hardy, and bloomed freely, but though interesting it does not merit the eulogy of M. Van Houtte, at least in my opinion. Habrothamnus fascicularis on a south wall has also stood well, and Mitraria coccinea has existed. My numerous Orange, Lemon, and Citron trees on south walls, protected by wooden or straw frames, stood the winter well, a few unripened shoots only being hurt, and they have all grown luxuriantly this summer; one rather rare species, the Egg Orange, was injured, but is recovering. Among the few new Pines that I possess, P. Russelliana is dead, and in a very high part of the grounds, open to the east; insignis became very brown, but all the plants have now recovered their verdure. Cupressus macrocarpa is certainly an unrivalled species, being alike indifferent to wind and frost; and on a high exposed terrace my plants, which were raised from the seed imported by the Horticultural Society, are strikingly beautiful. Tasmannia aromatica and Garrya macrophylla are both safe, while plants of Phormium tenax are much injured. Many things that we deemed as hardy as our Snowdrops and Primroses have manifested their exotic character by disappearing altogether from our borders; among them may be specified a large collection of Gladioli, Lobelias, &c. This can scarcely excite surprise when our common shrubs, such as the Arbutus and Buddlea were injured, and whole tracts of Furze were killed to the ground. *A Devonian.*

Vitality of Seeds.—Observing in several recent numbers of your Paper speculations on this subject, I beg to offer you the following facts, which came under my own observation, and for the truth of which I can vouch. Our parish church, which is a very ancient structure, was, previous to the year 1830, in a sadly dilapidated state, and the earth of the surrounding graveyard had accumulated against its south wall to a depth averaging rather more than 2 feet. Such had been its state for generations. At the above date it was taken in hand and thoroughly repaired, and it fell to my lot to superintend and direct the repairs of the graveyard, one part of which was to remove the accumulated earth from the wall of the church to the depth already mentioned, and to lower the adjoining ground to a corresponding natural-looking condition. Afterwards I was surprised to see on the surface of the ground, after the removal of the superabundant earth, that an immense number of plants made their appearance, which at first I mistook for common Tobacco: when they had time to develope themselves a little further, however, they turned out to be the common Henbane (Hyoscyamus niger). Now, from whence came these seeds? or how long had they been buried? They had doubtless been below ground for generations, no plant of the kind growing in the locality. Again: immediately outside this same graveyard, near its north-west corner, some five or six years since, a large old Oak was uprooted by the wind, and raised an immense mass of earth with its roots when the tree was removed, and the hole levelled in. It is also produced a crop of Henbane. Now the seeds must have been there before the tree, at least it seems so, for how else could the circumstance be accounted for? As to the many instances mentioned of Charlock making its appearance, I would beg to remark that Charlock is, I believe, an oil producing seed, and all seeds containing oil, if buried away from the air, will retain vitality a long time. I have myself raised Melons from seeds which I had kept for ten years. *Quercus.*

Larches.—The distance at which Larch of about 45 years' growth should be left apart to grow to the greatest profit per acre must be decided by the situation and present state of the plantation. If the locality is high and exposed the trees may not have attained the dimensions that would have resulted from more favourable circumstances, and therefore they would require to be left nearer each other than those of greater size. My system of thinning is to regulate the distance apart by the height of the trees, leaving a space between each, varying, according to situation, of from one-fourth to one-third, or little more, of the height of the trees. The distance at which Larches may be left apart at 45 years' growth may vary from 12 to 20 feet. "R. G. C." also asks if it would be advisable to have the trees "primed up." If pruning be what he means, it is decidedly objectionable to do more than clean off thoroughly all the dead branches. The quality of the wood is much improved by removing all branches as soon as they become deadened, and they should be attended to during all the stages of the growth of the plantation. *A. Patterson, Mariston.*

Protection of Frames, &c., from Frost.—Among other protecting materials one of your correspondents has lately accorded the preference to a covering of boards; but I am, however, inclined to think that there is a more effective material than any he has referred to, and to which the covering of boards itself in some degree, perhaps, owed its efficiency, as well as to its own non-conducting properties. The material I mean, is an enclosed stratum of still air, between the glass and the external covering; and if the stratum of air be 6 or more inches in depth, I doubt whether a more effective and desirable means of excluding frost is to be found. In the practical employment of this medium, it is requisite that the external covering should be close and impermeable by the surrounding air, in order to prevent any current or motion being introduced into the enclosed air, through crevices or other communications with the external atmosphere, by which its temperature would be speedily reduced to that of the latter. The covering material might be either wood or glass, according to choice or circumstances; but apart from the question of expense, the latter would certainly be preferable, as the glass covering might be kept on night and day throughout the entire winter, by which a great deal of labour would be saved, and the plants would never be deprived of the natural light of day, as they must be during periods of hard frost if a boarded covering be adopted. *J. H. H.*

Star of the West Cucumber.—Mr. Ayres speaks of this variety in terms of disapprobation. Being the raiser of it and having successfully competed for three years against other good sorts, at the horticultural show at Plymouth, I am led to suppose that some difference in the treatment of the plant must be the cause of Mr. Ayres not having more success. Being, like himself, much interested in the culture of Cucumbers, it would give me pleasure to compete with him at any show in London, Plymouth, or elsewhere, as it is only by comparing ourselves with others that we can discover where we excel, and where we fail. I have within the last week cut fruit 27 inches long, of uniform thickness, with flower attached, young, crisp, and well flavoured; but such fruit as described, 20 inches long, if uniform, and only 1 inch in diameter, I should very much like to see. *Richard Lynch, Port Eliot.*

Dioscorea Batatas.—After what I formerly stated concerning this Yam, I think it no more than right to send you the result. It may be remembered that I had but one plant, a tuber about the size of a finger or nearly so. It was started in the spring in a very moderate heat, and when pushed a considerable length it was turned out (I have forgot the date, but not early). To give it depth of soil, which I understood to be a requisite, I raised a sort of flattish hillock on a garden border, and turned the plant out on the top of it. The stems were tied to a 3½ feet stick, but had no other care except on two occasions, when a soaking of water was given to

moisten the ground about it. About a week ago I dug up the plant, which had made two long tubers—about the size of two moderate Carrots, only growing inverted, viz., the thick end downwards. I have weighed them, and I find their joint weight is 1 lb. 12 ounces; circumference round where thickest, 6½ inches. So much for facts—now for opinions; mine is, that although it will neither rival nor supersede the Potato, which no one can desire, yet if grown to some considerable extent, it would be a very good auxiliary to that useful root. I am further of opinion that it is not nice about quality of soil, but it seems essential that it should be deep. On digging mine I found these lower extremities from 18 to 20 inches below, the upper end forming a longish slender neck. Next spring I mean to plant a row of it. Am I right in believing that the tubers will bear cutting into sets like a Potato? I think some writers said they would. *Quercus.*——The following experiment on the Chinese Yam in a bleak and backward garden in West Kent goes to strengthen your inference from the experiments of Messrs. Henderson & Gordon, that the climate of England is adapted to its cultivation. Of my four small tubers one was as large as a ripe Marrowfat Pea, as heavy perhaps as two of the others, and this made the best plant and produced the largest root. They were planted early in March, singly, in thumb pots, and set on the shelf of a well ventilated greenhouse without fire heat; the plants were very slow to come up, and it was not till towards the end of April that a leaf was fully developed on each; by the middle of May the largest plant had 2 or 3 inches of bine; at this time they were planted out on the open border, a good sandy loam, on a bed 1 yard square, dug deep, and then shovelled up about 6 inches high. Strong winds and night frosts followed, and the two weakest plants perished, though a flower-pot was sometimes turned over them at night. The two remaining grew slowly, and as they grew were pegged down upon the bed, which however they never covered. The frost about the end of October, which killed the common Nasturtiums, changed the colour of the Yam leaves from deep to yellowish green; a fortnight afterwards they were dead, and the tubers were dug. They were fully formed; the largest, when washed and dried, weighed fully six ounces, and measured 4 inches round the largest parts—the smaller weighed 2 oz. No small tubers were found on the stems where pegged down, perhaps because care had not been taken to cover the axils of the leaves. Another season it is proposed to plant sets in the open ground of this garden about the middle of April, a considerable degree of warmth being apparently necessary to start the bine. *S. S.* —— Having purchased four small tubers of this new esculent, the same size as those sent out by Mr. Henderson, they were potted singly and placed near the glass in a late Peach-house, where they remained without fire-heat till the last week in May, when they were set out in a sheltered place for a fortnight, and were then planted on a ridge 3 feet wide at the base, such as is usually prepared for Cucumbers, &c., at that season. They were covered with hand-glasses till the middle of July, when the glasses were removed, and it then showed evident symptoms of having suffered from cold and wet; indeed, it had an injured appearance during the whole season of its growth, even in the Peach-house the temperature appeared too low for it—one of the plants died in August. At the end of October, however, when the tubers were lifted (which was done in presence of Lord Lovat and Sir William Gibson Craig, Bart.), they measured respectively—

	Length.	Circumference.
No. 1.	11½ inches.	4 inches.
2.	13 "	3½ "
3.	8 "	2½ "

No. 3 produced two tubers. It is evident, as remarked by Mr. Nutt, that the new tuber commences to form at the top of the old one, and grows downwards, which serves to teach us that a deep soil is required for its cultivation. A row of Holcus saccharatus was planted on each side of the Dioscorea bed; it grew about 18 inches high, but the first frost killed it. Neither sheep, horses, or cows would eat it. *W. Baxter, Riccarton, near Edinburgh.*

Durability of Timber.—Last night a fire broke out in Stirling Castle, which has destroyed some of the oldest buildings in the garrison. I was in Stirling to-day, and went and saw part of the ruins; there was no admission into the Castle, but it looked bad enough from the outside. Many of the burning rafters were thrown over the Castle rocks; the Ivy in some places was much scorched, and it had a strange appearance, from the number of articles upon it that had been thrown from the windows of the buildings, such as papers and books that had not reached the bottom of the rocks. People were collecting the choicest wood that had been thrown over the rocks, or had fallen from the burning, and were cutting it up for firewood. It was surprising to witness the freshness of the Oak timber that had been in use for centuries. I secured a small portion of it, supposed to be part of the well known "Douglas room." I have enclosed a chip of it for your inspection, hoping you can tell what species of Oak it is, that can resist the teeth of time so long. *P. Mackenzie, Nov.* 19. [The fragment sent us is so small that we cannot say with confidence. But we believe it to be Qu. pedunculata. Could Mr. Mackenzie procure by favour or purchase a good piece of an old beam not less than 6 inches cube.]

Ipswich Standard Cucumber.—Permit me to inform your correspondent (see p. 758) that I have spoken of his Cucumber according to its merits. It has been weighed in the balance for flavour and general usefulness against other kinds, and found wanting; and, consequently, with a great number of similar kinds, it has been thrown aside as unsuitable for my purpose. Mr. Wild describes the flavour as being neither "bitter nor sweet," which is quite confirmatory of my description of it; for if a Cucumber has not a "smack" of sweetness about it, I doubt not that all connoisseurs will set it down as insipid. Just for the same reason that I believe a really first-rate salad cannot be prepared without the addition of a little sugar, so do I consider that a fine flavoured Cucumber must also have a taste of sweetness. It is for this reason that the Syon House and Lord Kenyon's are so much admired, and though it may answer Mr. Wild's purpose to run them down, he may depend upon it that those two kinds will be grown when the Ipswich Standard, the Generals and Colonels before alluded to have passed away and been forgotten. Mr. Wild's twelve diameters, short shoulders, black spine, and fine bloom, may be all very well to look at, but they will not stand in the place of crop and flavour, where Cucumbers are grown to be eaten, and not for sight-seers. With reference to Mr. Wild's challenge, it could answer no good purpose, as I regard the mere production of a brace or twenty brace of fruit at a given time from plants, be it remembered prepared for the purpose, no criterion of the general worth of a variety; but to show Mr. W. that I am not unwilling to put his "Standard" to the test, I forward with this a packet of seed of my Perpetual Black Spine, and if he will do the same with his pet kind, I have no doubt that you will place the two varieties in the hands of some gardener both willing and competent to decide upon their merits. The same plants of my Perpetual (hence its name) have been in bearing since March last, and they carry good fruit now, and will until this time next year if I like to keep them; while all the long kinds in the same house have died out and been thrown away for some weeks past. This is my estimate of the value of a Cucumber, and therefore Mr. Wild must not be surprised if I and others who act with me take him at his own standard, and believe that he is only "a bit of a judge." *W. P. Ayres, Nov.* 20.

Societies.

Horticultural, *Nov.* 20.—J. J. Blandy, Esq, in the chair. Baroness L. de Rothschild, Sir R. Peel, Bart., M.P., W. H. Solly, Esq., S. Platt, Esq., J. Clough, Esq., Mr. John Spencer, and Mr. Arthur Henderson were elected Fellows. Subjects of exhibition were so numerous on this occasion that not only was the meeting room full, but the library, council room, and secretary's room, together with the passages leading to them, were also literally filled with flowers and fruits, many of them of the most choice description and all of them possessed of rare excellence. Of newly introduced plants, that to which perhaps the most interest was attached was the singular lace-like water plant from Madagascar, called Ouvirandra fenestralis, of which a full description was given in our number for Nov. 12, page 740. This was furnished by the Rev. Mr. Ellis, of Hoddesdon. Messrs. Veitch also showed a handsome Æschynanthus, called fulgens, a sort whose flowers resembled Æ. maculatus or grandiflorus, but it was reported to be shrubby and upright in its growth, characteristics sufficient to distinguish it from the last-named kind. From Mr. Sherratt, gr. to J. Bateman, Esq, came cut flowers of Paphinia tigrina, a handsomely spotted brown flowered Orchid from central America; and from Messrs. Rollisson, of Tooting, came a pinnated shrub, from Australia. The last-named nurserymen likewise sent a collection of plants remarkable for fine foliage, in which were various Dracænas, Crotons, Rhopalas, Aralias, Brexia, Oldfieldia and other plants, most of them with very handsomely divided leaves. A similar collection was also furnished by Messrs. E. G. Henderson, of Wellington Road, the most remarkable objects in which were perhaps Cissus discolor, Pavettas, Caladiums, Aphelandras, the Rice paper plant, Aralias, Rhopalas, and examples of the pretty little Sonerila margaritacea, which in addition to the beauty of its flowers has leaves so profusely covered with small round white spots as to look as if they were thickly sown with pearls. Mr. Ingram, gr. to J. J. Blandy, Esq., likewise showed a fine specimen of the last-named plant. Of Orchids Messrs. Rollisson sent several kinds, among which the most conspicuous was Lælia Perrini, a Brazilian species with handsome rose coloured flowers. Sophronitis grandiflora, in the shape of a single specimen, with five vermilion coloured flowers on it, came from High Grounds, Hoddesdon. It was stated respecting this charming little plant that it is one of the hardiest of Orchids, being found growing wild on the branches of trees, in a climate where the Grass about them is often covered with hoar frost. In the same class Mr. Phillpotts's gardener, Rhodes, showed Leschenaultia formosa, well grown and flowered considering the season of the year. Six Chinese Primulas, single fringed sorts, came from Mr. Windsor, gr. to A. Bligh, Esq., and Messrs. Rollisson had four nice little standard Myrtle-leaved Oranges loaded with fruit. A bouquet of flowers of the blue Vanda (V. cærulea), highly coloured and extremely beautiful, was furnished by Messrs. Maule & Son, of Bristol. Messrs. Veitch also contributed a hybrid Veronica, which was said to have been a cross between V. speciosa and Andersoni; and from the Royal Gardens, Frogmore, were branches of an Ageratum from Texas, of the value of which little can be said at present, few of the flowers on the specimens shown being fully expanded. From her Grace the Duchess Dowager of Northumberland came Nyctanthes arbor-tristis, an East Indian plant now little cultivated, but still worth attention on account of its fragrance.

Of Chrysanthemums there was a glorious display. Large flowered sorts, magnificent plants in 11-inch pots, we refurnished by Mr. James, of Stoke Newington. The varieties were Defiance, white; Pilot, purple; Dumage, yellow; Vesta, white; Annie Salter, yellow; and Christine. Another group of large flowered varieties was exhibited by Mr. Shrimpton, gr. to A. J. Doxat, Esq, but it was disqualified on account of its containing one of the Pompone or small flowered kinds. Of the last named class of Chrysanthemums Mr. Wetherill, gr. to D. M'Neill, Esq., produced admirably grown plants of Cedo Nulli, white with a pink tinge in it; Bob, a brown kind; Drine Drine, yellow; La Sultana, pink; La Gitana, and Requiqui, purple. In this class Mr. Doxat's gardener exhibited Madame Rousselon, pink; Pompone d'Or, yellow; Autumni, orange; Requiqui, purple; Drine Drine and Helene. Of other small flowered Chrysanthemums, Mr. Oubridge, gr. to J. Foster, Esq., and Mr. Windsor, gr. to A. Bligh, Esq., also showed collections. Cut flowers of large kinds, very fine specimens, were contributed from the garden of Mr. Foster, of Stamford Hill, and Mr. Salter, of Hammersmith, also showed handsome blooms of his new variety called Alfred Salter.

Fruits of various kinds were both plentiful and excellent. Mr. Tillyard, gr. to the Right Hon. the Speaker, showed beautiful bunches of Mill Hill and Black Hamburgh Grapes; and famous examples of the last-named Grape were exhibited by Mr. Hill, gr. to R. Sneyd, Esq., of Keele Hall, Staffordshire, who also sent a collection of Muscat, Black Prince and Black Hamburgh Grapes. From the last-named exhibitor likewise came three magnificent bunches of the old Tokay, two of which weighed 4 lbs. each, and the three together weighed 10¼ lbs. Mr. Hales, of North Frith, near Tunbridge, sent handsome specimens of the valuable late Grape Black Barbarossa; and Black Hamburghs were contributed by Mr. Shrimpton, Mr. Marcham, Mr. Beer, gr. to Captain Smart, R.N., and J. G. Nash, Esq, of Bishop's Stortford. The last-named exhibitor also furnished Muscats, but they were not nearly so fine as have been shown from the same place in former years. Of the last-named Grape the best exhibition came from Mr. Clarke, of Turnmoss, near Manchester, the bunches being large and handsome, and the berries possessed of that fine golden tinge which they should have when in perfection. Muscats little inferior to the last also came from Mr. M'Ewen, of Arundel Castle; and the same variety of Grape was furnished by Mr. Clements, of East Barnet; Mr. Thomson, gr. to T. Morris, Esq., and Mr. Miller, of Eardiston. Mr. Ingram, gr. to J. J. Blandy, Esq., showed well ripened specimens of Royal Muscadine.

Of Pine Apples Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel, showed a collection of eight sorts, all of them well grown and ripened. Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, also produced some good Pines, the heaviest of which, a Queen, weighed 4½ lb. Mr. Jones, gr. to Lady Charlotte Schreiber, furnished a Cayenne and two Black Jamaicas, and Mr. Clark, six specimens of Montserrat. A smooth Cayenne came from Mr. Joy, gr., Roundaway Park, Devizes, and the prickly variety of this fruit came from Mr. M'Ewen, gr. to Colonel Wyndham, of Petworth. Mr. Tillyard showed two Queens, the heaviest of which weighed 4 lbs. 12 oz., and Mr. Bray, gr. to Captain Lousada, a Ripley Queen, weighing 3½ lbs. Mr. Forbes, of Woburn, also sent an example of the last variety of Pine Apple.

Pear exhibitions from various parts of the country were numerous. Mr. M'Ewen, of Petworth, contributed a collection, in which were very fine specimens of Beurré de Capiaumont, Duchesse d'Angoulême, Marie Louise, Van Mons Leon le Clerc, Beurré Diel, and Napoleon. Mr. Whiting, gr. to H. T. Hope, Esq., of the Deepdene, near Dorking, also sent fine fruit of Duchesse d'Angoulême, Beurré Diel, Beurré Bosc, Althorp Crassane, Marie Louise, and Van Mons Leon le Clerc. Mr. Ingram, gr. to her Majesty at Frogmore, also contributed a collection, in which were Marie Louise, Van Mons Leon le Clerc, Flemish Beauty, Duchesse d'Angoulême, Knight's Monarch and Seckel. From the Right Hon. the Speaker's garden at Heckfield came Beurré Diel, Beurré Spence (?), Brown Beurré, Délices de Hardenpont, Beurré de Capiaumont, Winter Nelis, and Forelle, or Trout Pear. Other collections of Pears came from Mr. M'Ewen, gr. to the Duke of Norfolk; Mr. Salter, V. Fenn, Esq. (whose fruit was very fine, but came too late to be noticed by the Judges), J. Allport, gr. to H. Akroyd, Esq.; Mr. Robertson, gr. to Lady Emily Foley; Mr. Saul, gr. to Lord Stourton; Mr. Beer, gr. to Captain Smart; Mr. Thomson, gr., Stanstead Park; J. R. H. Treeve, Esq., of Coie House, Jersey (some of this collection was very fine, but others were inferior); and J. Abell, Esq., of Limerick. From the latter came Josephine de Malines, Beurré Diel from a south-west wall and from a north-west wall, those from the latter being brown, nearly like a Guernsey Chaumontel, and not nearly so large as those from the more southern aspect. Of Kitchen Pears Mr. M'Ewen, gr. to Col. Wyndham, sent Uvedale's St. Germain, Black Pear of Worcester, and Catillac. Mr. Ingram, gr. to her Majesty at Frogmore, contributed Uvedale's St. Germain, Spanish Bonchré-

tien, Catillac, and Vicar of Winkfield. We also noticed fine specimens of Grosse Calebasse from Mr. Tillyard.

Apples—excellent specimens, remarkable for fine colour, were exhibited in abundance. From her Majesty's garden at Frogmore came King of the Pippins, Fearn's Pippin, Small's Golden Pippin, Court of Wick, Court Pendu Plat, and Downton Nonpareil. Accompanying this collection were also Frogmore Nonpareil, and Golden Pippin, both seedlings of promising qualities. From Mr. Whiting, of the Deepdene, came well-grown fruit of Franklin Golden Pippin, Golden Reinette, Fearn's Pippin, Ribston Pippin, Adams' Pearmain, and Sudbury Beauty. Collections of Apples were also furnished from the Duke of Norfolk's garden at Arundel; Mr. Taylor, gr. to J. Coster, Esq., of Streatham; Mr. Saul, gr. to Lord Stourton, at Knaresborough; Mr. Salter, of Hammersmith; and Mr. Abell, of Limerick. From the latter came specimens of the Tankard Apple, a large ribbed, seldom seen kind. Of Kitchen Apples Mr. M'Ewen, of Arundel, sent Dumelow's Seedling, Alfriston, Emperor Alexander, Gloria Mundi, Blenheim Pippin, and Baxter's Pearmain, all remarkably fine fruit. From Mr. Coster's garden at Streatham came Yorkshire Greening, Blenheim Pippin, Golden Noble, Aldborough, Alfriston, and Old Pearmain. Of this description of fruit, Mr. Whiting, of the Deepdene, also sent Blenheim Pippin, Dumelow's Seedling, Kentish Fillbasket, Hollandbury, Bedfordshire Foundling, and Kirke's Lord Nelson, all well grown. Among other kitchen Apples, collections of which came from Messrs. Ingram, Beer, Saul, and Salter, was the Giant Apple, a green-coloured fruit, one of which sometimes weighs as much as a pound.

Plums, Coe's Golden Drop and Imperatrice, both excellent of their kinds, came from Mr. Hill, gr. to R. Sneyd, Esq.; and Mr. Tillyard, gr. to the Right Hon. the Speaker, at Heckfield, also furnished capital fruit of the first-named variety. Mr. Muirhead, gr. to Lord Charles Wellesley, contributed Coe's Golden Drop in good preservation, and Coe's Late Red came from Mr. Whiting, of the Deepdene, and Mr. Munro, gr. to Lord Clarendon. Mr. Lidgard, of Hammersmith, sent a small dish of Ickworth Imperatrice.

Figs, Nerii, a small sweet kind, and Brown Turkey, came from Mr. McEwen, of Petworth, and Mr. McEwen, of Arundel Castle.

Of Raspberries there were several exhibitions even thus late in the year, all of them consisting of good sized fruit well coloured and ripened. They came from the Duke of Norfolk's garden at Arundel, from Heckfield, and from Mr. Clements of East Barnet. Among the kinds was Rivers' Perpetual Bearing, shown on the branches on which they grew.

Late Strawberries were present from Arundel Castle. The sort was Trollop's Victoria, a large kind which, as might be expected at this season, wanted colour: it was, however, a great improvement in point of size on Alpines, of which a dish was furnished from the Society's Garden. Of other fruit there were Morello Cherries and Dutch Red Currants from Mr. Tillyard, and beautiful examples of the American Cranberry, from Mr. McEwen, of Petworth. Of this Cranberry it was mentioned that it will grow perfectly well in any American border, whereas the English sort is uncultivable except in ground through which there is a running stream.

Cucumbers were exhibited by Mr. Morris, gr. to C. Child, Esq.; Mr. Ingram, gr. to J. J. Blandy, Esq.; Mr. Ayres, Mr. Chilman, and Mr. Dunsford, of Essex. The best were Snow's Horticultural Prize, and the next best Weedon's Black Spine.

Mr. Lidgard, of Hammersmith, contributed some very fine White Celery called Wad's Invincible, and heads of another sort came from Mr. Lancaster, of Deptford. Asparagus and French Beans were shown by Mr. McEwen, of Arundel; and Seakale by Mr. Lancaster, of Deptford.

Miscellaneous subjects consisted of specimens of Fry's propagating and Seakale pots, from Mr. Pascall of Chislehurst, representations of which will be found at p. 470; and a model pit from Mr. Lancaster of Deptford. The latter was sent to exhibit a new kind of winter protection, called patent Lignum textile. This material, which is that of which hat-boxes are made, smeared over with coal tar to make it waterproof, is put over hollow frames or covers which are filled with straw and placed over the lights of the pit which is to be protected. The efficiency of this covering remains to be proved. It looks, however, as if it would be durable, and it only costs a penny a square foot.

Of Dioscorea Batatas or Chinese Yam there were, in addition to the roots from Mr. Henderson and the Society's garden referred to last week, specimens of this new esculent from her Majesty's garden at Frogmore, and of which the following are the weights and dimensions:—

	Length.	Girth.	Weight.
	inches.	inches.	ounces.
No. 1	17	4	4
„ 2	16	4¾	4
„ 3	19	3¾	5
„ 4	16½	4¾	4
„ 5	18	4⅛	5
„ 6	18	3½	3

It was stated concerning this root that small tubers answered better for the purpose of increasing it than the little Pea-like buds formed everywhere in the axils of the leaves. It was also mentioned that as the thick end of the root is that which penetrates the soil, and as it goes nearly straight down into the earth, deep land is indispensable to its successful cultivation.

From the garden of the Society were various plants, among which were Psidium Cattleyanum, which has been found to fruit freely in a common vinery; cut flowers of Cestrum aurantiacum, which, in the great conservatory, keeps gay the whole winter through; and a collection of fruit, both from the open ground and from the orchard-house. That from the latter consisted of the following Pears:—viz. Charlotte de Brouwer, Beurré d' Anjou, Doyenné Goubault, a large ribbed kind; Passe Colmar, Triomphe de Jodoigne, and others, all well ripened, large, and fine, from small trees in pots. From the glass wall in the garden were Black Hamburgh and Chasselas Musqué Grapes, grown there without fire heat. The former were well coloured, and altogether better than Black Hamburghs ripened on open walls; the latter were unripe.

Among the orchard fruit from the garden (whose quality was stated to be deteriorated by the wet weather during which it was gathered) were Fondante de Malines and Doyenné Sieulle Pears—both promising kinds. The Apple-shaped Pear (Pomme Poire) was also among them, and very excellent it is, especially from a standard. Among kitchen Apples from the same collection Mere de Ménage deserves notice, being very large, and a most abundant bearer. It is, in short, one of the best kitchen Apples in cultivation.

Notices of Books.

Lowe's Magazine of Natural Philosophy, of which three numbers (1*s.* each) have appeared, should not be called "A Popular History of Science," as we find it designated on the title page, for it is entirely occupied with meteorological phenomena, to which the author has long devoted his attention. No. 3 contains a curious account of the effect of lightning on an Apple tree at Lenton, with a woodcut. The lightning struck the topmost twig of the tree, "but for the first 3 feet the only injury occasioned was the scorching of the expanded leaves. The lightning then began to plough a path down the tree, of about half an inch wide, the fragments forced out being in long strips of from 2 to 10 inches, and very jagged and splintery along the edges. Two feet lower, the fluid encountered an upright bough; here it struck deeper into the tree, and ceased cutting the wood. Two feet lower, the lightning again ploughed a path, the furrow gradually becoming wider and deeper as it progressed. It then passed a small branch, which, near the lobe, was entirely peeled. At 4 feet from the ground, the marks of the lightning ceased, and the only trace below this was in a shrub (*Ribes sanguineum*), which had a bough reaching within a foot of the tree. Singular enough the bough had all its leaves scorched and burnt at 2 feet distance from the tree struck, whilst that portion nearer remained uninjured. From an examination it appeared evident that the flash was a down stroke, which was met at 4 feet from the ground by an up stroke, for all the pieces of wood were splintered downwards, except at 4 feet from the ground, where several were splintered upwards. The damage done was greatest at 4 feet from the ground. The flash was confined within very narrow limits; in some places leaves were uninjured only 2 inches distant from the lightning furrow, yet in several places they were scorched 3 feet off. Many examples of the American Blight (*Aphis lanigera*), were found uninjured within half an inch of the lightning stroke. Within a dozen yards of the tree struck, was another much taller, which escaped injury. The tree does not appear to have suffered in the slightest degree from the lightning stroke, as it has grown vigorously, and ripened fruit."

Messrs Bradbury and Evans have commenced the issue of a beautiful edition of THACKERAY'S MISCELLANEOUS WORKS. The admirers of Vanity Fair, Pendennis, Esmond, and the Newcomes have little remembrance of the brilliant or amusing contributions made by our great novelist to periodical literature. The *Chronicle of the Drum*, for instance, one of the best ballads in the language, has never been heard of by one in a hundred of those who have been charmed by the pages of the Newcomes; and the same may be said of the fatal boots, and the Adventures of Major Gahagan. We are not surprised to hear that the present collection of similar loose papers has already met with a large circulation.

Professor Downing has published a valuable treatise on *Hydraulics*, as a Text-book for the students in the School of Engineering, Trinity College, Dublin (8vo, Longmans). Relying in part on the formulæ of D'Aubuisson, and in part upon those of English engineers, the author has produced a work which cannot fail to be of the greatest value to all who are concerned in the drainage of land, or the supply of towns with water, or the construction of canals, or the irrigation of tracts rendered barren by dryness. Six well-executed lithographic plates illustrate the principles which Prof. Downing inculcates.

Garden Memoranda.

BELVOIR CASTLE, THE SEAT OF HIS GRACE THE DUKE OF RUTLAND.—In continuing our notice of this interesting place, let us descend the castle hill towards the south by a path which leads to the dairy, which is situated in a cool spot at the base of the hill, sheltered by tall trees. The dairy hovels and cow-houses adjoin the pasture fronting the dairy, but are separated from the latter by some drives and gravel walks, protected by iron fences. The park-like character of the scene is by no means destroyed by the appropriation of the pasture to dairy purposes, while the convenience of the position is great. The short-horned cattle bred by his Grace are of deserved celebrity. A broad road pierces a wood called "The Wilderness;" the road is lined with fine timber trees of great height and beauty, the stems of which are kept clear from boughs. Some of the finest Yew trees in England are interspersed amidst the forest trees, they are from 60 to 70 feet in height; the clay on which they grow appears congenial to their habits. This avenue, which is a quarter of a mile in length, leads to the kitchen garden, the entrance to which forms a marked feature in the vista; a noble gothic arch is thrown over the iron gateway of the kitchen garden, and elaborately carved stone pillars rise on each side of the gates, and between them the wall is battlemented; a similar gateway stands opposite the entrance to the east, and another to the south. The garden walls are 13 feet in height, and have a stone coping which projects 3½ inches. Ornamental pillars break the flat line of wall east and west, and the wall which crosses the garden, and commands a south aspect, is also ornamented with pillars surmounted with ornamental stone work; the architectural character of the garden is in keeping with the castle. The garden walls include about 8 acres, and with the cultivated ground outside the amount is 15 acres; a range of hothouses, 300 feet in length, backed by sheds, forms the north limit of the garden; a noble walk, 18 feet wide, runs up the centre of the garden, and other walks 12 feet wide reach round it. It was found impossible to keep the walks free from weeds by turning and hand weeding until Mr. Fleming's salting machine was called into requisition; since the application of boiling brine prepared by this contrivance, the walks have been perfectly sound and free from weeds and Moss; by adopting the precautions recommended by Mr. Fleming, the Box edgings have received no injury. The natural soil of the garden is lias clay by draining, dressing, and the application of burnt earth; the garden is in excellent condition for vegetables; Strawberry beds line the centre walk, the old Scarlet is still grown for preserving purposes, being preferred to all others. Keens' Seedling, British Queen, Prince of Wales, Elton Pine, &c., are the principal kinds cultivated; the soil is extremely favourable to their growth. Carrots, Potatoes, and Celery, are equally good on this soil, but Asparagus will not last many years; raised beds are now employed for its cultivation. Pruned fruit trees edge the quarters. Apple trees on reaching the cold subsoil often canker, Pears are induced to a too luxuriant growth by the soil. The borders fronting the walls have been prepared for fruit trees, in some instances by paring and aeration, but the south wall is appropriated to Peach, the other to Apricot trees, which are in excellent bearing condition. Many old Pear trees have been removed, and replaced with the best new sorts; the Jargonelle, Louise Bonne, of Jersey, and Marie Louise ripen well, and are of good quality; Winter Nelis, Beurré Rance, Easter Beurré, Crassane, are excellent on walls in this locality. The Chaumontel is worthless here. In the range of hothouses, which is divided into six compartments, two houses are devoted to Muscat Vines, the Grapes of which are kept late in the season; the last were cut this year in April. The Vines are chiefly old and exhibit the unfavourable influence of the position. The borders were originally made upwards of 6 feet deep! These are in the course of alteration. The Vineries, when Grapes are not kept, are filled in the winter with greenhouse plants, amongst which are a large quantity of well set Camellias and Azaleas, a quantity of Pelargonium crispitatum from seed which afford every variety of foliage and fragrance, and are invaluable in making up bouquets. The old-fashioned brick flues are still in use here. A house for early Cucumbers and a Pine pit are situated behind the range to the west. The gardener's house occupies a central position behind the hothouses, and overlooks the garden; a portion of the outside ground is devoted to pits and frames. Some extensive orchards are also connected with the garden. This garden, with respect to its walls and its broad and ample walks, is the best kitchen garden we have seen, with the exception of that at Frogmore. The stone gothic-arched principal entrances (three in number) with their elegant open-worked iron gates, flanked on each side with octagonal buttressed piers, surmounted by elegantly worked cupolas and finials, give to these entrances a degree of architectural importance and great elegance. The same octagonal piers, surmounted with similarly worked stone cupolas and finials, placed at intervals in the east, south, and west walls, are highly ornamental, strengthen the walls, and break the otherwise long line of coping-stone on their top.

Miscellaneous.

Sale of Mr. Schröder's Orchids.—These were brought to the hammer by Mr. Stevens on Tuesday and Wednesday last, and, as will be seen from the following statement, realised good prices. Aerides Schröderi, stated to be "the only plant ever imported of this the finest species of Aerides known," fetched 89*l.* 5*s.*; A. affine, 26*l.*; A. Larpentæ, 24*l.*; A. crispum, 14*l.* 10*s.*; Vanda suavis, a magnificent specimen, 31*l.* 10*s.*; V. teres, 10*l.*; V. tricolor, 10*l.*; V. cristata, 15*l.*; Saccolabium guttatum, a very fine plant, 22*l.* 1*s.*; S. Blumei, 7*l.* 10*s.*; Cymbidium eburneum, 21*l.*; Phalænopsis amabilis, 17*l.* 10*s.*; Lælia cinnabarina, 17*l.* 10*s.*; L.

anceps, 5*l.* 10*s.*; Oncidium Lanceanum, stated "to be the finest specimen of the kind in cultivation," 16*l.*; O. phymatochilum, 5*l.* 5*s.*; O. ampliatum majus, 5*l.* 5*s.*; Cattleya Mossiæ, 10*l.*; C. Quindios, 8*l.*; C. Skinneri, 8*l.* 10*s.*; Angræcum caudatum, 10*l.*; A. bilobum, 8*l.* 15*s.*; Trichopilia suavis, 9*l.*; T. tortilis, 7*l.* 10*s.*; Dendrobium formosum, 8*l.* 15*s.*; D. moniliforme, 4*l.*; D. densiflorum, 4*l.*; D. nobile, 3*l.* 15*s.*; Cœlogyne Lowi, 6*l.* 10*s.*; Miltonia candida grandiflora, 11*l.* 10*s.*; M. spectabilis, 6*l.*; Galeandra Baueri, 6*l.* 15*s.*; G. Devoniana, 6*l.* 15*s.*; Cypripedium barbatum, 5*l.* 15*s.*; Paphinia cristata, 4*l.* 15*s.*; Epidendrum bicornutum, 3*l.* 10*s.*; Cycnoches barbatum, 3*l.* 15*s.*; Odontoglossum citrosmum, 5*l.* 15*s.*; O. grande, 3*l.* 3*s.*; Sophronitis grandiflora, 5*l.*; Calanthe vestita, the crimson-eyed variety, 2*l.*; C. veratrifolia, 3*l.* 10*s.*; Lycaste Skinneri, 3*l.*; Scuticaria Steeli, 3*l.* 15*s.*; Chysis aurea grandiflora, 3*l.*; Schomburgkia tibicinis, 3*l.* 5*s.* Other lots, of which there were in all 270, fetched from 1*l.* to 3*l.* per lot.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Chrysanthemums will, in most instances, be the great attraction here at present, and where these are largely grown, which they should be wherever there is a demand for flowers at this season, they make a fine display and are worth every necessary attention in order to preserve them in beauty as long as possible. They are very impatient of a close rather warm atmosphere, and if the house contains plants requiring this treatment the Chrysanthemums should, as far as practicable, be placed in the coolest part where air can be given freely on every favourable opportunity; for except they can be rather freely exposed to the air the foliage will soon be attacked and disfigured by mildew, especially if the plants are well grown bushy specimens. Also see that they are never allowed to feel the want of water at the root. Use fire-heat here only when absolutely necessary either to keep the temperature from sinking too low or to dry the atmosphere. Attend to former directions, endeavouring to have everything neat and clean, and to set off the plants in bloom to the greatest advantage. Greenhouse.—If not already done get all the specimens neatly tied and arranged with the least possible loss of time, for even well-grown plants are no great ornaments in a house unless they are kept trim and orderly, and this cannot be done, save in the case of few plants, without staking. Endeavour, however, to do this work neatly, so that the stakes may not be conspicuous; and it is always a sign of bad workmanship or something worse—bad culture—when the stakes necessary to keep a specimen in form are at all conspicuous. Ericas, or indeed any other plants requiring more pot room, may be shifted as safely now, perhaps, as at any other season, and notwithstanding the prejudice which exists generally against repotting hard-wooded plants during the dormant season, most of these may be shifted now with perfect safety, but care must be exercised so as to have the ball and soil in the right state as to moisture at the time of repotting, and also in the application of water during the winter. But we do not recommend shifting plants at this season, unless they are suffering through the want of pot room, and there can be no doubt that a plant, the roots of which can strike into fresh soil and accumulate food during the winter will flower more strongly, or start into growth more vigorously in spring than if it had been starved for want of pot room until close upon its time of flowering or starting into growth, and the advantage of getting large specimens repotted when the outside stakes can be removed and the under branches tied out of the way without any unnecessary labour, is worth consideration. Look carefully after the Leschenaultias, and other tender things which are particularly liable to suffer from damp at this season, and endeavour to protect them from drip, and to afford them a sufficiently dry atmosphere, to prevent their being injured. Attend to former directions as to watering, withholding it until it is really wanted, and then giving a good soaking, for there is no more certain means of ruining plants than injudicious watering at this season. Give air freely whenever the weather is mild, but avoid letting cold easterly drying winds blow over the plants, especially in the case of things which have not well ripened their wood. Soft wooded plants, as Geraniums, Cinerarias, Calceolarias, &c., if they must be wintered in the same house with Heaths and other hard-wooded greenhouse plants, should be kept as much by themselves as possible, as they will require a somewhat closer temperature than the hard-wooded plants; but where circumstances admit, these should occupy a house or pit by themselves. Cinerarias and Geraniums intended for late flowering will do very well in a cold pit until severe weather sets in; but those intended for flowering early should be placed at once where fire-heat can be used at will, so as to be able to preserve the foliage from damp, &c. Roses for early forcing should be pruned by this time, and placed where they will at least be safe from heavy rains. Where American and other shrubs are used for forcing, these should be taken up and potted at once, placing them in a cold pit until they are wanted for forcing, or a turf pit where they can be protected from severe weather by straw shutters, or any other covering will do.

FORCING DEPARTMENT.

Pineries.—The amount of light is now insufficient to allow of obtaining anything like healthy vigorous growth in even the best heated and ventilated houses, and, therefore, the young stock should be kept quiet for some time to come, using no more fire-heat than may be necessary to maintain the temperature at about 60°, giving sufficient air to keep the atmosphere rather dry, so as to prevent weakly growth, and carry the plants over the winter in a strong stocky state. Take every possible care of the roots, however, maintaining a regular bottom-heat of about 75°, and keeping the soil about the roots rather dry, but do not allow it to become unhealthily so, as is often done, under the mistaken idea that this is necessary to properly ripen the season's growth. If the plants are expected to make vigorous growth in spring, the roots must be well cared for during the winter, keeping them in a healthy state by careful watering and a moderate temperature, for although Pines are, perhaps, the most accommodating plants with which we have to do they are often injured by bad treatment in winter. Let the same attention be paid to the watering of these which is bestowed upon stove plants generally, withholding it until it is absolutely necessary, and then giving sufficient to thoroughly moisten the whole of the soil, and with proper attention to the temperature of the atmosphere and soil, the plants will be in first-rate condition for making rapid and vigorous growth in spring. Vineries.—Where ripe Grapes are wanted early in spring, forcing must be commenced at once. Attend to former directions, and endeavour to get the root action a little in advance of the top; also secure plenty of moisture in the atmosphere, either by means of a bed of fermenting materials inside the house, or in some other more convenient manner, for there will be no moving Vines at the present season without a thoroughly moist atmosphere, particularly those that have not been started so early formerly. If the roots are outside the house the border must be well protected from the weather by means of wooden shutters or some other contrivance, and a little warmth must also be communicated to the soil. This is best done by having the border chambered, and hot water pipes under, which is doubtless the most economical arrangement in the end; but, in the absence of this, fermenting materials must be used. Let these be covered with something to throw off wet, and keep the fermentation as steady as possible. Do not exceed 50° at night by fire heat, raising it about 10° during the day, and with sun-heat an increase of 20° may be allowed. Figs.—Keep trees that have ripened their wood cool and airy, but do not expose them to frost, particularly where the future crop is visible. Get the trees thoroughly cleaned and painted, and the house put in readiness for forcing by the time when it may be wanted.

FLOWER GARDEN AND SHRUBBERIES.

If not already done, get the planting of the beds with their winter and spring occupants finished as soon as possible, in order to give the plants the advantage of any chance which may still remain of making a few active roots before severe weather sets in. Also take advantage of dry days to clean and trim up shrubbery borders and American beds, &c., for the winter. If it is intended to transplant any of the shrubs, or to make any alterations, get this done first, so as to avoid having to tread upon and disfigure the ground after having put it in order for the winter. Avoid deep digging among the roots of shrubs, unless it is desirable to check their growth, and where the plants are well established, digging amongst them should be confined to the ground seen from the walks, and this should be dug very lightly, merely loosening the surface soil so as to give it a fresh neat appearance. Where the soil is not very suitable for Rhododendrons and other American plants a good dressing of leaf-soil mixed with thoroughly rotten manure will be of great service to these; and any unhealthy plants should be taken up, and the ground well prepared by mixing a liberal quantity of the compost with the soil where it is to be planted, which will be a more effectual cure than surface dressings. Rose stocks should be procured and planted at once, and where it is intended to remove the tender kinds of Roses to some sheltered situation, this had also better be done soon. The hardier kinds may be procured from the nursery and planted, and the sooner these are had in the better the chance will be of getting good plants. In planting standards let these be staked at once, for this kind of work, when once left, is sometimes neglected until the plants suffer. Roll lawns frequently, to keep the surface hard and smooth, and prevent the Grass getting covered with worm casts. Gravel walks will also require the same attention.

HARDY FRUIT AND KITCHEN GARDEN.

Any planting of young trees, or removing of others which may yet remain to be done, should be proceeded with as expeditiously as possible, for the sooner this kind of work is finished for the season the less trouble will be required in watering next spring and summer. Pruning and nailing should now be expeditiously proceeded with every fine day, if at the expense of delaying some of the other work which can be done with less discomfort in any state of the weather than nailing, for it is most important to get this work done when the weather is mild. Nailing is a cold enough job for even a warm winter's day, but to turn men out to it in very cold or wet weather and expect them to do a fair day's work indicates bad management, and a want of anything like due regard to the welfare of the workmen. Look over the fruit stores frequently to see that all is keeping well, and remove any tainted with disease so as to prevent the mischief from spreading. A good stock of the Lettuces fit for use should be put into cold frames or turf pits where they can be protected from frost by means of straw shutters or some other efficient covering; also see to securing a good supply of Endive for winter use. Cauliflowers coming in must be frequently examined, and those not wanted for use should be taken up and stored until wanted, for these cannot be safely trusted to the weather after this season. Take advantage of frosty mornings to get manure wheeled on where it is wanted, and get all spare ground trenched and ridged up as soon as possible.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending Nov. 22, 1855, as observed at the Horticultural Gardens

The highest temperature during the above period occurred on the 28th, 1828—therm. 64 deg.; and the lowest on the 29th, 1846—therm. 16 deg.

Notices to Correspondents.

Atropa Mandragora: *A B C.* The roots of this are a powerful narcotic poison, acting as an anæsthetic, like chloroform, in small doses.

Books: *Tyro.* Neill's Flower, Fruit, and Kitchen Garden may possibly answer your purpose.‡

Beech Trees: *J. Mathison.* These and Spruce Firs *may* be removed, although they are 10 or 12 feet high, if proper precautions are taken; not, however, if they are to be packed and sent to a distance, subject to all the accidents of remaining long out of the ground. In all such cases the expense is greater than the result justifies, except where some special object is in view; nor is anything really gained, for younger trees will soon overtake the old ones. The Winter garden is published by Bradbury & Evans. You must remember that Beech trees are among the most difficult to remove.

Cucumber Pit: *T P.* Rough stable dung well mixed with leaves and thrown into a heap to heat for a few days before you introduce it into your pit will answer perfectly. You can easily keep it moist near the flue by watering it occasionally when it appears to be getting too dry. It will be less likely to harbour insects and fungi than tan‡

Dioscorea: *J.* Any respectable nurseryman can now supply it.‡

Hemitilia: *J R.* We will make inquiry and send you word.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Doz.* Tradescantia axillaris. Observe its beautiful stupose filaments.

Names of Fruits: *J C W.* 1, Manks Codlin; 2, Hoary Morning; 3, Braddick's Nonpareil; 4, Beurré Diel; 5, Passe Colmar; 6, Bezi de Motte; 7, Winter Bon Chrétien; 8, Chaumontel; 9, Flemish Beauty; 10, Hacon's Incomparable; 11, Rymer; 12, Court of Wick.—*W G.* 2, Bedfordshire Foundling; 1, Knight's Monarch; 3, Marie Louise; 4, Napoléon; 9, Beurré Diel.—*H J H.* Your long-keeping dessert Apple is not known. Your best mode of propagating from the tree is to take off cuttings in January; put their ends in the earth till March, and then whip-graft, or get a nurseryman to do it for you on proper stocks.—*W D S.* 1, Pearson's Plate; 2, 4, Scarlet Nonpareil; 3, like Cockle Pippin; 6, Wyken Pippin; 7, Yellow Ingestrie; 8, Duchesse d'Angoulême; 9, Brown Beurré; 10, Bezi d'Heri (stewing); 12, Passe Colmar; 13, Winter Nelis; 14, Beurré Rance; 15, Beurré Diel; 16, Old Colmar.—*W Sharp.* Your Fig appears to be the Black Marseilles.—*Rudolph.* 2, Golden Pippin; 3, Passe Colmar; 4, Piles Russet; 5, Winter Pearmain; 7, Hawthornden; 8, King of the Pippins.—*J A B.* 1, Seckel; 2, Doyenné Gris; 2, Beurré de Capiaumont; 4, 14, Duchesse d'Angoulême; 5, Winter Nelis; 6, 16, Passe Colmar; 7, Catillac; 8, Beurré Diel; 9, Napoléon; 11, Passe Colmar; 12, Bequesne Musqué; 13, Autumn Colmar; 15, 18, 20, Vicar of Winkfield; 22, Rouse Lench; 23, Fondante d'Automne; 24, Doyenné Blanc; 25, Downton; 26, Ross Nonpareil; 28, Wormsley Pippin; 29, Minchal Crab; 30, Margil; 32, Hollow-crowned Pippin; 33, Adams's Pearmain; 34, Lemon Pippin; 35, Royal Russet ‖

Plantations in Wales: *R G T.* Sow Furze to windward, so as to get early shelter, and plant the land with Pinus austriaca, Pinaster, Evergreen Oaks, Larches, Sycamores, Elms, Hazel. If Laricio Pines can be easily had they might be added for the sake of the rapidity of their growth. Underwood may be formed with Tamarisks, Broom, Hollies, and Mountain Ash. The other question is sent to the Agricultural Editor.

Plums: *A B.* The Blue Imperatrice will succeed perfectly well on a north wall in the east of Suffolk.‡

Quercus sessiliflora: *Quercus.* It and its varieties come quite true from seed. We speak from personal knowledge.

Tan: A correspondent at Halsall, Ormskirk, writes that he can get no tan because "they dry it and grind it for some purpose." Can any one inform us what that purpose is?

Vines: *M N.* Your white Muscats of Alexandria are blotched and shrivelled exactly like many others of the same sort this season, probably owing to the coldness of the ground in the early part of the season. It is a sort that requires more heat than most others do. At the time of setting it should be kept at a high temperature—75° or 80° at least. You must adopt means to keep the roots above the level of the stagnant water of the pond in the vicinity of your border; and you must also endeavour to keep the latter warm by plenty of fermenting materials. The Apple is not known.‖

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITROPHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.
PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINING BY STEAM POWER.
JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

DRAINAGE OF LAND.
MR. J. JOHNSON, DRAINAGE ENGINEER, is desirous to undertake the Drainage of Land by Contract or Commission. Temporary Tileries erected in any part of England, and Drain Pipes manufactured at moderate prices. Every description of Drainage Tools.—Abingdon Street, Westminster.

DRAINAGE OF LAND, BOGS, ETC.
MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre. Mr. HUMBERT (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

OWNERS OF SETTLED ESTATES and OTHERS desirous of availing themselves of the various recent Acts of Parliament, by which they may charge their Estates with money expended in the Improvement, Conversion, and Reclamation of Land, by Drainage, Irrigation, Embanking, Inclosing, making Farm-roads, Clearing, the erection of Farm-buildings and Machinery, Planting and other Agricultural Improvements, are respectfully informed that Messrs. HEWITT DAVIS & FRANCIS VIGERS undertake to advise and furnish Plans and Estimates, and if required, will contract to do the works, and dispose of the Rent charges.—3, Frederick's Place, Old Jewry, London.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Offices, 52, Parliament Street, London.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George T. Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir Samuel Morton Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., M.P.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.
2. In no case is any investigation of Title necessary.
3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. EQUAL FACILITIES WILL BE AFFORDED IN EITHER CASE.
4. The WHOLE cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.
5. The term of such charge may be fixed by the Landowner, and extended to FIFTY YEARS for LAND Improvements and THIRTY-ONE YEARS for FARM BUILDINGS, whereby the instalments will be kept within such a fair percentage as the occupiers of the improved Lands can afford to pay. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed Improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

SMITHFIELD SHOW, 1855.
TRIALS OF STEAM-THRESHING ENGINES.—The time run by TUXFORD AND SONS' FIRST PRIZE ENGINE, and that by the Engine of Messrs. Hornsby, of Grantham, at the Carlisle Meeting of the Royal Agricultural Society, in July last, with *Fourteen Pounds* of Coals to the horse-power, was—

TUXFORD & SONS ... ... 3 hours and 47 minutes.
Hornsby & Son .. .. 2 hours and 54 minutes.

At the North Lincolnshire Society's Meeting, at Boston, in August last, TUXFORDS' and Hornsbys' Engines again came into competition, when Hornsbys' was again left a long way behind. With 14 lbs. of a very inferior kind of Coal, the time run was—

TUXFORD & SONS ... ... 3 hours and 3 minutes.
Hornsby & Son .. .. 2 hours and 43 minutes.

And had the testing apparatus which had been supplied to the Society from Grantham, not indicated the steam pressure falsely by several pounds on the inch, the difference would have shown fully twice as much to the advantage of TUXFORD's Engine.
At the recent trials of Threshing Machines at the Paris Universal Exhibition, M. Tresca, the Government Engineer, employed as the motive power one of TUXFORD's Portable Engines that had previously been purchased by the French Government.
The Combined Threshing, Shaking, and Dressing Machine of TUXFORD & SONS was highly commended this year by the Royal Society at Carlisle, the Bath and West of England Society at Tiverton, &c.
Illustrated Catalogues, with prices, forwarded on application to TUXFORD & SONS, Engineers, Boston, Lincolnshire.

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.
Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE BIRMINGHAM CATTLE AND POULTRY SHOW.—The Seventh Great Annual Exhibition of FAT CATTLE, SHEEP, PIGS, ROOTS, & DOMESTIC POULTRY, will be held in Bingley Hall, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December. The PRIVATE VIEW and ANNUAL DINNER on TUESDAY, December the 11th.
There will be SPECIAL TRAINS on all the principal Lines of Railway, for which see the Advertisements and Bills of the several Companies.

The Agricultural Gazette.

SATURDAY, NOVEMBER 24, 1855.

MR. CAIRD has again written to the *Times* on the yield of the past harvest, and in defence of his former estimate of it. He adduces his own experience, for which Mr. STURGE had asked. His Wheat crop has yielded 36 bushels an acre on stiff land in Wigtonshire and 26 bushels an acre on light land in Kent, both full average crops. One of the statistical divisions of a Scottish county returns 4 bushels per acre over last year as the yield of this year's Wheat crop.

Of 167 reports published in the *Agricultural Gazette* in August, 122 describe the crop at or above an average; and of 89 reports given in the *Mark Lane Express* in September, 69 are equally favourable. On all these grounds Mr. CAIRD retains his opinion of the yield of the crop.

Then as to its extent:—drainage and good cultivation and guano have rendered farmers less the slaves of rotations than they were. The seed time of last year was at a period of rising markets and of every other circumstance which could recommend an extension of the Wheat crop. It only needs that the 570,000 farmers of this country extend their Wheat crop 2 acres a-piece to produce all the increased acreage for which Mr. CAIRD contends. And it is not necessary to suppose, as his "reviewers" have, that he imagined this extension to have been effected at the expense of the Barley. The fact that the price of Barley, which though high has not risen like that of Wheat, indicates an undiminished yield of that grain, is not inconsistent with his theory. On all these grounds, then, he maintains its soundness.

It thus appears that Mr. CAIRD's opinion was not formed hastily or without due consideration of the various influences affecting the state of the corn market: and accordingly he gives it for his advice that with Wheat between 80*s.* and 90*s.* the quarter the English farmer would be wise to sell. "It is just possible that by the months of May and June America, which has already made a good beginning, may pour into our markets the surplus of an abundant crop, as she has done before when prices were far less tempting than they are now."

We only add that our correspondents in the north, so far as we have received returns, corroborate Mr. CAIRD's report—but the statistical reports for Scotland will soon be published in detail. If an English report in like manner were now forthcoming, of what immense value it would be to the country as a guide to the most important trade and interest it possesses!

THE Turnip in its wild state is an annual plant with a disposition to a bulboid method of growth. In cultivation, however, it becomes strictly biennial, and by the use of manure and a change of circumstances from its original wild sea-side habit an augmented bulb is the result of the first year's growth, from and at the expense of which the stem and its appendages in leaves, flowers, and ultimately seeds are produced during the second year. This biennial habit it is necessary to maintain by (1) careful cultivation of seed, (2) due preparation of Turnip-land, and (3) sowing at proper time, or the plant will have a tendency to run, that is, to flower the first year—a sign that it is degenerating to its original wild condition. Now, as regards the three points just named, it may be stated that the biennial habit is much confirmed by storing the specimens for seed and replanting afterwards; in the preparation of the land everything that forms a different style of living from its sea-side parent, such as preparing the land with manure and the adoption of the usual processes of cultivation, are all like so many elements in civilisation—they destroy or elaborate the aboriginal condition. As regards the proper time to sow the seed, this is a matter which depends much on climate, for if in a dry warm climate we sow Turnips very early they have a great tendency to run; while, if it be cold and moist, earlier sowing can and ought to be adopted.

Now if we examine a Turnip that has run in the manner mentioned, we shall usually find it to possess a small and ill formed bulb, more or less forked or fingered, which will be hard and woody in its texture, and altogether unfit for use. In examples of this kind, therefore, we have a tendency to a reversion to the original wild form, and were we to allow these to seed and sow such seed for two or three seasons, the result, as we have proved from experiment, will be an altogether useless annual, and in fact a *wild* plant.

If we carefully examine any field of Turnips we shall find some evidences of degeneracy, just as in a community however polished we shall occasionally meet with a savage. The plants presenting several heads and *forked roots* all belong to a degenerate class, as a proof of which we have only to employ seed from these to produce a *crop*, not merely an exceptional individual, of worthless roots, though here perhaps a better form may rarely be met with.

This disposition to grow fork-rooted and malformed specimens in some districts and under some circumstances is exceedingly common, and has given rise to the name of *finger and toe* to designate it; and though with this have been included malformations from several other causes to be hereafter described, we shall now enter into a more exact description of finger and toe in Turnips and roots in general, restricting that term to malformations of outline, arising from degeneracy *of growth*, and not applying it to mechanical injuries—such for example as those by insects *in growing*.

In the Journal of the Royal Agricultural Society, vol. xv., and afterwards in the *Agricultural Gazette*, will be found an account of some experiments in the growth of roots; and although the roots experimented upon were Parsnips and Carrots, yet from these were deduced the following facts as applied to roots in general, including the different varieties of Turnip:—

1st. A tap root, of which the bulboid Turnip is but a variety, with a clear and unbranched outline, is not natural to roots, but can only be attained from wild plants by careful cultivation.

2d. In cultivating wild roots the first attempt will present enlarged examples, not only in the central or tap roots but in the lateral branches; while, by carefully choosing seeding examples from those in which the tap root presents the best outline, we shall gradually arrive at the form we require; and here it should be borne in mind that the production of good sorts of vegetables requires as much attention to points as the breeding of improved kinds of cattle.

3d. As therefore a branching of roots is a necessary condition of the passage from wild to cultivated examples, so we conclude that this branching in cultivated sorts is the result of *degeneracy*, or a reversion in a greater or less extent to their original wild form.

Now the degeneracy here spoken of is quite distinct from that distortion of form which results from injuries by insects, as the latter will attack the best sorts however carefully selected and tended, giving rise to the true *Anbury*, to be described in a future paper, while the branching of roots from degenerate growth is the result of, among others,

the following causes:—(*a*), degenerate seed; (*b*), the frequent employment of seed from a richer in a poorer district; (*c*), bad cultivation; and (*d*), a too frequent repetition of the crop. This malformation then is *finger and toe*, being merely a forked or *digitate* method of growth; this is further distinguished by the following important characteristics:—

(*a*). *Finger and toe is common to all root crops.*
(*b*). *Anbury is only formed in the Turnip crop.*

In understanding finger and toe, therefore, it is only necessary to carefully examine any field of the common and Swedish Turnips to acquaint us with the fact, that while some of the specimens will be faultless in form, others will show many signs of degeneracy, and it is well known that if we choose the former for seeding, we shall make more certain of a true future crop than if we chose the latter; and indeed the most casual observer, if he has *much* of this sporting in form, will complain that his seed is not *true*.

Almost any Turnip field will afford us examples of that degeneracy in the Turnip in which instead of merely one central axis of growth upwards, we have the development of many stems; this, like finger and toe, is equally the result of degeneracy, and, like it, is always the case in the first attempt at civilising a wild example; indeed it is generally accompanied by finger and toe.

In other cases, again, we have examples in which, both in root and herbage, there is more the appearance of Rape—doubtless the result of a downward tendency in an aggravated degree to the wild Brassica, of which the Swede is but a hybridised variety.

All Swede crops may have examples of this kind; nay, the seed from a single individual may present sports of many forms, according to the circumstances of the growth of seed, and of the after cultivation of the plant; this latter fact is particularly observable where the seed is own-grown and planted in the same soil, especially if the soil be poor and no manure be employed, and it becomes still more observable if the process be repeated.

Hybrids derived from species, as the Swede, are much more liable to finger and toe than those obtained by hybrids of mere varieties, as the various sorts of Turnip; and hence forked roots in the former will ever be found to be much more general than in the latter.

The experiment recorded in our first paper on the seed of the Turnip, in which hybrids were produced by growing Rape and Seeding-Turnips in proximity, resulted in the production of what we may term hybrid Rape, in which we had the glaucous smooth herbage which characterises this plant, as distinct from the brighter green rough leaves of the Turnip, united with a disposition to a bulbing of the stem, which presented a large increase of cellular matter over that which ordinary Rape would possess: and here, too, with this more succulent stem was a forked growth of root. In this we have a case of *progression* to the Swede form of Turnip, which is marked by its similarity to *retrogression* or degeneracy in our finger-and-toe examples when under cultivation. That the effects here described are the result of degeneracy may be further shown by an inquiry into the nature of soil and district in which finger and toe is most prevalent. Wherever we meet with this malformation we shall assuredly have some, if not all, of the following attendant circumstances.

It is constant in poor soils, in which Carrots, Parsnips, and Mangold Wurzel will also be liable to the same distortion.

In these it greatly increases by a frequent repetition of the crop in the same place, and still more rapidly from the use of own-grown seed.

It will be found, though to a less extent, in better land, if any of the circumstances usually attendant upon degeneracy be present.

Here, then, it seems clearly established that finger and toe is simply a malformation of growth arising from degeneracy; and hence, as we shall hereafter see, is perfectly distinct from Anbury, which latter is more general in rich land and in good Turnip districts.

DRY-DRILL *versus* WATER-DRILL.

The water-drill has now ceased to be a novelty. Since last year its use, in this neighbourhood, has been very greatly extended; and opinions relative to its value on our fen soils have undergone a thorough change. Many who last year regarded it with a good deal of suspicion and apprehension, have since been led to acknowledge its merits, and have pronounced favourably of its effects where it has been submitted to a trial. And I feel fully persuaded, that the more extensively the water-drill is used, and the more thoroughly and impartially its worth, as compared with the dry-drill, is tested, the more largely will it gain esteem and favour. And whatever a man's sentiments may be, and however formidable his prejudices may appear, they must of necessity yield to the force of facts acquired by actual experiment. Hence it occurs, that a simple narration of facts is always far more fruitful of conviction, than a mere statement of opinions, however well formed or well expressed. But to ascertain facts with correctness, experiments require to be carried out with the utmost care and fairness. This I endeavoured to do last year, and gave to the public the results with every needful particular. And again this year I have been induced to make a precisely similar series of experiments, and throughout have endeavoured to observe the strictest impartiality. I append a table showing full particulars of these different trials, the whole of which were made with Mangolds.

But I may here observe, that this year I also made a precisely similar class of experiments with Coleseed, and although I cannot furnish actual results, as such a crop cannot be tested by the weighing machine as the Mangolds can, I may, however, state that the water-drill produced from 30 to 50 per cent. more seed than the dry-drill, all other things being equal. I ought also to remark that all these several experiments, as well as those of the Mangolds, were inspected and carefully examined by several practical farmers, resident in the neighbourhood, and who can bear testimony to the perfect accuracy of my statements. Upon referring to the table below, it will be seen that in Nos. 1, 2, & 3, there is considerable less produce per acre, from both drills, than in Nos. 4 & 5. This arises entirely from the fact that in Nos. 1, 2, & 3, the soil is of a very hot gravelly nature, and consequently much less adapted for the growth of Mangolds than Nos. 4 & 5, where the subsoil is cool and moist, and the land necessarily much less affected by drought. But notwithstanding this, Nos. 2 & 3 are soils of greatly superior quality to Nos. 4 & 5 for general farming purposes. I feel it important to offer these few explanatory observations, although the relative merits of the two drills are in no degree affected by these peculiar circumstances.

No. of Experiment.	When sown.	When Weighed.	What drill used.	Description and Quantity of Artificial manure used.	Cost per acre for Artificial Manure. s. d.	Farm-yard Manure per acre.	Produce per acre Ton. cwt. st. lb.
1	April 26th	Oct. 16	Water-drill	1½ cwt. Lawes' superphosphate of Lime. 1½ cwt. Lawes' superphosphate of Lime.	11 3	13 loads	18 2 4 0
			Dry-drill		11 3	13 loads	8 10 5 10
2	April 25th & 26th	Oct. 16	Water-drill	1½ cwt Lawes' superphosphate of Lime. 1½ cwt. Lawes' superphosphate of Lime.	11 3	13 loads	19 2 6 12
			Dry-drill		11 3	13 loads	13 15 0 0
3	April 24th & 25th	Oct. 15	Water-drill	2 cwt. Lawes' superphosphate of Lime. 2 cwt. Lawes' superphosphate of Lime.	15 0	13 loads	19 2 6 12
			Dry-drill		15 0	13 loads	12 15 5 10
4	April 21st	Oct. 17	Water-drill	1½ cwt. Lawes' superphosphate of Lime. 1½ cwt. Lawes' superphosphate of Lime.	11 3	13 loads	27 5 5 10
			Dry-drill		11 3	13 loads	16 10 0 0
5	April 27th & 28th	Oct. 17	Water-drill	1½ cwt. Lawes' superphosphate of Lime. 1½ cwt. Lawes' superphosphate of Lime.	11 3	10 loads	30 0 0 0
			Dry-drill		11 3	10 loads	20 13 4 8

I must thank you for your kindness in permitting me to trespass so largely upon your space. *Alfred S. Ruston, Wenny Road, Chatteris.*

LIQUID MANURING.

Some observations in the *Gardeners' Chronicle* of the 3d inst. on an alleged new mode of applying liquid manure, and many in former numbers of the *Agricultural Gazette* on this subject are calculated to impress a certain class of our agricultural brethren who trust to what they read, rather than to their own careful observation and experience, with the notion that liquid manuring in the shape of supra-terraneous or sub-terraneous irrigation is essential to successful production generally. There is no doubt of the productive power of this mode of manuring in the case of the perennial Grasses, and other succulents of which successive cuttings are required during the season; but we have as yet seen no evidence of any advantage whatever having been derived by the cereal, grain, or root crops, from this application.

All manuring is, in fact, liquid manuring, for there is not a plant which absorbs its food in any other than a fluid or gaseous state. Not one of them can consume solid manure. The real question is, in what shape we can place the requisite food before a plant most effectually and economically?—whether by artificial solution in tanks, to be distributed on the surface, or according to Mr. Wilkins, under the surface; or by the more obvious and inartificial mode adopted by our forefathers, of spreading the solid manure on the surface, and incorporating that with the soil, leaving to natural agents its decomposition and ultimate solution ready for appropriation by the roots of plants.

The most rational and approved theory of manuring plants is the same as that for the feeding of animals, viz, to provide a gradual, moderate, and regular supply of food, rather than occasional supplies of highly nutritious and exciting food. We contend, that for all the ordinary crops of the farmer, the advantages of manuring by laying on the solid manure in the autumn, on clean land, and ploughing it in, are not exceeded by any other system. The result of this is gradual decomposition in the soil, and solution by rain, and the continued absorption by the roots of all those elements of the manure essential to the nutrition of the plant, and by which it is thus fed from hour to hour during the period of growth.

In the number of the *Gardeners' Chronicle* before referred to the superior effect of Mr. Wilkins' subterraneous irrigation is evidenced by the production of a long red Mangold Wurzel, weighing 14 lbs. 14 oz.; by a single Carrot having been found to weigh 1 lb. by virtue of the liquid manuring, while the best he had on the ordinary plan (by which we presume he means solid manuring) only weighed 7 oz.; and he further states that some Lucerne yielded five cuttings under the liquid system, while the same plant on the ordinary system only yielded two cuttings. It so happens that we are enabled to place in juxtaposition some results of that ordinary system. We picked up and cleaned and weighed a dozen Carrots out of a 4-acre piece, which weighed 56 lbs., being nearly 5 lbs. on an average, the heaviest weighed 7 lbs. We then tried a dozen Orange Globe Mangolds, which do not attain the weight of the Long Red; they weighed 121 lbs., averaging about 10 lbs. each, the heaviest having weighed 15 lbs. We then tried a dozen Swedes, which weighed 126 lbs., the heaviest of which also weighed 15 lbs.

Now, there is nothing remarkable in these weights, excepting as compared with those grown under the most approved mode of liquid manuring. We wrote to a gentleman at Gloucester, who had been in the habit of growing the Long Red Mangold on the solid manure system, to inquire whether he had ever succeeded in raising a root weighing 14 lbs. 14 oz. The reply is as follows: "We grew them from 20 to 28 lbs.; the heaviest we remember to have grown weighed 33 lbs., which we presented to a gentleman who was rather hard of belief, for exhibition at his Farmers' Club."

Mr. Mechi states his growth of Mangold this year at 28 tons per acre, but he does not state how this weight was ascertained. It is we know grown on the liquid manure system above ground. The state of the roots when weighed, and the mode of estimating the weight vary so materially, that in the absence of such details no comparison can be instituted. We had in one field 12 acres of the Yellow Globe Mangold, manured in the usual way last autumn. The crop was topped in the field, and then loaded into a set of Scotch carts of equal size, just as many as would ride without falling off. The number of loads was set down—one of them was shot, and the roots cleaned and then weighed, and the weight of the crop thus ascertained was 23½ tons per acres. This is a very moderate crop when compared with many accounts of which we read, and of which we entertain doubts of the accuracy from the various modes of ascertaining them, some of which are very fallacious. In this case the roots were generally fine, unusually close in the rows, and there was not a spot in the whole field uncovered, and the crop had been estimated by as many as exceeding 30 tons. *Charles Lawrence, Cirencester.*

A SOUND POTATO CROP.

In the end of March 1852 I planted 5 acres of York Regent, and 4 of Irish cup Potatoes,—the seed of the former variety having been grown in Easter Ross, and of the latter in Wester Ross; but each on lighter land than that in which they were planted. In both cases the roots delivered to me had passed through an inch-and-a-half riddle; and after delivery I had them passed over an inch riddle, and all under one inch in diameter were laid aside. From a few of the Potatoes two sets were got, but from the greater part only one; and each tuber from which only one set was got had a few of the eyes cut out, with the view of preventing the growth of too many shoots.

The field in which these Potatoes were planted consists of a free dry loam, and has an open, southern exposure. In the end of 1851 it was broken up with a strong furrow from one year's Grass (which had been cut for hay and afterwards pastured). The crop preceding was Wheat; and as the land was out of heart by previous heavy cropping, I was induced to try Potatoes, whereas otherwise I should have taken Oats. The sets were planted from 10 to 12 inches apart, and ploughed down every third furrow, with Peruvian guano applied at the rate of 3 cwt. per acre in the same furrow as the sets. The whole field was then harrowed and rolled, and left thus till the young plants showed themselves, when I had the earth pared away, and a drill grubber passed between the rows—care being taken not to approach the young plants too closely, either in paring or grubbing. In a few days thereafter they were carefully hand-hoed; the weeds near to the stems of the plants were pulled away with the hand; and when all the weeds were withered, the plants were earthed up with a double-

mould plough, and left in that condition till the Potatoes were lifted.

The whole crop, but especially the Irish cup Potatoes, grew most vigorously, and kept green till towards the end of August, at which time the shaws of the cups were not less than 4 feet high; and while these Potatoes were green and healthy, all those planted with dung in the usual manner were blackened and withered away, and the crop was a complete failure. With rare exceptions this was the case, not only on my own farm, but over the district. The Potatoes which were laid down with guano in the manner already stated, were taken up in the second week of October, and put into long narrow heaps—not pits—covered with straw, and just enough of earth to prevent the straw being blown away. After lying thus for a fortnight, they were hand-picked. Those exceeding one and a half inch in diameter were laid aside for sale; those again from that side down to one inch in diameter were separated for seed; and all the smaller, diseased, and broken roots were given to the pigs.

In the end of October the Potatoes were stored for the winter, by being laid on the surface of a piece of ground lying to the south, in long heaps 3½ feet at the base by about 2 feet high. The heaps, till within 6 inches of the ridge, were covered with Wheat-straw, over which was laid a thick coating of earth. The ridges were thatched with drawn straw, the ends of the thatch being brought over the earth already laid on, and a small quantity of mould, carefully smoothed down, being placed above them to retain the thatch in its place. The ridge was thus left open for ventilation, while it was at the same time perfectly water-tight. In the end of December a slight covering of horse-dung was spread over the heaps, which completely preserved the Potatoes from frost.

The bulk of the Regent Potatoes was delivered in the end of November 1852, and of the cup Potatoes in the beginning of March 1853; but a considerable proportion of both kinds was left as stored till towards the end of March. In each ton delivered, whether in November or March, there was not a peck of diseased roots, and this was the case also with those laid aside for seed. Both varieties were all along treated alike, and the yield was as follows:—

	Tn.	ct.	qr.	Tn.	ct.	qr.
1st. York Regent Potatoes—Gross per acre				3	11	0
Of this quantity, there were, of Potatoes exceeding 1½ inch in diameter	2	13	0

I would not, at the present date, have reported on the result of this crop, were it not that, from the comparative success I met with in it, I was induced in the following year to try whether or not I could grow Potatoes after a white crop with guano alone. The return, as compared with that I had from a fair application of dung, was so satisfactory, that in spring 1854 I planted a considerable extent of the fallow break with Regent Potatoes, allowing from 4½ to 5 cwt. Peruvian guano to the acre in the drill. I at the same time laid down some acres of the same variety with ordinary court manure, applied in the drill, at the time of planting, at the rate of 18 to 20 cart-loads an acre. So remarkable was the difference in the crop in favour of guano, that I had the ground measured, and found that, in round numbers, there were 6 tons an acre of sound Potatoes after guano, and only 3 after dung. The field on which these Potatoes were grown was in good heart, and under Oats in 1853, Grass pastured in 1852, Wheat in 1851, and Turnips, well laid down and ate off by sheep, in 1850; and that part in which the Potatoes were grown with guano got no dung from 1850 till after the Potatoes were lifted. It consists of a good dry loam lying on a steep incline, and the Oat-stubble got a strong furrow down the hill only in the end of the year.

I have taken the liberty of referring thus generally to the crop grown by me in 1854, as, although I had not two varieties tested by being treated alike, the result shows very clearly the important advantage to be derived from growing Potatoes with guano, and gives me greater confidence in submitting this report on my crop in 1852 for approval. *Mr. Hosach in the Transactions of the Highland Society.*

ON FARM-YARD DUNG.

When green crops were introduced into a regular cultivation, as a systematic portion of the cropping of arable land, now nearly 100 years ago, the application of farm-yard dung was made in the form of a rotten mass—black, dead, and mould from which all heat of fermentation had departed—and also every form of organisation that had existed in the straws and hays that constituted a part of the mixture. So very far was this practice carried of having the manure in a putrid form that it was most urgently recommended, and in very many cases adopted, that the mixture should be a year old at the time of application, in order to have a certainty of the thorough putrid state having been attained. In this condition the mass often became dry, light in weight, and brown in colour, wanting in moisture, and wholly inactive. In other cases moist putridity was the state of its existence—black and pulpy, soft and unctuous, and dry like soap and peat. This practice continued till about the beginning of the present century, or nearly 50 years after the cultivation of Turnips had fairly entered into systematic use.

By degrees the general observation was extended that a very great loss of bulk was sustained from this very reduced preparation of farm-yard dung; and the value for immediate use was questioned of a wholly decomposed mass, that no doubt contained the essential elements of food, but in a diminished ratio, and in a quantity insufficient for that large extension of Turnip culture, which happened from the necessity of supplying the urgent wants of a vastly increased consumption. The idea very generally gained ground of having a larger quantity of farm-yard dung by reducing the time of preparation, and of using the mass in a more fresh condition, but still fermented, and considerably advanced into putridity. The necessity of having a quantity of manure to be extended over the large area of ground that was used in Turnip culture was a prime mover to a new mode of preparation, and was assisted by the opinion of its more ready if not superior efficacy as a stimulus of vegetable life. Not that success did not attend the application of a black pulpy mass of farm-yard dung, but the extreme use of the mode of application as a dry snuffy material of more than a year old wrought its own cure, along with the very urgent necessity that appeared of having a much larger quantity for use of the inestimable article of farm-yard dung.

The next mode of preparation has been long used, and yet forms the most general in adoption in the best Turnip growing countries. The system having been established of consuming a part at least of the Turnip crop by fattening and store cattle in the yards of the farmery, that are divided into apartments to hold two, four, six, or eight together, according to age and quality; the hay and straw of the farm are regularly offered to the animals in these yards as food and shelter, and are regularly as possible mixed with the solid fæces and urinary excrements of the beasts, and trodden together by the moving weight of the animals. During the frosty weather of winter, when the ploughing is stopped, mostly occurring in January and February, the contents of the yards are carried to the fields to be planted with green crops in the ensuing year, and laid in a corner or in a lane adjoining, as convenience may direct. The heap is raised to the height of about six feet, and in regular banks of about four feet in width, to which the carts are backed, and the contents thrown upon it by means of forks. No pressure is permitted on the heap beyond the weight of a man and a lad, who spread evenly over the bank that is being raised all the materials that are brought forward, shaking out large lumps that adhere, and mixing as much as possible the wet and dry matters, and the straw with the excrements. No dry matters are permitted, or only in very thin layers, and well mixed with moistened and very wet materials. When town manures can be got, they are laid in mixture with the farm-yard dung in the layers of the heap, and spread regularly and thinly over the whole extent. Much attention is required in building the heaps, that the different matters are duly mixed—the hot dung of the horse with the colder excrement of the pig, with regular layers of the dung from the yards, and the generally more moist and short materials from towns and villages. In this regularity of mixture the heap is raised to the height of about 6 feet, and of any suitable length and width, 6 or 8 yards square on extensive farms, not narrow or short, as small extents make much outside to be dried by exposure. In this state of light consolidation the heap quickly ferments and decomposes; the dried outside is cut down and thrown on the top, which is lightly covered with earth, and sometimes moistened with the urine that escapes from the mass collected for the purpose in a rut around the heap. In this condition the heap remains for use in June, when it is found in a moist condition, pulpy, but not wholly wanting in warmth and vegetable fibre, and showing a mid condition between the old putrid mass and the fresh dung from the yards. Fermentation is mostly extinct, but still appears, according to the condition of the matters in the mixture when the mass was formed. If the materials are rough and strawy when the heap is made, a turning over with forks will be necessary, but is seldom done, as the mixtures are made with care and attention. The yards are generally emptied twice during winter, the first time about Christmas and the second time during wet weather in March, after which month the dry weather prevents the proper making of farm-yard dung in the necessary quantity. It is best that the heaps of dung be formed during wet weather. So much as roads and ground will permit the carriage, snowy weather suits well by the snow being mixed with the dung, and producing moisture on melting.

An unqualified success has attended this mode of using farm-yard dung in the most extensive practice and a long continuation of it. It is yet most generally followed. The idea still existed of having the largest possible quantity of farm dung, and in a state of fermentation, so as to advance to putridity, and with the view of securing the benefit of the active powers employed in the process of decay; and this idea led to another mode of preparation in the contents of the farm-yards being carried to the fields during the conveniences of the winter, and laid in a heap that slopes at both ends to permit the ascent and descent of the carts, which deposit the loads on the heap, over which the matters are spread. In this way the heaps are formed at any convenient times till April, a care being still exercised that the matters are mixed—dry with wet—and that no large quantities of dry materials are placed together. The heap is trampled into a consolidation that prevents fermentation, when, as the dung is required for Potatoes, Beet, and Turnips in succession, the heap is turned over with forks, with a very careful attention to break the lumps into small pieces, to throw the outside into the inside of the heap, and to place the whole mass lightly together. A very active fermentation is immediately produced, during which, in about 10 days from the commencement, the dung is laid in the drills, and the seed or plants placed over it. The fumes of evaporation reach the seeds and have a most beneficial effect; the fermentation, though checked, will continue, and the ultimate decomposition that was commenced in the heap will be done in the land, which receives the advantage of it. In this mode of preparation a larger quantity of dung is obtained, and the benefits of the active processes are secured more than by the former method, both modes requiring a previous attention to the mixture of matters in the farm-yards.

Our own experience has been very long and extensive in the most celebrated Turnip districts in Britain, during which the application of farm-yard dung was chiefly made from heaps without being turned over, and more latterly, but less extensively, in the last-mentioned mode of use. It would be difficult to establish an undeniable preference for either mode, the expense and previous requisites of the materials being nearly balanced. The first mode in the heaps that are not turned over requires that the mass be formed at one time or at twice, when the heap is put into shape and finished, to remain untouched till used in June. The second preparation permits the formation of the heap at all conveniences during winter from November to April, the materials being regularly as possible mixed in the cattle yards and spread evenly over the heap when carried to it at the different times. On this ground of convenience over an extent of time, and that of affording a larger quantity of dung for use, and of receiving the benefit of active operations in the process of fermentation, a preference may be given to the latter mode with the acknowledgment of an equal success in practice from both preparations. The latter mode suits well for Potatoes and Beetroot, for which fresh dung from the cattle yards has already been reckoned to be sufficiently prepared. But an incipient fermentation of farm-yard dung may be recommended for all crops, even on clay land fallows to be sown with Wheat.

The observations that occurred during a most extensive practice and experience in Turnip farming have suggested a third mode of using farm-yard dung in a wholly fresh condition from the cattle yards. In three instances, freshly voided dung from the cowshed was carried to finish the sowing of Turnips, where the quantity of fermented dung had failed, and produced in every case a very superior crop that was visible to my inspection. After three casual evidences on the point, in the fourth year a fair trial was made in equal quantities of freshly-voided fæces and from the fermented heaps, and the result was full 30 per cent. in a superior crop, shown from the brairding of the Turnip seed to the maturity of the bulbs. The experiment was decisive, along with the proofs that formerly appeared.

A difficulty is presented of using, as dung for Turnips, rank straws that are used for litter; being long and unbroken, and incapable of being covered on the land. This obstacle is removed by all straws being cut into short lengths by the steam-power of the threshing-engine, and being mixed with the fæces of the animals, they can be easily covered in the land. Another difficulty, and a more serious one, is presented in the distance between the cattle-yards and the fields in the season of sowing, and the length of carriage during the most pressing season of the year. But there may be soon expected a conveyance by moveable railway of the greater part of farm carriages, which will render easy and accessible every kind of transport. In present circumstances, the fresh dung from the yards may be carried to the fields, and spread in broadcast, and ploughed into the ground, or may be better mixed with the soil by means of Finlayson's harrow driven lengthwise and crosswise after one furrow of the plough, or without any. The drills being then made with one furrow of the common plough, the Turnip seed is sown by the common two-drill machine. This mixing mode may be more admissible without the loss by evaporation from exposed dung gains less credence in the agricultural world; for say what we may on that subject, the theory cannot be sustained.

Mr. Mechi has written that "that the days of dung-heaps are being numbered." This saying may soon be verified. There may not soon be settled the question between solid and liquid manures; but the superiority of fresh matters that possess the native caloric may soon supersede the adventitious warmth that is artificially produced, and afford an easier and cheaper mode of application. If the liquid manure system prevails, the fæces, with or without short straws, may be applied by Chandler's liquid manure drill; but this must rest for a time not yet come. For the present superiority has been shown of fresh matters over putrid. *J. D.*

Home Correspondence.

Hedges.—As you are directing attention to this important subject the following suggestions will tend to further ventilate the question. The cheapest of all operations in keeping a white Thorn hedge in order and uniformity is properly cutting it at suitable short periods. Railway managers are fully alive to this, but the expense of cutting and trimming a length of hedge by manual labour is considerable. I have for many years pointed out the necessity of a hedge cutting and clipping machine to be worked by horse-power. The operation is a regular and uniform one, and therefore most amenable to the application of machinery,—the clipping or cutting to be performed by either revolving circular knives, or knives with concave cutting edges, set on radiating arms of a wheel or a series of clippers like shears, the motive force to be obtained from a horse drawing the machine upon wheels from which shafts to connect the cutting instruments could only be made to act. As in having lengthy shafts a loss of power would be sustained, the point to be attained would be to have these shafts as short as possible, or if possible without any shafts at all, if the considerations of expense, strength, velocity, &c., would permit it. In the case of railway hedges I have long arrived at the conviction in my own mind that the machine would be best if it was simply with two wheels running one on each side of the hedge, and the cutting as far as possible to act immediately from these wheels. Velocity would not be thus obtained, but power would be economised, and so perhaps the cutting in such a machine should be best in the form of shears, either straight or circular with the wheel, and of course the axles would have to be connected by bending over the top of the hedge. On coming to a cross hedge one of these wheels would either have to be got over through a small gap or unshipped, and so lifted over or raised whilst on the machine by a lever, and so eased over the crossing hedge. In adopting a machine for this purpose it should be borne in mind that great velocity in cutting is a great element, for by great velocity the whole of the power is directed to the point struck, and there is no loss by vibration of the other parts; for instance, a bullet at great velocity will cut out a hole in a piece of glass only the size of its own diameter without fracturing the rest of the glass, and a tallow candle may, under the same circumstances, be shot through an inch deal board. It is also known that soldiers have, whilst standing with the musket in their hands, had part shot away, and yet never felt their musket to move or vibrate. Velocity in such a machine would, I fear, require multiplicity of wheels or bands (the latter I should feel incline to favour, as free from jars, &c.,) and so increase the weight and diminish the power. It should be a primary object to always make the force act as direct as possible from the wheels (which roll along the ground), one on each side of the hedge, either by revolving knives, cutting or clipping, or clipping like shears, or by one arm of the shears being fixed and the other moving. Friction in cutting should be reduced as much as possible, and if there were made a rod, &c., to move in advance of the cutting edge, and of course more out from the hedge the twigs would be bent away, and when the cutting edge arrived to separate the portion to be amputated, this bending would open the cut as it was being made, thus reducing the friction. I have always deemed this a requisite yet to be applied to reaping-machines in general. In cutting Box edging I have for many years had the top cut off with a scythe, which will beautifully level a great length of Box edging in half an hour, and perhaps if the hedge was gone over often to prevent the shoots becoming strong the same mode of cutting at a greater velocity obtained by horse power might be available for the end suggested. A machine of small size but on the same principle could be made to trim Box edging, although the scythe will not only level the top but may, in a handy hand, do to trim the sides of such edging if well kept; perhaps in practice it would be found that a machine to only cut one side of the hedge at a time will be the limit in a general way, first cost and power being considered along with due portability. I have already trespassed too much upon your valuable space; but trust I have in this rough notice to draw attention to the matter sufficiently indicated the general requisites of the suggestions. *W. Wooler, Nov.* 10.

Drains with Brushwood.—In reply to "H. B.'s" inquiries I can assure him he may safely drain lands with brushwood, viz., Thorns either white or black, but black are best; they will last good ten years; Willow is not so good; they so readily strike root, especially if they get air and moisture. The best mode of using the Thorns is to cut them as long as you can, and then tie them in long narrow bundles ready for laying in the drain when cut, not put in "helter skelter" as the workmen will do (being less trouble), if not prevented. A drain so made will last ten years. If "H. B." has land or other stones to put in with his Thorn faggots, the drain will be better. But one tile drain will be equal to two of Thorns in efficiency and durability, and made with the old-fashioned horse-shoe tile 2½ to 3 inches wide by 3 inches deep, and laid upon a flat tile or sole, thereby making a firm bottom, and the upper tile less likely to get displaced (like the pipes), when they happen to be laid in loose sandy places or sand-galls, so frequently met with in cutting drains. Presuming "H. B." a novice, I should by all means advise him to "drain deep" as he can go, securing a fall for his water by his outlet. One deep drain, whether in loose soil or strong clay, is equal to two shallow ones. "H. B." should first ascertain the depth of fall of his main drain or outlet, and work upwards from that, bearing in mind that the deeper the drain the further it will draw the water and carry it off; never mind what your stiff land men say about water not getting through strong soil. If there is a vacuum below I know it will drain off, not so fast through strong soil as porous, but it will get away; and when the strong soil is once run dry, all the rain that falls after will only be sufficient for the fertilising the soil. I would advise "H. B." to cut his drains across the fall—diagonally, not at right angles; I am quite satisfied that if water gravitates downwards, a drain cut slightly across the fall is more efficient than one cut directly down the fall. It intercepts the water (falling between drain and drain, or rising up from below) more completely. But where the fall, as in some low lands, is so little, and the drains necessarily shallow, it may be best to cut the drains down, or with the inclination of the land, in order that the water in the drains may get more easily away. There is one important point to be attended to after you have made your drains, I will suppose well; that is, to take care that their mouths are always kept clear, not left (as is too frequently the case) to be blocked up by rats or the earth that runs down the brink of the ditch in dry or frosty weather. I would recommend "H. B." to procure Mr. Mechi's "Letters on Drainage;" also Mr. Parkes's "Essay on Drainage;" and last, though not least, a little book on "Under-draining," published at Newman's, Bond Street; the author, Mr. John Wiggins, agent to Sir Thomas Hare, Bart., Stowe Hall, Norfolk, published it for the use of the tenantry. It contains a fund of sound information, and although published at a cheap rate, it is really a valuable little book on the subject of land drainage. *A Constant Reader.*

Tabular Statement, showing the distances required for planting or sowing various quantities of Wheat grain.—There are from 16,000 to 20,000 grains of Wheat contained in one quart, or 608,000 to 640,000 in one bushel, and 6,272,640 square inches are 1 statute acre of land. Taking the latter numbers as a rule, it necessarily follows that about 10 square inches are thus allowed for each grain, admitting all the land to be sown uniformly without furrows, or 14 grains on each square foot, or 132 grains on each square yard, or 4000 grains on each square rod, at one bushel of seed for an acre.* The following simple tabular form will, we trust, serve to show the different distances for each plant at this ratio, from more and less quantities of seed, which may or may not be thought most proper to be sown by any of our agricultural friends. For general sowing on a large scale, we ourselves think proper to draw a line of distinction—say one bushel or less, avoiding either extremes—bearing in mind, however, the fact and possibility of growing a large amount of produce from a small quantity, and the impossibility of reaping an average crop from a full plant of a large quantity of seed.

Per Acre.	Grains for an acre.	Grains for a rod.	Grains for a yard.	Grains for a foot.	Inches for each grain.
3 bushels at 20,000 grains in a quart, and 6,272,640 ins in an acre gives about	1,920,000	12,000	396	44	4
2 ditto ditto ...	1,280,000	8,000	264	29	6

—*Hardy & Son, Seed Growers, Maldon, Essex.*

The Mole.—The Talparian theory of drainage is certainly very nice for a winter's evening, and doubtless would be effective in the field generally speaking, provided Talpa would train his pipe-draining property to pay the necessary respect to levels—but the "water-kelpie" system of subterranean "tarns" and pools they follow, has little to recommend it, either to the park-keeper or his employer; and besides drains must be closer than many would like before any visible effect can be produced on insects, while the standing pools of water they make destroy the finer quality of Grasses, and encourage the growth of Rushes and other inferior plants, unless the land is sufficiently drained without the assistance of moles. We have found this to be the result in all the deer-parks and sheep-walks we have managed or examined. As much of Fowler's pipe drainage as you please, then, but away with your Talparian gentry. *B.*

Waste Land.—Some of your correspondents do not seem to agree as to the amount of cultivable waste land in the New Forest, but they had better turn their attention to the much greater waste of land in other places, such as the Highlands of Scotland, where glens and plains amongst the mountains are to be found abandoned to Heather, but which, with enclosure, shelter, and a little drainage, would be capable of growing ordinary field crops, varied according to the height and exposure. In the west the climate is very wet, but even there improved Grass and green crops might be grown, and all the eastern and central Highlands are dry enough and traversed by good roads, and in many places steamboat stations are near at hand. People seem to take it for granted that the Highlands are only fit for sheep or game, but this I think will be found a mistake by any one who will take the trouble to examine the soil, or try arable cultivation. *A. H. F. C.*

The Turnip Flea.—In connection with your article on the above subject of the 10th inst, it is a serious evil in many seasons, and should be the aim of all to contribute (however small) their experience in ridding the Turnip crop of that noxious insect, the flea beetle. Agreeing with you in the expedients you propose, which, if followed out, would no doubt tend to destroy numbers of the insects, yet a simple plan which we have followed for some years may not be uninteresting to your readers, based on your "Adoption of Expedients in Sowing." Instead of sowing alternate rows of Swedes and common Turnip we mix the seeds in the proportion of one-fourth white Turnip, which, when sown together, comes up first, and from the known predilection of the insect for Turnips proper, allows the Swedes to get into the second leaf, when great part of the danger is over. Our preference to this system is, 1st, that a crop of Swedes is more valuable than a crop half Swedes and half common Turnip, as it would be in the way you suggest; 2d, that Swedes require to be sown earlier; and 3d, that should any of the white Turnips escape the flea, they are easily distinguished from the Swedes at the thinning process, and rooted out then. We might also suggest that in sowing a crop of common Turnips it is advisable to mix seeds of various seasons growth, as from brairding (germinating) at different times, there is a greater chance of some of the crop escaping than when all the seed sprung at the same time. *Armis, East Lothian, Nov.* 12.

Threshing Machine.—The American agricultural paper, the *Albany Cultivator*, for last month has an article on the "trial of reapers in France." In the same article it states—"There were four threshing machines entered for competition. One American (Pitt's, of Buffalo), one English, one Belgian, and two French. They worked half an hour. Six men worked half an hour with flails at the same moment the machines started. The six threshers — 60 litres of Wheat; Pitt's American thresher, 740 litres of ditto; Clayton's English thresher, 410 do. do.; Dunoir's French thresher, 250 do. do.; Pinet's Belgian thresher, 150 do. do." In regard to Pitt's machine, the *Moniteur* says:—"Pitt's machine has, therefore, gained the honours of the day. This machine literally devours the sheaves of Wheat; the eye cannot follow the work which is effected between the entrance of the sheaves and the end of the operation—it is one of the greatest results which it is possible to obtain. The impression which this spectacle produced upon the Arab chiefs was profound." *Richard Nicklin.*

[We will endeavour to obtain a further report.]

Steam Ploughing.—It has lately been the fashion to cry down the plough as not suited to the purpose for which it is used, and so far is this taken for granted that very plausible arguments are built upon it. Let us shortly examine what its alleged faults and failings are. The first and greatest is that it presses and hardens the subsoil so much that the powers of language have been exhausted in describing its evil effects. But did the plough press it? I believe not. As well might we say that a knife is a very improper tool to cut the top off a round of beef, because it leaves the surface of the remaining part smooth and close; and hence argue that meat ought to be torn apart because it must be disintegrated before it can combine with or be absorbed by the human system. Does the planing tool compress the surface of the wood because it leaves it smooth and close? Some say this reasoning does not apply to the plough because its weight must be taken into account. Well, how heavy is it? Fifteen stones. And what pressure will that exert, even upon the loose surface, to say nothing of the dense bottom? Plates in Morton's "Cyclopædia" prove that it requires in ploughing a furrow 5 inches by 9 inches, a strain of 16 to 20 stones, and to draw the plough upon the top empty, it requires a strain of 8 to 12 stones. But the difference between a furrow and no furrow is in many cases less than this, which I think proves that the weight of the plough is as it were brought forward to the resisting point when in work, and not that it requires only 7 or 8 stones to cut and turn a furrow 5 in. by 9 in. Thus we think that the plough only polishes up the bottom of the furrow as a trowel does mortar—that it is only a great knife that cuts up a square junk, and the turn-furrow comes after, and lays it over, giving it a squeeze as it does so; this compression serves to pulverise it, instead of hardening it: and in this respect it excels the spade, which turns over but does not break up without an extra turn by using the spade as a hammer. With these remarks I shall conclude that the plough is the most proper implement that we yet possess for turning over the soil. But though our ploughs, so far as to their cutting parts, are about what we want, yet in applying steam-power for drawing them we must support them on two wheels in front and one behind; and the shanks of these wheels should extend above the frame of the plough, and be held on it by a moveable joint to allow the shank to swing backward and forward. Then we shall have our draught-rope attached to the top of this shank, and the effect will be that when the plough is pulled forward the wheels will be raised, and of course the plough lowered, and when the draught is backward the wheels will be lowered, and the plough raised before it will move back at all, and so it will clear itself above the land. The single wheel behind will work in a socket as the front wheels of scarifiers do, and by it we can guide the plough backward. Of course we must have

ploughmen for this as we have always had, and prizes may be given to the best hands as now. Any other implement can be put to work by the same machinery, only that all will have to go back empty as we at present arrange. *G. S.*

Steam Culture.—In your paper of Sept. 15 I read a letter from Charles Burcham, London, on a new plan of cultivatiug land hy steam in a circle, which he sets forth to be superior and quicker than those tried at Carlisle. Since then I have looked every week in vain for a contradiction of his statements, so have come to the conclusion that they are too plainly absurd to require refuting. However, seeing in the *Agricultural Gazette* of November 3 another long communication from him, in which he enters more into detail, I think it high time some one took up the side of common sense. In the first place—In English farming economy of land is of the first importance, but I find by this scheme, that between every 3 circles of 84 feet radius, there will be 7.16 perches, and in a 20-acre field (that is to say 20 acres of ploughed land) there would be 57 such pieces inclosed between the circles, or 2 acres, 2 roods, 8.12 perches, and of course much more on the outsides of the circles and some in the centres, so that I do not think it too much to say that to have 20 acres of cultivated land you would require 24 acres. This loss he attempted to get over by saying that plants require intervals between them to thrive properly, but I do not think the plants in the centre of the circle would derive any benefit from a space 80 feet removed from them; intervals in crops, to be of any use, should be equally distributed between each plant. This loss and waste of ground I consider quite sufficient to kill the scheme; still, if there were no loss at all, there are other considerations of a mechanical nature which would be quite as fatal. For instance, "C. B." seems to think that his plough or rows of ploughs will take no more power to move them round the circle in two and a half minutes than what the ordinary steam-engine would furnish, and that the universal mechanical law, as you gain speed you lose power, does not apply to this case. If you wish to increase the speed and duty of a machine, you must also increase the power in the same ratio as the speed. "C. B." intends ploughing at the rate of 12 acres per hour. If the best steam plough could turn over the soil at the rate of 1 acre per hour, we should require evidently 12 times the speed and power to do 12 in the same time. If the steam plough at an acre an hour required six horses, "C. B." would require $6 \times 12 = 72$ horse power. I hope soon to see another communication from "C. B." stating the probable weight and cost, its portability, and capability of turning from roads through gateways. I think it advisable to make all farmers' implements capable of being adapted to several different operations, but if a farmer had all th different ploughs, harrows, drills, rollers, cultivators, &c., required for the 84 feet machine, they would take considerable shed room. "C. B." attacks reaping-machines as unphilosophical; but if they are (as they should be) adapted to mowing, they form one of the most useful implements of the farming—performing the latter operation in a superior manner to the scythe, and relieving man of very laborious exertion. I hope "C. B." will explain how the *point d'appui* is to be removed to a new base of operations at the end of the two and a half minutes, and how many minutes that will require; how he intends to get over the difficulty of his engine turning a sharp curve of 84 feet radius, and whether the engine will go on rails or not. The object of an inventor in producing a machine should be to make the mechanism as self-acting and simple as possible. Machinery tends to elevate man, by changing him from the mere machine to the controller of its movements; therefore, the more self-acting machinery is, the more does it accomplish this noble end, and the more simple it is, the easier is it to control and more durable. But "C. B." has gone a step backward in taking the man off his legs and mounting him on a long gallery. Why not make it self-acting? It is my opinion that this circular principle is wrong, and that "C. B." had better employ his inventive talents on the rectangular principle of cultivation by steam. *Y. F. W.*

Ploughing in Line: The North Staffordshire Agricultural Society.—Will the secretary or any of the members of the committee of the North Staffordshire Agricultural Society explain through your columns why they give prizes for ploughing, the ploughs being drawn by three horses in line. When lately in Staffordshire I heard some lamentations over the decay of this society, when a gentleman who is a large landed proprietor and great agricultural improver stated that the reason no doubt was that the society patronised bad agricultural management, and gave what has been stated above as an instance. It would be interesting to know on what grounds the society justifies a practice which puts three horses, a man, and a boy to do the work of two horses and one man; and if they cannot justify the practice I, in common with others, would be glad to know why they encourage it by giving prizes for it. *Investigator.*

Stone Breaking.—In this district gravel is scarce, and our parish roads are made with broken flints picked off the land, the breaking of which with a hammer is tedious and expensive. Perhaps some of your correspondents will kindly communicate a more speedy method. Stones put on a brick or lime-kiln, after heating will break much easier, and possibly render the substance less serviceable, but this would be immaterial if the application of heat by some moveable contrivance could be brought to the stone-heaps, as kilns may be far off and the collection of heaps be in far separated fields, and the material itself is heavy and costly to move. Any information will be thankfully received by *A Stone Warden.*

Produce of a Potato.—In the month of March last I planted one Orkney Red Potato cut into plants or sets, I think about 10 plants, upon my farm at Goodmayes, near Ilford, Essex. The Potato weighed 1 lb., and in the month of October I dug up 84 lbs. of sound Potatoes, the produce from the Potato weighing 1 lb. I will feel obliged if you would tell me whether you have known as large a produce from the same weight of seed. *Alex. Tod.*

Farmers' Clubs.

CHERTSEY.—At the annual meeting of this Society the other day, Mr. Locke King, M.P., said: He could not help thinking that they ought not to rely on the present high prices. The war might last for a time, but he hoped it would be brought to a speedy, honourable, and satisfactory conclusion. And when that time came, they might rest assured that there would be a reaction, and they must be prepared to meet that change by improvements in the cultivation of the land. They must rely upon their own exertions for those improvements, and this was the proper time to do so. They must endeavour to remove those laws and abolish those customs which interfered to prevent the flow of capital into the cultivation of the soil. He felt that when the doors were somewhat forcibly opened for the admission of foreign produce it was only fair that the principle of free trade should be applied also to the raw material—the land itself—and that all those technicalities and difficulties which interfered with the transfer of land from a willing owner to a willing purchaser should be entirely removed. He found from statistics that there were in Great Britain and Ireland no fewer than 15,000,000 acres of waste land capable of improvement and cultivation, but which were not cultivated at all. In England there were said to be about 4,000,000 acres of waste land capable of cultivation; in Scotland, where the land was locked up under a close system of entail more severe than in England, there were no less than 6,000,000 acres capable of cultivation; and in Ireland 5,000,000 acres which still remained without cultivation. Lord Stanley had said that if any man retained land in his own hands which he had not the power to improve, and did not sell, he was a wrong doer to the community. If that remark was applicable to an individual, how much more so was it applicable to a legislature which allowed a number of laws to exist which compelled a man to keep in his own hands that which it was utterly impossible for him to improve.

Calendar of Operations.

NOVEMBER.

WEST SUSSEX, *Nov.* 20.—We have had rather a catching season for Wheat sowing, and the work has got rather behind, there is still a good deal to sow, and some has been put in with the land not in a very fit state for it; but as the weather, though damp, has been mild, we hope that it will come up well. The first sowings that are up look too forward, and what has been put in this month may turn out best able to stand the winter. This is the time for storing the Mangold, which is generally a good crop, and the land will, if possible, be sown with Wheat after it. All the Wheat that can be sown, will be, and though it is often said that this is not proper farming, yet we have found it answer as well as we could expect, and by sowing Clover on it in the spring, we have got a good plant, so that it will come in for Wheat every other year, that is, Wheat, Mangold—Wheat, Clover. This refers to heavy land unfit for Turnips, and which cannot be fed off once in six years. We put a heavy dressing of dung for the Mangold, then leave the tops to be ploughed in, and with the Wheat use 1½ to 2 cwt. of guano, which does well, and we cannot conceive a more profitable way to turn a stiff clay to good account. We have now land lying up in ridges or baulks, after being well worked, that will require no further preparation for Mangold but to split the ridges with the double plough, put in the dung, and cover it before sowing. We shall split the ridges as early in the spring as the weather will admit of, so that a fresh surface may be exposed as long as possible before sowing. Our market is not yet oversupplied with Wheat, but will no doubt be better as soon as sowing is done. We do not hear very good accounts of the yield: I fear it is below what we expected; there is a very large proportion of tail corn occasioned by its premature ripening. The price for average samples is about 22*l.* per load. The supply of Barley is fair, but really good is scarce; the price of malting is from 45*s.* to 47*s.* per quarter; of grinding, from 38*s.* to 42*s.* Oats are very inferior at 28*s.* to 30*s.* Our market has been better supplied with mutton than is usual at this season, and prices have rather given way, though the quality is good. Beef is plentiful, but hardly up to the mark in condition. We have now begun to use the Swedes and find the quality very good, though not so large as we expected. The late sown Turnips are a poor crop. We are rather puzzled to know how to get our beasts fatted in the most economical way—hay is out of the question; we do not think that it ever paid, but now that the price is so high the matter seems settled—straw chaff and cut Turnips, with Barley-meal and Linseed mixed, seems to be the right thing. *G. S.*

Notices to Correspondents.

ITALIAN RYE-GRASS: *F G.* It is too late to sow Italian Rye-grass in Fifeshire now. You had better sow in early spring or put the crop off for another year—sowing next autumn. Alsike Clover is to be sown just like the red or the Dutch Clover. Trifolium incarnatum will do on any undisturbed clean corn stubble, with a moist surface capable of being moved a quarter of an inch deep or less by a heavy bush harrow.

SHEEP: *T B J.* You should purchase full grown sheep, as two shear cross-bred Down and Leicesters, or Down and Cotswolds. If put on the Grass in August, and having a few Peas or some Barley or some cake after the middle of October, they will be fat before December.

TOBACCO JUICE: *J S G.* asks our correspondent "S." who writes from the Forfarshire Glens to describe in detail the mode of using tobacco juice for washing sheep. How is it prepared and used?

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents the insertion of whose contributions is still delayed

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1½ to 1 acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1788.

TO BE SOLD, a FOUR-HORSE POWER PORTABLE STEAM ENGINE.—Apply to WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, London.

CHAFF CUTTING MACHINES from 21*s.*—A complete Illustrative Catalogue, all sizes and most improved description, will be forwarded on application to WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, London.

BRUISING MILLS FOR OATS, BEANS, MALT, &c.—Illustrated Catalogue will be forwarded on application to WILLIAM DRAY & Co., Swan Lane, Upper Thames Street.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangold, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of COURE's Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late STEPHENSON & PEILL), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.

HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4*s.* 9*d.* each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5*s.* 3*d.* each.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

IRON BUILDING AND ROOFING WORKS.
GAS STREET AND BERKELEY STREET, BIRMINGHAM.

JOHN HENDERSON PORTER, ENGINEER and CONTRACTOR, Patentee of a new system of constructing (cheaply and expeditiously, by ordinary labourers) Portable Buildings and Sheds—formed of ordinary planks or boards—peculiarly suitable for Farm purposes. A Model Shed has recently been erected in the Agricultural Department of the Crystal Palace at Sydenham. Corrugated and Galvanised Iron Roofs and Roofing Plates, Eaves, Gutters, Rain-water Pipes, Tanks, Fences, &c.—London Office, 1, Riches Court, Lime Street.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street Westminster.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present reduced prices of Glass for Cash :—

SHEET SQUARES.—*In Boxes of 100 feet.*

6 by 4, and 6½ by 4½	£0 12*s.* 0*d.*

STOCK SIZES, in 100 feet boxes, from 12 by 10 to 20 by 15, at 18*s.* per 100 feet. If cut to order not exceeding 40 inches long.

16 oz. from 2½*d.* to 3½*d.* | 21 oz. from 3¾*d.* to 4½*d.*

26 oz. from 5½*d.* to 7½*d.*

Sixteen-ounce Sheet Glass packed in cases of 200 feet, or Crates of 300 feet, 2½*d.* per foot.

SIXTEEN-OUNCE SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO Mr. RIVERS, and of various dimensions, always on hand,

Double-crown Glass of various dimensions in 100 feet boxes.

GLASS TILES for Workshops, Farm Buildings, &c.

¼ of an inch thick	£1 17*s.* 6*d.*	per case of 50
3/16 „	2 1 3	„ 60
⅛ „	1 17 6	„ 60

Glass Slates of the usual dimensions.

Glass Milk Pans, 21*s.* per dozen; Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoys' Milk Syphons, Wasp Traps; Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, Sheet Lead, Pipe, White Lead, Oils and Colours, Paint Brushes, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, HELY & WARING, Managers, 296, Oxford Street, London.

STRONG HORTICULTURAL SHEET GLASS from 2*d.*; and HARTLEY'S PATENT ROUGH PLATE, from 4½*d.* per foot. CROWN or SHEET SQUARES, in 100 feet boxes, under 10 by 8, 12*s.* 6*d.*; above, 16*s.* 8*d.* per box. FOREIGN SHEET, in 200 feet cases, 34*s.* per case.

PERFORATED VENTILATING GLASS from 1*s.* 6*d.* per foot. TILES and SLATES from 6*d.* each. MILK PANS, 21*s.* per dozen. HELY'S HAND CHURN, 5*s.* 6*d.*; WARING'S BUTTER SLABS, 10*s.* each. Glass Fern Shades, Bee Glasses, Cucumber Tubes, Hyacinth Dishes, Propagating Glasses, Hand Lights, &c. Flower Labels, 7*s.* per 100, and the New Aquarium, 10*s.* each.—Catalogues free.

FOREIGN AND ENGLISH SHEET GLASS WAREHOUSE, 87, BISHOPSGATE STREET, WITHOUT.

T. MILLINGTON supplies the above SHEET GLASS in any size or substance, packed in 100, 200, or 300 feet cases. Same as supplied to Mr. RIVERS and the leading men of the day. Reduced tariff, boxes included.—Per 100 ft.

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the framework, but covered with Galvanised Iron Sashes, with excellent strong glass, and all completed for 1*s.* 3*d.* per foot super. Hundreds of references can be given, and Printed Price Lists sent.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark, (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY, WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. SEELEY (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	*s.*	*d.*

4 „	ditto 3 „ 6 „	as required.	3	3	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	14	0
2½ in.	long ditto	ditto ditto	2	18	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

(OBTAINED THE PRIZE PARIS EXHIBITION AWARD.)

COTTAM AND HALLEN

HAVE made important additions to their original Invention of PATENT ENAMELLED MANGER RACK AND WATER TROUGH AT ONE FIXTURE, the main features of which are shown in the above engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1s.
M. WEDLAKE, 118, Fenchurch Street, London.

TRANSPARENT SHEETING, a substitute for Garden Mats, nearly two yards wide, 1s. per yard run—MUCH APPROVED; thick Canvas ditto, 1s. per square yard; strong Tarpaulings for Carts and Waggons, 2s. per square yard: serviceable second hand ditto, 1s.; Waterproof Capes, to protect a man from wet while stooping down, 3s. each; second hand Policemen's Capes, fresh dressed, 18s. and 24s. per dozen; Horses' Waterproof Loin Cloths, lined with woollen, 7s. each: Driving Aprons, 7s. each; India Rubber Coats, 16s.; Oiled Coats, 7s. 6d.
R. RICHARDSON, 21, Tonbridge Place, New Road, London.

WIRE FENCING, less than 2-inch mesh, in various widths, from 15 inches to 6 feet wide, at 6¾d. per square yard; 3-inch mesh, 4d. per square yard; 4-inch mesh, 3d. per square yard. Galvanized Wire Fencing, 1s. per square yard, 1½-inch mesh. The above Wire-work is made by machinery, and is the cheapest article of the kind in England.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

GALVANISED WIRE GAME NETTING,
6d. PER YARD, 2 FEET WIDE.

BARNARD AND BISHOP, Market Place, Norwich, in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

	Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	6d. per yd.	4½d. per yd.
2-inch " strong, do.	8 "	6 "
2-inch " intermediate, do.	9½ "	7½ "
2-inch " extra strong, do.	11 "	9 "
1⅝-inch " 24 inches wide	7 "	5½ "
1⅝-inch " strong, do.	9 "	7 "
1⅝-inch " intermediate, do.	11 "	9 "
1⅝-inch " extra strong, do.	13 "	11 "

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10d. per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS. They contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright stoves, with bronzed ornaments and two sets of bars, 2l. 14s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s.; Bronzed Fenders complete, with standards, from 7s. to 3l.; Steel Fenders, from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s.; Fire-irons from 1s. 9d. the set to 4l. 4s. Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges.

1st,—From the frequency and extent of his purchases; and
2dly,—From those purchases being made exclusively for cash.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WM. S. BURTON to collect from the various manufacturers in Metal and Glass all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are ON SHOW over his SIXTEEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz., from 12s. 6d. (two light) to 16l. 16s.

LAMPS OF ALL SORTS AND PATTERNS.—WILLIAM S. BURTON invites attention to his season's SHOW of LAMPS. It embraces the Moderateur (the best Parisian specimens of which have been carefully culled), Argand, Solar, Camphine, Palmer's Magnum, and other lamps for candles; and comprises an assortment which, considered either as to extent, price, or pattern, is perfectly unrivalled.

Pure Colza Oil, 5s. 6d. per gallon.
Palmer's Candles, 10d. and 10½d. per lb.
Patent Camphine, 4s. per gallon.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

FOGGY WEATHER.

COLDS, COUGHS, ASTHMA, INFLUENZA, and DISEASES of the CHEST and LUNGS, arise chiefly from alternations of Temperature, and appear to be most peculiar to this climate, especially in damp foggy weather, and during the winter months; while persons of every age and station of life are alike subject to attack.

SPENCER'S PULMONIC ELIXIR

will be found a never-failing source of comfort and ease from suffering; enabling invalids to breathe with freedom during the keenest frost and thickest fog. In fine, it possesses every property which can be beneficial in cases of coughs, colds, asthma, and all complaints of the chests and lungs.

*** Ask for SPENCER'S PULMONIC ELIXIR.

Prepared only by T. Roberts & Co., Crane Court, Fleet Street, London; and sold wholesale and retail by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in the Kingdom. In bottles at 1s. 1½d. and 2s. 9d. each. *** The bottles at 2s. 9d. contain nearly as much as three small ones.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A method will be forwarded with instructions for 30 postage stamps which will destroy the above vermin quickly and without trouble. 1000 Acres may be cleared for a few shillings.—GILBERT DYSON, Hoo, Rochester.

DIRECT FROM YARMOUTH DURING THE SEASON.

REAL YARMOUTH BLOATERS 100 for 6s., forwarded securely packed to any address upon receipt of P. O. order by JAMES AYERS, Fish Curer, Great Yarmouth.
N.B. The trade supplied.

Circulars free by post.

NEW LABEL.—In consequence of the great variety of Counterfeit Labels of A. ROWLAND & SONS' MACASSAR OIL now in circulation, and which so nearly resemble the original as frequently to deceive the unwary—they have employed those eminent artists Messrs. PERKINS, BACON, & Co., who, at great cost, and by a peculiar process of their own, have succeeded in producing from steel "A NEW LABEL," which cannot be forged. It is composed of a section of an engine-turned circle, repeated 130 times, and forms an original lace-work ground, upon which is engraved in white letters, "UNDER THE PATRONAGE OF THE COURTS OF EUROPE," with an embossed profile of Her Majesty "THE QUEEN," lately specially taken for the purpose, and which surmounts the words (also in white letters) "ROWLANDS' MACASSAR OIL, for the growth, restoration, and for beautifying the Human Hair." Under which is the Signature of the Proprietors in Red Ink, "A. ROWLAND & SONS."—Sold by them at 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—ROSALIE COUPELLE'S CRINUTRIAR is guaranteed to produce Whiskers, Moustachios, &c., in a few weeks, and restore the Hair from whatever cause, strengthen it, prevent its falling off, and effectually check greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness. Sold by all Chemists, price 2s., or sent free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN—"Through using it I have an excellent moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

FOR THE BENEFIT OF SUFFERING HUMANITY.—A retired gentleman having cured himself of Deafness, Defect of Sight, and General Debility, after suffering upwards of 25 years, thinks it his duty to make the remedy known for the benefit of the afflicted; he will therefore forward the particulars for the cure of the same on receipt of a twopenny stamped envelope properly directed.—Address Rev. J. JOHNSTONE, 1, Park Terrace, Heavitree, Exeter, Devonshire.

DEBILITY AND NERVOUSNESS.—Encouragement to those in despair, and suffering from debility, spermatorrhœa, relaxation, nervousness, and exhaustion of the system. Advice and prescriptions, with a treatise on these diseases, for a successful course of self-treatment, by which a permanent cure of the most protracted case is effected, sent post free upon receipt of 14 postage stamps, by E. J. ROBERTS (late Army), Surgeon, 9, North Terrace, Moor Edge, Newcastle-on-Tyne.

HOLLOWAY'S OINTMENT AND PILLS WONDERFUL REMEDIES FOR THE CURE OF ULCERS.—Mrs. Yates, Grocer, of Clitton, near Eccles, suffered severely for some time from an ulcer in the neck, and with a fruitless perseverance in the use of various remedies, she felt convinced nothing whatever would heal it. However, by the recommendation of Mr. Heap, Druggist, of Openshaw, she commenced using HOLLOWAY'S Ointment and Pills, and these invaluable medicines very speedily cured her, not only healing the wound, but restoring her to a perfect state of health.—Sold by all Medicine Vendors throughout the world; at Prof. HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODS, Malta.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids: much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 80 years have been held in constant and increasing public estimation as the purest farina of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6d. and 1s.; and Family Canisters, at 2s., 5s., and 10s. each.

CITY PRICES IN REGENT STREET.

MR. MECHI feels it necessary to state (as a contrary impression prevails) that his varied Manufactures can be purchased with the same regard to economy, and at the same prices at his New Establishment, No. 112, Regent Street, as at his City House, 4, Leadenhall Street, London.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work Boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Papier Maché Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste &c. Shipping orders executed. The same prices charged at all the Establishments.

TO GARDENERS.

THE CROWN ESTATE PAVING COMMISSIONERS hereby give notice that they will be ready to receive TENDERS from Persons willing to enter into a Contract for keeping in Order the Gardens or Ornamental Inclosures attached to or situate in front of the several Terraces and Races in and about the Regent's Park; and likewise the Gardens or Ornamental Inclosures attached to Carlton House Terrace, and Carlton Gardens, and to Richmond Terrace. Specifications and Forms of Tender can be had on application to me here, where Tenders are to be delivered at or before 1 o'clock on Wednesday, the 5th day of December next.
1, Whitehall Place, Nov. 19. FRANCIS ADAMS, Clerk to the Commissioners.

TO MARKET GARDENERS.

TO BE LET, with immediate possession, an excellent HOUSE and about 10 ACRES of GARDEN GROUND, situate at Littlemore, three miles from Oxford, on the bank of the river Thames.—May be viewed, and particulars ascertained, on application to Mr. THOMAS PALMER, Littlemore.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY and PRACTICE of HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By John Lindley, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840 since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: Longman, Brown, Green, & Longmans.

CRYSTAL PALACE.—HORTICULTURAL FETES.—It is intended to hold TWO HORTICULTURAL FETES in 1856. The first on SATURDAY, the 24th May, and the second on WEDNESDAY, the 10th September.

Due notice of the Conditions of Exhibition and of the Prizes will be given. By order,

Crystal Palace, December 1. G. Grove, Secretary.

AMERICAN PLANTS:

JOHN WATERER'S CATALOGUE of RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.

☞ The Catalogue describes the colours of the Rhododendrons.

The American Nursery, Bagshot, Surrey.—Dec. 1.

AMERICAN PLANTS.

WATERER AND GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.

Knap Hill Nursery, Woking, Surrey.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.

American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway, where conveyances may be had.

R. PARKER begs to inform his friends and patrons that his PRICED CATALOGUE of DUTCH BULBS is now ready, and will be forwarded post free upon application.

Paradise Nursery, Hornsey Road, Holloway.

TO THE SEED TRADE.

ABRAHAM HARDY AND SON, Seed Growers, Maldon, Essex, beg to announce that their WHOLESALE PRICED CATALOGUE OF SEEDS and early Potatoes is now ready, and may be had post free on application.—Dec. 1.

TO PEAR AMATEURS.

THOMAS RIVERS'S DESCRIPTIVE CATALOGUE of PEARS is printed separately from the Catalogue of Fruit, and will be sent free on application to The Nurseries, Sawbridgeworth, Herts.

PEARS GRAFTED ON THE QUINCE AS PYRAMIDAL SHAPED TREES.

J. AND J. FRASER beg to announce that their Priced List of the above is now published, and may be had post free on application.

J. & J. F. have sold a large number of these Trees for the last three years, and have received numerous letters from gentlemen in the country speaking in very high terms of their productiveness. They can therefore recommend them with greater confidence to the notice of their friends and the public in general.

Lea Bridge Road, Essex.

ARROW SMITH'S (Nurseryman) CATALOGUES are now ready, and may be had free on application.

FOREST PLANTING undertaken by Contract.

LANDSCAPE and ORNAMENTAL GROUNDS executed.

Sydnope, near Matlock, Derbyshire.

FLOWER AND VEGETABLE SEEDS.

JAMES CARTER AND CO. beg to announce that they will publish, on 1st January, 1856, their TWENTY-FIRST ANNUAL CATALOGUE OF FLORICULTURAL, VEGETABLE, AND AGRICULTURAL SEEDS, acknowledged to be the most comprehensive yet compact Annual Catalogue of Seeds extant. It has been subjected to a careful and elaborate revision, in order to ensure the greatest possible correctness. Forwarded free of charge, and post paid, upon application.

James Carter & Co., Seedsmen, 238, High Holborn, London.

GERMAN FLOWER AND VEGETABLE SEEDS.

MESSRS. PLATZ AND SON, Seed Growers, Erfurt, Prussia, respectfully inform the Trade that their Catalogue for 1856 contains more new and choice articles than have ever been offered. Early applications are solicited through their Agent, Mr. Robert Kennedy, Bedford Conservatory, Covent Garden, London.

CEDRUS DEODARA.

YOUELL AND CO. beg to offer fine healthy well grown Plants of the above, admirably adapted for Cemetery planting, &c., at the following prices, viz. Fine handsome well-furnished Plants, 2 to 3 feet, 3s. 6d. each, 36s. per dozen; ditto, 4 to 5 feet, 7s. 6d. each, 72s. per dozen. The above were all transplanted last season, and will remove with perfect safety.

Their CATALOGUE of Rare and Hardy Conifers and other Ornamental Hardy Evergreen and Flowering Shrubs, may be had on application. Railway Carriage and Freight by Steamers very reasonable.—Royal Nursery, Great Yarmouth, Norfolk.

SEED POTATOES.

SUTTON AND SONS, Seed Growers, *Reading, have a large Stock of the best early kinds of Potatoes very true and free from disease. Prices, &c., will be sent post free on application.*

TO THE SEED TRADE.

GENUINE NEW SEEDS, *of the undermentioned kinds, warranted all of the growth of 1855, may be obtained from the Undersigned, who will forward prices on application.*

CARROT, of several sorts.	SKIRVING'S SWEDE, fine stock
MANGEL WURZEL, do.	GREEN GLOBE TURNIP.

Sutton & Sons, Seed Growers, Reading.

DUTCH FLOWER ROOTS.

WILLIAM DENYER, Seedsman and Florist, offers the following choice Collection for 10s.:—

12 good Hyacinths	12 Single Tulips	12 splendid Anemones
12 Narcissus	12 Jonquils	25 Snowdrops
12 Double Tulips	12 beautiful Iris	100 Dutch Crocus, all colours.

No charge for packages.—82, Gracechurch Street, London.

NEW DOUBLE WHITE PETUNIA—"IMPERIAL" (TRUE).

CHARLES TURNER will be able to supply strong Plants after the 1st of January of this beautiful new variety, which is as double as an Oleander, and fragrant. Plants 3s. 6d. each, with a considerable reduction to the trade if a dozen is taken. C. T. begs particularly to recommend it, as it is not only a novelty but also a valuable bedding plant.

Royal Nursery, Slough.

THE TRUE LANCASHIRE SHOW GOOSEBERRIES.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, can now supply 24 strong plants for 12s., or 12 plants for 7s., of the below-named GOOOSEBERRIES, which are of fine flavour. Weights taken from the "Gooseberry Grower's Register of 1855," viz.:—

	dwts.	grs.		dwts.	grs.
London	30	5	Lady Leicester	22	16
Thumper	26	18	Pilot Snowdrop	22	10

Napoleon	22	22	Broomgirl	20	0
Overall	22	22	Coppice Lass	19	10

Post-office Orders to be made payable at Middleton, Lancashire. Catalogues on application.

FRUIT TREES, GOOSEBERRY & CURRANT BUSHES.

TO BE SOLD, the surplus Stock, comprising Standard Cherries, Plums, Apples, and Pears, from 6 to 12 years' old growth; several thousands Rifleman Gooseberries, and large Red Grape Currants, from 2 to 4 years' old, will be sold for much less than their value.—To view, apply to Mr. Mitton, Lampton, near Hounslow, 1 mile from station.

TO BE SOLD very cheap for Cash, as the Ground is required for other purposes, 10,000 ORNAMENTAL FOREST TREES, from 6 to 15 feet, a great variety of sorts; 20,000 GOOSEBERRIES and CURRANTS, leading kinds: 500 BUSHY YEWS, from 4 to 6 feet; about 1000 DECIDUOUS FLOWERING SHRUBS; and a large quantity of 2-year SEA-KALE and ASPARAGUS Plants.—Apply to Mr. Chas. Clarke, Nurseryman, &c., 179, Windmill Street, Gravesend, Kent.

PINE PLANTS.

TO BE SOLD, a quantity of fine fruiting QUEEN PINE PLANTS, many of them ready to start. No reasonable offer will be refused.—Apply, Thos. Steer's Pinery, Teddington, Middlesex.

SPANISH CHESNUTS.

TO BE SOLD, about 200,000 Strong SPANISH CHESNUTS, from 2 to 4 feet. Price sent on application to Waterer and Godfrey, Knap Hill, Woking, Surrey.

WANTED TO PURCHASE, a quantity of ERICA CARNEA, for bordering.—Address, stating lowest price per 100, D. C. L., *Critic* Office, 29, Essex Street, Strand. Also, a few HARDY HEATHS, varieties.

HARDY HEATHS.

WATERER AND GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

THOMAS BELL, Seedsman, Wigan, Lancashire, has for sale TRUE LANCASHIRE FLUKE POTATOES, 4s. 9d. per bushel, of 80 lbs., or 6l. 6s. per ton. YORK REGENTS, 4s. 3d. per bushel. RED DOWNS, 4s. 6d. per bushel.

THE FLUKE KIDNEY POTATO.—This excellent and famed Potato, which has proved so beneficial to the Farming interest, from its capability of withstanding the ravages of disease and its abundant bearing qualities, was raised in Middleton; purchasers may therefore rely upon having it true from the original stock. May be had in any quantity, at 4s. per bushel of 56 lbs.—Apply to John Holland, Bradshaw Gardens, Middleton, near Manchester. Post Office orders may be made payable at Middleton, Lancashire.

BUSBY'S STOCKWOOD GOLDEN HAMBURGH GRAPE.

MESSRS. VEITCH AND SON in reply to the many inquiries they are constantly receiving as to when plants of this splendid new Grape will be ready for distribution, and for the information of the public, beg to say that the stock of eyes they have just received from Mr. Busby is sufficiently ample to justify the belief that it will be ready for delivery in the autumn of 1856, at the price previously announced, 21s. each. All orders already given have been duly registered, and will be executed strictly in rotation, and the same rule will be observed with reference to all future orders. Consequently the earliest orders will secure the strongest Vines.

Nurseries, Chelsea and Exeter, Dec. 1.

NEW SEEDS, GROWTH OF 1855.

WILLIAM E. RENDLE AND CO., Seed Merchants, Plymouth, *are now receiving their general Collection of Seeds from the Growers, and all the earliest varieties are now ready for delivery.*

William E. Rendle & Co., Seed Merchants, Plymouth. Established 1786.

SCARLET RHODODENDRONS.

J. AND J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine bushy Plants of the above 2 to 3 feet high, in Pots, well set with Flower buds.—Price 10s. 6d. each.

CHARLES SHARPE AND CO. beg to acquaint the trade that having harvested their stocks of SEEDS they will be glad to forward prices on application.

Nursery and Seed Establishment, Sleaford. Dec 1.

TO THE TRADE.

NEW PURE WHITE COLLINSIA.—The price per ounce of this new and beautiful ANNUAL can be had on application.

J. G. Waite, Seed Merchant, 181, High Holborn, London.

NEW RHUBARB, EARLY RED EMPEROR.—The stalks of this variety are as large as the Victoria, very high in colour, red throughout, good forcer, and very prolific. Price 18s. per dozen.

J. G. Waite, Seed Merchant, 181, High Holborn, London.

NEW VICTOR A RASPBERRY, twice the size of Falstaff, and a good bearer, price 6s. per dozen Canes, or 40s. per hundred.

J. G. Waite, Seed Merchant, 181, High Holborn, London.

WAITE'S DANIEL O'ROURKE PEAS.—The best Early Pea in cultivation can be supplied in any quantity, and price had on application to J. G. Waite, Seed Merchant, 181, High Holborn, London.

ASPARAGUS AND SEAKALE.—Plants of the above cannot be offered better for size, quality and reasonable charges than at the Horticultural Establishment of Messrs. John Weeks & Co., King's Road, Chelsea.

MESSRS. JOHN WEEKS AND CO. beg to offer a considerable quantity of STRAWBERRY PLANTS in pots, for forcing, of superior growth, and of the best known sorts for that purpose, at their Horticultural Establishment, King's Road, Chelsea.

MESSRS JOHN WEEKS AND CO. are provided at their Horticultural Establishment, King's Road, Chelsea, with a fine selection of CAMELLIAS of the better kinds, in dwarf bushy plants, well set with flower-buds; of RHODODENDRONS and AZALEAS for forcing of the same qualities, with a good stock of autumnal blooming HEATHS.

CAMELLIAS.

CHANDLER AND SONS, Nurserymen, Wandsworth Road, beg to inform their friends and customers that their CAMELLIAS are finely set with flower buds this season. They are sending out bushy plants from 30s. and upwards per dozen.

BASS AND BROWN'S new AUTUMN CATALOGUE, comprising a considerable portion of descriptive and useful information for purchasers, will be sent free by post for three penny stamps, or gratis to their customers, who may not have received them.

Seed and Horticultural Establishment, Sudbury, Suffolk.

ROSES, HOLLYHOCKS, CONIFERS.

(Wholesale and Retail.)

A. PAUL AND SON beg to inform their Patrons and the Trade generally, that owing to extended experience and improved systems of culture, their ROSES, HOLLYHOCKS, and CONIFEROUS PLANTS are this season unusually fine.

Nurseries, Cheshunt, Herts (13 miles N.E. of London).

DAHLIAS IN DRY ROOTS.

J. ROBINSON respectfully begs to offer his well known collection of DAHLIAS, about 300 in number, and in excellent condition, and each Root correctly labelled. They consist of nearly all the new kinds, both fancy and others, of last season, together with all the older varieties of both kinds worth growing.—Full particulars may be had by communicating with J. Robinson, 2, Glasgow Terrace, Thames Bank, Pimlico.

TO THE SEED TRADE.

Hardy Winter White Broccoli New Seed.

W. JACKSON AND CO. have for sale new seed saved this year of the above White Broccoli. When sown early and grown well, it heads in November, December January, and February—a valuable winter kind. Price in quantity on application.—Nurseries, Bedale, Yorkshire, Dec. 1.

NEW BEDDING PLANT.

Double White Petunia "Imperial" (true).

MESSRS. WILLIAM ROLLISSON AND SONS can now supply good plants of the above-named at 5s each. This extraordinary, new, and beautiful variety can be strongly recommended, and doubtless will become an universal favourite, both as a bedding and conservatory plant, being of excellent habit, fragrant, and the flowers as double as a Carnation or Gardenia blossom.—The Nurseries, Tooting, London.

DAHLIA INCOMPARABLE (ABLITT'S).

THOMAS BARNES having purchased the surplus Stock of the above, which was but partially let out last spring, is enabled to offer fine roots at the following prices, viz., 5s., 7s. 6d., and 10s. 6d. each. Colour rich ruby crimson, of first-rate shape, shown in all T. B.'s stands, as also the raiser's.

T. B. has also a few roots of his splendid Dahlia WARRIOR. Deep crimson, shaded, 10s. 6d each, with all the leading varieties of other raisers.—Dane Croft Nurseries, Stockport.

CHARLES DALY AND SON, Nurserymen, Coleraine, beg to inform the Trade and the Public that they have one and two years' seedling Thorn Quick for sale; Irish Yews, Forest Trees, and Shrubs: Beech, 3 to 4 feet. Hollyberries, 4s per bushel; Haws, 4s ditto; Common Laurel, 12s. 6d. per 1000; Portuguese ditto, 6s per 100; Seedling Forest Trees, cheap. Catalogues with prices free by post.—Dec. 1.

TO PLANTERS AND THE TRADE.

HAY, SANGSTER, AND CO., will Sell the following cheap, as the ground must be cleared:—

Strong Standard Dwarf and Dwarf Trained PEARS,
Do. do. do. GREENGAGE and VICTORIA PLUMS,
Do. do. and half Standard MULBERRY,
Do. do. and Dwarf Trained CHERRIES, [RHUBARB,
PRINCE of WALES, PRINCE ALBERT, and VICTORIA
Strong two years' SEAKALE and ASPARAGUS,
EVERGREEN OAKS, in pots, 3 to 5 feet.

18 and 19, Cumberland Place, Newington Butts, London.

NEW DAHLIAS FOR 1856.

STEPHEN SHILLING begs to offer to Nurserymen, Florists, &c., the following NEW and SUPERB DAHLIAS, raised by Mr. J. Smith, of the Floral Cottage, Crookham.

HELEN SMITH, yellow ground tipped and shaded with orange, well formed flower, good centre, pronounced to be one of the most constant Dahlias cultivated (raised in 1854). Ground Roots, 42*s.* each; or strong plants in May, at 10*s.* 6*d.* each.

LORD CARDIGAN; crimson purple, fine formed flower, with full centre, highly recommended (raised in 1854.) Ground Roots, 42*s.* each; or strong plants in May, at 10*s.* 6*d.* each. A discount allowed where two or more of the ground roots are taken, or where six or more plants are taken in May. Their having been grown two seasons, and fully proved, can be sent out with confidence as first-rate varieties.

John Edwards, Esq., speaks of Helen Smith in 1854: "Flower highly desirable, good build, pleasing colours, and well formed petals." Mr. Turner, in "The Florist" of September, 1855, says: "The flower is of the Malvina form, and making good outline and centre." Six blooms were exhibited at the Basingstoke Horticultural Show, September, 1855, cut indiscriminately from the plants, no shading or care whatever taken, were "highly commended by the judges," and acknowledged to be the best Dahlia there. "The Florist," for September, 1855, speaks of Lord Cardigan: "Sir F. Bathurst form, deeper in colour and fuller; a deep fine formed flower with full centre."

All orders strictly executed in rotation as received.

North Warnborough Nursery, near Odiham, Hants, Dec. 1.

WATERER AND GODFREY respectfully invite the attention of parties engaged in Planting to their fine Stock of the following HARDY ORNAMENTAL TREES, &c.

Araucaria imbricata, 2, 3, 4, 5, 6, 7, and 8 feet high, in quantities, all stocky well grown plants; the larger sizes especially it would be difficult to match.
Cedrus Deodara, 1½, 2, 3, 4, and 5 feet, by the thousand; do. a fine lot of larger, 6, 7, and 8 feet; do. some magnificent Trees, 10 to 15 feet. These are all in a famous condition for Transplanting, having been annually removed.
Cedars of Lebanon, 3, 4, 5, and 6 feet; do. a few splendid Trees, 10 and 12 feet.
Cedars Red Virginian, 5 to 8 feet.
Cedars, variegated white, 2, 3, and 4 feet, one of the handsomest variegated plants we know. We have a large stock. It is extensively planted at Elvaston Castle.
Cryptomeria japonica, fine plants, 4 to 7 feet.
Cupressus macrocarpa or Lambertiana, 3, 4, 5, 6, 7, and 8 feet. Nothing can be handsomer than some of the specimens of this fine hardy plant.
Juniper, Chinese, 2, 3, 4, and 5 feet; a fine lot of large plants, 6 to 8 feet.
Do. Irish, upright, 3, 4, 5, and 6 feet; do. larger, up to 8 and 10 feet. Our stock of the two last mentioned Junipers we believe to be quite unequalled, the Irish especially; the larger sizes are perfect columns.
Do. recurva, 3, 4, 5, up to 8 feet.
Do. hispanica or thurifera, 2, 3, and 4 feet.
Abies Douglasi, 2, 3, and 4 feet. A fine lot of large and very handsome plants, 7, 8, 10, and 12 feet.
Picea nobilis, several hundreds of nice plants, 1½ to 2 feet, well grown, and with good lead. None are grafted. A few taller specimens up to 6 feet.
Do. Nordmanniana, a large quantity of remarkably handsome plants, 1½, 2, 3, and 4 feet. Nothing can exceed the vigour of these plants, and all from seed.
Do. Pinsapo, magnificent plants 4 to 7 feet high, in perfect health.
Pinus insignis, 1½ to 3 feet; a few good specimens up to 7 feet.
" Lambertiana, from seed, 4, 5, and 6 feet.
" Cembra, 3, 4, 5, up to 10 feet.
" Montezumæ, fine plants, 4 and 5 feet.
" macrocarpa, 2 and 3 feet, from seed.
Weeping Larch, clean, stems good, heads 7 feet high.

The following 10 varieties form a very singular group. They are of dwarf habits; the well known Abies Clanbraziliana may be taken as the type of the whole. We believe our collection to be quite unique, and, we may add, most interesting.

Pinus strobus pumila (the dwarf Weymouth).
" sylvestris pumila (the dwarf Scotch).

Abies Clanbraziliana	Abies pumila	All dwarf varieties of the Spruce Fir.
" compacta	" diffusa	
" pygmæa	" Gregori	

Picea pectinata pygmæa (the dwarf Silver Fir), Hudsoni.
Yew, common English, 3, 4, 5, 6, and 7 feet, in large quantities.
Do. upright, Irish, 4, 5, 6, and 7 feet; some splendid plants, 8 to 12 feet.
Do. Dovaston or Weeping, a great many fine plants, worked on straight stems, 7, 8, and 10 feet high, with good heads.
Do. adpressa, 2 and 3 feet.
Do. do., worked on common Yew, as standards.
Do. gold striped, 1½ to 2 feet, by the thousand.
Do. do., a splendid lot of plants, 4 to 6 feet.
Do. do., worked as standards on the common Yew, 8 to 10 ft. high.
Do. do., worked on Irish Yews, 6, 7, and 8 feet high.
Do. elegantissima, or new gold striped; a large quantity, 1½ to 2½ feet, and also worked as standards on the common and Irish Yews. We may safely assert our stock of Golden Yews is unsurpassed.
Do. yellow berried (true), very beautiful when in fruit as we have it, 1½ to 3 feet.
Libocedrus chilensis, 2 to 3 feet, very handsome and bushy.
Thuja Wareana, fine bushes, 3, 4, 5, 6, and 8 feet. This is one of the most useful, and, at the same time, ornamental hardy plants we possess.
Do. American, for hedges, doubtless the very best, 4, 5, and 6 feet.
Do. aurea, or Golden Arbor-vitæ. This plant originated at this Nursery; it has now, as it deserves, become a universal favourite. Our stock of it enables us to offer a choice of many hundred fine specimens, from 1½ to 3 and 4 feet high, and as much through—in fact, perfect globes.
Wellingtonia gigantea, a few of the finest plants in the country, being near 1½ feet high, and as much wide.
Hollies variegated, by the thousand, 2, 3, and 4 feet high. Some splendid Plants, 10 to 15 feet high.

We may here remark with reference to the large specimens alluded to in this Advertisement that every one of them is in a condition to transplant, and travel any distance with perfect safety. They have one and all been annually removed in our Nursery, and in soliciting a personal inspection of our stock, we believe we are justified in stating it offers a choice which is to be found in but few establishments of its kind in this country.

The Nursery may be reached in 40 minutes by Train from the Waterloo Station; and the South Western Railway Company having a Branch on to the North Western, enables us to send plants to all parts, in trucks throughout, without packing and other extensive additions.

Knap Hill Nursery, Woking, Surrey.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERS, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

KINGHORN'S UNEQUALLED NEW SCARLET GERANIUMS.

COUNTESS OF WARWICK.—Beautiful large variegated foliage, white margin, dark horse-shoe, banded with pink, strongly marked, large truss of deep scarlet, the individual flowers of fine form, is of vigorous growth, proved to grow and flower well planted out. Received a certificate at the Royal Botanic Exhibition. Plants in May, 10*s.* 6*d.*

ANNIE.—This is a decided improvement on "The Flower of the Day" and "Silver King," possessing fine large trusses of bright scarlet, the foliage large and flat, margined with pure white, does well planted out, has produced leaves 4¾ inches over, very free grower. Plants in May, 10*s* 6*d.*

GENERAL PELISSIER.—This noble Geranium has been the admiration of all who have seen it, either in pots or bedded out, throwing its numerous globular trusses of orange scarlet flowers, well above the foliage, on strong white flower-stalks, flowers of fine form, with white eye; is of compact vigorous growth, leaves medium size, with dark green margin, distinct horse-shoe, paler green in centre. The best scarlet Geranium ever offered, flowers very free and perfect in the smallest pot. Was awarded a first-class certificate at the National Floricultural Society. Plants in May, 10*s.* 6*d.*

F. R. KINGHORN begs to state that this is the first time that he has advertised any of his numerous seedlings to be sent out by himself, and would most respectfully assure those who may not have seen the above at the exhibitions of the Royal Botanic, Horticultural, Crystal Palace, and National Floricultural Societies, that they are very superior to his former seedlings, "The Flower of the Day," "Attraction," "Silver King," or "Cerise Unique," &c., and that he has the greatest confidence in recommending them, both as pot and flower-garden plants. He may also state that they were noticed very favourably by all the leading periodicals in their reports of the several exhibitions. The usual discount to the trade. A remittance will be required from unknown correspondents.

St. Margaret's Gardens, Isleworth, Middlesex, Dec. 1.

BASS AND BROWN beg to offer the following from their Catalogue just published, which cannot fail to afford full satisfaction to purchasers, for strong growth and superiority of sorts:—

	s.	*d.*
ROSES.—100 dwarfs in 100 very superior varieties ...	60	0
" 100 " 50 ditto ditto	45	0

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (PAMPAS GRASS).—E. G. H. & SON having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2*s.* 6*d.* each, 25*s.* per dozen, or 7*l.* 10*s.* per 100.

Wellington Nursery, St. John's Wood.

TREE CARNATIONS.
"FLOWERING WINTER AND SUMMER."

YOUELL AND CO. have now to offer a fine stock of all the best varieties of the above deservedly favourite class, which cannot be too strongly recommended, not only for their fragrance, but the brilliant display they afford during the autumn and winter months, either in the Greenhouse, Conservatory, or open Garden. In Bouquets they are unsurpassed. Strong plants in pots, 18*s.* per dozen.

They also beg to call attention to the following:—

CARNATIONS AND PICOTEES.

Our collection of the above is probably the most extensive in Europe, having for a series of years bestowed our special attention to their cultivation upon an extent that enables us to offer—

The choicest varieties by name at 18*s.* and 24*s.* per dozen pairs		
Fine mixed border ditto	9*s.*	"
Fine old Clove Carnations	12*s.*	"
True White ditto	18*s.*	"

Pinks, comprising all the new first-class show flowers, 9*s.* and 12*s.* per dozen pairs.

All orders of 2*l.* and upwards are delivered, carriage free, to London, Newcastle, and Hull, as well as to any Railway Station within 150 miles of the Nursery.

Royal Nursery, Great Yarmouth, Norfolk.

WALTON NURSERY, LIVERPOOL.

TO NOBLEMEN AND GENTLEMEN PLANTING NEW PLEASURE GROUNDS, OR IMPROVING PARKS OR DRIVES, AND TO COMPANIES PLANTING PUBLIC PARKS OR CEMETERIES.

W. SKIRVING begs to offer his extensive Stock of TREES and SHRUBS of various sizes, adapted either for immediate effect or for extensive new Plantations, where smaller sized and less expensive plants are required. In addition to his general stock of the leading kinds of Trees and Shrubs, which is allowed to be the most extensive in England, he this season offers upwards of a hundred thousand of the two most valuable Trees lately introduced, the ARAUCARIA IMBRICATA and CEDRUS DEODARA, of various sizes, from one to six feet.

W. S. invites any one wanting considerable quantities of Specimen Trees and Shrubs to inspect his collection and obtain prices on the spot, as the mere height of such trees (as quoted in lists) gives no idea of the value of well grown select plants for choice situations.

N.B. A few hundreds of the larger sized and finely shaped plants of the Araucaria imbricata and Cedrus Deodara have been grown in tubs, to secure their travelling in safety to great distances in this country, or to any part abroad.

Priced Lists will be sent on application.

NEW OR RARE PLANTS AT REDUCED PRICES.

MESSRS. WILLIAM ROLLISSON AND SONS are now prepared to offer the annexed:—

TYDÆA ELEGANS.—A most beautiful plant from New Grenada, with bright scarlet flowers; 10*s* 6*d.* each.
BIGNONIA CHRYSOLEUCA.—A distinct new species semi-creeper, the blossoms are yellow, tipped with white; 15*s.* each.
COLEUS BLUMEI PECTINATUS.—A very distinct variety, the foliage is variegated similar to Coleus Blumei, but the leaves are beautifully laciniated; 5*s.* each.
MANDIROLA ROEZLI.—An extremely handsome gesneraceous plant producing fine spikes of lilac-coloured blossoms; 15*s.* each.
VACCINIUM ERYTHRINA.—A truly magnificent plant sent us by our collector Mr. John Henshall; the flowers are produced in bunches, of a bright crimson colour; 31*s.* 6*d.* each.
ARAUCARIA COOKI.—Handsome well formed seedling plants; 84*s.* each.
AUBRIETIA MOOREANA.—A new and distinct beautiful flowering Alpine plant; 5*s.* each.
MANDIROLA LANATA.—A pretty gesneraceous plant, of a delicate violet colour inside the mouth of the blossoms, and shaded lilac outside; 15*s.* each.
ORTHOSIPHON SPICATUS.—This plant has been recently introduced from Ocana, and is a great acquisition, its foliage being deliciously fragrant; its blossoms are large and white; 10*s.* 6*d.* each.
BEGONIA SPLENDIDA.—This exquisite plant has been discovered and sent us by our collector Mr John Henshall, during his researches in the Indian Archipelago; as an ornamental plant it is unequalled, 21*s.* each.
LASIANDRA HOIBRENKI.—This is a very distinct and handsome plant, with very large beautiful blue flowers, and pretty ornamental foliage; 10*s.* 6*d.* each.
PASSIFLORA ALBA-NIGRA.—As the name implies, this is a very distinct new greenhouse climber; 5*s.* each.
ERICA ÆMULA.—A very beautiful hybrid, in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour; 10*s.* 6*d.* each.
ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent, whose name it bears; it is a very compact grower and excellent in habit, with tubular blossoms of a fiery scarlet colour; 21*s.* each.
ERYTHRINA COTTYANA, a superb variety, producing immense spikes of blossom, with flowers of a very rich deep scarlet colour; 5*s.* each.
CRYTHRINA BELLANGERI.—The free flowering character of this plant renders it a great acquisition. Cuttings struck in the spring blossom profusely through the summer, which is not generally the case with the other sorts, as they do not usually flower until the second year after being propagated; 5*s.* each.
RHOPALA ORGANENSIS, an exquisite ornamental Stove Plant, far exceeding in beauty any other sort in this family, 31*s.* 6*d.* each.

The Nurseries, Tooting, London.

SAYNOR AND COOKE'S KNIVES *may be procured from* Messrs. SUTTON and SONS, Seed Growers, Reading, *who have for many years been supplied direct from* Messrs. SAYNOR'S Manufactory, *and none others are kept on* Messrs. SUTTON'S Premises.

CROCUS, TULIP, AND HYACINTH BASKETS, with Wire or Zinc Linings, for suspension or for table stand; also Bracket Baskets made and Japanned in a variety of colours and designs, by W. RICHARDS, Imperial Wire Works, 370, Oxford Street. Conservatories fitted up.

Window Blinds and Wirework of every description.

OLDENBURG NECTARINE.

MESSRS. VEITCH AND SON, of the Exeter and Chelsea Nurseries, having received the stock of the above valuable NECTARINE from the raiser, Mr. Madge, gr. to Miss Fanshawe, of Torquay, respectfully announce that they are now prepared to supply good trees on the following terms:—

MAIDEN TREES, ... 7*s.* 6*d.* each
DWARF TRAINED ... 10*s.* 6*d.* and 15 0 „
With one over on threes to the Trade.

A few extra-sized Dwarf-trained, and Trees in pots for Orchard Houses, at 21*s.* each.

The OLDENBURG is believed to be a cross between the ELRUGE and WHITE NECTARINES; fruit of it exhibited on the 2d of October last, at a meeting of the Pomological Society, elicited the following very favourable report, which appeared in the "Cottage Gardener," on the 9th of that month:—"The most interesting part of the exhibition was the examination of a new Peach and Nectarine from Messrs. Veitch & Son, of Exeter and Chelsea. The Nectarine, which was called the Oldenburg, was one of a very superior quality, and contrasted considerably with the five specimens of Stanwick in the same collection, which were very inferior in flavour. The Oldenburg is a medium-sized fruit, somewhat similar in size to the Elruge. It is ovate in shape, and very much covered with very dark red, except where shaded by the leaves, when it is pale yellow. The flesh separates freely from the stone, is very melting and juicy, with a rich sugary and vinous flavour; it is yellowish white throughout, and even at the stone there is not the slightest trace of red. The fruit seems to keep well after being gathered, and shows a disposition to shrivel without decaying."

In our advertisement of OLDENBURG NECTARINE, inserted last Saturday, the price of *Maiden Trees* should have been 7*s.* 6*d.* each, and not 2*s.* 6*d.*

Nurseries, Exeter and Chelsea.

WILLIAM IVERY begs to inform his friends and the public that he is now prepared to send out his splendid Seedling CINERARIA, ADMIRAL DUNDAS, which was awarded a Certificate at the National Floricultural Society, April 20th, 1854, and has been much admired for its compact habit and form of flower, colour white ground, with deep rich plum margin, 7*s.* 6*d.* each. Also a few Plants of that much-esteemed CINERARIA, MRS. TRUELOVE, 7*s.* 6*d.*

W. IVERY can with great confidence recommend the above two to be the best ever offered. W. IVERY can also supply all the best INDIAN AZALEAS, well set with bloom, in 54 and 48-size pots, from 12*s.* to 18*s.* per dozen; also all the leading kinds of Hybrid, Perpetual, Tea-scented, Bourbon, and Noisette ROSES, on their own roots, in 60-sized pots, well established, from 12*s.* to 18*s.* per dozen.—A select Catalogue of the choicest Geraniums, Fuchsias, &c., may be had on application.

N.B.—A choice collection of Ornamental Shrubs and Fruit Trees. Mushroom Spawn of the finest quality. The trade supplied.—Hanover Nursery, Peckham, near London, Dec. 1.

CHOICE PLANTS, ETC.

YOUELL AND CO. beg respectfully to call attention to the following, which they are now sending out in fine strong plants:—

AZALEA, varieties of Indica, comprising the following and other equally choice kinds, good bushy plants in large and small 48 sized pots, at 12*s.* and 15*s.* per dozen, viz.: Aurantia elegans, Exquisite, Fulgens grandiflora, Constance, Prince Albert, Murrayana, ignescens, Lateritia grandiflora, Conqueror, Emily, Decora, Rosea punctata, carminata.
CAMELLIAS, in choice new kinds, without bud, 21*s.* per dozen.
EPACRIS, of finest varieties, bushy plants in 48's, 12*s.* per doz.; smaller ditto, 9*s.*
GLOXINIAS, a very choice collection of all the new varieties, strong bulbs, 18*s.* per dozen.
GREENHOUSE PLANTS, in 50 best kinds, for 50*s.*
EUGENIA UGNI, a new Myrtaceous of easy cultivation, producing delicious fruit now being used for dessert, good plants, 2*s.* 6*d.* each.
STATICE MARITIMA ROSEA, and PSEUDO ARMERA.—Strong plants of these two beautiful hardy herbaceous species, producing throughout the year a profusion of deep lake coloured flowers, 3*s.* per dozen.
GYNERIUM ARGENTEUM, the New PAMPAS GRASS, 2*s.* 6*d.* each, or 24*s.* per dozen.
CINERARIAS, a choice collection of all the best kinds, 9*s.* per doz.
PHLOXES, a selection of all the new and handsomest varieties of this much admired flower, 9*s.* per dozen.
PHLOX, Countess of Home (Downie & Laird), fine strong plants of this, the finest Phlox yet offered, 5*s.* each.
PANSIES, a fine collection of all the new and first-rate flowers, 9*s.* per dozen.
HYACINTHS, very fine double and single red, white, blue, and yellow, by name, 9*s.* per dozen; extra fine ditto, 12*s.* per doz. These comprise the varieties so highly recommended in the *Gardeners' Chronicle* of the 21st July, 1855.
DEUTZIA GRACILIS, fine strong plants for forcing, 9*s.* per doz.
LILY OF THE VALLEY, strong for forcing, 5*s.* per 100.
PÆONIES, a choice collection of 20 new varieties for 20*s.*
ROCKETS, double crimson (strong), 9*s.* per dozen; the old double pure white ditto, 3*s.* per dozen.
HERBACEOUS PLANTS, a very extensive and select collection of the handsomest kinds including those adapted for rock work, 6*s.* per dozen; 30*s.* per 100.

CHOICE FRUITS, WARRANTED TRUE TO NAME.

APPLES,	Standard, in best selection, good heads,			9*s.*	per dozen.
„	Dwarf	ditto	ditto	6*s.*	„
„	Trained	ditto	ditto	30*s.*	„
PEARS,	Standard	ditto	ditto	12*s.*	„
„	Dwarf	ditto	ditto	8*s.*	„
„	Trained	ditto	ditto	30*s.*	„
PLUMS,	Dwarf	ditto	ditto	9*s.*	„
„	Trained	ditto	ditto	36*s.*	„
PEACHES,	dwarf trained, in fine strong plants,			36*s.* to 60*s.*	„
NECTARINES,	Dwarf trained		ditto	36*s.* to 60*s.*	„
APRICOTS,	ditto		ditto	36*s.* to 60*s.*	„
CHERRIES,	standard, in fine variety,		ditto	12*s.*	„
„	dwarf	ditto	ditto	9*s.*	„
„	trained	ditto	ditto	36*s.* to 42*s.*	„

GOOSEBERRIES, 25 of the finest varieties by name (good bushes) selected for size and flavour, 30*s.* per 100; 4*s.* per doz.
CURRANTS, improved large White Dutch, Black Naples, Raby Castle (red), large Red Grape, Ogden's Black, and Fox's Red Grape, 4*s.* per dozen; Knight's Sweet Red, Knight's large Red, Cherry Red, large and fine, and Wilmot's White Grape, 6*s.* per dozen: these are the most desirable kinds in cultivation, and are highly recommended.
RASPBERRY FASTOLFF (TRUE), strong well-rooted canes, 15*s.* per 100; Large White Raspberry, 24*s.* per 100; New Monthly Fruiting, 20*s.* per 100; Belle de Fontenay, 6*s.* per doz.

ASPARAGUS, Giant, 2 years	2*s.* 6*d.*	per 100
„ „ 3 years	3 6	„
„ „ extra strong, for forcing	5 0	„
RHUBARB, Myatt's Victoria	8 0	per doz.
„ „ Linnæus	8 0	„
„ Mitchell's Royal Albert	8 0	„
„ Hawke's Champagne, new & fine, 2*s.* each	18 0	„
SEAKALE, strong, 2 years	6 0	per 100
„ extra for forcing	10 0	„

All Orders of 2*l.* and upwards are delivered Carriage free to London, Newcastle, and Hull, as well as to any Railway Station within 150 miles of the Nursery.

Royal Nursery, Great Yarmouth, Norfolk.

SUPERB DWARF HYBRID PERPETUAL ROSES BUDDED ON SIX-INCH STEMS.

WILLIAM WOOD AND SON respectfully solicit attention to their very extensive and splendid stock of the above. The plants are vigorous, and expressly suited for potting or forcing; they are also very eligible for grouping, consisting of all the leading kinds, and will be supplied at 12*s.* to 18*s.* per doz. Catalogues may be had on application.

N.B. A very liberal allowance to the Trade.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

NEW ROSES.

WILLIAM WOOD AND SON have again much pleasure in recommending their beautiful Seedling Rose, the Perpetual DUCHESS OF NORFOLK; the colour is a very rich vivid crimson, the underside of the petals shaded with lively pink, giving the flowers an exquisite shell-like appearance.

Price for Standards, or Dwarfs, 3*s.* 6*d.* each.

Williams' Evergreen Climbing Rose, 1*s.* 6*d.* each—This Rose is a seedling from the Ayrshire Splendens fertilised with the Yellow Tea Rose; its flowers are creamy white, deliciously sweet-scented.

N.B. The New Rose Catalogue and Supplement may be had on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

NEW ROSES.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer fine Standards of the following beautiful NEW ROSES:—

Belle Lyonnais	5*s.*	0*d.*	Vicomtesse Laure de Gironde	5*s.*	0*d.*
Comtesse d'Orleans ...	5	0	Madame Masson	7	6
„ Vaillant	5	0	„ Theodore	5	0
General Jacqueminot ...	3	6	„ Cambacères	5	0
Gloire de France	3	0	„ Vidot...	7	6
„ de Vitry	5	0	„ Hector Jacquin ...	3	6
Madame Guinoiseau ...	3	6	Lord Raglan	5	0
Mademoiselle Aline Gibbon	3	0	Madame Place	5	0
Prince de la Moskowa...	5	0	Panaché d'Orleans	5	0
Sir John Franklin ...	3	6	Prince Leon	3	6
Souvenir de Madame Lille	3	6	Triomphe de Paris	3	6
			Gloire de Dijon (Tea) ...	3	6

Melanie Willermoz (Tea) ... ... 3*s.* 6*d.*

For a full description of the above see Catalogue, which may be had on application.—Dec. 1.

NEW ROSES.

M. BELUZE, (Vaise), Lyons, France, begs to offer the following:—

HYBRID BENGAL.—Empress Eugénie, very vigorous plant, flowers 3 to 3½ inches in diameter, cup-formed, very full; exterior, deep or purple red; interior, light silver pink; sweet perfume. This Rose somewhat resembles "Souvenir de la Malmaison," and is very hardy, having withstood the severe winter of 1854-5 without the least injury. Price 25f.

PERPETUAL MOSS ROSES.—Gloire d'Orient, very vigorous; leaves dark green, beneath covered with light moss; flower, medium, full, dark rose; the buds covered with thick moss. Price 15f. Madame de Villars, vigorous plant; leaves, brilliant green; buds covered with green moss; flower, medium size, flattened, very full, light rose; very free growth. Price 15f.

Parties taking four plants will receive a fifth gratis.

The above deliverable immediately.

SPLENDID NEW RHUBARB—SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of RHUBARB is now ready for distribution; it is universally allowed to be the most early, prolific, and delicious variety ever offered to the public. See *Gardeners' Chronicle*, June 11, 1853:—"Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—ED.

Certificates of merit were awarded for specimens exhibited at the meeting of the Horticultural Society, Regent Street, London, June 20, 1853; at Nottingham, May 24, 1854; at Derby Midland, May 25, 1854; at Ormskirk, Lancashire, August 30, 1854.—Price 3*s.* 6*d.* per root, three for 10*s.*, and six for 1*l.* A few two-year-old Plants at 5*s.* each.

Orders addressed to ROBERT SALT, Longton, Staffordshire, or the following Agents will have immediate attention:—Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess & Kent, Penkhull, Staffordshire; Messrs. Francis & Arthur Dickson, 106, Eastgate Street, Chester; Messrs. James Dickson & Sons, 102, Eastgate Street, Chester; Mr. Salsbury, Melbourne, Derbyshire. A liberal discount allowed to the Trade. —A Post-office Order from unknown correspondents.

Longton, Dec. 1.

DENYER'S NEW PROLIFIC GREEN MARROW PEA.—A fine variety for succeeding the first early Crops. Very hardy, and one of the greatest cropping Peas in cultivation. It obtained the first prize at the Hastings and also at the St. Leonard's Horticultural Exhibitions.

From the Dean of Battle.—"The sample of Peas you sent me surpasses in beauty of colour and richness of flavour any that I have ever met with."

From Mr. Waters, Gardener to Lady Webster, Battle Abbey.—"I have examined the growing stock of your new Pea, and find it crops abundantly, the pods being a good length, very broad, and well filled. It is also a fine flavoured and beautifully green-coloured Pea."

From Mr. Bunyard, Maidstone.—"My opinion of the new Pea is, that it is a distinct sort, a good cropper, and for colour I do not know its equal."

From Mr. Parks, late Nurseryman and Seedsman, Dartford, Kent.—"I am much pleased with your new Pea. It certainly is a very fine cropper. The Peas are large, and the pods completely filled. It will when known become a superior Pea for market."

Price 3*s.* 6*d.* per quart. Post Office orders payable to WILLIAM DENYER, Seedsman, Battle, Sussex. May also be had through the London and other seedsmen.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

ERICAS.

MESSRS. YOUELL AND CO. beg to submit the following list of choice ERICAS, which can be supplied in good bushy and healthy plants, in large and small 48s, at 12*s.* per dozen:—

ERICAS.—Aggregata, ampullacea, ampullacea carnumbrata, ampullacea rubra, aristata major, Archeriana, Bandoniana, bicolor, Cavendishi, cerinthoides, cer. coronata, Cliffordi, colorans, Coventryana, daphnoides, Devoniana, depressa, denticulata moschata, echiflora, elata, Ewerianа, eximia, exurgens coccinea, gracilis, Hartnelli, hyemalis, hybrida, hyacinthiflora, Linnæoides nova, L. superba, metulæflora bicolor, ovata, perspicua nana, pinifolia discolor, princeps, propendens, p. tubiflora, pyriformis, primuloides, rubens, retorta major, Shannoniana, Shannoniana (Turnbull), Sindryana, splendens tricolor, tri rubra, umbellata, ventricosa alba, v. alba tincta, v. breviflora, v. carnea, v. coruscans, v. curta ruba, v. densa carnea, v. dependens coccinea, v. fasciculata longiflora, v. f. rosea, v. f. superba, v. globosa, v. hirsuta, v. magniflora, v. perspicuades, v. superba, v. turnida, v. tenuiflora, Vernonia, Ver. superba, verticillata, vestita tenuiflora, v. coccinea, v. c. tenuiflora, v. rosea, vitriflora, Westcottii, Westpicalingi, Wilmorea superba, Walkeri.

The above are well grown, and of a suitable size for making specimens. The usual discount to the trade when taken per 100.

All orders of 2*l.* and upwards are delivered carriage free to London, Newcastle, and Hull, as well as to any Railway Station within 150 miles of the Nursery.

Royal Nursery, Great Yarmouth, Norfolk.

GOOD SEEDS, CARRIAGE FREE.

SEEDS DIRECT FROM THE GROWERS THE MOST CERTAIN MEANS OF PREVENTING DISAPPOINTMENT.

SUTTON AND SONS, SEED GROWERS, Reading, Berks, *can supply every kind of* GARDEN SEEDS *and* FARM SEEDS *of genuine and superior quality, warranted all of the growth of* 1855.

Horticulturists and Agriculturists residing in the most remote parts of the kingdom, can procure good Seeds at very moderate prices from this Establishment.—For particulars, apply to

SUTTON & SONS, Seed Growers, Reading, Berks.

WEST OF ENGLAND HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENT.—*The* PROPRIETORS *have during the past summer considerably enlarged their Offices and Seed Warehouses at a considerable expense, so as to be enabled to execute all orders with regularity and dispatch.*

With increased exertion, redoubled energies, and more assistants, they hope to give the greatest satisfaction to all who honour them with commands.

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 1, 1855.

THE difference and varying contrasts of colour in the foliage of trees which add so much beauty to the landscape at this period, must, one would think, ere now have attracted more notice from gardeners and ornamental planters than they appear to have done. If our observations on this subject seem to our readers worth attention, it should be remembered that this is the season for observing, and where necessary, planting or transplanting trees for effect, as their tints are *now* in full autumnal beauty; many combinations that look well in summer when all are green, having a totally different effect now. Can we deduce any *rules* or canons as to taste in the arrangement of colours in trees? we know that in music certain notes harmonize with each other, and why should not some similar rules be laid down as to foliage. It may be considered a fanciful *crotchet*, perhaps, but we think it may be well worth the attention of landscape gardeners, and if others will join in contributing their ideas and observations we may arrive at some general definite rules for guidance.

What we mean is this, that we too often see a confused mass of foliage in clumps and ornamental plantations, which are as displeasing to the eye and taste as others are agreeable, and being something of amateur artists, we have endeavoured to analyse the why and wherefore. The result appears to us to be thus: all ornamental *groups* (we are not now writing of forests) ought to consist of trees which please, either by *contrast* (and that not too strong) or by harmony; and generally only two or three species ought to be placed together; a group of three, five, or more trees ought to consist of either one-third deciduous and two-thirds evergreens, or *vice versâ*. The species which we remark suit best with each other are these:—

1. Common *Oak*, with the Scotch Fir and other Pines related to it makes a very agreeable combination, such as Pinus Montezumæ, Pyrenaica, Massoni, Pinaster, perhaps Austriaca, but not Laricio. Cupressus Uhdeana and funebris. The scarlet or red American Oaks, on the contrary, would look too glaring with these Firs.

2. *Beech*, common or purple variety, always unites well with the Spruce. Here we have *harmony* of colour and growth, and *variety* in shape (one being round-headed, the other pyramidal). With Beech ought to be planted Abies excelsa, rubra, alba, Khutrow or Morinda, orientalis, and perhaps Douglasi; also Cupressus macrocarpa *aliàs* Lambertiana, and C. Goveniana.

3. *Ash* and Mountain Ash: this combines admirably with the *Silver Firs*; its graceful sweeping branches contrast with the stiff formal horizontal lines of the latter, including all called Picea in books. Also Laricio and Araucaria imbricata (this

last is no favourite of ours, but it looks better grouped with Ash than in any other way, we think).

4. *Spanish Chesnut* and Weymouth Pines, Strobus, &c., Ayacahuite, Lambertiana, excelsa, Coulteri, Sabiniana, and macrocarpa; Birch may also be added.

5. *Maple and Sycamore* (and in some situations the Plane) will look well mixed with the *Cedars* of Lebanon, African, and Deodar.

6. The *Larch* mixes well with Yews and Taxodium sempervirens.

7. The *Wild Cherry* and scarlet Oaks require a bright green, such as Pinus insignis.

Elms, Horse Chesnuts, and Limes ought, in our opinion, to be planted by themselves on a *flat* surface near roads or buildings; they are unsuitable for mixing with Conifers, as are all the Poplar tribe.

Hollies, Junipers, Box, Laurels, and Rhododendrons harmonise well with almost all, and form in clusters a good base for a group.

These appear to be the best principles for a planter—at least to our own eye, but other persons may have different tastes. It is observable that when growing *wild* all natural trees and shrubs harmonise well with each other; but we have now such a number of foreign Pines collected from the four quarters of the globe, that we can hardly expect them to look well indiscriminately mixed like patchwork on a harlequin's jacket. When judiciously chosen they will form the greatest ornaments of parks and pleasure grounds. These remarks will be made more intelligible if our readers who intend planting would get a few small branches of each of the trees above named, and arrange them on a table as has been formerly suggested; they will then *see* the effects of judicious and injudicious mixtures in combination. *C. D.*

In Payen's charming little book on the diseases of some of our principal agricultural plants, which forms part of the French "Railroad Library," two maladies are described which affect the Sugar Beet, differing far more in their chemical than in their external characters. In the one the sugar is either already turned into glucose, or has such a tendency to this chemical condition, that every root which is affected is at once cast aside by the manufacturer as useless, inasmuch as he knows from experience that it will yield nothing but molasses; the reaction of the diseased tissue is acid, and the glucose itself gradually vanishes, as the starch does in the tubers affected by the Potato murrain. In the other disease the reaction is alcaline; the density of the juice is sensibly diminished, and the return of sugar is reduced in the proportion of 10 to 8 or 10 to 6, though sugar is still produced instead of glucose. We do not recollect that the subject has been noticed before in this Journal, and as there are some interesting points about it, we have taken occasion of a communication of some slices of diseased Mangel Wurzel from one of our correspondents, accompanied by a few details as to the case, to call attention to the maladies so well described by Payen.

The specimens before us agree in several respects with Payen's first disease. The tissues are affected principally on one side of the root, being injected or saturated with brown matter like that of diseased Potatoes; the affected tissue after long boiling is harder than that of the sound cells; the reaction is acid,* and the glucose drips out abundantly from the diseased portions. Previously to the affection of the roots the foliage had become yellow, and had in great measure perished. There appears to have been nothing in the agricultural treatment likely to produce disease, the ground being well-drained, and the manure of an ordinary character. It is stated, however, that the bottom of the roots was affected first, and that the disease was in all cases confined principally to the part of the root beneath the soil or immediately above it; to that part of the plant indeed, which in a healthy condition contains the greatest quantity of sugar. Now as regards the first disease of Payen, nothing is said of the probable cause, whereas in the second case, not only is a reason assigned, but a mode of treatment suggested which has proved successful, and may possibly be useful in cases of diseased Mangel Wurzel, as well as of Sugar Beet. For though the chemical condition may be different, the original cause may have been the same and the two maladies may be modifications of one and the same disease.

It appears then that this second affection commences uniformly at the very lowest point of the tap root, or of the numerous adventitious radicles, the spongelets at the same time being much decomposed, and incapable of transmitting pure and healthy fluid to the plant. Crops like Beet are often grown for many successive years in the same ground, and when the produce is lifted a portion of the root is almost always left behind, equal frequently in length to that which is secured for storing. The plough penetrates only half-way down, and fragments of the old roots are, therefore, left to decay in the soil, and may injuriously affect the descending root of the new crop, so as to render it unhealthy. Some proof that this is the case is afforded by the fact that while plants from seeds sown on the spot are affected, transplanted individuals in which the tap root is broken, and in which the adventitious roots do not consequently descend so deep, remain perfectly healthy.

We do not indeed feel convinced that the evil is due to noxious gas ascending from beneath, or to want of oxygen, inasmuch as the transplanted roots which are equally exposed to any ascending noxious matter do not fail. It is, however, well worth the cultivator's while to consider whether he is right in planting such a crop year after year on the same land, and if he does, as such plants abound in alcalies, whether he ought not to take some pains to restore the necessary loss of such matter, and if he does not whether he ought to be surprised at any failure. It must, however, be remembered at the same time that too strong a proportion of alcalies is unfavourable to the production of sugar, and in the cultivation of Mangel Wurzel the same principle will hold good to a certain extent, though in the Sugar Beet part of the evil arises from the practical difficulty attendant on the separation of the sugar where the proportion of alcalies is excessive. *M. J. B.*

* After boiling for three or four hours, neither litmus nor turmeric paper were the least affected by contact with the tissues.

New Plants.

150. Lycaste mesochlæna, *Rchb. f. in Bonplandia.*

L. *mesochlæna*; spathâ subrotundâ ventricosâ apiculatâ columnæ longitudine, mento obconico obtuso infra spathæ basin producto, sepalis oblongis: lateralibus multò majoribus, petalis lanceolatis minoribus, labelli lobis lateralibus semiovatis obtusis incurvis nanis intermedio oblongo obtuso margine inferiore lacero superiore integro, appendice retuso secus unguem sulcato, columnæ facie villosâ.

Among a collection of Orchids formed by Mr. Warczewicz at the head waters of the Marañon, and sold by Stevens in May, 1853, was one named provisionally *Maxillaria conica*, and represented to have ivory white flowers, on the authority of a drawing made by M. Warczewicz in its native country. It was especially remarkable for a very large inversely conical spur, and a great inflated spathe. One of the plants then sold has just flowered with the Lord Bishop of Winchester, at Farnham Castle; but with green, not white flowers; a circumstance that may be owing to the season of the year. The only white about the blossom is to be found on the column and outside the spur. The lip is dull yellow like that of *L. Barringtoniæ*, to which it nearly approaches, as it also does to *L. ciliata*, both which species have the lip fringed throughout the edge of its middle lobe. Here, on the contrary, the upper half is perfectly entire, the fringe being confined to the lower part. Prof. Reichenbach has a *Lycaste mesochlæna*, from Warczewicz's collections, the description of which reads so much like this that although he does not notice the peculiarity of the lower half only of the middle lobe of the lip being fringed we cannot doubt its being the same plant, and therefore adopt his name; but we may add that it is uncertain whether the plant ought not to be referred to *Lycaste costata*.

The species before us belongs to a race in which the column, next the lip, is always more or less shaggy with dense hairs. Can any one suggest the use of so unusual an apparatus!

We learn from the noble prelate, in whose rich collection this has first opened its flowers, that, although the blossoms want colour, the habit is particularly good, the stem standing up well and showing them to great advantage. They are among the largest in the genus, measuring 3½ inches in length before opening.

151. Catalpa Bungei, *De Candolle.*

The name Catalpa is so associated, in this country, with delicate and beautiful flowers that it is as well to mention that the plant at the head of this notice resembles it in little except name. It appears from a statement by M. Jacques, formerly the Royal gardener at Neuilly, that it forms but a small tree 2 or 3 yards high, with a slender stem and heart-shaped leaves with an unpleasant odour like that of Stramonium. The flowers grow in small terminal panicles, but are small and yellowish green, except the interior of the tube, which is dotted with brownish purple, and marked with a few yellow streaks. The plant, therefore, although hardy, has little to recommend it.

VEGETABLE PATHOLOGY.—No. XCVII.

388. Sclerogenia.* (*Induration of Roots, Tubers, &c.*) This perhaps would more correctly come as a subdivision of Phytolithes, inasmuch as it depends upon a similar principle, but the phenomena are so distinct that I follow Meyen in placing it under a distinct head, remarking with him that it is Ré's Fitoliti di Radice.† Like grittiness in Pears it is a reversion from the hypertrophied productions of art, to the more solid forms exhibited by plants in their natural condition. It is, however, as far as the interests of the cultivator go a formidable disease, and as such deserves to be treated separately.

389. Two forms of this malady may be distinguished, the first in which the walls of the cells are indurated, though the induration in such cases never equals that which is so common in Pears; the second in which the woody tissue itself accompanying the vascular bundles, as well as the vessels themselves, becomes solidified, and instead of presenting the delicate nutritious mass which renders the several organisms which are affected useful for food, yielding nothing except a woody mass completely indigestible. The new layers of woody matter which are thus deposited, grow at the expense of the contents of the several cells; and hence all their useful products, such as starch, gum, sugar, or proteinous matters, are wholly suppressed or diminished to a greater or less extent in quantity. Both these forms may exist together or separately, and according to the organs which are affected, or their several relations is the extent of mischief. The first is far less common than the second, at least separately. Slight cases of the second often exist in soft tubers like Potatoes, where the general cellular mass is altogether unaffected; and such tubers are known familiarly as stringy, a state which is by no means incompatible with great perfection in other respects, and even with a superabundant development of fecula, the same cause probably which produced thickening of the walls of the vascular tissue having induced an excessive development of starch granules in the cells.

390. Every case, however, in which the cellular tissue of such organisms is indurated does not come under this head. All those cases must be excluded in which a greater or less degree of decomposition accompanies the induration. Tissues may become hard from large deposits of humates or other analogous substances, and may in consequence resist prolonged boiling when neighbouring tissues give way under the process.

391. The most complete cases are those in which without any change of colour all the tissues acquire a firm and woody texture, or in which while the cellular tissue is little affected the vascular bundles and their accompanying wood cells are completely solidified, so as to have their cavities entirely obliterated. This may take place without any change of size. The tubers, roots, &c., may be just as plump as ever, and give no external sign of mischief, whereas on examination they may be either quite unfit for food in consequence of their hard, close, stringy texture, or their nutritious properties may be so diminished as to make them comparatively useless even for cattle feeding. In such cases not only does the external appearance of the tubers remain the same, but the condition of the foliage does not indicate any evil. In other instances a great diminution of size takes place, and this is predicated by the plant itself having sent up a flower stem, to the exhaustion of the root.

392. Amongst seed selected with the utmost care from picked plants, there will be always some which have a tendency to revert to the original wild condition, and this tendency is of course purely constitutional. A tendency, equally constitutional, may exist in other individuals to form indurated tissue where that tissue is in general soft and delicate. Against such tendencies little can be done on the part of the cultivator. At times all his care will meet with only partial success. Such evils may, however, arise where there is no constitutional tendency at all; dry and ungenial weather, a penurious supply of manure, bad drainage, &c., may prevent the development of the more succulent parts and induce the deposit of ligneous matter instead of those substances which are more immediately profitable to the cultivator. But though he cannot always guard against mischief, it is quite certain that the more perfect his cultivation is and the more carefully he selects his seed, the more certain he will be of general success. Nevertheless, however perfect his cultivation may be in other respects, he will be always liable to vexation if his seed be taken indiscriminately from bad or good individuals, or if he obtains it at a low rate from quarters on which he ought not as a prudent man to place dependence.

393. Fruit may be affected to a greater or less extent in a similar way. Apricots, for instance, during the present year, though perfectly ripe, were frequently so stringy as to make their use almost disagreeable. This was, doubtless, owing to long continued drought; but I have observed the same condition to hold good in highly favourable seasons, where too large a crop had been left. From a similar cause individuals often become hard, but such fruit always falls off prematurely. *M. J. B.*

* From σκληρος hard, and γιγνομαι, I become.

† This, however, is true only to a certain extent. The especial instance brought forward by Ré is in all probability identical with the disease called Potato curl.

PROBABLE CHARACTERS TO BE LOOKED FOR IN A SEEDLING PEAR-TREE.

It is by no means a difficult task to discover in a seedling Pear-tree the indications of its probable worth. It is only necessary to observe the characteristics of five or six good varieties raised in the end of the last century, which have been worked on the Pear stock, and which bear good fruit when the trees are placed in the conditions required for producing well. It is then, also, that the characters are displayed to the fullest extent in the stem, in the branches, in the shoots, the wood, the fruit, and the leaves.

Once these distinctive characters are understood it is easy to discover them in seedlings, and the estimation of

the value of one of these becomes a matter regulated by skilful investigation. Nevertheless, it is necessary to state that these characters are much more prominent in the more recently improved sorts, and are, therefore, more easily recognised and placed beyond doubt.

An experienced practitioner finds the first indications of a promising seedling in the seed leaves. If these have long petioles, and are themselves long, narrow, of a delicate green, and deeply serrated at the margin, with the surface finely and delicately reticulated, there is a good prospect; if, on the contrary, the petiole is short and thick, the leaf round, thick, without serratures, white or cottony, without distinct reticulations on the surface, there is not much chance of the seedling proving good. If the plumule, on becoming a stem, is short jointed and forms wood buds of a conical shape, at one foot above the soil, it is a good sign. If on a grey, hazel, or pale greenish brown-coloured bark, grey ash-coloured specks are here and there visible, it is a still better sign. If, on the contrary, the seedling has a stem which does not bear itself erect, and has distorted irregular branches at unequal distances, no confidence can be placed in it. These marks rarely occur at the present time among seedlings raised from the more recently improved varieties of the Pear. A smooth shining bark, soft to the touch, of a brown, hazel, lead colour, fawn, or reddish, the whole sprinkled more or less closely with pale specks, or lenticular glands, is also considered to be a favourable indication; so it is likewise when the mature wood of the one year old shoots breaks clean. It is not, however, in the first or second year that one can judge of a seedling by its characters; for these are more distinctly marked in the second year after transplanting. The best time for making comparative observations is at the fall of leaf. It will then be seen that promising seedlings have leaves possessing the good characters above described, and a moderately thick stem, furnished with large prominent well swelled wood-buds.

It will also be observed that some of the seedlings have produced shoots forming wide angles, or are spreading; others spurs; some slender fruit-bearing twigs; others short spines on the stem and on the branches, which are furnished with four or five prominent wood-buds. Two or three well formed leaves, and a large plump terminal bud will be perceived at the extremity of each of the shoots. A disposition to bear spines is, in general, the surest sign of the beauty, delicacy, and long-keeping of the fruit. The contrary opinion is generally maintained; but it can only be considered as an old-fashioned prejudice. In fact, at the present day it is generally admitted that fine, smooth, spineless wood betoken a summer fruit. Spineless wood with thick downy leaves is the sign either of a musky summer Pear, or of a winter stewing Pear. I know of only one exception to what has been stated respecting downy leaves, and that is those of the variety called the Comte de Flandres; but this variety, on the other hand, possesses all the other characters of a good winter fruit. In this case it may be said there is no rule without exception. Fine spines along the branches and young shoots, the latter weak and twisted, form an assemblage of characters of bad omen, especially when these characters continue to be reproduced in the upper part of the tree. But the worst character of all is a bad habit of growth, either as regards the stem or the branches, and when, at the same time, the latter are straggling, short, weak, and crooked. Luckily these characters do not occur in seedlings from good varieties.

Besides the favourable signs already enumerated, the following are found in seedlings of five years old:—1st, A straight stem sufficiently strong to maintain itself in an upright position without support. 2d, Lateral branches and shoots of moderate vigour, without being either too slender or too thick, and of moderate length, with their extremities pointing upwards. 3d, Spines regularly distributed on the stem as well as on the lateral branches; these spines are long or short according to where they are produced and furnished with prominent wood buds throughout their length; they are placed perpendicularly, are well fixed on the surface of the branch, and wrinkled at their bases. 4th, The leaves, either of a light or dark green, are finely shaped, rather long than round, not folded, either perfectly flat or with the margins slightly elevated, and the apex recurved, the finest leaves on the current year's shoot being furnished with stipulary leaves. The tissure of the leaves is compact, the skin thin, the incisions regular and deep. The nerves are prominent, the midrib strong and straight, extends from the petiole to the apex of the leaf. The petiole is long and slender. 5th, The wood buds, which are reddish, brown, or gray, are neither too much nor too little developed, neither too much compressed nor too long, and not placed on the surface, but based on projecting supports. 6th, The internodes between the wood buds are not long; but those between the fruit buds are shorter than those others by half, that is about half an inch in length or even less.

The above are all characters of good presage, and even of a fine and long-keeping fruit; indeed, it has been established, by repeated experiments made by the late Van Mons, that the longer the sowing of seeds of the best of every successive generation of Pears is continued, the greater is the tendency of the fruit produced to keep long, to improve in form, and to increase in delicacy.

The spines should not extend on the stem and branches higher than 5 or 6 feet from the ground, especially if the seedling appears naturally inclined to take the form of a dwarf pyramid. The higher the tree the more rare the spines, and ultimately they entirely disappear.

These observations may guide the cultivator in the selection of seedlings before the third transplanting. It is in the second year after the third transplantation that the indications of the future worth of the tree are displayed to the close observer in the most striking manner. In a promising seedling the whole habit of the tree is pleasing to the eye, and clearly indicates that the period of full growth and of fructification is at hand. *J. de Jonghe, Brussels.*

Home Correspondence.

The Osborne Shell Shower.—I should not have troubled you again on this subject until I had had something new or more definite to communicate, had the tone of Mr. Bree's letter (see p. 758) been less objectionable and more satisfactory to my own mind. I am as great a lover of truth as Mr. Bree himself, and should at all times feel grateful to that gentleman for correcting any error into which I may inadvertently have fallen; but to do so in a manner in which it requires no very great discrimination to discern the spirit of ridicule is anything but creditable or praiseworthy. As a naturalist Mr. Bree stands deservedly high, and I would treat his opinions with all deference. In this particular instance, however, I must beg to differ from him, and adhere to my original conviction, until I am so far convinced of its fallacy as to see its absurdity. Possessing a strong predilection for the study of natural history, I am not altogether unacquainted with, or an inattentive observer of nature. Nature has peculiar charms for me. I have wooed her not only in those grand and magnificent moods in which she astonishes the mind by her sublimity, but also in those more humble and unobtrusive forms in which she excites its wonder by her minuteness. I did not, as Mr. Bree seems to think, in the short space of "half an hour," jump at the conclusion that the shells at my feet had fallen from the clouds. It was not until I sought to elucidate what appeared so singular and interesting a phenomenon, that I ventured to give an opinion on the subject, which opinion, according to Mr. Bree, is now "blown to the winds." Of this, however, I am not quite so certain as that gentleman; nor are his arguments sufficiently cogent and conclusive to induce me at present to give up the point in dispute. His communication does not meet all the details of the case. There are some points yet to be cleared up, and I cannot but regard Mr. Bree's letter as somewhat premature. In accounting for the sudden appearance of so large a number of mollusks, Mr. Bree overlooks the fact of the dead shells. His remarks apply only to the living ones, and as far as my experience goes the proportion of the former to the latter was as two to one. These dead shells surely could not have been out on a foraging excursion? Neither had their inmates forsaken them on the spot where they were, as in no instance could I discover one of the missing tenants among the many thousands around me. This in my opinion is an important point, and one which remains to be cleared up. I would remind Mr. Bree that the whole extent of surface over which they were scattered had been swept and cleaned daily for months previous to the "memorable day" on which they were first observed, and had likewise, to prevent the growth of vegetation, been subjected to frequent washings with a poisonous acid; and, further, that there are neither stones, moss, or even crevices under and in which they could possibly find a refuge from the attacks of their natural enemies. If, indeed, they had left their rocky or mossy retreat in quest of food, and had wandered to this particular spot, they had certainly left the land of Canaan behind them to roam over what to them would be but a foodless waste. Instinct in this instance appears to have been at fault. Again it was but a short time (about half an hour) previous to that on which they were first observed, that not one shell living or dead was to be seen. If then they had come from some neighbouring rocky or mossy retreat, and in so short a time had scaled walls 4 or 5 feet high, and scattered themselves over so large a space, they must have possessed a power of locomotion, a quality of which I know no antecedent in the snail kind. This is another important particular, and one, too, which remains to be investigated. In conclusion I beg to assure Mr. Bree that I have frequently sought for the Zua in the neighbourhood of Osborne, but without success, and that whatever may be the result of "C. D.'s" inquiries I shall in no wise be astonished thereat. *C. Winchester.*

The Osborne Shell Shower.—The editor of the *Banbury Guardian* takes the same view of this case as Mr. Bree; and he illustrates it by the following statement:—"We had on our premises some years since a shed abutting on a tall warehouse, which was on the south side of it, while on the east there was another building; the two keeping off the sun's rays, excepting late in a summer's evening. The position was therefore cool, and usually moist. The shed was roofed with Stonesfield slates, a heavy covering—in fact, a stone which by exposure in the winter splits into laminæ. On more than one occasion after a shower, we found the roof of this shed, which was about 10 yards in length, covered with the Zua lubrica; there were thousands of them, and to an ordinary observer they would appear to have fallen with the rain, but there were none upon the ground. We entertained no doubt as to their origin; and the opinion we formed was shortly afterwards fully confirmed. Being compelled to increase our office buildings the shed had to be removed; and when the slates were taken from the roof, we found between them where they overlapped heaps of these molluscs, then in an inert state, but which would after a warm shower probably crawl out to feed upon the tufts of Moss with which the roof was sprinkled over. The occasions on which we saw them out of their retreat were not numerous; if we had taken a light on a moist warm night and examined the shed, we should in all probability have seen them much oftener. So the Zua lubrica has been seen in Banbury as well as at Osborne."

Osmunda regalis.—Did you ever see this in perfection? At Killarney, the year before last, I found its fronds 7 feet high—more picturesque than any Palm. I wonder the Irish Roman Catholics do not use them dried on Palm Sunday. It has, however, one peculiarity—all the finest plants grow in situations flooded in winter, and 1 to 3 feet above water in summer, so that their roots are always in water. It has all the characteristics of a tree Fern, its caudex often being 2 feet deep in the ground; and in large specimens 5 or 6 inches in diameter it is extremely difficult to get up. I succeeded in bringing home five or six, but was obliged to be content with small specimens not above 2 inches in diameter, and these I could only get out of the bank of a stream where I could tear down the soil, a very sandy alluvial loam. It gave me some idea of the difficulty of procuring and importing tree Ferns. *R.*

Whitethorn.—Can any means be adopted to cause all Whitethorn berries to vegetate in the spring after they are gathered? *J. P.* [No. But if they are sown as soon as gathered, and not buried too deep, the greater part will germinate the first year.]

Effect of Salt Water on the Germination of Seeds.—In my communication of last week it is printed by mistake that the fruit of "evergreens," instead of the fruit of the Euonymus, did not sink after immersion in salt water during a month. I may add that I think that the experiments on immersion of seeds in sea water have some little interest, as showing that we cannot infer from seeds of certain orders long retaining their power of germination in a dry condition, that these same seeds will retain it under different conditions. Thus the Solaneæ and Leguminosæ are believed to keep longest when preserved in the ordinary way in a dry state, and the Solaneæ seem generally to resist well the salt water, whereas most Leguminosæ resist much worse, as I have shown in your number of the 26th May, than other orders. I have lately tested this conclusion with quite fresh seeds of Trifolium incarnatum and Kidney Beans. Indeed with respect to some Leguminosæ I have reason to believe that a short immersion in plain water will kill them. So with respect to the subject lately discussed in your columns, namely how long seeds will remain alive when buried in damp earth, I do not see that any safe conclusion can be drawn from the length of time during which the same seeds can retain their vitality whilst dry. *C. Darwin, Down, Bromley, Kent.*

Oak Galls.—I believe that it was only last year that the attention of the Entomological Society of London was called to the existence of the hard Oak gall, Cynips Quercus-petioli, Linn., in this country, though previously noticed by Mr. Westwood. But surely it must have been of rare occurrence in this country until of late years, or it would have been observed before; and even now I believe it is confined to the southern counties of England. At all events I have never seen it in the midland counties, or indeed north of Somersetshire, and I should much wish to know if any one has hitherto seen this gall-nut further inland than I have mentioned. This may be important to know, as I believe the range of the gall-nut is extending, and with obvious injury to young Oak plantations, so that the gall-fly that produces the nut is becoming an absolute pest in Devonshire and Somersetshire, and I am led to inquire if anything can be done to arrest its progress. It is very different from the innocuous soft galls upon the leaves, seldom very numerous, and dropping off with the foliage in the autumn. But these gall-nuts of C. Quercus-petioli are mostly persistent upon the tree, and continue there for a long time hard as bullets. They seize upon the young shoots of the year, often the leading shoot in young trees, and cluster at its termination, thus stopping the expansion of the buds by taking up their nutriment, and keeping the trees in a dwarf state. I have now before me young shoots that are terminated by eight or nine of these hard brown galls clustered together; and I recently noticed in the Oak plantations on Worle Hill, near Weston-super-Mare, that many young Oaks had been quite ruined by their leading shoots being thus loaded, and some were absolutely dead. Now I have reason to believe that this attack upon the Oaks, at least in this plantation, is of recent origin. Four years ago I first observed a few on two or three trees, and looked upon them as a curiosity; last year I was surprised to observe many more, and the present autumn in walking through one portion of the plantations only, and without going out of the path I counted 91 trees that were more or less subjected to this scourge—for thus it has become. Some, it is true, had only about a score of galls or so upon them, but many had hundreds clustered upon their branches thick as Grapes, and the smaller trees were evidently drooping and checked in their growth by the absorbing villainous galls. Some of the trees were actually withered and dead, and others had their leading shoots killed, with the evident cause burdened upon them. It is clear to me that fresh trees are attacked every year by the increasing insect that produces the galls, and what can be done to stay their assaults? Though I only

counted 91 trees in the Worle Hill plantations, I dare say I could have doubled this number by going deeper within the coppice; but say that only these 91 Oaks had 50 gall-nuts on a tree—although many had hundreds of them—that only would give more than 4500 of the Cynips to commence the next season with, so that next year instead of only 91 trees attacked I may expect to find thousands, on every tree perhaps throughout the plantations. The mischief is that the Oaks are certainly rendered barren by these hard gall-nuts, and wherever they occurred on the larger trees there were no acorns at all produced. It has been suggested that these gall-nuts may be used in the manufacture of ink, but I should doubt to such a profitable extent as to keep the Oaks entirely for that purpose; and if not it is but a poor consolation to have ink produced only to record the destruction of plantations made and kept up at some expense in the hope of good timber being some day ripe for sale. Can any suggestion, then, be made upon the subject now, before the Cynipidal hordes have spread to all the Oak trees in the country, whether of Quercus robur or Q. sessiliflora? *Sylvanus, St. John's, near Worcester.*

Food and Cookery.—The still increasing price of provisions, and the near approach of the rigorous season, will doubtless lead benevolent persons to assist the poor by supplies of food; might not the opportunity be embraced to introduce articles and modes of preparation successfully habitual in France? In that country many nutritious substances are made use of which here are neglected and despised, and French cookery extracts a greater proportion of aliment from a given quantity of ingredients. We, in England, waste a considerable amount of nourishment: in the common process of baking, meat is much dried up; in broiling, fat falls into the fire, and the surface of a chop is often burnt to a cinder; if fish or even meat be boiled, the liquor is frequently thrown away; and in regard to pulse of all kinds, the boiling on a fierce fire softens indeed the grain partially, but not sufficiently for easy digestion. The French more frequently make soups or stews, thickened with grain, pulse, or roots, thus retaining the juices which contribute so greatly to nutriment. Another difference in the cookery of the two nations is, that in England the use of condiments is apt to be neglected; the Frenchwoman flavours with herbs or spices, and even with Celery leaves and other items here cast away. Our labourer rejects what he calls "messes," which, if seasoned to his taste, might be relished. Were benevolence to distribute stews in lieu of bread, the superior mode of cookery would perhaps be appreciated; a given sum of money would also go farther: for bread, as Count Rumford has shown, affords greater nourishment soaked in soup or a stew than when eaten dry. Of late, many books have been published containing receipts good and economical, indicating also articles now despised, which if suitably prepared, afford wholesome food; of these publications the following amongst others may be found useful:—"Soyer's Shilling Cookery," "Domestic Economy," by Tegetmeier, "Cottage Cookery" and "Cottage Comforts," by Esther Copley. With the assistance of these and similar books, the benevolent, whether in town or country, might instruct the industrious poor, how, with a small outlay, to provide an abundant family meal. There are, however, some cheap or neglected substances not mentioned in these publications, for instance, gelatine, now only used for confectionary, but of which the quantity is so great in bones, that those of London would suffice for the basis of a pint of soup daily for every inhabitant: true, many of these bones are not lost, being collected for manure; desirable, however, as it is to enrich the land, substances fit for human diet should scarcely be employed for the purpose, and besides they are just as fit for manure after boiling as before. Even the cottager might make soup from bones by means of Papin's digester; some years ago one was presented to a mother who found that by its use the allowance of meat for two days amply sufficed for three. Another article, which in this country is even cast into the gutters, but which our wiser Scotch brethren make use of, is the blood of sheep and oxen: and why should it be rejected, when that of the less cleanly animal, the hog, is habitually made into black puddings? *M.*

Cork-barked Elms.—The Elms growing in the upland districts of this parish, the soil a stiff white clay, have their shoots covered, even when quite young, with corky bark in great abundance; they are varieties of Ulmus glabra, and called here the Hertfordshire Elm. I gathered the enclosed from a hedge-row at the side of a wood; all the shoots, even those growing vigorously, were covered with the same bark. *T. Rivers, Sawbridgeworth.* [The Elm in this state, with its bark producing rifted cork, is the *Ulmus suberosa* of Ehrhart. Can our experienced correspondent explain the cause of this condition of the bark? All the European Elms except U. montana, the Witch Elm, and Ulmus effusa, appear to be liable to the affection, sometimes being smooth-barked, sometimes cork-barked. We believe the cause of the cork formation has never been explained].

Holcus saccharatus.—I was surprised to see at p. 774 a statement to the effect that neither sheep, horses, nor cows would eat this plant. I sowed two large pans of seed of it last April, and placed them in heat. In the first week in June I planted them out in the kitchen garden; for a few weeks they made but little progress; they, however, at last grew vigorously, and attained the height of 5 feet. They were just unfolding their panicles of bloom, when the early frost in September finished their career. The plant appears to be very tender, for the night on which the Holcus was destroyed the Heliotrope was not the least injured. I tried cows, pigs, and a donkey with it, and all of them seemed fond of it. *E. Bennett, Perdiswell.*——The following is the result of my trial of this plant. The seeds were sown rather late in the spring of this year, and made little progress till towards the end of July, when the plants commenced growing rapidly, and by the middle of September they were (reckoning the whole growth of the plants) 8 feet high, the stems (or canes) being 6½ feet. They came into flower the latter part of October; on the 23d of November they were cut, and on the 26th the canes were pressed in a common cider press, and yielded just 6 gallons of juice. The seeds were sown in my garden, under a south wall, on a piece of land (highly manured for a former crop) in four rows, the piece of land being only 18 feet long by 8 feet wide. So far from the foliage being rejected by cattle, I found, on the contrary, that they were eagerly devoured (when in a growing state) by one of my horses to which I offered them. *G. S. K., Brooke, Norfolk.*——With regard to the statement that no animal will eat this plant, I beg to say that my donkey would eat nothing else if he had a choice in the matter. *An Old Sub.*

Quercus sessiliflora.—Can you favour me with the probable age of an Oak sessile-fruited, having a circumference of 25 feet at that part from which the enclosed was cut. *Eben.* [The specimen, which is genuine, is 1¼ inch wide and has 15 rings. The diameter is 8 feet 4 inches, or we suppose deducting the bark, 8 feet 2 inches. The semi-diameter is therefore 4 feet 1 inch. Supposing that the specimen sent represents the average rate of growth, about 600 years will have elapsed since the birth of the tree; but as it grew faster when young than now it is old it may not be too much to reduce the estimate of age by 100 years.]

Horse-chesnut Flour.—The following is M. Flandin's plan of making flour from Horse Chesnuts. Grind the Horse Chesnuts and mix with the pulp carbonate of soda in the proportion of one or two per cent at the utmost, and then wash the produce until it is perfectly white; 1 lb. of carbonate of soda will purify 100 lbs. of Horse Chesnuts and produce 60 lbs. of flour fit for bread, as the salt removes the bitter principle from the nut. *A. L. O.*

Notices of Books.

We have before us the first part (Van Voorst, 10*s.* 6*d.*) of *Contributions to the Natural History of Labuan, and the Adjacent Coasts of Borneo*, by James Motley, Esq., of Labuan, and Lewis Llewelyn Dillwyn, Esq., F.L.S. Mr. Motley has become advantageously known by his interesting communications to Hooker's Journal of Botany, and his residence in Labuan affords himself and Mr. Dillwyn a very favourable opportunity of making themselves acquainted with the natural products of that island. We learn from the prospectus that the "Contributions" are intended to contain descriptions of such animals, both vertebrate and invertebrate, as inhabit the island, accompanied with original notes on their natural history. Illustrations are to be given of such animals as are new, or of which figures are not easily attainable. The work may be expected to extend over several parts, two or three of which will be published annually. The first part is worthy of being published by Mr. Van Voorst, but we must object to its title, which should have been "Contributions to the *Zoology* of Labuan," &c., not Natural History, Botany being wholly excluded from the plan of the authors. The 12 plates which it contains are charming representations of animals, birds, and snakes. We find at page 15 the following interesting note upon the habits of the Pectoral Sunbird (*Nectarinia pectoralis*):—

"I think there is no doubt that this lovely little bird feeds almost entirely on honey; three or four of them frequent all day long a beautiful plant of Russelia juncea just before my office window, clinging to the slender twigs in all sorts of positions, and turning up the scarlet bells to insert their fairy little beaks; they appear very sociable little birds, never passing one another without putting their beaks together with a little chirp. If any one comes too near, off they go like meteors, but are back in a minute. I think I never saw anything more beautiful than this plant (whose beauty you cannot imagine from greenhouse specimens); its long pendent twigs are one blaze of scarlet blossoms for months together, with half-a-dozen of these living gems flitting among them. I often sit and watch them, and wish I could place them some fine morning before your window; birds, flowers, broad sunshine and all."

The Duties on Imports into France, compiled from the Official Tariff, with the latest modifications, an English Translation, and full Index. By G. W. Yapp. 8vo. Stanford; pp. 183.

This is one of the first results of the Great French Exhibition, showing how intimately French and English trade is becoming mingled. A few years since who would have thought it worth while to incur the cost of publishing a translation of a French tariff; yet 1855 has produced two, the one in Mr. Newdegate's great work noticed in our columns lately (p. 583), the other now before us. In the present case we fear the execution is beneath the conception; in a work like this accuracy is the only point to be attended to, and accuracy has scarcely been attained by Mr. Yapp—not, at least, if we are to judge from his translation of the names of articles belonging to the vegetable kingdom. For example, *badiane*, or star anise, is untranslated; *écorce de quinquina* is called cascarilla instead of Peruvian bark; *absinthe*, or Wormwood, is untranslated; *lierre*, Ivy, is rendered ground Ivy, a totally different plant: *Garou*, or Daphne Gnidium, is called Spurge Laurel; *Brou de Noix* signifies Walnut husks, not nutshells! and *Tourteaux de graines oléagineuses* are "oil cakes," not husks of Olive, &c., as they are here rendered. We need not say that if errors like these occur in other parts of the tariff, the mercantile utility of Mr. Yapp's translation is much impaired.

In a little volume called *The Newspaper and General Reader's Pocket Companion*, for the price of a shilling, uneducated people will be able to learn the meaning of the foreign scraps with which overeducated or pedantic writers are fond of interlarding their discourse, till their

> English is cut on Greek and Latin,
> Like fustian heretofore on satin.

We are no admirers of such a lofty style, but others are, and it passes current with the many, for the usual reason that people are apt to admire what they cannot understand. Anything to make it intelligible is therefore useful, and the little volume before us accomplishes that purpose.

Garden Memoranda.

Enville Hall, the Seat of the Earl of Stamford and Warrington.—Within the last few years this place has deservedly become very celebrated, in consequence of the Earl of Stamford and Warrington having expended an enormous sum of money in adding considerably to the pleasure grounds and glass structures, as well as purchasing extensively both ornamental and new plants. In this his lordship has received valuable assistance from Mr. Aiton, the head gardener at Enville, so that in a very short space of time this has been made one of the most extensive and beautiful gardens in the country. When the Earl of Stamford came into possession of the estate there were but six acres of garden, but in 1847 and the two following years 20 acres more were added, and within the last two years upward of 50 more, making in all about 100 acres of pleasure ground. The grounds are richly diversified, while the situation itself is naturally beautiful, and with the introduction of water in four different places the *tout ensemble* is such as to please the most fastidious. A noble conservatory has just been added, and is the most majestic glass erection we have ever seen, and so far as our pages will admit, the accompanying sketch gives a good representation of it. It was built by Messrs. Gray & Ormson, of Danvers Street, Chelsea, and certainly reflects credit on their already well known taste and skill as horticultural builders. It is we believe the most magnificent and substantial structure of this elegant branch of architecture ever erected. It is 150 feet in length, 70 feet in width, 65 feet in height to the apex of the domes, and 30 feet to the top of the curved roofs. The style it will be seen is mixed, gothic being predominant; the perpendicular part is of wood, the curved roofs and roofs of domes consist of cast-iron principals and wrought iron bars. It is well supported and bound together by ornamental columns and girders of cast-iron, which have a fine appearance inside, and from which ornamental baskets will be suspended. It is heated by a hot-water apparatus. It is not intended to plant out the different kinds of plants in beds, as is common in large houses of this description, but to grow them in pots and tubs, and by this means a much greater display can be kept up throughout the year, by using the extensive plant-houses in the kitchen garden as a nursery for that purpose. Creepers are to be planted out round the pillars, and a number of ornamental baskets filled with suitable plants, similar to those that have such a pleasing effect at the Crystal Palace, will be suspended from different parts of the building. In the ground plan the internal lines give the idea of divisions, but they are in fact not so; they are merely lines showing where the girders and columns are. The flower garden, when we saw it in August, was a complete mass of bloom, and is of no particular plan, the beds being chiefly circular, of a good size, and each filled with one variety of plant. The most effective colours for contrast are chosen, and many of the beds were filled with very choice things, such as Calceolaria Purity, a new white variety, which has succeeded very well, and will make a valuable plant for the Italian style of flower gardens. C. amplexicaulis is grown largely, and is an excellent late variety, and one of the best bedders when well done. Among other Calceolarias used at Enville are Prince of Orange, a light orange kind, of excellent habit, and certainly one of the best, being very dwarf, and a profuse bloomer; Frosti, a pretty small yellow; but soon flowers itself out; Gem, a deep rich brown variety; and Aurantia. In Geraniums, the sorts grown are Sidonia, Unique, and Conspicuum; these three do best in pots, plunged. Commander-in-Chief, Cerise Unique, with some of the best old kinds of scarlet, are also freely used; Hendersoni is found to be the only white worth growing out of doors. Boule de Neige, Skeltoni, Miss Emily Field, and Shrubland Pet have been tried, but are not effective. Ingram's Princess Alice and Shrubland Rose bloom freely and do well here, as also Purple Nosegay. Variegated kinds are grown very extensively; Flower of the Day was by far the most effective, taking foliage and flower together; Mountain of Light, of which there was a large bed, was very patchy and irregular as regards bloom.

Mangles' Old Variegated is also largely used, and is found very useful; Alma, a new kind, promises to be the best of this class, the foliage and flower being better than any other we have seen, but there was not enough of it to see what the effect would be when grouped in a mass; Golden Chain is only grown for its foliage, as the flowers are cut off. Not many kinds of Verbenas are used, only a few of the most decided and effective colours. In scarlets, Defiance is still the favourite, but Mrs. Woodroffe was very good. There were good beds of André, Wonderful, Purple King, Blue Beard, Bouquet Parfait, Emma, Parfume de Madeline, Madame de Stael, Etoile de Venus, and Mont Blanc. The beds of Defiance and Bouquet Parfait were the most showy and best filled. Ageratums, Petunias, and various other plants were equally gay with those we have enumerated. There are 72 beds in the flower garden and 30 in the pleasure-grounds; some idea, therefore, may be formed of the large number of plants required to fill so many beds, and of the effect they produced, when we state that many of them require 500 plants in each, and but few less than 100 plants. What is termed the "Riband system" of planting is adopted here to a very great extent. This is simply done by planting in lines, commencing in front with a row of some dwarf plant, and using taller growing varieties in the back rows. One "riband" was 400 yards long, half of which was filled with the following plants:—1st, or front row, Golden Chain Geranium; 2d, Lobelia Erinus maxima; 3d, Geranium Cerise Unique; 4th, Calceolaria Aurantia and Scarlet Pentstemon planted alternately; 5th, Phlox tardiflora; 6th, Hollyhocks. The Phlox would have been more effective had it been earlier. The other half was composed of the following:—1st, Geranium Golden Chain; 2d, Lobelia Erinus; 3d, Geranium Cerise Unique; 4th, Calceolaria Gem; 5th, Humea elegans; 6th, Dahlias; the whole being backed with evergreens. The Geranium Cerise Unique is found to be a more suitable colour to back the Lobelia. Another riband, 140 yards long, was planted as follows:—1st row, Geranium Golden Chain; 2d, Forget-me-Not (Myosotis cæspitosa); 3d, Scarlet Geranium; 4th, Calceolaria Gem and Aurantia alternately; 5th, Dahlia Zelinda (a dwarf purple variety). Another riband is composed of straight lines, 160 yards in length, and backed with Roses—such kinds as flower during the summer and autumn. In these rows plants of variegated Alyssum, intersected with Verbena venosa and Virginian Stock, formed the front row. Geraniums, Salvia patens, Delphiniums Hendersoni and D. Barlowii formed the other rows. This plan, whether in straight lines or curved borders, is most effective, and is admired by every one, especially when carried out to such an extent as it is at Enville, where, in many instances, so many new and good things are used in quantities. Another feature of no less importance is well observed at this establishment—namely, that good plants are grown ready for turning out, so that half the season is not lost before they come into bloom. This could not be done without the command of glass to a great extent, and this has been liberally provided by his lordship, both in the shape of houses and pits heated with hot water. Coniferous plants do exceedingly well here, and there are numbers of choice trees already of a good size, with a large number coming on. The finest specimen is a large and handsome plant of Pinus macrocarpa, and

ELEVATION OF CONSERVATORY AT ENVILLE HALL.

GROUND PLAN OF CONSERVATORY AT ENVILLE HALL.

there is also a beautiful plant of Picea nobilis, with a quantity of good Deodars, Taxodium distichum, &c. There is also an abundance of noble specimens of Portugal Laurels, Rhododendrons, and other hardy shrubs. Copper Beech, Limes, and other deciduous trees abound, of an immense size and age, many of which produce a peculiar effect by drooping to the ground, where the branches take root and form a progeny of young trees around the parent. Rhododendrons and American plants generally grow most luxuriantly here in the natural soil. The kitchen garden consists of 6 acres, four being inside the walls, and two outside. The walls were commenced in 1853, and are well furnished with healthy young trees which have not yet generally fruited. The glass here consists of a Peach case, which from its extent and height has a noble appearance; it is 360 feet long and 14 feet high, and sufficiently wide to admit hot-water pipes, and allow room to walk between them and the trees. In addition to the above there are also five Vineries, a house for New Holland plants, two Orchid houses, a stove and Geranium house, a house for forcing early flowers, besides houses for Cucumbers and Figs, all erected by the same builders, and fitted up with all the appliances which liberality, skill, and practical knowledge could suggest. There are also 400 feet of pits for Pines, Melons, and wintering bedding plants, all of which are heated with hot water, besides 200 feet of cold pits. The fountains are a splendid feature of this charming place. They were projected by Lord Stamford himself, and with two large reservoirs, completed in less than two years, no expense being spared. One of the reservoirs is placed on the gathering grounds, from which the water is pumped up through half a mile of 12-inch pipes, by two 30-horse power engines, to the other reservoir on the high grounds, and then descends with a fall of 350 feet, through the same length of pipes to the large jet, which throws it from 150 to 200 feet high. The lower fountain, served from this same main, consists of 16 jets, placed among sea horses, and one *through* a figure of a sea or river god. The 16 jets throw the water 40 feet, and the centre 70 feet high. No pen can describe the fine effect of the two playing together, surrounded as they are by such beautiful scenery. There are other fountains about the place, but not of such remarkable size as those just described. The Earl of Stamford most liberally allows the public to view the whole of the pleasure grounds and flower gardens twice a week, on Tuesdays and Thursdays, but gardeners may see them at any time, Lord Stamford being most desirous that every facility should be afforded them for doing so. Mr. Aiton, the very able gardener here, deserves great credit for the judicious and very extensive alterations that have been made in so short a time, and his exertions are warmly supported by Lord Stamford, who is very fond of horticulture, and spares no expense in making Enville one of the best gardens in the country, as it most unquestionably will be. *From the "Florist," with the permission of the Proprietors.*

FLORICULTURE.

Cinerarias.—The following memoranda respecting the best of the new as well as old varieties of these useful plants were made during a visit to Mr. Turner's collection at Slough while it was in bloom. Of the new varieties, Optima (Bousie's) is certainly the most attractive, and, in a general point of view, the best—clear white, with medium margin of intense blue, dark disc, fine form and substance, and good habit. Lady Paxton is a fitting companion to it, being one of the most attractive and best Cinerarias we have; colour white, with broad deep lilac purple margin, and dark disc, broad, stiff, well formed petal, producing close, well arranged heads of bloom, equal to an Hydrangea under the best culture. Sir Charles Napier is decidedly the best blue, opening

deep blue, and changing to bright blue as it ages; petal, form, and habit good. Mrs. Foster is a deeper coloured Cerito flower, good in form and habit, but not a free grower, with good foliage. Lady Mary Labouchere has been good this year and of excellent habit—white, with small margin of lavender blue, and moderately dark disc. Admiral Dundas is one of the best formed flowers we have seen—white with shaded blue purple margin, and from what we have seen of it, a flower worthy of every collection. So also is Optima (Hopwood's), not a new variety, still little known—white, with broad rosy crimson margin, a good exhibition variety, and dissimilar to any other yet out. Empress is white, with a broad margin of pale rose, light disc, good form, but uncertain in colouring this season, having a tendency to become mottled in colour, otherwise it would be a most desirable variety. Prince of Prussia is a light blue, with a light disc, but deficient in form and substance. Esther, if first-rate in form, would be a charming variety; for in habit it is more compact and even than any variety we know. In colour it is clear white, with broad deep crimson margin, and dark disc, dwarf and perfect habit, and beautiful early, but it becomes starry as it ages. Notwithstanding this, it is a general favourite. There are two or three other new sorts, but as yet they have not bloomed well. Of older varieties the best are Picturata, white with broad even margin of bright rosy purple, good shape and habit—certainly one of the handsomest Cinerarias in cultivation. Rosy Morn is a very attractive flower in a collection, rosy carmine with a white ring round a grey disc, tolerable form, and very useful for exhibiting. Estelle is a most serviceable flower—white, with very broad deep rosy lilac margin, and dark disc, rather cupped, good form, but deficient in substance to be a first-class flower, still one of the best and most attractive. Mrs Sidney Herbert, in its class, is unrivalled—white with delicate rosy margin and pretty habit. Lablache is a most useful blue, dwarf, and of first rate habit and moderate form, and the colour is best described as a medium blue. Amy Robsart is not yet surpassed in its colour, which is rosy lilac with a dark disc. Lady Camoys is of dwarf habit, white, with medium bright blue edging, and is a general favourite, and possesses tolerable form. Kate Kearney is no doubt the best white, and Prince Arthur the best crimson. Marguerite d'Anjou is duller in colour than Prince Arthur; reflexed, and not so good. Teddington is a light purple with white disc, good form, but reflexes slightly; it is, however, of good habit and of a pleasing colour. Formosa is a good variety for exhibition—light violet purple with white disc; of good form, and with a dwarf compact habit. Asmodeus is a good dark blue, dwarf, and of good form and habit. Advancer is white, with purplish blue margin, but too starry. Scottish Chieftain, if first-rate in form, would be a great acquisition; in colour white, with deep violet margin, clear and well defined, but the flower is somewhat starry. Lord Stamford is a very attractive variety in a collection—white with medium margin of deep blue, light disc, and close compact habit; the flower is somewhat confused and indented at the edge, but it is notwithstanding a very showy variety. Loveliness is a rosy crimson with white ring round the disc; a very distinct and serviceable flower for exhibition purposes. Mrs. Beecher Stowe is a very useful variety—white, with broad deep lilac, margin and dark disc; good form, valuable for exhibition purposes, and much better than Empress Eugenie, which is deeper in colour, but by no means so good. Etoile de Vaise is a little improvement on an old variety named "Annie"—white, with dark plum purple; broad margin. We greatly want improvement in this colour. Ringleader, although old, is a very useful flower for exhibiting, and is of a pale carmine colour. Octavia is the lightest azure blue we have, with light disc and dwarf habit. Of seedling varieties the best we have seen is Emperor of France, a very great improvement on Hopwood's Optima; colour, rosy crimson, with broad white ring round a dark disc; great width and depth of petal. This is a fine stout flower, of great excellence. Rose of England is also a first-class flower; colour, clear white, with medium margin of rich rosy purple; compact dark disc, fine form, and good substance. This flower will be a standing variety. Magnum bonum is of a rich purple crimson colour, with a small white ring round a black disc; a large, bold, and attractive variety of first-rate habit. Lord Cardigan is a very large striking flower that will be a great favourite; white, with a broad margin of violet purple; small dark disc. Florence Nightingale is a very promising flower, of good substance, white, with medium margin of deep rosy lilac; good petal and dark disc. Duchess of Wellington is evidently a first-class flower; white, with a broad margin of lilac purple, and dark disc; good substance, and of first-rate form. Lord Nelson is a lively purple self, rather thin in substance, but with a close dark disc, and is certainly the best of all the purples. Monarch is a shaded plum purple, with fiery centre; good form and habit.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—A little fire heat will be indispensable here during cold damp foggy weather, in order to allow of admitting a little fresh air to carry off superfluous moisture without lowering the temperature too much; but this should be applied during the day, and all watering should be done in the morning, so that the atmosphere may get moderately dry before night, when a damp stagnant atmosphere is especially injurious to flowers. But although some care is necessary at this season to preserve plants in bloom from being injured by damp, it is easy enough to fall into the opposite extreme, and as excessive dryness is much more injurious to plants generally, than the amount of damp which would ruin flowers, this must be guarded against. Unless where fire heat is used too freely, however, there is little danger to be apprehended from the want of sufficient moisture in the atmosphere at present.

FORCING DEPARTMENT.

Pineries.—The plants expected to show fruit early next year will be greatly benefited by being kept in a comparatively dry state for a few weeks previous to subjecting them to a warm moist temperature. The atmosphere should be kept dry, also allowing the soil about the roots to become as dry as can be done with safety; do not, however, subject the plants to a very low temperature, but keep this at from 60° to 65° by means of fire heat, for although the plants will bear a considerably lower temperature without any apparent injury, those not subjected to any unnecessary extremes will produce the finest fruit; and a short period of comparatively dry treatment will ripen the growth, and just as effectually induce a tendency to show fruit as checking the energies of the plants by an unnaturally low temperature, and without any of the ill effects of the latter method. No dependence can be placed on the weather at this season, therefore see to plants in pits with insufficient means of heating being well protected by means of covering at night, and maintain the command of a rather high temperature by frequently renewing the linings, &c., so as to be prepared for any sudden decrease of the external temperature; avoid anything approaching excess of atmospheric moisture among young stock, whether in pits heated by linings, or in better arranged structures, which only tends to promote a too free rate of growth for the amount of light, and weakly blanched foliage is the result. Vineries.—Where forcing is commenced, attend to previous directions as to keeping the atmosphere moist, as there will be some difficulty in getting Vines to break freely at this season except this is attended to. If circumstances allow of having a bed of fermenting manure inside the house, this will be found the best means of keeping the atmosphere regularly moist, but if this cannot be used the house must be sprinkled with the syringe frequently, and the evaporating troughs kept full. Also see that the roots are afforded a steady gentle warmth until the buds are fairly swelled; keep the temperature about 50° by fire heat at night, and 60° by day, letting it rise to 70° on the forenoons of sunny days. Get succession houses cleaned, the Vines pruned, painted and put into order for work, and see that the heating apparatus is in perfect order, as if this or anything else about the house requires any repairs this should be done while the house is idle.

FLOWER GARDEN AND SHRUBBERIES.

Except where alterations are in hand, there will be little requiring attention here at present beyond the clearing up of leaves and putting the borders, &c., into neat order for the winter. Get this done, however, with the least possible delay, in order that the place may be rendered trim and neat and as enjoyable as the season will admit; also sweep and roll the walks frequently, so as to keep these clean and smooth, for without hard dry walks pleasure ground is next to useless at this period of the year. Turf will also require rolling frequently to keep it smooth and firm, and prevent its being disfigured by warm casts. If any of the turf requires levelling take advantage of any leisure time which may occur to get this done.

HARDY FRUIT AND KITCHEN GARDEN.

The tedious work of pruning and nailing wall trees should be prosecuted with the utmost dispatch on every favourable opportunity. Trees infested with scale should be loosened from the wall entirely, the bark well scraped and painted with a mixture of soft soap, cow-dung, and lime, taking care to well work the composition into the crevices of the bark. If any planting of young trees or removing of others has still to be done attend to this at once. Get Gooseberry and Currant bushes pruned on frosty mornings, or when the ground is in a dry state, so that it will bear treading upon without injury. After pruning give the ground among the Gooseberry trees a good dressing of lime, which we believe to be useful as a preventive of their great enemy caterpillar. Also get whatever manure may be necessary for the other small fruit bushes wheeled on first favourable opportunity, and get the ground dug so that it may look clean and fresh. Where the Raspberry grub is troublesome give a good dressing of gas lime before digging the ground, taking care to apply it regularly about the base of the plants. The ground among fruit bushes should be dug very lightly, especially in the case of Raspberries which have their roots near the surface, and it is better in all cases to dispense with digging where it cannot be done without injuring the strong roots. The unusually fine dry weather which we have experienced for some weeks past has been very favourable for getting on with the work of manuring and trenching in the kitchen garden, and where this is backward it should be pushed forward on every favourable opportunity until every spare bit of ground is thrown up, so as to expose it to the action of the weather. Be prepared with plenty of covering for Celery, and endeavour to prevent its being injured by frost.

The highest temperature during the above period occurred on the 8th, 1843—therm. 58 deg.; and the lowest on the 5th and 6th, 1844—therm. 14 deg.

Notices to Correspondents.

Books: *S G F.* Roberts on the Vine, with the exception of that portion of it which relates to carrion, which should never be used in Vine borders.‡

Common Plants: *S, Esq.* No taste can be worse than that which limits beauty to mere colour. It is the feeling of savage and not of refined life. Not that we would in any way depreciate the effect of colour, which, if skilfully managed, is charming; but we regard it as only one ingredient in beautiful effects, and altogether subordinate to form. For examples of the latter it is not necessary to travel from "Indus to the Pole;" you will find instances of the most perfect beauty wherever plants can grow with their natural luxuriance free from the invasion of cattle or the dominion of man.

Cucumbers: We have received another letter or two relating to the "Ipswich Standard;" but we think the difference of opinion respecting it can only be settled by such a comparative trial as is proposed by Mr. Ayres, who has sent us twelve seeds for experiment. Mr. Wild having also sent *four* seeds we will put them into the hands of growers from whose judgment there can be no appeal.

Deformed Mushrooms: *Anon.* Specimens of Mushrooms like those which you have sent are not very uncommon. The appearance is not confined to that species of Agaric. We have however seen a far more curious case than yours in the common Mushroom. A new hymenium was produced on the top of the fibres with all the characters of Merulius, and what is still more curious the spores of the new hymenium were different from those of the ordinary gills. *M J B.*

Erythrina macrophylla: *Ashdean.* Roast it in summer, starve it in winter, and if you can cut the roots well in, do so. If it is a seedling it may not yet have arrived at the age for bearing.

Fagus antarctica: *Ashdean.* This will *bear* even such a winter as the last, in a cold place near London, but it does not *like* it. In a warmer climate, like the west of England or sheltered places in Sussex, we should not be alarmed about it. All the specimens we have seen are mere bushes with no tendency to form a trunk. If it grows into a tree it must be, we think, a very little one.

Fungus: *Sylvanus.* If you will refer to p. 744, col. *c*, you will find that your question has been answered.‡

Hedgehogs: *An Old Sub.* Harm! no, no, they are harmless enough, poor things; and what is more, they help you to get rid of garden pests. We are happy to see them running about in the fading light of evening.

Holcus saccharatus: *C R C.* A full account of this plant has been given at p. 835 of our last year's vol.; you will also find some further information respecting it in our "Home Correspondence" of to-day.‡

Names of Fruits: *J A.* 1, Bellissime d'Hiver; 2, Duchesse de Mars; 3, Autumn Bergamot; 4, Marie Louise; 7, Achan; 8, Brown Beurré; 9, Bezi de Caissoy; 1, Kerry Pippin; 2, Court of Wick; 3, Fearn's Pippin; 4, Blenheim Pippin; 5, Wormsley Pippin; 6, 7, Dumelow's Seedling; 8, Reinette du Canada; 10, Winter Queening; 11, Keswick Codlin; 14. Braddick's Nonpareil.—*X Y Z.* 3, Winter Crassane (Knight's); 5, Beurré Diel; 6, Old Colmar; 7, probably Thompson's; 8, Passe Colmar; 9, St. Germain.—*B B.* 1, King of the Pippins; 2, Court Pendu Plat; 3, Beurré d'Aremberg; 4, 6, Glou Morceau; 5, Beurré de Capiaumont; 9, Beurré Rance.—*W C.* Your Pear is the Bishop's Thumb.—*N H.* 3, Knight's Monarch; 5, Marie Louise; 6, Swan's Egg; 7, Hacon's Incomparable; 8, 12, Beurré Rance; 13, Urbaniste; 14. Aston Town; 15, Beurré Diel; 16, Napoleon; 17, Passe Colmar; 18, Braddick's Nonpareil.—*G G.* 1, St. Germain; 2, Franc Réal d'Hiver; 3, 5, Chaptal; 4, 6, Winter Nelis; 7, Passe Colmar; 9, Dutch Mignonne; 10, Beauty of Kent; 11, Rymer; 12, 13, appear to be the Gravenstein.‖—*E O P.* If you will send your fruits carriage paid to our office, they will be named as soon after they are received as it is possible to do so.‡

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*E B.* Rhus Cotinus, the Venetian Sumach.‡—*E M G.* Juniperus recurva.—*Acton.* Isopogon anemonefolius.—*F P.* We will compare the leaves once more and give you an answer next week.

Personalities: *D B C.* We will have nothing to do with such a discussion. All papers which admit them ultimately suffer for it—and very properly.

Phalænopsis: *J M A.* It is suffering from damp and too low a temperature combined. We will ascertain the name of the plant in time for next week.

Sermons: *A Sub.* We could not possibly venture to recommend books of sermons. You should consult the clergyman of the church or chapel you attend.

The Squash: *R W.* We now see that the squash you remember from your youth is a kind of Vegetable Marrow. The Americans have many kinds to which the name is applied. The French call them Pâtissons. Since you cannot get the seed through your seedsman, we recommend you to apply to Messrs. Charlwood & Co., Covent Garden.

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents the insertion of whose contributions is still delayed

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the Importation and Sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves; to our agents, Messrs. Gibbs, Bright, & Co., of Liverpool and Bristol; or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence.—ANTONY GIBBS & SONS.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than any other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre. MR. HUMBERT (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

OWNERS OF SETTLED ESTATES and OTHERS desirous of availing themselves of the various recent Acts of Parliament, by which they may charge their Estates with money expended in the Improvement, Conversion, and Reclamation of Land, by Drainage, Irrigation, Embanking, Inclosing, making Farm-roads, Clearing, the erection of Farm-buildings and Machinery, Planting and other Agricultural Improvements, are respectfully informed that Messrs. HEWITT DAVIS & FRANCIS VIGERS undertake to advise and furnish Plans and Estimates, and if required, will contract to do the works, and dispose of the Rent charges.—3, Frederick's Place, Old Jewry, London.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
HENRY KER SEYMER, Esq., M.P., *Chairman.*
Offices, 52, Parliament Street, London.

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.
2. In no case is any investigation of Title necessary.
3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. EQUAL FACILITIES WILL BE AFFORDED IN EITHER CASE.
4. The WHOLE cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.
5. The term of such charge may be fixed by the Landowner, and extended to FIFTY YEARS for LAND Improvements and THIRTY-ONE YEARS for FARM BUILDINGS, whereby the instalments will be kept within such a fair percentage as the occupiers of the improved Lands can afford to pay. WILLIAM CLIFFORD, Sec.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangel, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of CORNE'S Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

CHAFF CUTTING MACHINES from 21*s.*—A complete Illustrative Catalogue, all sizes and most improved description, will be forwarded on application to WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, London.

BRUISING MILLS FOR OATS, BEANS, MALT, &c.—Illustrated Catalogue will be forwarded on application to WILLIAM DRAY & Co., Swan Lane, Upper Thames Street.

PURE AND CHEAP BREAD.—Flour Mills for Family Use.—Grind your Wheat.—Pure Bread, and do away with medicine entirely, besides effecting a saving.
MARY WEDLAKE'S FLOUR MILLS, 4*l.* 10*s.* and upwards. Washing Machines, 6*l.* 10*s.*; Mangles, from 50*s.*; Chaff-cutters and Oat-crushers. Book on Feeding Horses, 1*s.*
118, Fenchurch Street, London.

SMITHFIELD SHOW, 1855.

TRIALS OF STEAM-THRESHING ENGINES.—The time run by TUXFORD AND SONS' FIRST PRIZE ENGINE, and that by the Engine of Messrs. Hornsby, of Grantham, at the Carlisle Meeting of the Royal Agricultural Society, in July last, with *Fourteen Pounds* of Coals to the horse-power, was—

TUXFORD & SONS ... ... 3 hours and 47 minutes.
Hornsby & Son ... ... 2 hours and 54 minutes.

At the North Lincolnshire Society's Meeting, at Boston, in August last, TUXFORDS' and Hornsbys' Engines again came into competition, when Hornsbys' was again left a long way behind. With 14 lbs. of a very inferior kind of Coal, the time run was—

TUXFORD & SONS ... ... 3 hours and 3 minutes.
Hornsby & Son ... ... 2 hours and 43 minutes.

And had the testing apparatus which had been supplied to the Society from Grantham, not indicated the steam pressure falsely by several pounds on the inch, the difference would have shown fully twice as much to the advantage of TUXFORD'S Engine.

At the recent trials of Threshing Machines at the Paris Universal Exhibition, M. Tresca, the Government Engineer, employed as the motive power one of TUXFORD'S Portable Engines that had previously been purchased by the French Government.

The Combined Threshing, Shaking, and Dressing Machine of TUXFORD & SONS was highly commended this year by the Royal Society at Carlisle, the Bath and West of England Society at Tiverton, &c.

Illustrated Catalogues, with prices, forwarded on application to TUXFORD & SONS, Engineers, Boston, Lincolnshire.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. SEELEY (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
PROTECTION FROM MORNING FROST.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLCHESTER POULTRY SHOW, 1855.—The THIRD GREAT ANNUAL EXHIBITION OF THE ESSEX ASSOCIATION FOR THE IMPROVEMENT OF THE BREEDS OF DOMESTIC POULTRY will be held in the Vegetable Market, Colchester, on THURSDAY, FRIDAY, and SATURDAY, December 27th, 28th, and 29th, 1855.

In addition to the ordinary Class Prizes, the Society offers the "COLCHESTER CUP," a piece of Plate, value 20 Guineas, for the best General Collection of Poultry, consisting of not less than 10 Pens, open to Amateur Exhibitors in the United Kingdom; and W. FISHER HOBBS, Esq., offers a PIECE OF PLATE, value 5 Guineas, for the best General Collection of Fowls, of not less than 6 Pens, open to Amateur Exhibitors in Essex or Suffolk.—Prize Lists, Certificates of Entry, Programmes of the Meeting, and any further information, may be obtained from the Secretaries, 10, High Street, Colchester, on application, post paid, and containing a stamped addressed envelope for reply.
By order of the committee,
W. FISHER HOBBS, Chairman.
*** The ENTRIES CLOSE on SATURDAY, Dec. 15.

THE BIRMINGHAM CATTLE AND POULTRY SHOW.—The Seventh Great Annual Exhibition of FAT CATTLE, SHEEP, PIGS, ROOTS, & DOMESTIC POULTRY, will be held in Bingley Hall, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December. The PRIVATE VIEW and ANNUAL DINNER on TUESDAY, December the 11th.

There will be SPECIAL TRAINS on all the principal Lines of Railway, for which see the Advertisements and Bills of the several Companies.

PRIZE CATTLE SHOW OF THE SMITHFIELD CLUB.—The ANNUAL EXHIBITION of Prize Cattle, Seeds, Roots, Implements, &c., commences on TUESDAY MORNING and closes on FRIDAY EVENING, 11th, 12th, 13th, and 14th December. Bazaar, King Street and Baker Street. Open from daylight till nine in the evening. Admittance 1*s.*

The Agricultural Gazette.

SATURDAY, DECEMBER 1, 1855.

THE Society of Arts have arranged for the discussion of the subject of LAND DRAINAGE in all its aspects, methods, and results, at a meeting to be held during the ensuing meeting and exhibition of the Smithfield Club. Mr. BAILEY DENTON is to read a paper on the subject, and in accordance with the energetic and public-spirited plan always adopted by the Society, invitations to all those who have proved themselves interested in the subject have been issued in order to secure the full representation of every variety of opinion and of practice.

Deep and shallow drainage, air drainage, the Keythorpe drainage, spring drainage, will all no doubt be perfectly described and criticised. One of these peculiar systems was a prominent subject at the late meeting at Lord BERNERS', to which reference has already been made in our columns. Mr. TRIMMER'S geological researches, coinciding so accurately as they do with the Keythorpe practice, have elevated what was a mere instance of clever observation and successful practice into a subject of general interest and probably of general usefulness.

We may just refer here to the principle on which the practice is based, hoping, in the report of the ensuing meeting, to find in the addresses of the different speakers the full development of this and every other peculiarity connected with the subject.

The Keythorpe system of drainage was described last year by Mr. TRIMMER before a meeting of the English Agricultural Society, and it may be illustrated thus: In draining a farm very much cut up by the hedgerows of small fields, it was found advisable after grubbing up the fences to lay drains in all the old ditches and former open water-courses, in addition to the regular system of parallel underground drainage carried out over all. The water, it was found, continued to draw towards the old water-courses, and it became necessary therefore to retain them as drainage channels by laying tiles in each.

The thorough drainage of the Keythorpe estate in Northamptonshire, the property of Lord BERNERS, has been effected by attention to some such principle as this, only here the old water-courses which have been attended to, date, not from any previous arrangement of the surface of the soil by previous occupiers, but from a pre-existent arrangement of the surface of the subsoil (which is found to be furrowed into grooves and ruts of considerable depth) before it became covered with the soil. To this conformation of the under surface, which as a geological fact has long been known with reference

to some formations, Mr. Trimmer has called attention as of agricultural importance. When the subsoil is clayey and retentive and the furrows in its surface become filled up with porous material they are natural drains, or would act as drains, if exit were provided for the water which will gather in them, and Mr. Trimmer accordingly advocates the arrangement of the drains, not upon any regular system corresponding to the uniform supply of the water from the clouds upon the land, but upon a system which shall correspond in some measure to the irregular manner in which, owing to these natural drains, the water arranges itself after it has sunk beneath the surface. It is therefore recommended that by sinking pits and otherwise examining the structure of the land, the direction of these ruts beneath the surface be ascertained, and that then the direction of the drains be laid as nearly right across them as the fall of the land will allow. It is the existence of these ruts, not the cause to which theory assigns them, that is of any interest to agricultural readers, and therefore it is not necessary to state Mr. Trimmer's views upon the latter point: but it may be added that he has found them generally so far parallel as that having ascertained the existence and direction of any one such groove the direction of them all may be taken from it, and that of the drains then laid down, so as to combine in the best manner possible the line across these grooves with the line of surface fall. Attention to this subject at Keythorpe has resulted, it is stated, in a very economical and efficient drainage of the land. Whether that condition of the subsoil on which the system is based be so general as to make Mr. Trimmer's researches into the subject generally available remains to be proved. The latest information on this and on every other aspect of the subject will no doubt be fully brought out at the meeting of the Society of Arts, which will, we hope, be well attended and reported.

In previous Papers (pp. 730 and 746) the history of the Turnip has been traced until it has attained a position in which it may be considered as safe from its formidable enemy the *Haltica*, and the farmer is satisfied with having got "a plant;" but as a plant is by no means a crop it now becomes a duty to examine into some of the causes which may operate to prevent the realisation of those hopes which success so far might have engendered, to which end this paper will be devoted to an inquiry into those injuries to which the plant is liable from the attacks of some of the species of insects which feed upon the bulb in its young state. In doing this we shall now direct more particular attention to the wireworm and the larvæ of the cockchafer. From the earlier state of the root growth until it arrives at maturity the Turnip is liable to be eaten by wireworms, which we need not stop to describe any farther than to state that they are the larvæ or caterpillar state of some beetles; these eat into the very heart of the Turnip root, and by mutilating or destroying it either cause mutilated and ill-formed roots or ruin the bulb altogether, according to the severity of the attack. To destroy this pest many expedients have been had recourse to; the use of salt, lime, and various plans of manuring have from time to time been recommended and abandoned, and now after all the care and trouble bestowed in the inquiry *the encouragement of their natural enemies is found more to discourage their increase than all other plans put together*. Amongst those we may especially number the mole, rook, and starling.

It cannot be expected that so time-honoured a craft as that of mole-catching will be lightly given up, but if we recur to the fact that the mole was formerly considered as an enemy to the farmer and gardener upon the *erroneous supposition that he fed upon roots**, we shall in this case see reason to believe that he has been wrongly convicted, and if upon further inquiry we find that he lives entirely upon insects, and that the root-destroying wireworm is his principal food, we ought, unlike the law, not merely to grant pardon for offences never committed, but to cherish the victim of our former injustice.

As one practical case of the good done by moles has come under our own immediate observation within a recent period, it may be worth recording. The botanical garden at the Royal Agricultural College was for several years so overrun with the wireworm that no crop was safe—the garden esculents and the experimental plots all shared the same fate. Whether guided by his natural instincts to an abundance of food, or quietly introduced there by the intelligent Scotch gardener, who ever speaks of the mole and treats him as a friend—how he came we cannot pretend to say, but the mole established himself in the part of the garden most infested by the wireworm, and after two years' residence it disappeared, and what is so much to the point the wireworm has disappeared also. Much has been advanced both for and against the mole, but this much must be admitted, that he is carnivorous and almost insectivorous in his food, and it may therefore be a matter of grave consideration whether the injury he does by disturbing the soil is not more than compensated by the good resulting from his appetite, for we may be quite sure that like the Indian he will only stay in his hunting ground so long as it furnishes him with food; failing this, he migrates to a spot better adapted to supply his appetite, which is of a most voracious description.

At the season of the growth of the Turnip which it is our present object to describe, the larva of the Cockchafer (*Melolontha vulgaris*) is frequently one of the most serious pests. In this species the beetle, as is well known, may often be observed in thousands feeding upon most of our deciduous trees in the month of May—and hence the term May beetle, by which it is often known: in this state it does much injury by feeding on the leaves of the trees; its eggs are laid in the ground, and in a short time these, on becoming hatched, present the larvæ, which are at first small, but gradually becoming larger, in the space of three years forms a large fat grub, as much as an inch and a half in length. This bulk is attained at the expense of almost any crop among which they may be located, and amongst others the Turnip too frequently falls a prey to their ravages. We remember some three years since a friend of ours, who was a great enemy to rooks, came to us in great glee at having at last, as he thought, made out a clear case of felony against these respectable birds, which he had detected under the following circumstances. On passing the Turnip field he had observed the rooks very busily engaged among the plants from one end of the field to the other, and upon instituting inquiries as to their occupation he saw that the mere tops of the young plants eaten off from just below the collar were thickly strewing the ground heels upward, the bulbs which had just commenced forming having been evidently eaten away. Here, then, he had hastily concluded that the rooks with malice aforethought, and contrary to the laws of our sovereign lady dame Nature, had been feloniously enjoying a vegetable refection of Turnip roots; but on a more careful survey we found that the injury had not been just then inflicted; that the tops, indeed, bore evidence of having been gradually eaten away by a smaller creature than the rook, and upon looking along the rows we soon saw many sickly looking plants which were evidently suffering from some injury then in the process of infliction beneath the surface; and upon removing the soil we were not surprised to find a number of the larvæ of the cockchafer, varying from one to four at each sickly root. Here, then, was strong confirmation of the error of hasty observation, and consequent erroneous conclusions, as in this instance the very creatures which were considered by our friend as enemies were doing the part of real friends; and as they were afterwards left in quiet possession of the field, it is not too much to conclude from the numbers of the observed larvæ, that the saving of the crop was mainly attributable to their labours.

Again, some few years since, we saw, on a farm in Gloucestershire, a Turnip field so infested with these larvæ that a crop was obtained only by setting women and boys to grub about the plants, and hand-pick the caterpillars, for which service the farmer paid a few pence for every quart, and a tolerably large party for two or three days in that way obtained very good wages, the creatures, which formed a good-sized heap, being afterwards destroyed.

Now, the first of these instances occurred on a farm where rooks are abundant, but from some cause or other, perhaps from frequent molestation, they had gone far afield for their food, which they would still have done, if indeed they had not been executed on the spot but for a timely verdict of acquittal. However, in the second instance, rooks are unusual, and if guided to the place by their unerring instinct, the fact that a man was constantly employed to "keep birds" who was by no means chary of powder, is sufficient to account for the vast quantities of these creatures which occurred, especially when we consider that the enormous fecundity of these lower tribes of animals is on purpose to compensate for the myriads which if allowed would constantly fall a prey to their natural enemies.

The rook, too, is an enemy to the wireworm, which, with the larvæ just described, are among the most prolific sources of failure to the Turnip crop, both of them commencing their ravages after the plant is considered as safe, at which time the mischief is all the greater, inasmuch as the plants have been thinned, and therefore cannot well be replaced. Caterpillars, of some species of moth, are also enemies at this time, but as these, like the preceding, are best kept under by insectivorous birds, we shall not stay to describe them, but would conclude this part of the history of the Turnip crop by earnestly recommending farmers not hastily to destroy insect-eating animals, for although under some circumstances, especially if too thick, they may be compelled to have recourse to vegetable food, yet on the whole their tendency is so much to good that great evils must arise from their indiscriminate slaughter.

Here then, we would observe, let the owners of rookeries and the farmers be content with the annual thinning entailed by rook-shooting, not however in anger as against enemies, for we are convinced the more the natural history of the rook is inquired into the more shall we be inclined to look upon him as *the farmer's friend*, and that his behaviour to the all-important Turnip crop when understood, will ever ensure his being so considered.

* The writer when a boy was placed with a gardener and his wife for the benefit of country air and exercise, and he well recollects that this worthy man, who belonged to a club, was carefully nursing a promising double Stock in which to shine in the club procession on Whit Monday: but alas! a few days before, the flower drooped so sadly that the plant was taken up and examined, when its main root was found to have been eaten away. This mischief was at once attributed to "oonts" or moles, and vengeance of no ordinary kind was carried out against them.

THE YIELD OF LAST HARVEST.

My attention has been called to several letters which have lately appeared in the *Times* from Messrs. Caird, Turner, and others, speculating on the quantity of Wheat which has been grown this season in the United Kingdom; but these gentlemen have not attempted to inform the public how a larger Wheat crop may be grown during periods of scarcity, if not permanently, on the strong Wheat-producing soils of England. I therefore venture to state what I have myself succeeded in doing towards that desirable object this last harvest. My farm consists of 170 acres of strong clay land, which five years ago was unable to produce more than about 150 quarters of Wheat. Within that period I have drained, cleaned, and heavily manured the entire farm, and this harvest I am rewarded by a crop of the finest quality of White Wheat, averaging as nearly as I am at present able to estimate 5 quarters to the acre over 105 out of the 170 acres; and of this 105 acres, about 20 carried a very heavy crop of Oats and Wheat last year.

I have just now finished sowing some 116 acres, and have 18 yet to sow, after the roots have been removed by the aid of Crosskill's Railway, which by the bye, I always use for this purpose, when the land is at all wet, as it has been this autumn. It will thus be seen that a farm of the moderate extent of 170 acres can be made to produce 500 quarters of Wheat, of the very finest quality, without deterring the cultivator from taxing its productive powers, and a still greater extent for a succeeding crop. The secret rests in a system of deep drainage, thorough cleaning, and liberal manuring, with deep and perfect cultivation.

My growing Wheat crop looks as well as it is possible to do, and notwithstanding the doubts and fears, and may I add, hopes of many of my neighbours, I have every expectation of as fine a crop next year as I have succeeded in growing this year, and my intention is to continue successive Wheat crops as long as I can get 90s. per quarter for my 5 quarters to the acre. *J. C. Sherrard.*

Inverness-shire is of trivial importance as a grain growing county, the statistical returns for 1854 showing that of its huge extent (upwards of 3 millions of acres) the following only were appropriated to grain crops, viz.:—

1684	acres	Wheat.
3674	,,	Barley and Bere.
13,674½	,,	Oats.

Of the Barley and Bere fully one half is grown in the upland straths and remote islands of the Hebrides, where agriculture is very inefficiently conducted; of the Oat crop about two thirds may be ascribed to the same districts. I do not suppose that the acreage under crop for 1855 will much vary from the above, as though the high price of Wheat in 1854 was an inducement to sow as much as practicable, the practicability was much limited by the extreme wetness of October and November, and the frozen state of the ground in March. The Wheat crop is deficient of an average to the extent of 4 bushels per acre. The Barley and Bere crop is about an average. The Oat crop is deficient to the extent of 12 bushels per acre. The apparent causes for this short-coming in Wheat are the severity of the winter months, during which much of the seed sown perished, and the coldness and ungeniality of April and May, when the plants should have been tillering. Oats of course were subject only to the unfavourable influences of these latter months, from which Barley and April (bearded) Wheat, owing to their late period of sowing, were comparatively exempt. *S.*

Northumberland.—I think the crop of Wheat in this district will be about one-sixth below an average; Barley and Oats an average in quantity, but light per bushel. There will have been a little increase in the breadth of Wheat sown, on account of it being in some cases substituted for Barley. Potatoes above the average of the last few years. *Joseph Lee, Dilston.*—Whatever difference of opinion may prevail upon the aggregate yield of last harvest, I have, from a general acquaintance of this county, no hesitation in asserting

that the produce in Northumberland will be found far short of an average. Mr. Caird shows a pertinacity in his opinion that the last harvest will not fall above one million quarters short, and seems to lay much stress upon the increased breadth of land sown with Wheat last year. Mr. Caird must know something of Northumberland, having in its schools imbibed in his youth an acquaintance with our system of husbandry; improvements since then have made as rapid strides here as elsewhere, and the dormant productive properties of our soils have been called into active operation by the numerous modern discoveries in agriculture, as shown in the astonishing increase in the manufacture of beef and mutton, and in the additional production of our cereal and green crops, but the extent of land under tillage has rather decreased of late years in Northumberland than otherwise. The repeal of the corn laws, which unreflecting minds feared would throw all our arable lands out of culture, certainly did, during the panic, convert many fields into pasturage that had been under the plough; and as the growth of beef and mutton has of late been equally as remunerative as the cultivation of corn, consequently there has been no relapse to the former system of husbandry with us. Then, how far have the seasons been hurtful or favourable to an increased breadth of Wheat last year? The autumn of 1854 was undoubtedly of the most auspicious kind for the sowing of fallows, and even the month of January was mild and dry beyond precedent; but the spring was one of the most untoward and ungenial we ever remember; the sowing of spring Wheat upon the fine dry Turnip loams of Glendale, Bambro, and other favoured localities in Northumberland, was sadly curtailed by the severity of the snow storms and intense frosts which here prevailed till the middle of April, and a less than usual acreage of spring Wheat was sown. As the spring was late, so was the summer cold and ungenial. July was a wet month (rotting much of our new land hay); every farmer knows that the most critical stage of the growth of the Wheat plant is the blossoming time—it was easy to foretell the deficiency which exists in the yield of almost every field of Wheat, which had become lodged and deranged by the unpropitious weather in July, upon the inferior Wheat soils, of such considerable extent in Northumberland; the severe spring and cold summer operated no less against an average crop, either in bulk or yield, and the stack garths as well as the threshing floors at once solve the problem you put in your circular "of the probable yield of the last harvest." In Wheat we are deficient 20 per cent. Of other grain Barley is the most productive crop, though exhibiting a stain and unevenness in many samples. Oats are very deficient upon all inferior lands, and cannot, upon the whole, be pronounced a full crop. Beans and Peas, plentiful of haulm, but wanting in pods, and will give a prolific yield. Agricultural statistics are now occupying much attention. However satisfactory it might be to the statistician to know to a quarter the produce of our harvest, yet I confess myself one of those who have no faith in figures as a panacea to the many ills which beset the farmer. I have less in the certainty of obtaining correct returns; and figures, assuming all the authority of facts, while they rest on the most fallacious basis will ever be mischievous in their quotients. We suppose the subject of agricultural statistics is taken up at present as a Shibboleth by the farmers' friends, for lack of a more significant grievance. One stubborn fact presents itself for the reflection of the landowners—the waste, unreclaimed, but reclaimable acres that yet disfigure the face of the country. Not long ago Lord Stanley declared at an agricultural meeting, that there are 77,900,000 acres in the United Kingdom, of which 47,000,000 are under culture, 15,000,000 by nature unreclaimable, 15,000,000 reclaimable waste. Why, surely here is a field ample enough for the profitable employment of what used to be termed our surplus population. Fifteen millions of productive waste lands, and philanthropy in distress at the idea of a famine! P.S. A severe frost in the night of the 7th September damaged the unripe Wheat seriously upon our higher and later altitudes, otherwise the weather throughout the harvest was delightful in the extreme, and every sheaf housed in good condition.
S. Donkin, Bywell, Felton.

AGRICULTURE OF THE FRENCH EXHIBITION.

The winter session of the Edinburgh University commenced last week in the agricultural class with a lecture on this subject by Professor Wilson, whose services in connection with the Exhibition have been acknowledged by the French Emperor by the award of the Cross of the Legion of Honour:—

Professor Wilson remarked that the Agricultural Section was certainly the most comprehensive, if not the most important, of the various divisions of the French Exhibition. It included the following branches:—Agricultural statistics, manures, agricultural mechanics and engineering, cultivated crops, special crops, crops obtained without cultivation, farm stock, and agricultural economics. The first section contained few subjects of interest, and unfortunately the admirably organised statistics of Scotland could not be shown, as they would have contrasted too strongly with the poverty and prejudices of our southern neighbours. In artificial manures the fish guano particularly claimed attention, inasmuch as the practicability of the manufacture had lately been the subject of much discussion in scientific, as well as in commercial, circles. Various processes of manufacture were shown, illustrating a branch of industry to which attention might profitably be turned, particularly in such places as the fishing villages on the north-east coast of Scotland, where there was abundance of fish and fuel. The practice of drainage had hardly yet commenced in France. Some few most creditable examples existed, and were extremely well illustrated by plans, and by the exhibition of the comparative results of drained and undrained fields. In agricultural mechanics, England was represented by an excellent collection of the best manufactures of the leading firms, almost all the continental states were represented by their implements, while the United States showed its great mechanical applications in the shape of reaping machines. Notwithstanding this large display, however, there was nothing new to be seen. The ploughs comprehended almost every variety known, even from the most remote periods. There were numerous and somewhat ill-made copies of various English implements, a great number of threshing machines, horse powers variously contrived, some few moveable steam-engines, and one of a novel construction, having a threshing machine attached, and being carried on two large travelling wheels. The price of this machine was 168*l.*, and it was stated to do 250 to 750 bushels (30 to 90 qrs.) per diem. For districts where it was customary to let out power and the threshing machine, this appeared to be a good arrangement, being efficient in action, and economical in construction as well as in transport. The character of the English implements was well sustained in almost all the practical trials. In reference to the cultivated crops the lecturer said:—Rivalling the fine samples of hard Wheats from Algeria, were the white Wheats of Australia, Tasmania, the Cape, Canada, and Sweden; France, Spain, and Belgium also exhibited beautiful Wheats, both white and red—while the red Wheats of Portugal were very highly commended. Austria and Baden both furnished very comprehensive and well arranged collections of agricultural produce, and the quality of the Wheat exhibited by Turkey showed the richness of her soil, while its dirty unmarketable condition testified to the want of care of its inhabitants. Denmark, Sweden, Canada, and Hungary exhibited the finest samples of Barleys, and Tasmania sent a sample of Oats equal to any in the building. The specimens of Maize were very numerous and of admirable quality; the finest perhaps were from Algeria, Canada, Australia, Portugal, Hungary, and Styria. Rye and Buckwheat, two crops hardly known as bread corn in this country, were contributed by France, Bohemia, Denmark, Sweden, and Canada, in which countries they are very largely consumed. Samples of Rice were contributed by South Carolina, of remarkable size and colour. Algiers, Portugal, Tuscany, and the Pontifical States also exhibited their produce. Bavaria, Bohemia, and Belgium, sent fine collections of Hops of superior quality. Canada also exhibited samples, showing a marked improvement in quality since 1851. The advanced state of the Flax cultivation in France, Holland, Belgium, and Austria, was well represented—from each country an extensive series of samples of various qualities, and in the different stages of preparation was sent. The Tobacco specimens, I was informed, were of extraordinary quality—in many cases, I am sorry to say, superior to the samples of grain of the exhibiting country. Those most commended were contributed by Algeria, France, Austria, Baden, Spain, and Portugal. From Greece a small collection of grain was sent, as also a pot of honey from Mount Hymettus, which agriculture, still faithful to the traditions of the poets, pronounced to be the best in the exhibition. In the French department, the numerous exhibitors most creditably represented the agriculture of France; many of the collections of Wheat contained specimens whose names indicated their British origin. Here were represented the two newly-introduced plants—the Dioscorea Batatas, with its elongated fleshy tubers, indicating a capacity to become, in a suitable soil, an advantageous substitute for, or successor to, our old friend the Potato; the other the Sorghum Sacch., forming the climatal connecting link between the sugar Beet of the temperate and the Sugar Cane of the tropical zones. This plant, owing to the proportion of sugar it contains, obtained at once a high economic position, and has been the subject of experiments, both scientific and practical, upon a considerable scale. One exhibitor from Marseilles confined himself solely to the representation of its merits. The stem and seeds were shown of the living plant, as also a colouring principle obtained from them, and specimens of its application to silk and woollen goods—sugar crystallised, molasses, wine, alcohol, cider, and vinegar—farina, simple and in a manufactured state. I have refrained thus far from any reference to the representation of British agricultural produce—firstly, because it consisted only of a single collection exhibited by the Government and not by individuals: and, secondly, because the whole responsibility of it was intrusted to myself. When I recollect, however, how largely I was indebted to the liberality and assistance afforded me by a well-known Edinburgh firm (P. Lawson & Son), and that many of the most commended specimens were contributed by Lothian farmers, I am sure my motives will not be misconstrued if I tell you of the complimentary manner in which it was noticed by foreigners as well as by French authorities. [The lecturer read an extract from the *Conservatoire des Arts et Metiers*, speaking in high terms of the English collection.] In woods used for construction, and for ornamental purposes, the English colonies of Canada, Guiana, Jamaica, and Australia were without any rivals. The gigantic dimensions of the soft timber of Canada were only equalled by the strength of fibre and beauty of grain of the hard woods of lower latitudes. Such a large collection of specimens offered an excellent opportunity for testing their comparative values for different purposes of construction: and a series of experiments were carried out, the results of which, I have no doubt, will materially add to our knowledge of the relative strength of materials. Several very important experiments were made with reference to ship-building. Next to woods, vegetable fibres perhaps occupy the first place of importance in respect to our present industrial requirements. Our demand for them has increased so largely of late years, both for textile and paper purposes, and we have relied so much for our supplies upon other countries, that any disturbance in the markets of Europe immediately affects our own, and makes us anxious to discover new sources whence they can be obtained. It has long been known that the indigenous flora of the lower latitudes contain multitudes of plants furnishing excellent fibres, suitable for well-nigh every purpose, but it needed an industrial crisis like the present to invest the specimens exhibited of different countries with the importance they so well merited. In these, also, our colonies took the lead—Guiana and Jamaica both contributing large samples of their produce. In cottons there was little to notice except the specimens exhibited by two new producing countries—Algeria and Australia. Those from the former were beautifully prepared, and of several varieties, but with all the care and expense bestowed upon then, were not the representatives of a successful cultivation. From Australia only one variety—the ordinary short staple cotton—was sent, and that under its ordinary commercial garb; but what it lacked in appearance, when compared with its showy rival, it possessed in value and importance, and the reception of the produce in the home market will no doubt ensure a successful development of its cultivation in the colony. In wools the number of exhibitors was very large: probably so large and comprehensive a collection was never before got together. Specimens were sent from almost every country—from Arctic Greenland to the plains of Hindostan. The extensive display of fleeces and sample wools from Moravia, Silesia, and Bohemia were of the highest class, and were contributed from the most renowned flocks of those countries. Those from Hungary, Transylvania, and Gallicia were also excellent in their class, but fell short of the fine qualities of the Moravian flocks. The Prussian collection comprised small samples merely; the quality of those from Brandenburgh, Posen, Westphalia, and Silesia made us regret that entire fleeces had not been sent. From Spain, the native pastures of the Merino, our expectations were not realised; notwithstanding their geographical advantages, these wools could not stand a comparison with the produce of German flocks. The fleeces of Leon and Segovia have no longer their ancient reputation; and, though the Government has striven to resuscitate the breed by the importation of Saxon rams, the want of more successful results indicates clearly the backward and neglected state of Spanish agriculture. The collections in the French department were comprehensive in character and admirably arranged, possessing, in many instances, a particular interest for an English observer, as many fine specimens were exhibited of fleeces indicating, in whole or in part, an English origin. Here not only was the pure Merino breed represented, but also the celebrated Rambouillet and the Métis Merino; and these, again, crossed with our Leicester, Romney-Marsh, and Southdown breeds. Some few flocks still exist in France which have preserved the ancient character of the fine short-stapled Merino wool. This, however has been secured by a continuous system of breeding in and in, and at the expense of a considerable depreciation in the animal, and also of certain valuable properties in the wool. The International Exhibition, grand and spacious as it was, could not, within its walls, do full justice to Agriculture—the true productive industry—the real standard of a country's wealth. Beyond its walls was reared another range of buildings, and there were seen in well-nigh countless lines the living specimens which were denied admission among the inanimate productions of the farmer's skill. These contained the picked representatives of breeds for which the different exhibiting countries were most celebrated—the dark spotted Holsteiner and the large framed Schweitzers, both famed for dairy purposes, were well represented. Alongside were seen the ever neglected German breed, with their improvement by an Ayrshire cross. Specimens of the draught cattle from the banks of the distant Vistula—the cream coloured Comptoise, the team oxen of France—the brindled Normande—the small framed Bretonne—and the milk white Charolaise—a breed which struck our English eyes as possessing all the physical outline of an improvable stock. The fine short-woolled sheep of Germany were amply represented, while the heavier breeds of France admirably exemplified the characteristics of her rural policy. Our own country, too, though somewhat tardy in her appreciation of the attempt, sent specimens of her leading breeds—Shorthorns, Devons, Herefords, Leicesters, and Southdowns—names now current abroad wherever systematic agriculture is known—animals which have done more to spread the fame of England's agriculture in distant lands than all the treatises that have been received from the press. This vast collection of living specimens, in addition to the General Exhibition, rendered the circle of agricultural produce complete, and the banner of Ceres, with its international quarterings, waved triumphantly over the Champ de Mars. There for the first time the domesticated animals of different countries were brought together in friendly rivalry. France completed in the Champ de Mars what England began in Hyde Park. The blank then left in industrial competition was filled up, and an example offered to us, which, I am happy to see, has already been productive of good effects. The excellent arrangements and the admirable organisation of the show left nothing to be desired; while the policy that suggested, and the liberality that encouraged, this onward movement were acknowledged by every one, I think, who participated in it. A living "Book of the Farm" was opened on a scale and under conditions such as had never occurred before. Each country had sent her best, and these all stood together within the same wide area, models of their respective races, standards of comparison by which the farmers of France could estimate the native breeds, or stocks from which they could draw supplies either to improve or to replace any that were found deficient. The success of this great experiment was shown, as regards England, by its renumerative results to our exhibitors; as regards France, by its intended repetition on a more comprehensive scale next year. In the interests of agriculture let us wish it all success. This brief sketch (said Professor Wilson in conclusion) which I have given you has touched but the surface—the salient points of interest which naturally present themselves to the ordinary observer. But a man cannot long remain an ordinary observer whose duties lead him day by day, and week by week, to the examination of these great and varied evidences of Divine beneficence. He cannot compare unmoved the productive ratio of skilled and Christian Europe with that of the dark unevangelised nations of the East. He cannot but trace the hand of Providence in adapting the wants and the produce of a country to each other, whether he seeks for it in the contributions from the ice-bound shores of Scandinavia, or the sunny lands of south latitudes. He feels, after all, how poor are man's efforts and how small is his success, when, with all the powers of advanced civilisation—the matured intellect, and the developed skill—he cannot rival the beauty and the richness of those productions which nature has bestowed on lands over which her sway is still undisturbed. His intellect may originate—his skill may apply—science and heart may lend—means for the adaptation of nature's gifts to his daily need, but his own finiteness must ever come home to his mind with the great truth that "though as Paul he may plant and as Apollos may water, 'tis God that giveth the increase." (Applause.)

Home Correspondence.

Agricultural Education.—The following well written passage is from the address of the president of the Canadian Agricultural Society at their late anniversary: A man is not deemed competent to make a coat or a shoe who has not served an apprenticeship of several years. Yet men are expected to manage farms who are mere tyros in experience, and in great measure ignorant of the science of agriculture. If the next generation of farmers could be well educated in their profession, it is almost impossible to estimate the vast change which would take place in the world's progress. What is urged is, Education, in the true and proper sense of the term, namely, the thorough training of the mind with a special reference to the practice of Agriculture. It includes the theory and practice of the profession, neither separately, but both combined. Theory alone cannot make a man a good farmer. In order either to do work well, or to be fitted to direct others in the performance of it, a farmer ought with his own hands to have gone through the process. A young man, when commencing his course, should begin at the rudiments, and progress step by step to its completion; doing with his own hands, daily, the labour in each department. But together with the correct practice of farming, he must call in the aid of science in order to make him a good farmer. Science must assist him by telling him what sustenance each kind of crop requires, whether it be organic or inorganic, and from a careful analysis of the soil, whether such substances be among its component parts, and in the necessary proportions. No amount of merely practical skill can in all cases indicate this; science alone can determine it. How often is the merely practical man bitterly disappointed when, after preparing a field in his usual way, he finds that the crop falls far short of his expectations. Such failures cannot be accounted for by any incidental and obvious causes; there is the want of something to complete the amount and kind of food necessary for the crop, but he can't tell what that some-

thing is. Here science must aid him, or he will be left to grope in the darkness and mist of uncertainty. We may learn much from the book of experience, but its teachings are vague and uncertain, unless we are somewhat acquainted with the laws which regulate the universe. A physician practising his profession in ignorance of general principles, and trusting to his experience, might avoid doing much mischief in ordinary cases, but in those of complexity and peril he would be completely at sea and utterly helpless. The like case is that of the farmer who has no scientific knowledge. He may indeed wish to read correctly the laws of the practical world, but this he cannot do accurately without science. This is the difference between the empirical and the scientific physiologist. The empiric is contented with observing and recording the resulting fact, while the scientific physiologist must ascertain the manner in which physiological laws operate. The attention of the one is directed to results in the improvement of his art, and that of the other to the enlargement of his stock of knowledge. There is a strong tendency in those two methods to combine and unite in one grand result. That they do so combine is unquestionably true. All science is true, and the results of the operation of the great principles which it teaches must be exactly in accordance with it. Now, the object of the science of agriculture is, to construct a scheme of knowledge which shall not only explain results, but be a guide to the evolution of correct systematic practice. This identity of result is not merely important as respects the discoverers and improvers, but to man as man, elevating him morally and intellectually, and providing largely for his temporal wants.

Draught of Steam Plough—Can any of your readers who have a dynamometer, and with rope, say 200 yards long or any given length more, sufficient to draw two or more ploughs in a framed carriage such as Williams', say what is the draught required to draw it over, first, level land or a regular inclined plane; second, over a convex surface (stating the convexity); and thirdly, over a concave surface, stating the concavity as nearly as possible? The object we have is to ascertain what additional draught such a rope would add to the plough carriage in ploughing, supposing it wound up upon a drum or windlass at the headland by a stationary engine. Any party who can answer the question will readily appreciate its importance at the present moment, and may vary it in any manner he thinks best calculated to afford information. If we could ascertain again the strain upon the two anchors of an endless wire rope in being drawn over the ground empty it would be of great value. *W. B.*

Drains with Brushwood.—The reply of "A Constant Reader" to the inquiries of "H. B.," although written with much authority, is far from being in accordance with the experience of the present day. With respect to using Brushwood, I should not venture to say, as he does, "lands may be safely drained with it," even admitting "it may last ten years," seeing that when it commences to decay the drains become partially stopped, and the land is made very much wetter than ever, and far more difficult to drain, from the lodgments of water in the old drains; nor can I consider, seeing how small is the cost of pipes, that it can ever be advisable to use Brushwood. Of this I am sure—it is always adviseable for the landowner to come forward and arrange with the tenant for the substitution of pipes; and with respect to the recommendation to use "the old-fashioned horse-shoe tile laid upon a flat sole," fortunately there are so few now made, and they are so seldom to be had—the introduction of pipes having very generally altogether superseded them—that very little harm can come of it. They have ceased to be used because the pipe is found to be a far cheaper and stronger material; the first cost being one-half (the 2-inch pipe is made for 14*s.* to 18*s.* per 1000, while the tile and sole costs 30*s.* to 40*s.*), and the cost of cartage and cutting the pipe drain, and laying the pipes, is also less; and the tile, as I have myself experienced, and as Mr. Gisbourne, in his very superior little work "On Agricultural Drainage," has pointed out, has long since been found unable to resist the great lateral pressure of 4 feet of clay and soft soils. They split along the back, and the sides are pressed together by the weight of 4 feet of earth lying against them. With respect to "cutting the drains across the fall," I am at issue with "H. B." I am persuaded from my experience that the action of a drain ceases to be perfect whenever taken out of the line of greatest fall. The water in the soil, until set in motion by draining, is in a state of rest, and then does not flow on the face of a plane, or like rain over a surface, but rises into the drain, and takes a course down the line of greatest descent: if the drains take that course, the water follows the drains; but if the drains cross the line of descent, the water will soak from the lower side of the drains into the soil below; for the drains are not like gutters or sunk channels, that catch the water on the upper side and hold it, and do not admit of a passage across, but are always of material that affords the like facility of escape as of entry. Nature, (our master drainer) in the course of rivers, which are the earth drains, ever follows the line of greatest descent, and the stream when turned aside, will still, by its soakage into the lower ground, show its tendency to take its natural course and true line of drainage—namely, down the line of steepest declivity. *Hewitt Davis, 3, Frederick's Place, Old Jewry, London.*

Cotton Seed Cake.—My attention has been directed to Sir T. Parkyns' letter in the *Gazette* of the 20th October, and as no one has replied to that letter, I think it my duty to do so, in justice to those gentlemen who had made, imported, and used the cake there referred to prior to Mr. Barber. Notices of it will be found in the "Tran-actions of the Highland and Agricultural Society of Scotland" of 1850, No. 28, and in the "Journal of Agriculture," No. 45, both published by Wm. Blackwood and Sons. Mr. Burn, Merchiston House (a friend of my own), referred to in the "Transactions of the Highland Society," as the first maker of the cake in this country, holds a medal awarded by the jurors of the Great Exhibition of 1851, as the importer and manufacturer of the seed, and also obtained honourable mention as the exhibitor of the only sample of Cotton seed cake. I have been importing the cake for years back, and latterly the seed, and I would suggest that instead of the cake being called after any gentleman it ought to retain its appropriate name of "Cotton seed cake," to distinguish it from Linseed, Rape seed cakes, &c., and by which name it has been known in Scotland for some years. I will be glad to show the cake to any one desirous of seeing it, and can give the names of highly influential agriculturists in the Lothians and in Fifeshire who have made use of it for feeding. *James Bennett, Leith.*

The Sunflower.—I have copied the following from a newspaper paragraph; will you kindly give in your next Number some information respecting the cultivation of the Sunflower, and the process used to extract the oil and make the cake. "The Sunflower is now much cultivated for its oil, and as food for cattle and poultry. One acre will produce 50 gallons of oil and 1500 lbs. of oilcake. The stalks when burnt for alkali give 10 cwt. of potash. *An Admirer.*

Root Crops at Canarn, Mylor.—Passing through this farm the other day, I had but just finished admiring the beautiful green hue of one of the Grass fields through which I had just passed, as also the fine handsome short-horn cows that were grazing in it, when I came into a field where the hands were busily employed taking up the crops of Mangels and Turnips. My attention was immediately drawn to the enormous size of some of the former. On mentioning it to the farmer, Mr. B. Lawrance, he at once complied with my request to get some weighed. Four square yards of each of the following were then measured off, and after being taken up and carefully divested of all the adherent soil, but not tops, weighed as follows:—

	lbs.	tons.	cwt.	qrs.	lbs.
Mangels, Yellow Globe =	99 =	53	9	2	6
Turnips, Coppertop Swede =	76 =	41	1	0	8
" Pomeranian White =	80 =	43	4	1	4

per acre. The Mangels were put in early in May, in drills 20 inches apart, with a dressing of 3 cwt. 2 qrs. of guano per acre; Swede Turnips late in June; White Turnips middle of July; each with a dressing of 1 cwt. guano and 2 qrs. of bones. The Swedes, I was informed, would have been much larger, but for that little pest the fly having carried off the whole of the first sowing. Better Turnips than the White ones I have never seen, and I should say they cannot be too highly recommended. No fingers and toes are to be seen here, but a handsomely formed large Turnip. *Observator.*

Farmers' Clubs.

Grimshoe Hundred.—*Economical Feeding of Stock.*—Mr. Phillips said his idea was, that there was a great waste committed in the feeding of animals by giving them at one time more highly nutritious food than they could properly assimilate to themselves; it hence passed through them in waste; and his remedy was to add largely to that nutritious food other and more bulky and less nutritious substances, which while it filled their bellies, which it was essential to do, would not throw into the system more nourishment than it was capable of assimilating. Thus in feeding farm horses, whose work was slow, instead of giving them a feed of unmixed Oats, he gave them their Oats reduced (so to speak) with a large portion of steamed straw chaff; and even for the Oats, or at least a large part of them, a portion of roots, either Carrots or Swede Turnips, minced with his patent mincing machine, might be substituted in mixture, with the steamed straw chaff; so that instead of giving working horses what in this district was the usual allowance, namely 2 bushels of Oats per week, weighing about 35 lbs. per bushel, he only gave them half that quantity, and sometimes even less. He held it to be important also, in the feeding of horses, to crush their Oats. He was satisfied there was a great saving effected by so doing. It was also an excellent method, in the feeding of horses, where it could be obtained, to feed them largely with Gorse or Furze, crushed; they were very fond of it, and did extremely well upon it; and in the feeding of neat stock he carried on the same system. He never gave them highly nutritious food unmixed with food that was less nutritious; whether therefore he gave them linseed-cake, or even roots, he always mixed them with a large portion of minced straw chaff, steamed, which they eat with avidity. The quantity of highly nutritious food thus went fully as far again, and though the animals did not perhaps graze altogether so fast, yet they had the agreeable conviction that there was no waste committed. The same applied to the feeding of sheep, whether fatting or otherwise; let their roots be reduced to a fine state by mincing, and mixed, in their troughs, with a portion of steamed straw chaff. It was an excellent plan also in the feeding of sheep (indeed, he did so with all sorts of stock, and even horses) to let a lump of rock salt remain in their troughs or mangers. But as to sheep—he meant fatting sheep especially—he thought it highly important to furnish them with shelter, even while they were grazing on the open breaks. For this purpose he had portable houses as lightly made as possible, consistent with a proper degree of strength, 10½ feet long and 5 feet wide, open on one side, and closed at the back and the two ends. These he spread about the fold, and the sheep, after they had filled themselves, retired to them for warmth and shelter. Thus a great portion of the food, which would otherwise have been expended in keeping up the animal heat, became converted into nutriment, and was, consequently, so much food saved. In feeding of pigs, too, he resorted to the same expedients. He never gave them meal unmixed with bran or pollard; and he also most frequently gave them steamed roots in addition; and thus in feeding pigs for the London markets, for which purpose pigs from 40 lbs. to 50 lbs. were amply large enough, of which he fed a large quantity, he hardly gave them any corn at all. Parsnips, by the bye, were excellent roots for fatting pigs. When he exhibited his prize pulping machine, at the Smithfield Cattle Show last year, a gentleman from the Isle of Ely came to his stand, and seeing his mincing machine there, was much taken with it, and said it was just the thing he had been seeking hitherto in vain, a machine for reducing roots to a fine mince. He said he was in the habit of growing a large quantity of Parsnips for feeding pigs for the London markets; now he would grow double the quantity, and he would have five of his (Mr. Phillips's) machines. At this time 15 of them had been sent into the same parish.

Reviews.

The Agriculture of the French Exhibition; an Introductory Lecture, delivered in the University of Edinburgh, Session 1855-6. By J. Wilson, F.R.S.E., and Professor of Agriculture in the University of Edinburgh. Edinburgh: Adam & Charles Black.

We have received a copy of this lecture since the condensed report of it in another page was put in type. Its readers will find that the account of it which we have given is a very abridged and condensed statement of the original, which is remarkable, as all Professor Wilson's writings are that we have seen, for simple adherence to the subject, without digression of any kind, whether for rhetorical effect or for the gratification of mere amateur students. The lecture is simply and very fully instructive on the agriculture of the French exhibition. We extract a passage in illustration of the whole. It relates to the specimens of timber exhibited by Canada:—

"Thus far I have only touched upon the produce of cultivated crops, and these have for the most part been the food substances of Europe. Of these, even some fine specimens were sent from our own colonies, but their strength and importance were displayed in the admirable collection of the produce of special crops, or of those obtained without any cultivation at all. First and foremost of these, in number and beauty of specimens, if not in actual importance, must be classed the woods used for construction and for ornamental purposes. In these the English colonies of Canada, Guiana, Jamaica, and Australia were without any rivals. The gigantic dimensions of the soft timber of Canada were only equalled by the strength of fibre and beauty of grain of the hard woods of lower latitudes. Each specimen in these large collections was correctly named, and formed an object of study for the economic botanist, no less than an object of commercial interest to the merchants and artificers of Europe. Such a large collection of specimens offered an excellent opportunity for testing their comparative value for different purposes of construction; and a series of experiments were carried out, the results of which, I have no doubt, will materially add to our knowledge of the relative strength of materials. The importance of these experiments would probably be more readily seen in reference to shipbuilding than to any other ordinary purpose for which wood in large quantities is required. In shipbuilding about 40 cubic feet (using round numbers) are required per ton—say 32 cubic feet for the hull, and 8 cubic feet for fittings—this would give for a ship of 1000 tons 32,000 × 8000 cubic feet. The two important elements for the consideration of the builder are strength and specific gravity, both separately and in relation to each other. The value of the former is not so generally determined as that of the latter; indeed this formed the principal object of the experiments alluded to: let us see, then, how far the latter element of the physical character of timber influences the ship. The first-class woods entered at Lloyd's are eight in number—English Oak, American Oak, African Oak, Morung Saul, East India Teak, Greenheart, Mora, Iron Bark; these mostly differ considerably in specific gravity. A cubic foot of English Oak weighs 40 lbs.; of American Oak, 46 lbs.; of African Oak, 50 lbs.; of Malabar Teak, 39 lbs.; of Mora Excelsa, 62 lbs.; of Iron Bark, 65 lbs. Besides these, other woods are largely used, as Honduras Mahogany, which weighs 31 lbs. per cubic foot; Eucalyptus, 50 lbs.; Canada Pine, 22 lbs.; and Cedar, 25 lbs. Now, taking these specific gravities into calculation, the hull of a 1000-ton ship would require of English Oak, 572 tons; of American Oak, 657 tons; of African Oak, 714 tons; of Teak, 537 tons; of Mora, 885 tons; of Eucalyptus, 714 tons, and of Iron Bark no less than 930 tons; while it would only require of Mahogany, 443 tons; of Canada Pine, 316 tons; or of

Cedar, 362 tons. Taking the two extremes, Iron Bark and Canada Pine, a difference is shown of 614 tons—nearly 200 per cent.—in the displacement tonnage of the vessel and consequent increased capacity for freight.

Calendar of Operations.

NOVEMBER.

BORDER OF THE FENS, *Nov.* 24.—If one fine October was invariably followed by another fine October and a wet November always occurred, it would be easy to prescribe out-of-door operations, and to advise without fear of disappointment; but the experience of old farmers avails nothing further than giving vigilance to use every favourable opportunity to complete Wheat seeding, and provide shelter and food for stock, and to guard against severe and wet weather in taking up and storing roots. The unusually sharp frost of the 15th November made every one busy who had a Potato heap to cover or Mangels to take up, and the wet, foggy, cold weather since has caused much additional care to be given to littering stock, shifting sheep from wet lairs, and looking after the roofs of stacks wherever any signs could be detected of the rain having penetrated to the corn below As to Mangels and Turnips, they have shown such evident signs of continued growth during the late rains by greenness of top and short juicy tenderness of root, that we have not been willing to disturb them sooner than necessary, that we might secure as much weight from them as possible. For pulling Mangels and taking the leaves off we give 12*s.* an acre, for Turnips 8*s.* and 10*s.* The Coleseed is finished, and the lambs put on Turnips; the ewes have been separated from the tup, and in the course of a week will have a slight dressing of sheep ointment which is termed "lining;" it kills lice, and is supposed to promote the growth of wool; from 12 to 14 lbs. of ointment, containing 3 lbs. of quicksilver, is used to 100 ewes; a somewhat larger quantity is required in case of scab, and though the application of ointment is rather expensive, yet if well prepared it is far superior to any "specific wash" in use, whether composed of tobacco, arsenic, sublimate, or any other poisonous stuff whatever. The beasts are of course all sheltered by this time in yards, boxes, or stalls; if fresh and old enough the largest are receiving, with straw and Turnips, 4 lbs. of Linseed-cake per day, and as old Beans at 56*s.* per quarter are cheaper than cake at 15*l.* per ton, we shall try some as recommended in the recent valuable discussions at the Farmers' Club and in Hampshire. Although a good deal of Wheat is above ground, and looks strong and healthy, yet there is much to sow, as whatever may have been the case last year, there can be no doubt that every available piece of ground will be devoted to an increased breadth this season; there are many indications that the course of cropping will be directed to this object, and that not only will it take the place of Barley and Oats in the strict turn of rotation, but will for "once and a way" be made to follow them, with or without guano or any other excuse for the perpetration of such heresy in these times of progress, for as a high authority has said—"who would have the face to go to law with a man in these days of scarcity for growing too much Wheat?" It would be well notwithstanding to be careful of the life of the goose, lest too serious an impediment should be raised to the appearance of future "golden eggs." *J. W., Peterborough.*

CHESHIRE, *Nov.* 21.—Since our last report we have had six or seven weeks of most propitious weather for the various operations of the farm. Wheat sowing is in a very forward state, and the land is still in fine condition for receiving the seed, where from unavoidable circumstances it had been delayed. Potatoes have generally been well secured, but the accounts respecting the crops, as compared with last year, are exceedingly variable. On one farm we hear of their being superior as to quality and quantity to any of the crops within the last ten years, or from the commencement of the disease in 1845; on another farm we are told they are far inferior in both respects to those of last year. therefore, from the various accounts which reach us, and the price they are selling at in the market, we may infer that the crops generally have been only moderate, and that the disease still continues to a serious extent. Mangel Wurzel, which are generally considered an average crop, have in a great measure been secured from the frost, and Turnip-pulling and storing have commenced in good earnest on some farms. Last winter's frost has taught the farmers a lesson which they will not soon forget. The yield of Wheat and Barley proves, as was anticipated, very deficient, but it is a great blessing that the small or light corn, of which there is an unusual proportion, is perfectly sound, and will make wholesome bread as far as it goes. Labourers are plentiful, and it is to be hoped that the farmers will continue to employ them at fair wages throughout the winter, for on that will depend the comfort or misery of the labouring classes of our agricultural population. It is the practice of many farmers to turn off their labourers on the approach of winter, or as soon as they have secured their harvest and green crops, and not to take them into their employ again until the days begin to lengthen in the spring. This is unjust towards them, and it should be borne in mind that they have to support themselves and families in the winter as well as the summer, and at a greater expense, too, on account of additional expense of coals and warm clothing. Grass is scarce, but farmers are induced by the mildness of the weather, and from the fear of being short of fodder, to keep out their cattle at night to a later period than usual. Late-sown Swedes, which almost invariably escape mildew, have grown astonishingly within the last few weeks, and in many instances prove sounder and better crops than the early sown ones. We have seen very satisfactory crops sown as late as the 21st June. Cattle of all descriptions are selling well, and we do not hear much of that dreadful scourge, the pleuro-pneumonia. *W. P.*

WESTER ROSS, *Nov.* 20.—Since I last wrote we have had a continuation of weather uncommonly fine, scarcely a shower having fallen for a month, and with the exception of a few frosty nights, it has been extraordinarily mild. Potato lifting was accomplished in the best possible condition. A large breadth of Wheat has been sown and beautifully harrowed in. Turnip-storing, so far as yet proceeded with, has been comfortably performed for man and beast, and a very large proportion of our green crop lot has received its winter furrow. We are thus so far comfortably prepared for the approach of frost and snow. There was a large breadth of Wheat sown last year, but this year there will be sown a breadth larger still, as most farmers having already sown about an average, are seriously bethinking themselves what additional field can be laid under that gold-yielding grain with any chance of a fair crop. Our stacks are thrashing out pretty well, but when we calculate the return per acre we find that the additional breadth sown will have much to do to make up for the general deficiency. The quality is uncommonly fine, the ordinary weight per bushel being from 63 to 64 lbs., and a few days ago there were samples shown at our seed exhibition weighing 66 lbs. per bushel. In the earlier sown fields the braird is making its appearance. We have a much smaller quantity of Barley to dispose of this year than usual, the greatly increased sowing of Wheat having encroached on its usual allotment, and the crop itself being inferior. Little of it has as yet been thrashed; two guineas per quarter is freely offered. Oats are still more inferior than either Wheat or Barley—inferior both in quantity and quality. The average weight per bushel is under 40 lbs. Sheep are rejoicing because of the weather, and thrive apace. Hogs reached us, for their wintering, from the hills in much worse condition than for many years bygone, having suffered much from the uncommon severity of last spring, but are now speedily making up for the starvation they endured. At our last Muir of Ord market lean cattle were nearly unsaleable, and the few disposed of fetched greatly reduced prices.

Notices to Correspondents.

BEANS: *M.* A correspondent in the *Agricultural Gazette* of October 13th recommends boiled or steamed Beans, for the food of horses, but he does not say how long they should be boiled, or whether they are to be put in the water when cold, or when the water is at its boiling point. Perhaps he will describe his practice in fuller detail.

COMPOSITION OF CROPS: *A Cor.* The following is a portion of the information existing on this subject, extracted from Mr. Hemming's tables, in the Journal of the English Agricultural Society. It gives the composition per cent. of the whole plant:—

Plant.	Parts.	Water	Organic Matter.	Ash	Azotised ingredients.	Fatty matters.	Starch	Sugar, gum, &c.	Fibre.	Sulphur.	Sand and Silica	Potash.	Soda.	Lime.	Magnesia.	Alumina.	Oxide of iron.	Oxide of manganese.	Chloride of Potassium.	Chloride of sodium.	Phosphoric acid.	Sulphuric acid.	Carbonic acid.

THE REFUSE LIME OF GAS-WORKS: *A. M.* It is applied to clay lands near most towns, at the rate of about a ton per acre. It is useful in compost with other substances, and requires that frequent turning over and exposure to the air which most composts receive before it can be safely applied in any quantity to the land.

THE ADVANTAGES OF DEEP-CULTURE: *J S.* These have been well illustrated during the past year by the publication of the book to which reference has already been made, on the "Yester Deep-land Culture," by H. Stephens, Esq. Yester is the property of the Marquis of Tweeddale, lying in the county of East Lothian, under the range of the Lammermuir hills, from which it slopes downwards towards the north. It is not naturally a fertile neighbourhood, but has been made productive by energetic and laborious cultivation, the keystone to which, according to Mr. Stephens, lies in the pulverisation of the subsoil and its mixture with the upper soil. The difference between the Yester system and that of ordinary farming consists in this—that the latter attains an imperfect pulverisation of little more than the upper soil, while the former effects the thorough disintegration and commixture of the whole to the depth of 20 or 22 inches. The history of the process—of the implements and methods employed—and of the results achieved, is well written in the work already named, which deserves to be widely known and read by agriculturists.

TRIFOLIUM INCARNATUM: *X.* This plant is grown to a considerable extent in Hampshire and the South of England, and while it furnishes a sort of change to Clover-sick lands and yields generally a heavy and nutritious crop in early summer, it is not at all difficult of cultivation. In fact the failures that have been complained of have generally arisen from a too careful and laborious attention to the preparation of the soil for the reception of the seed. The land has been scarified after the corn crop has been removed, and then manured, ploughed, and harrowed to a fine tilth, and sown and rolled and the seed has never "come." If, however, the stubble be tolerably clean, there needs nothing more than that after the first rain it be well harrowed just to raise a very little soil upon the hardened ground, and 20 lbs. of the seed may then be sown per acre, and brushed and rolled in, and the plant will generally come early enough and strong enough to yield a crop in June next year.

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

212° MILNER'S HOLDFAST AND FIRE RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.

Circulars free by post.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c.

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

A SHOW ROOM DEVOTED ENTIRELY TO ARTICLES OF HORTICULTURE.

ILLUSTRATED CATALOGUES UPON APPLICATION.

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK,

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Priced Lists of Plant Tubs and Boxes forwarded on application.

TURNER'S REGISTERED MALT MILLS, AND PATENT CRUSHING AND GRINDING MILLS.—A variety of these Mills will be exhibited at the ensuing Smithfield Club Cattle Show, Stands 63, 64, and 65.

CAUTION.—Legal proceeding will be instituted against any person or persons unlawfully manufacturing the above Mills, or otherwise infringing upon the Registration or Patent for the same.

E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark, (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the framework, but covered with Galvanised Iron Sashes, with excellent strong glass, and all completed for 1s. 3d. per foot super. Hundreds of references can be given, and Printed Price Lists sent.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility Gentry, and the Trade, in most of the counties in England.

C. STEPHENSON, late STEPHENSON AND SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late STEPHENSON & PEILL), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.

HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4s. 9d. each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5s. 3d. each.

IRON BUILDING AND ROOFING WORKS.

GAS STREET AND BERKELEY STREET, BIRMINGHAM.

JOHN HENDERSON PORTER, ENGINEER and CONTRACTOR, Patentee of a new system of constructing (cheaply and expeditiously, by ordinary labourers) Portable Buildings and Sheds—formed of ordinary planks or boards—peculiarly suitable for Farm purposes. A Model Shed has recently been erected in the Agricultural Department of the Crystal Palace at Sydenham. Corrugated and Galvanised Iron Roofs and Roofing Plates, Eaves, Gutters, Rain-water Pipes, Tanks, Fences, &c.—London Office, 1, Riches Court, Lime Street.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP,

with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50s.
1½-inch Flexible Rubber and Canvas Suction for ditto, 3s. 6d. per foot.

1½ Gutta Percha Suction, 1s. 6d. per foot.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	10	0
2½ „	long 3 „ 3 „		1	14	0
3 „	ditto 3 „ 6 „		2	8	0
3½ „	ditto 3 „ 6 „		2	12	0
4 „	ditto 3 „ 6 „		3	3	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	14	0
2½ in.	long ditto	ditto ditto	2	18	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THIS *is the Original Patent for Important Improvements in Stable Fittings, Hay-box, Manger, and Water-trough as one fixture*, including a method

surpassing all others for conveying the straps and halter-weights to the back of the fitting to prevent the horse being cast in the stall. Stable Fittings of every description, plain, enamelled, or galvanised. Also the newly invented Loose Box Fittings, Surface Gutters with moveable cover-plates, Stable Posts, Ramps, Sills, and all kinds of Stable Furniture in stock.—JAMES BARTON, Iron Founder, &c., 370, Oxford Street, London.

MANUFACTURER OF KITE'S PATENT VENTILATING AND SMOKE-CURING CHIMNEY CAPS, patronised by her Most Gracious Majesty, 200 on Buckingham Palace. In use also on St. James's Palace, Windsor Castle, Government Offices, &c. &c. Zinc, 30s.; cast iron 35s. each; the latter as durable as the building itself. Drawings and Price Lists forwarded on receipt of two postage stamps.

Address BARTON'S Iron Works, 370, Oxford Street, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. ROE (late FREEMAN ROE), Hydraulic Engineer, 70, Strand, London.

CUPISS'S CONSTITUTION HORSE BALLS.—To Sportsmen, Agriculturists, Postmasters, and all Proprietors of Horses, these Balls are particularly recommended in all cases of swelled legs, cracked heels, loss of appetite, and vital energy; for Coughs, Colds, Fever or Inflammation, they are the best Medicine that can be exhibited, moreover their operation, though effectual, is so mild, that they require no alteration of diet, and if given with a bran mash on Saturday night, will not interfere with the ensuing week's regular work.

NEAT CATTLE.—The Constitution Balls are strongly recommended by many highly respectable Gentlemen (see Testimonials) for Cows and Oxen as a most valuable medicine in cases of Hove or Blown, Scouring or turning out to Grass, or from bad food, Gargate, Hide Bound, Loss of Appetite, Staring Coat, Distemper, Epidemic, or Influenza. Bullocks fat much faster by occasionally giving a Ball.

Prepared only by FRANCIS CUPISS, M.R.V.C.S., author of the "Prize Essay on the Diseases of the Liver of the Horse," Diss, Norfolk; and sold by all respectable Medicine Vendors in Town and Country, in packets, six Balls each, 3s. 6d. per packet, with a wrapper giving full directions for the use of the Balls, and treatment of the Horse whilst taking them. Also a Pamphlet of Testimonials from many Gentlemen who have used the Balls in various Complaints. Any Gentleman using the Balls may consult the Proprietor gratuitously, either personally, or by letter, post-paid.

THE EDUCATIONAL MICROSCOPE.

PRICE 10l.

See leading article in the *Gardeners' Chronicle*, Nov. 24, 1855.
Manufactured by SMITH & BECK,
To whom
The Council Medal of the Great Exhibition of 1851, and
The First Class Medal of the Paris Exposition of 1855,
Have been awarded,
"For the excellence of their Microscopes."

An illustrated Pamphlet giving a full description, price, &c., of the Educational Microscope forwarded on receipt of 6 postage stamps.—6, Coleman Street, London.

GEORGE CASE'S CONCERTINAS. — These unrivalled instruments are sold exclusively by BOOSEY & SONS, 28, Holles Street, London. Prices from four to twelve guineas each. Prospectus gratis.

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

DISH COVERS AND HOT WATER DISHES in every material, in great variety, and of the newest and most recherché patterns. Tin dish covers, 6s. 6d. the set of six; block tin, 12s. 3d. to 28s. 9d. the set of six; elegant modern patterns, 34s. to 58s. 6d. the set; Britannia metal, with or without silver plated handles, 76s. 6d. to 110s. 6d. the set: Sheffield plated, 10l. to 16l. 10s. the set; block tin hot-water dishes, with wells for gravy, 12s. to 30s.; Britannia metal, 22s. to 77s.; electro-plated on nickel, full size, 11l. 11s.

THE PERFECT SUBSTITUTE FOR SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when PLATED by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Fiddle Pattern.	Thread or Brunswick Pattern.	King's Pattern.
Tea Spoons, per dozen	18s.	26s.	32s.

HOT AIR, GAS, VESTA, JOYCE'S STOVES. Stoves for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10s. each to 30 guineas. His variety of register and other Stoves, Fenders, and Kitchen Ranges, is the largest in existence.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

NEW LABEL.—In consequence of the great variety of Counterfeit Labels of A. ROWLAND & SONS' MACASSAR OIL now in circulation, and which so nearly resemble the original as frequently to deceive the unwary—they have employed those eminent artists Messrs. PERKINS, BACON, & Co., who, at great cost, and by a peculiar process of their own, have succeeded in producing from steel "A NEW LABEL," which cannot be forged. It is composed of a section of an engine-turned circle, repeated 130 times, and forms an original lace-work ground, upon which is engraved in white letters, "UNDER THE PATRONAGE OF THE COURTS OF EUROPE," with an embossed profile of Her Majesty "THE QUEEN," lately specially taken for the purpose, and which surmounts the words (also in white letters) "ROWLANDS' MACASSAR OIL, for the growth, restoration, and for beautifying the Human Hair." Under which is the Signature of the Proprietors in Red Ink, "A. ROWLAND & SONS"—Sold by them at 20, Hatton Garden, London: and by Chemists and Perfumers.

TO NURSERYMEN AND GARDENERS.

THE CROWN ESTATE PAVING COMMISSIONERS hereby give notice that they will be ready to receive TENDERS from Persons willing to enter into a Contract for keeping in Order the Gardens or Ornamental Inclosures attached to or situate in front of the several Terraces and Places in and about the Regent's Park; and likewise the Gardens or Ornamental Inclosures attached to Carlton House Terrace and Carlton Gardens, and to Richmond Terrace. Specifications and Forms of Tender can be had on application to the Clerk, where Tenders are to be delivered at or before 1 o'clock on Wednesday, the 5th day of December next. FRANCIS ADAMS,
1, Whitehall Place, Nov. 19. Clerk to the Commissioners.

WANTED, A COUNTRY FARM HOUSE, completely or partly Furnished, containing a Sitting and three or four Bed-rooms, for a gentleman's occasional residence; with from 15 to 50 acres of Land, chiefly pasture. Within a reasonable distance of London; vicinity to a Railway Station preferred. To rent from Christmas next.—Address, stating rent and full particulars, to N. E., Post Office, Great Marlow, Bucks.

TO MARKET GARDENERS.

TO BE LET, at Great Malvern, a comfortable COTTAGE, with land suitable for a gardener capable of undertaking the laying out of Gardens, management, &c., by the year or otherwise. The position is considered to be an excellent one for an intelligent steady man, as regular employment can be relied upon, and there exists a good demand for all garden produce in this fashionable and rapidly increasing town.—Apply by letter to C. A. MASON, Esq., Park Field, Great Malvern.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

HOUSE AND LAND TO BE LET.

TO BE LET, and entered upon at the usual times next spring, a large convenient HOUSE, well suited for a gentleman, and from 20 to 70 acres of Land in very good condition; the land is suited for any purpose (all drained)—for the breeding and rearing of horses, horned cattle, &c. There are first-rate accommodation for brood mares, with loose boxes, shippon for a large number of cows, &c. There are Steam Power and Pipes ready for laying down for irrigating with liquid manure; connected with the farm are also a Mill with two pairs of French Stones for grinding flour, a Drying Kiln—in fact, every convenience. This is well worth the attention of any gentleman who wishes to farm, and is fond of agricultural pursuits. The Farm is six miles south of Lancaster, within 300 yards of a railway station.—For particulars as to rent and conditions, apply to the owner, W. TALBOT ROTHWELL, Esq., Foxholes near Lancaster.

CANNES, SOUTH OF FRANCE.

TO BE SOLD, completely furnished, in one of the warmest, driest, and most healthy and agreeable localities for invalids in all Europe, that beautiful Marine Residence and Grounds known as the CHATEAU ST GEORGES, fit for the immediate reception of any nobleman's or gentleman's family, and situate one mile west of the town and port of Cannes, within a few minutes walk of the chateau of the Right Hon. Lord Brougham, and 20 miles south-west of Nice. The property faces the Mediterranean, which forms its southern limit, while its northern boundary is the grande route from Italy to Marseilles, from which latter town it is only 14 hours by posting, or 11 hours by the steamers, and there are also two diligences daily each way, in connection with the railway from Paris to Marseilles, which is now opened throughout, and the distance is performed each way in 20 hours, total travelling from London to Cannes, 47 hours.—For particulars and viewing plans, apply to Messrs. GREEN, Estate Agents and Auctioneers, 28, Old Bond Street.

Sales by Auction.

IMPORTANT SALE OF DRIED PLANTS.

THE BRIGHTON AND SUSSEX HORTICULTURAL SOCIETY'S EXHIBITIONS OF PLANTS, FLOWERS, and FRUITS, for 1856, are fixed to be held as follows:—The Summer Show, on the 25th and 26th of June, and the Autumn Show on the 3d and 4th of September, on the same grand scale as in former years.

Thomas Attree, Esq., Chairman of the Committee.
E. Spary, Superintendent of the Exhibition.
Edward Carpenter, Secretary.

NOTICE IS HEREBY GIVEN, that the PARTNERSHIP heretofore subsisting between WILLIAM MYATT and JOSEPH MYATT, Market Gardeners, of Manor Farm, Deptford, in the county of Kent, was DISSOLVED on the 29th day of September last, by mutual consent. All debts owing to or by the said concern will be received and paid by the said William Myatt, who will in future carry on the business on his own separate account.—Manor Farm, Deptford, Dec. 8.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.
HORTICULTURAL ERECTIONS on the best improved principles.
*** An extensive stock of Fruit Trees, Ornamental Shrubs, Evergreens, Forest Trees, Roses, and Thorns.

DODECATHEON ELEGANS.
DOWNIE AND LAIRD have upwards of 3000 of the above beautiful Herbaceous Plant to dispose of. Price to the trade, 40s. per hundred, or 6s. per dozen.
17, South Frederick Street, Edinburgh.—Dec. 8.

CUPRESSUS LAWSONIANA.
PETER LAWSON AND SON beg to intimate to inquirers after the above fine hardy Californian Tree, that they will be able to supply good plants early in the spring, when a scale of prices will be duly advertised, and commands executed in the order in which they are received. A list of other rare Californian Coniferæ may be had on application.
Edinburgh, December 8.

STANDARD AND DWARF TRAINED FRUIT TREES.
RICHARD SMITH begs to inform the Trade and the Public generally that he has a fine stock of flat and well trained FRUIT TREES of all the best and most popular sorts (true to name), which he will be happy to sell at very moderate prices.—Priced Lists will be sent on application.
Nurseries, St. John's, Worcester.

NEW CONIFERÆ AND SPECIMEN EVERGREENS.
RICHARD SMITH has a fine stock of all the best Ornamental EVERGREEN TREES and SHRUBS for Lawns, Shrubberies, or for single specimens.—Priced Lists will be sent on application.—Nurseries, St. John's, Worcester.

NURSERY TREES.
FOWLER AND WRIGHT, Seedsmen and Nurserymen, Glasgow, have on Sale a fine Stock of SEEDLING and TRANSPLANTED FOREST TREES, ORNAMENTAL PLANTS, SHRUBS, and FRUIT TREES, at very moderate prices. Catalogues may be had on application.—Dec. 8.

ISAAC DAVIES can supply the following in large quantities at reduced prices:—APPLE TREES, of all the best kinds, 4 feet in the stem, two to four years grafted; PURPLE ELM, 6 to 7 feet, bushy; SCARLET THORNS, two years grafted; WEEPING MOUNTAIN ASH, with stout straight stems, 7 to 10 feet; Do. ELM, 6 to 8 feet, with handsome heads.
Larkfield Nursery, Wavertree, near Liverpool.

WANTED TO PURCHASE (Sound Maiden Trees) 300 Peaches, 300 Nectarines, 300 Apricots, 300 Plums, 300 Cherries, 300 Pears, 500 Apples, 2000 Apple Gribbles, two packs of Pear pips. Also to be sold or exchanged a large quantity of Aucuba, Japonica, &c., Bays, Standard Roses, &c., and other evergreen shrubs.—S. Eddy, Foxhay's Nursery, Exwick, near Exeter.

TO ROD GROWERS.
WANTED TO PURCHASE, at the lowest price cash on delivery to any of the London Railway Stations, 300 BOLTS of THREEPENNY, and 200 do. LONG FISH TWIGS, all to be of best quality.—Address, W. Mason, Alpha Villa, Lower Road, Deptford.

TO BE SOLD, very handsome large IRISH YEWS, from 4 to 8 feet. Purchasers taking a large number will be liberally dealt with. Prices on application.—Thomas Jackson & Son, Nurseries, Kingston, near London.

TO BE SOLD very cheap for Cash, as the Ground is required for other purposes, 10,000 ORNAMENTAL FOREST TREES, from 6 to 15 feet, a great variety of sorts; 20,000 GOOSEBERRIES and CURRANTS, leading kinds; 500 BUSHY YEWS, from 4 to 6 feet; about 1000 DECIDUOUS FLOWERING SHRUBS; and a large quantity of 2-year SEA-KALE and ASPARAGUS Plants.—Apply to Mr. Chas. Clarke, Nurseryman, &c., 179, Windmill Street, Gravesend, Kent.

GOOD SEEDS, CARRIAGE FREE.
Seeds Direct from the Growers the most certain means of Preventing Disappointment.
SUTTON AND SONS, Seed Growers, Reading, Berks, *can supply every kind of* GARDEN SEEDS *and* FARM SEEDS *of genuine and superior quality, warranted all of the growth of* 1855.
Horticulturists and Agriculturists residing in the most remote parts of the kingdom, can procure good Seeds at very moderate prices from this Establishment.—For particulars, apply to
Sutton & Sons, Seed Growers, Reading, Berks.

SCARLET RHODODENDRONS.
J. AND J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine bushy Plants of the above 2 to 3 feet high, in Pots, well set with Flower buds.—Price 10s. 6d. each.

CAMELLIAS.
CHANDLER AND SONS, Nurserymen, Wandsworth Road, beg to inform their friends and customers that their CAMELLIAS are finely set with flower buds this season. They are sending out bushy plants from 30s. and upwards per dozen.

TO THE TRADE.

Large two year planted Roots for Forcing	12s.	"
Extra strong SEAKALE Roots for Forcing	10s.	"

Apply W. Myatt, Manor Farm, Deptford.—Dec 8.

TO THE SEED TRADE.
Hardy Winter White Broccoli New Seed.
W. JACKSON AND Co. have for sale new seed saved this year of the above White Broccoli. When sown early and grown well, it heads in November, December, January, and February—a valuable winter kind. Price in quantity on application.—Nurseries, Bedale, Yorkshire, Dec. 8.

"GYMNOGRAMMA LEPTOPHYLLA."
Or the Annual Maiden-hair Fern.
BERNARD SAUNDERS, Cæsarean Nursery, Jersey, will be happy to supply six growing plants of the above pretty little Fern, in a small box, postage free, to any amateur wishing to possess it, for 2s. 6d.—Dec. 8.

MR. ROBERT BAKER, Writtle, Essex, begs to offer his improved SKIRVING'S SWEDE TURNIP SEED, warranted of good stock and all of this year's growth, at 2l. 2s. per bushel, inclusive of sack. A Post-office Order upon Chelmsford to be first remitted.

MR. ROBERT BAKER, Writtle, Essex, has succeeded in obtaining a new SEEDLING KIDNEY POTATO, the WRITTLE KIDNEY. It is a good cropper, free from disease, superior flavour, fine yellow colour, and breaks mealy; is in perfection from September to July, and, as a late Potato, is superior in May and June to any known variety. Sound Tubers of 1854 are still in his possession. Price per bushel of 60 lbs., inclusive of sack, 10s. Forwarded upon remittance of Post-office Order, payable at Chelmsford.

THE FLUKE KIDNEY POTATO.—This excellent and famed Potato, which has proved so beneficial to the Farming interest, from its capability of withstanding the ravages of disease and its abundant bearing qualities, was raised in Middleton; purchasers may therefore rely upon having it true from the original stock. May be had in any quantity, at 4s. per bushel of 56 lbs.—Apply to John Holland, Bradshaw Gardens, Middleton, near Manchester. Post Office orders may be made payable at Middleton, Lancashire.

BASS AND BROWN'S new AUTUMN CATALOGUE, comprising a considerable portion of descriptive and useful information for purchasers, will be sent free by post for three penny stamps, or gratis to their customers, who may not have received them.
Seed and Horticultural Establishment, Sudbury, Suffolk.

TO THE SEED TRADE.
ABRAHAM HARDY AND SON, Seed Growers, Maldon, Essex, beg to announce that their WHOLESALE PRICED CATALOGUE OF SEEDS and early Potatoes is now ready, and may be had post free on application.—Dec. 8.

GERMAN FLOWER AND VEGETABLE SEEDS.
MESSRS. PLATZ AND SON, Seed Growers, Erfurt, Prussia, respectfully inform the Trade that their Catalogue for 1856 contains more new and choice articles than have ever been offered. Early applications are solicited through their Agent, Mr. Robert Kennedy, Bedford Conservatory, Covent Garden, London.

TO PEAR AMATEURS.
THOMAS RIVERS'S DESCRIPTIVE CATALOGUE of PEARS is printed separately from the Catalogue of Fruit, and will be sent free on application to The Nurseries, Sawbridgeworth, Herts.

PLANTING SEASON.
WM. URQUHART AND SONS respectfully intimate that their PRICED LIST OF FOREST TREES, SHRUBS, HERBACEOUS PLANTS, &c., may now be had on application.—Dundee, Dec. 8.

ARROW SMITH'S (Nurseryman) CATALOGUES are now ready, and may be had free on application.
FOREST PLANTING undertaken by Contract.
LANDSCAPE and ORNAMENTAL GROUNDS executed.
Sydnope, near Matlock, Derbyshire.

HARDY HEATHS.
WATERER AND GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

AMERICAN PLANTS.
WATERER AND GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.
Knap Hill Nursery, Woking, Surrey.

AMERICAN PLANTS.
JOHN WATERER'S CATALOGUE of RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.
☞ The Catalogue describes the colours of the Rhododendrons
The American Nursery, Bagshot, Surrey.—Dec. 8.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.
American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway, where conveyances may be had.

FLOWER AND VEGETABLE SEEDS.
JAMES CARTER AND CO. beg to announce that they will publish, on 1st January, 1856, their TWENTY-FIRST ANNUAL CATALOGUE OF FLORICULTURAL, VEGETABLE, AND AGRICULTURAL SEEDS, acknowledged to be the most comprehensive yet compact Annual Catalogue of Seeds extant. It has been subjected to a careful and elaborate revision, in order to ensure the greatest possible correctness. Forwarded free of charge, and post paid, upon application.
James Carter & Co., Seedsmen, 238, High Holborn, London.

PETER LAWSON AND SON, Seedsmen, Nurserymen, and Wood Foresters to the Queen's Most Excellent Majesty; and to the Highland and Agricultural Society of Scotland, Edinburgh, and London.
Peter Lawson & Son beg to intimate that their Prices, Lists of Seeds, Plants, &c., for the present season are in course of Publication, and will be sent free by Post on application.
27, Great George Street, Westminster; and at their Stand at Smithfield Club Show, Baker Street Bazaar.

PICEA AMABILIS.—Seedlings of this fine hardy species have been for a long time desirable, as in grandeur of appearance it is scarcely excelled by PICEA NOBILIS. We have much pleasure in offering stout plants, three years old, 6 to 9 inches high, at 31s. 6d. each.
Hugh Low & Co., Clapton Nurseries, London.

NEW BEDDING PLANT.
Double White Petunia "Imperial" (true).
MESSRS. WILLIAM ROLLISSON AND SONS can now supply good plants of the above-named at 5s. each. This extraordinary, new, and beautiful variety can be strongly recommended, and doubtless will become an universal favourite, both as a bedding and conservatory plant, being of excellent habit, fragrant, and the flowers as double as a Carnation or Gardenia blossom.—The Nurseries, Tooting, London.

EARLY PEAS.
THEDAM'S FAVOURITES having been tested against the earliest varieties grown in this locality, Five Pounds are offered for 1 bushel of any sort that will come quicker, prove more prolific, and better adapted for the London Market. May be sown directly, or the first week in March.—Apply to Mr. T. K. Thedam, Little Braxted, Witham, Essex, by whom trials are solicited; and with any person having a forward variety, and wishing to test their respective merits, samples will be exchanged.
P.S. A few Quarts of Scimetars are also for sale.

MESSRS. E. G. HENDERSON AND SON beg to announce that they have now received their noted collection of HYACINTHS in excellent condition, and for the assistance of those persons unacquainted with the culture of the Hyacinth, printed instructions will be given gratis with each order they are kindly favoured with, Catalogues of which, together with their Plant and Seed Lists, will be forwarded post free on application.

CUCUMBER HENDERSON'S NAPOLEON III., in packets, 3*s.* and 5*s.* 6*d.* each.

CALCEOLARIA, CINERARIA, and PRIMULA SEED of first quality, 2*s.* 6*d.* and 5*s.* per packet.

FUCHSIAS.—Banks' Favourite, 10*s.* 6*d.*; Prince of Wales, 10*s.* 6*d.*

NEW RHODODENDRONS.—Boothi, Hookeri, Calophyllum, Kendricki, Eximium Windsori Leucanthum.

GYNERIUM ARGENTEUM (PAMPAS GRASS).—E. G. H. & SON having in their possession the largest stock in the country of this noble ornamental Grass, can supply free healthy seedling plants, which are superior to any other at 2*s.* 6*d.* each, 25*s.* per dozen, or 7*l.* 10*s.* per 100.

Wellington Nursery, St. John's Wood.

NEW ROSES.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer fine Standards of the following beautiful NEW ROSES:—

	s.	d.		s.	d.

Post-office Orders to be made payable at Middleton, Lancashire. Catalogues on application.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERS, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

THUJA GIGANTEA.—We are again induced to offer this fine tree during the present planting season. It is from the Upper Waters of the Sacramento (in California), where it attains a height of 140 feet. It has been proved to be perfectly hardy in this country; the foliage is most beautiful, resembling some of the most graceful species of Lycopodium. The plants now on sale are in vigorous health, and average from 10 to 16 inches in height. Price 31*s.* 6*d.* each.

HUGH LOW & Co., Upper Clapton Nurseries, London.

MR. ROBERT KENNEDY, Bedford Conservatories, Covent Garden, London, respectfully announces that for the purpose of extending the Seed Department of his business, he has entered into PARTNERSHIP with MR. KEMPTON, who for the last 15 years was the oldest and principal assistant to Mr. James Carter, Seedsman, Holborn, LATELY DECEASED. Their business will be conducted on the same extensive and liberal principle as that of the late Mr. James Carter, in order to ensure the patronage he so long enjoyed.

KENNEDY & KEMPTON'S Scientific, Comprehensive, and Unique Catalogue of Vegetable, Horticultural, and Agricultural Seeds is now Published, and may be had on application.—Establishment as above.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, which they will forward to any part.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the framework, but covered with Galvanised Iron Sashes, with excellent strong glass, and all completed for 1*s.* 3*d.* per foot super. Hundreds of references can be given, and Printed Price Lists sent.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark, (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1*d.* per square foot. CROGGON'S Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to CROGGON & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

GALVANISED WIRE GAME NETTING,

6*d.* PER YARD, 2 FEET WIDE.

BARNARD AND BISHOP, Market Place, Norwich in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

	Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	6*d.* per yd.	4½*d.* per yd.
2-inch „ strong, do.	8 „	6 „
2-inch „ intermediate, do.	9½ „	7½ „
2-inch „ extra strong, do.	11 „	9 „
1⅝-inch „ 24 inches wide	7 „	5½ „
1⅝-inch „ strong, do.	9 „	7 „
1⅝-inch „ intermediate, do.	11 „	9 „
1⅝-inch „ extra strong, do.	13 „	11 „

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10*d.* per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THIS *is the Original Patent for Important Improvements in Stable Fittings, Hay-box, Manger, and Water-trough as one fixture*, including a method surpassing all others for conveying the straps and halter-weights to the back of the fitting to prevent the horse being cast in the stall.

Stable Fittings of every description, plain, enamelled, or galvanised. Also the newly invented Loose Box Fittings, Surface Gutters with moveable coverplates, Stable Posts, Ramps, Sills, and all kinds of Stable Furniture in stock.—JAMES BARTON, Iron Founder, &c., 370, Oxford Street, London.

MANUFACTURER OF KITE'S PATENT VENTILATING AND SMOKE-CURING CHIMNEY CAPS, patronised by her Most Gracious Majesty, 200 on Buckingham Palace. In use also on St. James's Palace, Windsor Castle, Government Offices, &c. &c. Zinc, 30*s.*; cast iron 35*s.* each; the latter as durable as the building itself. Drawings and Price Lists forwarded on receipt of two postage stamps.

Address BARTON'S Iron Works, 370, Oxford Street, London.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

(OBTAINED THE PARIS EXHIBITION AWARD.)

COTTAM AND HALLEN

HAVE made important additions to their original Invention of PATENT ENAMELLED MANGER RACK AND WATER TROUGH AS ONE FIXTURE, the main features of which are shown in the above engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

PEARS GRAFTED ON THE QUINCE AS PYRAMIDAL SHAPED TREES.

J. AND J. FRASER beg to announce that their Priced List of the above is now published, and may be had post free on application.

J. & J. F. have sold a large number of these Trees for the last three years, and have received numerous letters from gentlemen in the country speaking in very high terms of their productiveness. They can therefore recommend them with greater confidence to the notice of their friends and the public in general.

Lea Bridge Road, Essex.

BUSBY'S STOCKWOOD GOLDEN HAMBURGH GRAPE.

MESSRS. VEITCH AND SON in reply to the many inquiries they are constantly receiving as to when plants of this splendid new Grape will be ready for distribution, and for the information of the public, beg to say that the stock of eyes they have just received from Mr. Busby is sufficiently ample to justify the belief that it will be ready for delivery in the autumn of 1856, at the price previously announced, 21*s.* each. All orders already given have been duly registered, and will be executed strictly in rotation, and the same rule will be observed with reference to all future orders. Consequently the earliest orders will secure the strongest Vines.

Nurseries, Chelsea and Exeter, Dec. 8.

NEW EARLY MARROW PEAS.

HARRISON'S GLORY (blue) & HARRISON'S PERFECTION (white.)—These extraordinary Peas, which are nearly similar in habit, are as early as Double-blossomed Frame, about 3 feet in height, full of large pods which cluster from the bottom to the top of the haulm, and are equal in flavour to Knight's Marrow. Samples of the haulm may be seen at the following firms in London, of whom only they can be had, in quart packets at 5*s.* each:—

Messrs. BATT, RUTLEY, & SILVERLOCK, 412, Strand; BECK, HENDERSON, & CHILD, Middle Wharf, Adelphi; HURST & M'MULLEN, 6, Leadenhall Street; MINIER, NASH, & NASH, 63, Strand; NOBLE, COOPER, & BOLTON, 152, Fleet Street; JACOB WRENCH & SONS, 39, King William Street, City.

DENYER'S NEW PROLIFIC GREEN MARROW PEA.—A fine variety for succeeding the first early Crops. Very hardy, and one of the greatest cropping Peas in cultivation. It obtained the first prize at the Hastings and also at the St. Leonard's Horticultural Exhibitions.

From the Dean of Battle.—"The sample of Peas you sent me surpasses in beauty of colour and richness of flavour any that I have ever met with."

From Mr. Waters, Gardener to Lady Webster, Battle Abbey.—"I have examined the growing stock of your new Pea, and find it crops abundantly, the pods being a good length, very broad, and well filled. It is also a fine flavoured and beautifully green-coloured Pea."

From Mr. Bunyard, Maidstone.—"My opinion of the new Pea is, that it is a distinct sort, a good cropper, and for colour I do not know its equal."

From Mr. Parks, late Nurseryman and Seedsman, Dartford, Kent.—"I am much pleased with your new Pea. It certainly is a very fine cropper. The Peas are large, and the pods completely filled. It will when known become a superior Pea for market."

Price 3*s.* 6*d.* per quart. Post Office orders payable to WILLIAM DENYER, Seedsman, Battle, Sussex. May also be had through the London and other seedsmen.

SPLENDID NEW RHUBARB—SALT'S CRIMSON PERFECTION.

ROBERT SALT begs leave to inform the Gentry, Nurserymen, Gardeners, &c., that this splendid variety of RHUBARB is now ready for distribution; it is universally allowed to be the most early, prolific, and delicious variety ever offered to the public. See *Gardeners' Chronicle*, June 11, 1853:—"Very good, and of a most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."—ED.

Certificates of merit were awarded for specimens exhibited at the meeting of the Horticultural Society, Regent Street, London, June 20, 1853; at Nottingham, May 24, 1854; at Derby Midland, May 25, 1854; at Ormskirk, Lancashire, August 30, 1854.—Price 3*s.* 6*d.* per root, three for 10*s.*, and six for 1*l.* A few two-year-old Plants at 5*s.* each.

Orders addressed to ROBERT SALT, Longton, Staffordshire, or the following Agents will have immediate attention:—Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess & Kent, Penkhull, Staffordshire; Messrs. Francis & Arthur Dickson, 106, Eastgate Street, Chester; Messrs. James Dickson & Sons, 102, Eastgate Street, Chester; Mr. Salsbury, Melbourne, Derbyshire. A liberal discount allowed to the Trade.—A Post-office Order from unknown correspondents.

Longton, Dec. 8.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by JOHN WATERER at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

WALTON NURSERY, LIVERPOOL.

TO NOBLEMEN AND GENTLEMEN PLANTING NEW PLEASURE GROUNDS, OR IMPROVING PARKS OR DRIVES, AND TO COMPANIES PLANTING PUBLIC PARKS OR CEMETERIES.

W. SKIRVING begs to offer his extensive Stock of TREES and SHRUBS of various sizes, adapted either for immediate effect or for extensive new Plantations, where smaller sized and less expensive plants are required. In addition to his general stock of the leading kinds of Trees and Shrubs, which is allowed to be the most extensive in England, he this season offers upwards of a hundred thousand of the two most valuable Trees lately introduced, the ARAUCARIA IMBRICATA and CEDRUS DEODARA, of various sizes, from one to six feet.

W. S. invites any one wanting considerable quantities of Specimen Trees and Shrubs to inspect his collection and obtain prices on the spot, as the mere height of such trees (as quoted in lists) gives no idea of the value of well grown select plants for choice situations.

N.B. A few hundreds of the larger sized and finely shaped plants of the Araucaria imbricata and Cedrus Deodara have been grown in tubs, to secure their travelling in safety to great distances in this country, or to any part abroad.

Priced Lists will be sent on application.

WEST OF ENGLAND HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENT.—*The* PROPRIETORS *have during the past summer considerably enlarged their Offices and Seed Warehouses at a considerable expense, so as to be enabled to execute all orders with regularity and dispatch.*

With increased exertion, redoubled energies, and more assistants, they hope to give the greatest satisfaction to all who honour them with commands.

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

NEW TURNIP.

WAITE'S "ECLIPSE," PURPLE TOP YELLOW HYBRID TURNIP.

THIS new and distinct variety is a hybrid between the Purple Top Swede and Purple Top Yellow Scotch Turnip; it possesses the properties of the Swede, and may be sown much later. Coloured Drawings of this splendid Turnip may be had on application, or may be seen at the principal Seed Establishments throughout the kingdom. The Seed can be obtained of all respectable Seedsmen, price 3*s.* per lb.—A liberal allowance to the Trade.

J. G. WAITE, Seed Merchant, 181, High Holborn, London.

SEED POTATOES.

SUTTON AND SONS, SEED GROWERS, *Reading, have a large Stock of the best early kinds of Potatoes very true and free from disease. Prices, &c., will be sent post free on application.*

TO THE SEED TRADE.

GENUINE NEW SEEDS, *of the undermentioned kinds, warranted all of the growth of* 1855, *may be obtained from the Undersigned, who will forward prices on application.*

CARROT, of several sorts.	SKIRVING'S SWEDE, fine stock
MANGEL WURZEL, do.	GREEN GLOBE TURNIP.

SUTTON & SONS, Seed Growers, Reading.

SMITHFIELD CLUB.—BAKER STREET BAZAAR. **STANDS Nos. 153, 154, 155, and 156.** SUTTON AND SONS, READING.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 8, 1855.

SOME of our readers have asked us questions concerning the distinctions and origin of what are called PUMPKINS, GOURDS, and SQUASHES. It would be useless to refer them to standard English works in satisfaction of their curiosity; for nothing satisfactory therein appears. Neither is it worth saying "look into the *Géographie Botanique raisonnée* of M. ALPHONSE DE CANDOLLE and similar foreign works," for either they have them not or cannot read them. It therefore seems worth while to devote a column or so to the matter, especially since the time is approaching for procuring seeds against the season of 1856. In doing this we borrow largely from the important work just quoted.

Three races belonging to the genus CUCURBITA, are designated by the three names above mentioned. Botanists call Pumpkins *Cucurbita maxima;* Gourds *C. Pepo;* and Squashes *C. Melopepo.* We shall speak of them under their familiar names.

PUMPKINS are those great rambling plants which bear fruit the magnitude of which astonishes the novice. One of them, the "great yellow Pumpkin," often seen in shop windows, weighs commonly a hundred weight, and sometimes twice as much. SAUVAGES happily described it as *Sphæra polis compressis meridianis sulcatis* (a sphere compressed at the poles and furrowed at the equator). Several other sorts, green, grey, &c., are grown by the French, who consume them largely as a vegetable, merely boiling them, or more commonly making them into soup. They are all rather coarse, and inferior to the other races. Moreover, they are bad bearers, as might be expected from the enormous weight they commonly acquire.

GOURDS are also scrambling plants, but their flowers are smaller, and contracted at the base. Among them stand Vegetable Marrows, Orange Gourds, Egg Gourds, Giraumons, Crooknecks, Turk's Caps, Warted Gourds, &c. Of these sorts the quality varies greatly; some, like the Orange Gourd, are bitter even when young; others are always delicate and fit for food. The best known to us are, for eating young, the Vegetable Marrow, and for soup or mere boiling when ripe, the Egg Gourd. The latter is in reality one of the most valuable of all garden things in this country for winter food. In the Bon Jardinier great merit is assigned to the *Courge de Valparaiso* and the *Courge sucrière du Brésil;* but we are unacquainted with either.

SQUASHES are the Gourds which do not scramble over the ground, but form bushes 3 feet high and a little wider. In shops their seeds may be had under the name of Pâtisson, Elector's Cap, and Jerusalem Artichoke Gourd. In this country they are little known. Their fruit is small, broader than long, with the edge often furrowed. In North America they have a great reputation. To us they seem inferior to our Vegetable Marrows, and are much less productive.

Where do these plants come from? Some writers say from the Levant, some from India, others from Africa, others from America; yet they are hardly of universal origin. That Gourds of some sort were known to the Greeks and Romans scholars are aware, but whence they obtained them is a mystery. TARGIONI TOZZETTI says they were all introduced in very early times from Asia or Africa. The only critical inquiry that has been made into their origin is by M. ALPHONSE DE CANDOLLE, in that learned work of his to which reference has been already made. The PUMPKIN he thinks all evidence tends to show must have come from the south of Asia, though it has not been found in a wild state. Having no name in Sanscrit it is probable that it originated beyond the Ganges, or in some island of the Asiatic Archipelago. Perhaps it is so altered by cultivation that it is not recognised in its wild state; or perhaps LINNÆUS was right in regarding it as a mere variety of the Gourd. (What, by the way, is the origin of the word Pumpkin?) Gourds, properly so called, formed the Colocynthæ and Pepones and Cucurbitæ of the Greeks and Romans. M. De Candolle considers it quite certain that they are not inhabitants of America. "Remembering," he observes, "that the name Cucurbita is pure Latin, that the Greek words Kolokunthe and Sikua also appear to be true Greek, that the species has no Sanscrit name (for Roxburgh's Cuc. Pepo is a different plant); seeing moreover how many were to all appearance the varieties in the time of the Romans, and especially in Europe in the 16th century, I hesitate between the Mediterranean region and Southern Asia as their original birthplace. At any rate the species has not been found wild. Possibly it may be hereafter found in the South of China." As to the SQUASHES, the same great authority observes that they are probably an artificial race, produced in Europe by cultivation in the 16th century.

It would appear however that our friends on the other side the Atlantic have a ready way of settling difficult questions of this sort without a careful study of historical facts; for we find in the *Report of the Commissioners of patents for the year* 1854, under the head of Agriculture, the following statement by Dr. T.W. Harris, of Harvard University.

"Accident led me, some four years ago, to undertake the investigation of the history of Squashes and Pumpkins, which has led to quite interesting results. Most of the older and well-known species and varieties were by modern botanists supposed to have come originally from Asia, and particularly from India. This I have proved to be an error, and have shown that these fruits were wholly unknown to the ancients, no mention being made of them in the Scriptures, nor by Greek and Latin authors. The writers of the middle ages, while they describe or take note of other Cucurbitaceous plants, entirely omit Pumpkins and Squashes; and these did not begin to be known and noticed in Europe till after the discovery of America. Early voyagers found them in the West Indies, Peru, Florida, and even on the coast of New England, where they were cultivated by our Indians before any settlements were made here by the Europeans. The old botanists, who flourished during the first century after the discovery of the New World, or the West Indies, begin to describe them for the first time, and give to them specific names, indicating their Indian (American) origin. Hence arose the mistake of modern botanists in referring these plants to the East Indies and to Asia.

"From a study of the history of the plant, I went next to a study of the species, with particular reference to their botanical characters, and to this end have been cultivating and examining every year all the kinds accessible to me. I think I have established the fact that all the fruits known by the names of 'Pumpkins' and 'Squashes' are of American origin; that there are three distinct groups of them; the first, including summer Squashes, that have shells when ripe; the second, the winter Squashes and Pumpkins with deep five-furrowed fruit stems; and the third, the winter Pumpkins and Squashes, with short, cylindrical, and longitudinally wrinkled (but not five-furrowed) fruit stems. The last group was probably originally confined to tropical and sub-tropical parts of the western side of this continent, from California to Chili. The most esteemed varieties now cultivated in New England belong to this group, and the best of them are the 'Autumnal,' 'Marrow,' and 'Acorn' Squashes."

We are afraid Dr. Harris will have to modify his opinions.

WE learn with great pleasure, that Lord FITZWILLIAM has already commissioned Mr. HENDERSON, his very intelligent and experienced gardener at Wentworth, to take means for ascertaining the comparative of value of our two English Oaks. A couple of trees, of similar age (about 120 years), have been selected for experiment. That they are genuine we know, in consequence of specimens of the leaves and acorns having been sent us for

examination. They were felled in the end of October; they are to be seasoned for not less than six months, and a piece 6 feet 9 inches long from the butt end is separated, which will be hereafter cut up into scantlings for experiment.

As we trust that many others of our great nobles and gentlemen will co-operate in this inquiry, and since it is desirable that the trials should be conducted, as nearly as possible, on one uniform plan, we think it advisable to mention how some experiments made in H.M.'s dockyard at Portsmouth, by Mr. James Bennett, the very able timber inspector there, were conducted. Six pieces of New Forest Oak were taken from the Vindictive, each piece being 7 feet long, 2 inches square, containing 336 cubic inches, and resting upon props 6 feet asunder. Three of these pieces were common Oak, and three Durmast, all received into store in 1830, used in 1832, and tested in 1849. The results were given thus:—

Name of Oak.	No. of piece.	Weight		Deflection at crisis of breaking.	Weight of a cubic foot.	Specific gravity.
		of each piece.	borne.			

Since Lord Fitzwilliam's experimental timber is already cut into 6 feet 9 inch lengths, it is as well that others should adopt the same measurement; for the comparative results will not be affected if 6 feet 9 inch pieces, 2 inches square, resting on props 5 feet asunder, are substituted for those employed by Mr. Bennett.

We would also advise that, in order to render comparison perfectly satisfactory, the pieces experimented on should be squared from just within the sapwood, and therefore consist of nothing but heartwood or "spine." The back and belly of the pieces should be as nearly as possible parallel with the annual rings, while the sides should also be parallel with the grain or medullary rays. Moreover, in trying the strength the back of each piece, that is to say the side which was next the sapwood, *should be placed downwards.* It would not much matter, indeed, for comparison if it were placed upwards, provided all experimenters would do the same; but we should prefer it downwards, because when wood is bent in that direction the elastic resistance to a strain is the greater, as archers know.

Since writing the above, we have received a piece of the old timber taken from the remains unburnt at the late fire at Stirling Castle, which the Governor has been so obliging as to place at the disposal of our friend Mr. Peter Mackenzie. It came from "the Douglas room," which is said to be the most ancient part of the old castle. How long it may be since the tree that produced it was felled we have no means of knowing; but it must have lain in its place for several centuries, inasmuch as James II. of Scotland who stabbed the Douglas in the room it floored died we think in 1456, at which time Stirling Castle was an ancient fortress. It is not a little curious to find that this wood, of such high antiquity, is that of Quercus sessiliflora, as every piece of very ancient English Oak which we have yet seen has invariably proved to be.

The annexed is an exact measure of the annual rings in the specimen before us; from which it appears to have grown pretty fast for the first 30 years, after which its rate of increase gradually diminished, till at last the annual rings can with difficulty be counted even with the aid of a magnifying glass. That it must therefore have been produced in an unfavourable climate would seem certain. In fact the sap wood, now in a state of decay, formed so slowly that the tree could not have gained half an inch in diameter in 15 years.

New Plants.

152. Coccocypselum cordifolium. *Nees and Martius, D. C. Prodr.* iv. 397.

Among many curious plants raised in the garden of the Horticultural from the abundant collections of our zealous friend Mr. Skinner is this, which he describes as "an exquisite little thing, with ultramarine-coloured seeds. It crawls over shady banks. Both leaves and flowers beautiful." From its great resemblance to a *Geophila*, it was provisionally named *G. villosa*, under which name it has been distributed. Now that it has flowered it has been identified as the *Coccocypselum cordifolium* of Brazil, which has found its way as far northwards as the forests of Guatemala. The flowers are in very small heads, about three together, of a pale lilac colour, and of little interest in their present state; but it is conceivable that if carpeting a bank, and blooming abundantly, the appearance might be gay enough. It is, however, to the "ultramarine-coloured" berries that we must trust for the beauty which belongs to the plant. The leaves are roundish cordate, of firm texture, shaggy, with stalks longer than the peduncles in the wild plant, though much shorter in the specimen that has just flowered.

153. Eucharis grandiflora. *Planchon and Linden Fl. des Serres*, ix., 957.

This is one of the handsomest of bulbous plants. A correspondent (J. M. A.) has sent us a flower, pure white, thick like fine kid leather, 4½ inches in diameter, and sweet, like a Tuberose in the evening. In appearance it may be compared to a Pancratium, or rather to a Eurycles. The leaf is 5 inches broad by 7 inches long, acute, somewhat heart-shaped, with the texture of a Funkia. Three or four such flowers as are above described form an umbel, on a stiff terete scape. The tube is curved and trumpet-shaped, more than 2½ inches long; the border is quite flat, consisting of six ovate segments, the inner overlapping the outer at the base. The coronet is fleshy, cylindrical, about half an inch deep, with 18 thick teeth, every third of which is longer than the others, and bears an anther. The style projects a little, is very slender, slightly declinate, and ends in a flat bluntly 3-lobed stigma. Each cell of the ovary contains about a dozen papilliform ovules.

The plant was found by Mr. Triana, one of Mr. Linden's collectors, in the province of Choco in New Grenada. It requires stove temperature while growing, and a dry greenhouse when at rest, and is a charming thing.

VEGETABLE PATHOLOGY.—No. XCVIII.

394. Dactylorhiza*.—(*Fingers and Toes*).—This disease was not clearly distinguished from Anbury, which is in reality a very different affection, till Mr. Buckman published his excellent memoir in the 15th volume of the "Transactions of the Royal Agricultural Society," which was transferred with copious illustrations to this Journal in the volume for 1854, and some observations on the same subject have very recently appeared in our pages confirmatory of what had been advanced in the previous year. It is like the disease treated of in our last article (P. 388), a more or less complete reversion to the natural condition of the plant, and the remedy consists in like manner (P. 392) in good cultivation and a proper selection of seed.

395. Anbury properly so called (and clubbing belongs to the same category) is a deformed condition of the roots induced by the attacks of insects.† In the present disease no insect is immediately concerned, and if larvæ appear at a later stage of growth their presence is altogether accidental. In their wild condition Parsnips, Carrots, Turnips, &c., throw out a multitude of principal roots and heads, whereas the effect and object of high cultivation is to produce a plant which shall have a single head only, and one tap root without any principal laterals. In some plants, as in the Rampion and Skirret, the innate propensity to division is so strong as to make them scarcely worth cultivating, notwithstanding their intrinsic merits. Mr. Buckman has shown that the tendency of cultivation accompanied by a careful selection of seed and change of soil is to produce single taproots, but that amongst a quantity of seedlings, under the most favourable circumstances, there is always a disposition to revert to the original condition, and that this tendency is increased in proportion to adverse agricultural influences, as untimely sowing, poverty of soil, repeated produce upon the same ground, &c. Wherever, therefore, a large quantity of branched roots occur the quality of the seed may be suspected, provided it has not come from too rich a soil, the soil itself be in proper condition, and the same crop has not been taken several years in succession. Under unfavourable circumstances the branched roots will become woody and the plants run rapidly to seed, presenting a condition identical with that in our last article. The vulgar notion that the division arises from the manure not being properly incorporated with the soil, insomuch that small fibres attracted by the isolated patches become strong branches, is, I believe, entirely without foundation.

395. It is highly necessary for the prevention of this condition, that seed should be raised from selected roots, and not from a crop taken indiscriminately; that the roots should not have come from very late sown seed, a circumstance which has an especial tendency to produce plants which run to seed rapidly without forming a tap root, and that the roots themselves should have been raised and stored some time previously to being committed to the ground. It was explained before that the greater part of the objects of agriculture are due to a certain debility of constitution, and by storing the plants, that exuberance of vegetation is checked which has a tendency to reduce plants to their former condition.

396. It is clear that where plants are naturally wild, the tendency to reversion may be expected to be much greater than under contrary circumstances. Hybrids too between species will have a much greater tendency to revert than hybrids between varieties, and consequently the Swedish Turnip is much more subject to the malady than the common Turnip.‡

397. Affections, apparently similar, exist occasionally in tubers, as in the Potato. As these tubers have in reality neither the functions nor organisation of a root, the case is one merely of analogy. In the Potato, for instance, where the tubers, sometimes, as in a case before me, assume a form like that of a human foot, or as in that figured in *Gardeners' Chronicle*, 1849, p. 4, present a gouty hand, the affection is due to the protrusion of some of the superficial buds, so as to form fresh tubers adherent by their base to the original tuber. In the first case mentioned above some larva had burrowed into the substance, so as to destroy the vitality of the terminal bud, and hence as the tuber was still inclined to increase some of the lateral buds were brought into action. The same effect may be produced by excessive pressure, as was probably the case with the Belgian specimen figured in this Journal. The affection is, however, no attempt to revert to the original condition of the plant, but arises from purely accidental causes. *M. J. B.*

* From δακτυλος a finger, and ῥιζα a root.

† The articles Anbury, Clubbing, Fingers and Toes, and Turnip disease in the "Encyclopedia of Agriculture," may be consulted on this subject.

‡ Precisely the contrary was stated in Mr. Buckman's paper, see *Agricultural Gazette*, 1854, p. 572. The mistake was probably a mere misadvertence, and at any rate the matter is correctly stated in the present Volume, p. 778.

SUBTERRANEAN IRRIGATION.

[From Mr. Mechi's communications to Stöckhardt's Chemical Field Lectures.]

"I am so frequently questioned as to the cost and success of this operation, that I purpose, as briefly as possible, giving the necessary information.

"Supposing the farm to be of 200 acres, pipes of 3 inches diameter would be sufficiently large:—

	Cost per acre. £	s.	d.
15 yards of 3-inch iron pipe, weight 5½ cwt., at 7*s.* 6*d.*	2	1	3
Laying and jointing with lead and yarn, 18 hydrants, and fixing, at 1*s.* per yard	0	15	0
A liquid manure tank of 4½-inch brick-work, with 9-inch dome, 100*l.*...	0	10	0
200 yards of gutta percha 2-inch tubing, at 5*s.* 6*d.* per yard, or 1 yard per acre	0	5	6
Steam-engine of 6-horse power, 200*l.*	1	0	0
Pair of 6-inch pumps, 20-inch stroke, 100*l.* ...	0	10	0
	£5	1	9

So that about 5*l.* per acre will be the cost of the whole operation; this is considerably higher than the estimates quoted by the General Board of Health, p. 136 (whose paper on this subject everybody should read), and much higher than my own expense; because when I carried out this operation in March 1852, the price of iron pipes was only 4*l.* 5*s.* per ton, labour, materials, &c., in proportion.

"I think I have somewhat over-estimated the cost, but there are always a number of incidental expenses which tend to enlarge the estimate.

"Assuming 7½ per cent. on the sunk capital to be a sufficient charge, your fixed charge on every acre of the farm will be 7*s.* 6*d.*, and your working expenses will be as follow on the land actually irrigated:—

6-horse power, or 7 cwt. of coals per diem ...	£0	8	0
Engineer	0	2	6
Man and youth to work jet, 2*s.* 6*d.*, 1*s.* 6*d.* ...	0	4	0
Miscellaneous expenses	0	1	0
	£0	15	6

Or 15*s.* 6*d.* per diem working expenses. With this power you will put on 5000 gallons per hour, or 50,000 gallons in 10 working hours; allowing two hours on each acre, or 10,000 gallons per acre, the cost for each dressing per acre will be 3*s.* 1*d.*

"Supposing the Grass or other crop requires four dressings per year, the cost would be 12*s.* 4*d.* per acre on the land actually irrigated.

"It is now three years and a half since I first began irrigating, and I have no hesitation in saying that the operation is a profitable one. By this process you intimately admix your manure with every granule of the soil and subsoil to the depth of the drains, which I have often seen discharging the liquid at 4 and 5 feet deep. A cross cut in our ordinary soils exhibits 5 inches of friable and well-looking soil, whilst all below shows undisturbed poverty.

"Irrigation remedies this and fertilises where the plough-iron never enters.

"In the practical working of the operation, a hundred difficulties presented themselves; these have all been overcome, (as with steam, gas, and other new inventions); and now our men pursue their avocation without let or hindrance.

"I have written largely on this subject in the *Agricultural Gazette*, and under the head 'Sewage' in 'Blackie's Cyclopædia of Agriculture.'

"The main difficulties that have been overcome were—the avoidance of concussion by ample air-vessels, the intermixture and suspension of the solid manure by constant agitation produced by an impulsion of air from an air-pump.

"The substitution of a gutta percha suction pipe with corrugated joints instead of iron pipes.

"The use of a large suction gutta percha bulb with many holes, by which the manure is gradually and slowly drawn in, thereby avoiding the choking, which was caused by a violent rush through limited openings.

"Painting the gutta percha tubing white to prevent its melting in summer by the heat of the sun.

"Inserting corrugated joints, at intervals of 18 feet, to enable the gutta percha tubing to curve without 'knuckling.'

"Improving the draught and setting of my steam-boiler, by a strict adherence to the rules laid down in Mr. W. Williams's admirable work 'On the Combustion of Coal and the Prevention of Smoke,' which every owner of a steam-engine would find it profitable to read.

"There is no reason why the sewage of our towns should not be applied to the fertilisation of the soil, except that prejudice and disbelief will obstruct all new undertakings.

"An examination of the Croydon Water Works, where 650,000 gallons are raised daily 150 feet, and pumped a mile for 13*s.* 6*d.* worth of dust coal, will show how cheaply our irrigation might be effected by a proper investment of capital.

"Mr. Whitworth, in his Special Report on America, states that the Navy Dock, New York, containing 610,000 cubic feet of water, is converted into a dry dock in four hours and a half by a steam pump, which shows how easily the contents of our London sewers might be applied to the soil instead of poisoning our river; but then you must get farmers and landlords to believe that it is profitable for them to economise and pay for this precious ingredient, or they will not make the necessary arrangements for its application.

"In conclusion, those who desire to save themselves trouble in this matter may send their engineers to examine my works at Tiptree, or come themselves.

"Mr. Walker pays 50*l.* a year for the sewage of Rugby, and applies it to his land. The Earl of Essex takes the sewage of Watford for 10*l.* per annum.

"The Edinburgh meadows (once barren waste) have, by irrigation with the town sewage, been converted into rich Grass lands, let annually by tender to the Edinburgh cowkeepers at an average rental of 21*l.* per Scotch acre!!!

"N.B. This operation can only be carried out where water is obtainable in sufficient quantity. In my case I obtained a constant supply of pure water by draining a piece of boggy land 12 feet deep. Water that will produce the Water Cress is considered by Devonshire men well suited for irrigation. Mine is of that quality."

AUTUMN.

How beautiful is autumn, with its varied tints of rich brown and deep green, its fading Oak and Beech, whose leaves seem to linger on the branches where they have waved so merrily during the long warm past summer! And the wind as it rustles through the crisp foliage, scattering about our path the emblems of the life and fertility of another season now gathering into the filling tomb of the past—how clearly it speaks the object of its mission and falls upon the ear as a soft moan of grief over the dying and the dead! Spring with its renewed life—its sunny days, its gladdening hopeful happy face, has many and varied varieties. Summer has perhaps more substantial elements of Nature's power and the wisdom and love of Nature's Creator. But I must confess a weakness in favour of autumn as a season in which, above all others, the mind acquires that calm and happy tone which befits it best to contemplate the wonderful world around us. Where is the busy life—the myriads of insects—the birds with their varied notes and joyful songs? They do not now, it is true, enliven the solitude of the forest or cover its "babbling brooks" with their gay and graceful motion.

But the very fact that they are gone, and all around is silent, save the chance caw of the passing rook, the screech of the startled jay, or the "wood sprite," or may be my old friend the tom-tit cracking the stone of the Hawberry on a neighbouring branch, gives a feeling of awe to the thoughtful, and adds another charm to the mind's eye of Nature's student. In The Book we are told there is "a time to weep and a time to laugh; a time to mourn and a time to dance." Emphatically I would add that autumn is, *par excellence*, a "time to think." Because, do as you will—say as you will—argue as you will—to the conclusion you must come that no one can look upon the rich tints of autumn, listen to its falling leaves and think of the busy life that has fulfilled its purpose and passed away, without feeling in his inward soul that he is reading a type of his own destiny among created things. His joy, and hope, and affection, and love—were they not the attributes of his spring? And the busy, crowded, active thoughts and actions of life—do they not tell of his summer? How easy then is the transition to that period when in the calm of life, his remembrance of those who are gone from the bright world for ever brings him to the mellow autumn of his own existence—and the falling leaf, and the fading landscape, and the stillness of all around him, do not these things raise within him thoughts too "eloquent to speak," and give a sanctity to that which is the type of his own mortality—the shadow of his own doom?

And yet again the thoughts which this season excite are not alone of self. "He hath made everything beautiful in His time." And there is nothing more beautiful than the design which He has imprinted upon all that He has made. The stupid Pantheist who localises his God in each leaf or stone or flower on the face of the earth, forgets that the thing created can never be equal to Him who creates. As the labourer sleeps after his toil that his strength may be restored, so Nature in autumn is preparing for that sleep of winter which will give it renovated luxuriance in the coming spring. As the animal slumbers after its food so does the tree or flower, and autumn is a fitting symbol of that Providence which careth for "every creeping thing." Long before the green leaves have faded, the swallow and most of the songsters of our summer have been guided away to a warmer land—the dormouse has made its nest and the insect has sought its hole, and man looks on with no wonder, and, alas, too often with no thought, for such things "always were."

And autumn is in another aspect a proof of the finite nature of the human mind. "No man can find out the work that God maketh from the beginning to the end." We know that the life of the world becomes dormant for a season; but who shall say what that life is, the current of which is checked by the autumnal frost? The operation is evident, the fact is clear, but the moving spring is hidden from our gaze among the grand and sublime attributes of infinity.

Still once more, autumn is the storing season of the world. "And also that every man should eat and drink and enjoy the good of all his labour, it is the gift of God." The squirrel stores his nuts in the high trees, the beaver fills his granaries, the "wee mousey" drags the Chesnut into its nest, and man gathers his golden corn into his stackyard.

These and many more are the facts which give, to my mind, a peculiar charm to autumn, but as we think and ponder upon them all, the subject opens out into a yet wider and grander field of contemplation; the brook no longer ripples in the ear—the passing bird no longer startles the thinker from his reverie—the leaves crisping at his feet no more tinge his memory with thoughts of the past and gone—the mellow tints are changed, for the mind has passed onwards, and has pierced the gloom of winter, seeing in the far distance the awakening again of that which but seemed to die, and the type of his own existence again looms forth—speaking of the Eternal, of that which lives for ever.

And the dead leaves are gone and new buds spring forth, and again the sound of life is heard, and the birds sing and the insects hum and the Grass grows green, and Nature rises once more into life, and the thinker reads the history of a human soul which shall never die. And so I love all the seasons which God has given us for our happiness, but above all I love to linger upon the mellow tints of autumn. *C. R. Bree.*

THE VERULAM PEAR.

Syn. Buchanan's Spring Beurre.

Under the latter of these names a tree was received into the collection of the Horticultural Society, from the nursery of Mr. Buchanan, of Camberwell, in 1828. The name, however, is objectionable, inasmuch as the fruit is not properly a Beurré, nor is it asserted that the

variety was raised by Mr. Buchanan. In 1827, however, a cutting was received from Mr. Jutler as the Verulam Pear, which proved to be identical, and this name is considered the better one to adopt.

The fruit is produced all over the tree with great regularity, and it is remarkably uniform in size, which is similar, in tolerably good soil, to that of the fruit here represented, from a standard; but in rich soil it grows considerably larger. The form is regular. Stalk slender and woody. Eye rather open in a slight depression. The skin is strong, and with its bronze-like close coating of russet is well adapted for protecting the fruit for a long period. The flesh is crisp and juicy, and in good seasons becomes tolerably melting, especially if placed in a temperature of from 60° to 65° for some weeks previous to using. Its principal merit, however, is as a stewing Pear, for which purpose it is found to be excellent, and acquiring a fine rose colour without the aid of cochineal. In this way it may be used all through the winter and till May.

The tree is hardy, forming a round spreading head, and bears abundantly. Shoots moderately strong, dark olive, sprinkled with both round and linear grey specks. Leaves middle-sized, somewhat obovate, acuminate slightly serrated; petioles slender, about 1½ inch in length. A variety of Pear that is hardy, an abundant bearer as a standard, and which keeps sound like the above, must be considered a valuable acquisition. *R. T.*

Home Correspondence.

Longevity of Seeds.—The following may interest you. Whilst the Great Northern Railway was making through the fens of Hunts the workmen came to a parcel of Nuts and Acorns. One of the Acorns had vitality, but, unfortunately, the navvy who found it cut it asunder to ascertain the fact; the chaplain, however, was in time to save the Nut, which he sowed in a pot. It vegetated, and is now in the Kew Gardens, and showing in its growth all the indications of age. The annual shoots are, or at least were when I saw it, short and jagged. The fen in which these fruits were found is full of trees several feet below the surface, black and hard so that no tools can work them, showing that it was once covered with wood, though certainly not within the last eight centuries, and probably many more. *Thos. Richard Rooper, Wick Hill, Brighton.* [We have requested Dr. Hooker to have the kindness to inquire into this case, and he has done so, as the following highly interesting memorandum shows.]

Longevity of Seeds.—I have referred Mr. Rooper's note to Mr. Smith, who has made inquiry in the Gardens, but can hear nothing of the Oak plant in question, nor does he remember any such having ever been brought or sent to Kew. I am not aware how far experiments have been carried to show the extent to which seeds, or rather embryos, will suffer mutilation and still retain sufficient vitality to become plants; this point will, however, be well worked out if the proposal to attempt the grafting of embryos, submitted by you in the *Gardeners' Chronicle* to the attention of skilful practical horticulturalists, be carried out. The main question as to the vitality of seeds supposed to be long buried in the soil is, however, apart from this, and one which appears to have received comparatively very little additional illustration at the hands of trustworthy observers for many years past. The famous Raspberry seed case, to which allusion has again been made, remains the most closely investigated example hitherto put on record of embryos retaining life after the lapse of several hundred years; I do not by this mean to say that as well authenticated cases of seeds supposed to be ancient having germinated are not on record; but this is, I believe, the only one in which all stages of the process, from exhumation to germination, have been seriatim rigorously investigated and vouched for, right or wrong; that some unknown and unsuspected cause of error may lurk in this case too, I am strongly inclined to suspect; and though I cannot point to any such, I have been too often myself deceived in cases which I once thought beyond the pale of doubt or dispute, to put implicit confidence in any experiment that makes large demands upon my faith, all whose steps have not been watched by practised observers.

That I may not be accused of being a churl of my confidence or an unreasonable sceptic, I will add a case in point in which I was not only myself most entirely deceived, but a much more cautious and most shrewd naturalist shared the delusion. Dr. Thomson and I, as you are aware, visited the Khasia mountains in East Bengal during our Indian travels; and previous to doing so, in the course of reading what was published about that curious country, we fell upon an observation by the late lamented Griffith, that an arboreous terrestrial species of Loranthus (otherwise an unexceptionably parasitical genus) grew there. As Griffith was not only an acute and experienced but a profound observer, who had made of Loranthus a particular study, physiologically especially, we never for a moment doubted the accuracy of his statement; nor perhaps will some botanists yet, in spite of the negative evidence Dr. Thomson and I can offer against it. Soon after our arrival we too found an (apparently) terrestrial arborescent Loranthus, forming a small tree at elevations of about 1000 feet, whose slender trunk we climbed, and procured abundance of specimens of leaves and flowers, and also a section of the wood; as, however, Griffith stated his plant to have been found at 6000 feet elevation, and to have the habit, &c., of an Elæagnus, we could only congratulate ourselves on finding a second case of the anomaly in question. During several subsequent journeys towards the bases of the mountains we found the same species, being always, as far as our observations went, terrestrial. After some months we proceeded along Griffith's route to Myrung, where he had found his terrestrial species, and there we soon re-discovered it, exactly corresponding with the following description, taken from his Journals (vol. i., p. 166):—"The most curious tree is one which, with the true appearance of an Elæagnus, seems to be a Loranthus, the first arborescent species yet found, although, as one or two other exceptions occur to

parasitism, there is no reason why there should not be a terrestrial arborescent species as well as a fruticose one." We unsuspectingly began to gather abundance of specimens, but our habit of never, when possible, collecting from one individual, soon led to the discovery that this was no terrestrial plant at all, but simply that of an Elæagnus-like Loranthus, growing on an Elæagnus, parasitically, of course. Both Elæagnus and Loranthus were extremely abundant on all the hills there and elsewhere in the Khasia, the former often contributing largely to the copse wood, and we were not a little surprised that Griffith, who had twice, after an interval of several years, visited Myrung, should have fallen into such a mistake. We congratulated ourselves all the more on the genuine crop of our terrestrial Loranthus of the foot of the hills. We were, however, ourselves doomed to disappointment, for on finally leaving the Khasia by the same road we had followed so often before, we stopped to procure a larger specimen of the Loranthus wood than we had previously obtained, and to do so cut down the tree, when we observed a very suspicious looking minute but familiar green leaf amongst the apparent Loranthus branches, and the truth came out that this was a case of the parasite possessing itself wholly of the branches of an Orange tree, its own branches covered with green leaves spreading out on all sides, and their branchlets hanging down, completely concealed the few remaining leaves of the Orange in one case, and wholly so in another close by. It may well be asked how experienced botanists can make such mistakes, especially how they came to be made in the field, and by persons who were not merely collecting for specimens, but endeavouring to observe every plant accurately in its living state. But for Dr. Thomson and my having visited Griffith's locality in one case, and having spent months in the Khasia, and collected wood specimens in the other, the anomaly would have remained almost indisputably verified by three botanists of there being such things as terrestrial tree Loranthi in India. I need hardly add, that when both the Elæagnus and its Loranthus were known to us, we saw so much difference between them as they grew, that to make such a mistake appeared impossible; and so in the case of the Orange and its parasite, it puzzled us to conceive how we had failed to recognise the trunk of our supposed Loranthus to be that of an Orange tree, abundance of which of the same size and height were growing around it. These are perhaps remarkable cases, but they are far from solitary ones; I have been so often deceived myself, and have been sent after so many mares'-nests by honest but inexperienced observers, that I have learnt by experience to mistrust all paradoxes in science. The cases of seeds lying buried in the ground for years, and springing up after the soil is disturbed, belong to almost another class from the Raspberry case; for there is sometimes no proof of the seeds having been buried at all, and at others there is no possibility of approximating to the length of time that they have been buried; they may, in short, be quite recently deposited. Mr. Darwin's Charlock seed case appears to me to be for various reasons by far the best instance yet adduced, for he proved that the seeds grew from below the surface of the disturbed soil, and therefore could not have been recently deposited on its surface. My objection to placing implicit confidence in this case, is the want of evidence that Charlock seed will withstand the destroying effects of moisture for any number of years. A vast accumulation of observations have been made, some intentionally and some accidentally, on the vitality of seeds, and all fail to show that this can be long retained under moisture, except those few of whose early history (as of the Charlock) we can obtain no satisfactory information. This of itself appears to me to be suspicious; and another fact is still more so, viz., that as observers and means of observation increase, the number of well attested facts does not multiply proportionately. How is it that we never find scarce or interesting plants under such circumstances? how is it that the seeds never are seen in the soil? If I am answered that they are too minute, I would ask why it is that only minute seeds lie so buried. Again, we are as yet very ignorant of the habits of many animals, and this interference of the animal kingdom with the laws that regulate the vegetable, are constantly giving rise to apparent paradoxes and anomalies. Such being the case we have surely a right to demand the most rigorous investigation of every case of anomaly by the reporters of them, if they wish to command our confidence; it is hardly fair to pitchfork paradoxes at naturalists' heads and tell them they may believe them or not as they like. With regard to the Charlock seed, one of the correspondents in the *Gazette* remarks that being an oily seed it is likely to retain its vitality unimpaired, and quotes Melon seeds as a case in point; but the seeds of Cucurbitaceæ are better protected than those of Cruciferæ, and the latter order is considered by some gardeners as not good keeping seeds in general. That many oily seeds become rancid and spoil quickly is certain, but I am not aware that any relation has been discovered between the vitality and chemical or other qualities of seeds. The suggestion of your correspondent "G. B." that the ground in which the supposed buried Charlock seed sprung up should be examined, is an excellent one, nor can I conceive its not giving conclusive evidence on one side or the other, for the Charlock seed, as "G. B." says, is not small, and for every living one there must be many dead in the soil. I would further suggest the burying Charlock seeds under a series of sods at different depths, and examining them *seriatim* after certain stated intervals, say one or two yearly. We should thus at any rate solve the first question, whether the seed can resist the effects of damp and for how long. The operators, too, would certainly have the advantage over Nature, for the seeds as shed from the plant must lie long on the surface exposed to birds and the weather before they are covered at all; and indeed it is difficult to imagine how it is that they can get buried in any abundance without germination taking place. If my friend Mr. Darwin would undertake these experiments, he would be conferring a great boon on sceptics like myself, and on science in general. I can assure him that there is no one into whose care all classes of naturalists would rather see them intrusted, for there is none in whose acuteness, judgment, and sagacity they place more confidence. He has already conferred a lasting benefit on both botanists and horticulturists by his admirable experiments upon salted seeds; and until these experiments were tried by him, I did not at all believe that many of the seeds he steeped would have withstood as many days' immersion as they have weeks, and even months. I shall be only too glad to change my opinion, or rather to dismiss my doubts as to the Charlock seeds, if he will kindly undertake to help me to do so. *J. D. Hooker.*

Meteorological Summary, for September, 1855. Prepared from the Comparative Observations in the Irish Land Schedule of 15th October. No. 98.

Month of September. Locality.	Mean Barometer	Mean Thermometer. Max.	Min.	Mean.	Amount of Rain.
England.	Inches.	deg.	deg.	deg.	inches
1 Durham	*30.165	58	47	52.5	0.29

* Observations are reduced to 32 deg.

† Height of cistern not given in these localities, and, therefore, the observations are not corrected for height; all others have been corrected.

Remarks.

Thermometer.—Mean daily temperature in England, 56.4°; Ireland, 56.7°; and Scotland, 54.0°; being a mean of 55.7° for the United Kingdom during the month of September.

Rain.—Average fall: England, 0.88 inches; Ireland, 1.28 inches; and Scotland, 0,55 inches, being a mean of 0.90 inches for the United Kingdom during the month of September.

Wind.—Prevailing direction in England, north-east; Ireland and Scotland, south-west. Taking the above 17 localities, the following is the average number of days during the month of September that the following winds have prevailed:—North, 2½ days; north-east, 4¾; east, 2¼; south-east, 2½; south, 1½; south-west, 7¼; west, 3; north-west, 3; and calm days, 3.

—*Henry Allnutt*, 27, *College Green, Dublin.*

The Double Crimson Chinese Peach.—This is the most beautiful of all double rosaceous trees, and when gently forced so as to bloom in February it is one of the greatest ornaments to the conservatory. After being removed from the forcing-house it retains its blossoms a long time in a greenhouse temperature. My tree in a 13-inch pot blooms every year admirably, and gives me a good crop of its curious pointed fruit, which as the tree is stationary in a corner of one of my forcing-houses ripen in July. They are juicy and really agreeable, although not rich or high flavoured. The tree is every year a beautiful object when in bloom. *T. R.*

Heating.—I have a pit and a hothouse heated with warm water. The boiler I use is one recommended by Mr. Rivers, and placed over a brick Arnott stove. On the top of the stove is a strong iron plate, which becomes very hot soon after the fire has been lighted. Now I do not get so much heat in my hothouse as I require in severe weather, and my object is to know how best I can make use of this hot plate to convey hot air into the house. At present I have a small hot-air chamber, about 30 inches square and 4 inches high, closed on three sides, and opening into the house. Of course from this I get some heat, but not so much as I think I ought and might. Would the heightening of the air-chamber, closing it all round, and introducing a pipe at top and another at bottom of the side which joins the house have a better effect by producing a circulation? and if so, what should be the diameter of the pipes? and should one be larger than the other, or one shorter than the other? Or could Mr. Rivers, or any of your correspondents propose a plan which would succeed? I could introduce fresh air from without also, but how best to do this is the question. Any advice that can be given me on the subject I shall be grateful for to your experienced practical correspondents. *A Constant Reader, Bentley, near Farnham.*

Osmunda Regalis.—Allow me to inform your correspondent "R." that finer specimens of this noble Fern may be seen in this county (Denbighshire) than any I have seen of it in Ireland; many of the fronds I have measured this season have been 8 and 9 feet high. The situation in which these plants grow is bog, which is flooded every season. I have dug for the caudex 3 feet deep, but I never could get one entire; could we get such noble specimens to grow in our Ferneries their effect would be truly striking. There would, I think, be some difficulty in procuring specimens of this Fern for all the Roman Catholics in Ireland to use upon Palm Sunday; the favourite Palm there for that day is the common Yew. *J. D., North Wales.*

White Thorn.—Forty years ago it was the practice to give the Haws to turkeys or other fowls and to sow their dung, by which it is believed that the germination of the seeds in the first year was secured. Is the practice exploded or forgotten? *J. G., Bury St. Edmunds.*

Apricots in Orchard Houses.—With some cultivators these have not done so well as Peaches and Nectarines, having failed to set their fruit. I have always had good crops, I believe owing solely to my having had the trees placed, while in bloom, near the openings for air, so that a brisk wind always blew on them. The Apricot while in bloom seems to defy the coldest winds if they are dry; but with the least stagnation of damp air its blossoms drop without setting their fruit. *T. R.* [They fruited well with the free ventilation of the orchard-house in the garden of the Horticultural Society.]

Cypresses.—After reading your leading article of Oct. 27, where you observe that in the neighbourhood of Bouloukli in Asia Minor, M. Balansa had met with a grove of wild Cypresses, all of the spreading sort, my attention was drawn to the great number of spreading Cypresses in the cemeteries north of the arsenal on the Golden Horn here. They are of all intermediate shapes, from the closely compressed spiral to the open round-headed form of evergreen Oaks. Most of the open sorts, however, have the general appearance of Spruce Firs—many of them like Scotch Firs—with drooping branches; from one of these I cut a specimen of leaves and buds to make quite sure they were really true Cypresses, which I found they were. Some took the shape of the flat-headed Stone Pine, but these were rare. In the other cemeteries round this city and suburbs, as well as at the large cemetery behind Scutari, I have not observed so great a variety as in the one behind the arsenal. But, doubtless, observers who have had greater opportunities than I have had must have seen the same thing in other places, though I should think there are few places, if any, where such an extent of cemetery and such numbers of planted Cypresses exist as round Constantinople, with its European suburbs and Scutari. *T. S. P., Constantinople, Nov.* 19.

Genera Plantarum Floræ Germanicæ.—As some of your readers may have taken in the early numbers of this work by Professor Nees v. Esenbeck and others, it will be satisfactory to them to know that there is a reasonable prospect of its being continued and completed. By a direct application in Bonn I have learned that, in spite of many and peculiar difficulties, the publishers are proceeding, that three competent editors are occupied in the work, and that four or five fasciculi may be looked for in the coming year. Up to the present time 28 fasciculi have been issued. *G., Bath.*

Societies.

Linnean, *Nov.* 20.—The President in the chair.—Among the presents announced was a collection of about 200 species of dried plants from the Australian Alps, collected and presented by Dr. Müller. Mr. F. Ruffe, of Tamworth, exhibited specimens of a Cardamine, supposed to be a hybrid between C. amara and C. pratensis, gathered at Dunstall, near Tamworth; but which Mr. Syme was of opinion differed in no respect from the former species. The following papers were read:—1. "Observations on the mode in which the Argyroneta aquatica forms the bell of air with which it surrounds itself beneath the surface of the water," by the President. In one of the experiments detailed, the following results were observed. In an upright vessel of water furnished with a plant of Stratiotes, six Argyronetæ were placed. The one now referred to began to weave his beautiful web about 5 P.M. After much preliminary preparation, he ascended to the surface, and obtained a bubble of air, with which he immediately and quickly descended, and the bubble was disengaged from the body, and left in connection with the web. The nest was on one side in contact with the glass, and enclosed in an angle formed by two leaves of the Stratiotes, so that the movements could be easily observed. Presently he ascended again and brought down another bubble, which was similarly deposited. In this way no less than 14 journeys were performed, sometimes two or three very quickly in succession, at other times at a considerable interval, during which he was employed in extending and giving shape to the beautiful transparent bell, getting into it, pushing it out at one place, rounding it in another, and attaching it more closely to the supports. At length he seemed to be satisfied with its dimensions, when he crept into it and settled himself to rest with the head downwards. The cell was now the size, and nearly the form of half an acorn, cut transversely, the smaller and rounded part being uppermost. Similar observations were made in other instances. 2. "On some new species of Chamælancieæ," by Dr. C. F. Meisner. The group of myrtaceous plants which was established by De Can-

dolle under the name of Chamælancieæ, and which is one of those particularly characteristic of the Flora of New Holland, has become so well known to botanists, through the collections of Drummond and Preiss, that the author considers it surprising that so few of them—marked as they are in many cases by uncommon elegance and the loveliness of their flowers—should have found their way into gardens, to which they would certainly be valuable and highly ornamental acquisitions. "As far as I have been able to ascertain," he continues, "the only representatives of the group which were known prior to the last year, in European gardens, were two or three species of Calycothrix. To these have been quite recently added the two fine species of Genetyllis, figured in the Botanical Magazine (t. t. 4858 and 4860). Dr. Meisner proposes for that figured at t. 4860, under the name of G. macrostegia, the name of G. Hookeriana, considering it to be distinct from the plant so named by Turczaninow, which is figured at t. 4858, under the name of G. tulipifera. Turczaninow's description and reference, on comparison with the authentic specimens in the Linnæan Society's herbarium, support this view. In the paper now read, Dr. Meisner described 22 new species, making the number of described species of the order 121. 3. "Notice of two undescribed species of Genetyllis from S. W. Australia," by R. Kippist, Esq. This paper was supplementary to Dr. Meisner's, and described two species of Drummond's which that author did not appear to have seen, namely, Genetyllis fimbriata, *Kip.* (Drum. ser. 5, No. 99), and G. Meisneri, *Kip.* (Drum. ser. 5, Nos. 100, 101). They were both gathered by Mr. Drummond at Congineerup, in a journey to the southward of Swan River, towards Cape Riche; those described by Dr. Meisner in the paper already noticed having been collected during a subsequent tour of 18 months to the north of the settlement. The author added some remarks explanatory of the reasons which had independently led him to the same conclusion as Dr. Meisner, in the identification of G. macrostegia. A constant interchange of publications having been carried on down to the commencement of the war, between the Linnæan Society and the Natural History Society of Moscow, he had been able to consult Turczaninow's original paper in the Bulletin of the latter Society (t. xxii., pt. 2, p. 18), in which a reference to Drummond's number, not given by Walpers, is made. He had consulted the very complete set of Swan River Chamælancieæ in the collections of Mr. W. W. Saunders, and found that the number quoted by the Russian botanist as that of his G. macrostegia was that belonging to the G. tulipifera of the Bot. Mag., with which also Turczaninow's description better agrees, especially in the broadly linear leaves, the ten ribs at the base of the calyx-tube, and the obovate obtuse bracts of the general involucre, "colore purpureo plus minus tinctis;" Sir W. Hooker's G. macrostegia having narrower leaves, five furrows at the base of the calyx-tube, and elliptical unicolorous bracts, besides other differences. The opposition or alternation of the leaves is a very variable feature. It also would appear that Turczaninow had only seen the 4th series of Drummond's plants, for had he seen the 5th series he would certainly not have overlooked the very well marked species which formed the subject of this paper. The 4th series does not contain the species. Sir W. Hooker has referred to Turczaninow's name, but only that with the variegated bracts, whilst the 5th series contains both these, as well as Mr. Kippist's new ones. [It would thus appear certain that the G. macrostegia, Turcz. = G. tulipifera, Hook., and that the former name must consequently be adopted; while for the G. macrostegia, Hook. the name of G. Hookeriana, proposed by Dr. Meisner, should be substituted.]

Notices of Books.

Dr. Hooker's valuable *Himalayan Journals*, one of the most interesting books of travels we know, as was formerly stated (page 150, 1854), has just been republished by Mr. Murray in two beautifully printed volumes. The present edition is divested of the elaborate scientific matter which the general reader does not require, and is confined to the personal narrative of the distinguished author. By this means the public is provided with an admirable literary work at we imagine half the cost of the original.

Chemical Field Lectures, by Dr. Stöckhardt (Bohn, 12mo, pp. 378.) Under this name has just appeared a volume of Bohn's Scientific library. It contains the lectures of a gentleman who has gained considerable reputation in Saxony for a sound knowledge of vegetable physiology, and who is also Professor of Forestry and Agriculture at Tharand. Professor Henfrey is the translator and annotator. Mr. Mechi has contributed a paper on subterranean irrigation with liquid manure. Thus we find combined a scientific author, a conscientious translator, and a practical cultivator. Out of such materials something good should come. We however regret to add that the last is answerable for three pages only; but these are important, as the extract in another column will show.

We have read the work carefully, and we can say conscientiously that for practical purposes it is calculated to be of more real value than the similar work of Baron Liebig, notwithstanding the learned author's cumbrous sentences, which Mr. Henfrey will, we trust, forgive us for saying are not rendered more elegant in the translation. It is notorious that when Liebig took up the subject of agricultural chemistry he was entirely unacquainted with vegetable physiology, as the first edition of his celebrated work sufficiently proved, and as we have long since pointed out. Nor can we say that his latest writings indicate any material advance in practical physiology. In fact he is a mere chemist, though no doubt of the highest order. Dr. Stöckhardt, on the other hand, seems to be a practical forester and farmer as well as a man of science; and this gives his opinions a value which those of cabinet philosophers never can have. This is more especially shown by the manner in which he handles the well-known dispute between Liebig and Lawes, taking the side of the latter, like all men really acquainted with the cultivation of the soil.

We do not dwell further in this place on Prof. Stöckhardt's work, because we hope to be able to refer to it on other occasions; but we must not dismiss it without one extract characteristic of the author's style. Speaking of refuse materials he says:—

"One thing is above all necessary for this, namely that the farmer shall distinguish his true friends from the false, and give the latter their dismissal. One friend of the latter sort has been especially successful in acquiring and retaining the favour of farmers, and many hold warmly to him and love him like a brother; this is the well-known worthy 'old O.' Acquainted with most from their youth upward, and readily borne with because he never contradicts, but always humours them, old O. has become on many farms not only a well-beloved home-friend, but also infallible oracle, whose counsel is sought when decisions are to be made or doubts of any kind arise. Pacific and quiet-loving as old O. is by nature, he can also be very fierce when any one tries to disturb him, and hence novelties are an abomination to him. Against these he fights with an obstinacy which it is difficult to overcome, because the weapons which one thinks sharpest lose their edge upon him; for, like Falstaff, he does enter into battles for 'reasons,' which bound harmless off the Hegelian shield with which he covers himself: 'What is, is good.' If the farm-yard drainage runs away, and this is represented to him, the answer is, 'Oh, that has always been so.' If one shows him the advantage he would derive from introducing a rational system of rotation of crops, he says, 'Ah, my grandfather kept to three-field farming, and yet he lived in Clover.' If one recommends deep ploughing, he replies, 'Yes, that may do in other places, but our fields won't bear it, as *we* must know best who have grown upon them.' When we calculate to him the profit he might obtain by purchasing guano, he objects: 'I had rather buy straw; straw remains straw; dear stuffs won't suit our fields.' And more of the like sentences.

"Yes, it is difficult to get over him, the good old O., or to give him his full name 'Old-Style,' for the different natural propensities and peculiarities of character which have descended to him from his grandfather, who was called 'Egotism,' his father the well-known 'Phlegm,' and his mother, one of the 'Verjuice' family, are united in him into such a compact, tough and solid nature, that even lye and aquafortis do not exert much action on it—into a nature which is also inherited by his numerous children, called 'Prejudices.' How shall we make an impression on an individual who, like the Marquis Posa, says with dignity, 'I am content with myself,' and holds the words 'old and good' as synonymous and opposed to 'new and bad,' without evidence or judgment? I imagine by good example, and by continual, ever-new teaching, explaining and pointing to this good example.

"Far be it from me to declare war against all that is old. No, indeed! Would to heaven many old things were still as they have been! It would certainly be far better, even in the farms of the country folks."

Another work on Ferns has made its appearance, in the form of a beautiful gift-book bearing the name of *A Popular History of the British Ferns and the Allied Plants* (square 12mo. Reeve). When we say that it contains 20 well coloured plates from the skilful pencil of Fitch we state all that is necessary to guarantee their accuracy and tasteful execution. Mr. Thomas Moore, so well known by his previous writings on the same subject, is the author. For Christmas presents it is extremely well adapted; for we can scarcely name a volume more likely to be welcome to residents in the country.

Garden Memoranda.

Messrs. Veitch's Nursery, Chelsea.—In one of the houses here may be seen a capital illustration of the additional effect to be obtained by a judicious arrangement of plants in greenhouses. No materials could be less promising for producing what is called effect than those now alluded to, consisting of young nursery stock of hard-wooded greenhouse shrubs, together with some bedding plants. The area of the house is divided between a very broad flat stage, a pathway, and a more elevated stage of two or three tiers of shelves. Now for the arrangement. Among the plants was a fine stock of young healthy variegated-leaved Pelargoniums. Instead of these being placed altogether at the front, or at the end, or on one special shelf, as would be done in ordinary cases, a close regular rank was set along the edge of the stages close to the pathway. The broad flat stage was next divided into squares by transverse rows of these and other lively-looking variegated plants, the spaces between being filled with the hard-wooded stock. Along the raised shelves, which were principally occupied by somewhat larger hard-wooded plants, were dotted at regular intervals, alternately on the different shelves, bright green healthy looking Humeas. Without attempting further to particularise the plants, enough has been stated to give an idea of the arrangement. The result was, that from these unpromising materials which, as ordinarily placed, no visitor would care to look at, a perfect flower garden was produced, which it was really a pleasure to behold. This mode of arrangement too, is highly beneficial to the plants, for the more tender soft-wooded kinds, being more widely dispersed and more fully exposed to light and air, are consequently less liable to damp off. Of course, the effect was much heightened in this case, by the excellent health and scrupulous cleanliness of Mr. Veitch's stock; but are not the simple facts above stated highly suggestive both to commercial and private gardeners! The curious Ouvirandras or lattice plants to be seen here, are well worthy of inspection. *M.*

Mr. Salter's, Versailles Nursery, Hammersmith.—The Chrysanthemums at this establishment are now in full beauty; a large house about 80 feet long has been formed into a winter garden, in which some hundreds of varieties have been tastefully arranged and intermixed with Pinuses, Ferns, and other plants possessed of fine foliage; therefore, as may be supposed, an excellent effect has been produced. Of late years few flowers have made greater progress than the Chrysanthemum. Those who remember the little variety called Chusan Daisy, introduced by the Horticultural Society, would hardly believe that to be the parent of the beautiful Pompones now cultivated, and that in so few years its character could be so completely changed; but such is the fact, for Mr. Salter, then residing at Versailles, introduced it into France, where it produced seeds, which have each succeeding year yielded flowers more perfect in form and of almost every colour that could be desired.

Among the new varieties in this class we noticed Trophé, a rose pink; Auréole, red crimson, with gold border; Saint Thais, chesnut brown; Mr. Dale, brassy yellow; Fulton, rose and yellow; Queen of Lilliputs, small blush; Aigle d'Or, fine yellow; Alexander Pélé, red chesnut; Mrs. Westwood, a silvery blush; Lilliputian Regulus, a red cinnamon anemone; Etoile du Berger, bright gold; Scarlet Gem was almost out of flower, but its dwarf habit and abundance of blooms in some measure show its character. To these may be added Creole, salmon and orange; La Promesse, rose; and Io, fringed lilac.

The following older varieties were also very distinct: Riquiqui, violet plum; Brilliant, bright chesnut red; Mme. Vatry, pale lilac; Bob, dark brown; La Vogue, golden yellow; Zebra, carmine and white; Nemesis, bright buff; Polichonne, sulphur, curiously mottled orange; Berrol, pale yellow; Dr. Duval, red salmon; Comte Vigier, silvery blush; Perle du Prado, rosy blush; Hélène, dark rose; Marabout, fringed white; Adonis, mottled rose; President Decaisne, carmine and blush; Bijou d'Horticulture, sulphur white; Cedo Nulli, cream white anemone; Jonas, bronzed rose; Vesta, small white. Among the large flowering sorts the most conspicuous were Hermione, white tipped rose; Zephyr, red and orange; Albin, deep maroon; Eclipse, sulphur anemone; Le Prophéte, golden buff; Conspicuum, bright rose; Chevalier Dommage, golden yellow; the Queen, white; Rolla, silvery lilac; Aregena, dark crimson; Auguste Mie, chesnut edged gold; Gluck, golden anemone; Mrs. Coombs, white anemone; Trilby, white and yellow centre; Versailles Defiance, clear rose; Pio Nono, dark red; Annie Salter, fine yellow; Prince Jerome, orange and brown; Cassy, dark orange and red; Princesse Marie, rose and white; Astre du Matin, lilac anemone; Triomphe du Nord, large light red; and Antigone, white.

Among seedlings we noticed a large incurved flower named Alfred Salter, a delicate rose, which is considered one of the finest Chrysanthemums yet raised of this colour.

In the same house were several trailing variegated plants suspended from the roof, such as Vincas, Mangles's Geranium, Hederas, Tropæolums, Sedums, &c., which added considerably to the general effect.

Miscellaneous.

Beech Oil.—Amongst the various kinds of oil used in northern Germany, especially in the kingdom of Hanover, for culinary purposes or as materials for combustion, that extracted from the nuts of the Beech (Fagus sylvatica) is, on account of its numerous good qualities, deserving of notice. Beech oil does not play a prominent part in commerce, nor is it likely to do so, owing to the fact that it cannot be procured in large quantities; the country people who collect the nuts, or cause them to be collected, use the greater part of the oil extracted from them in their own household, and only dispose of the remaining fraction. This is the reason why it is impossible to give even a rough estimate of the quantity annually produced. About Hanover the nuts are gathered towards the end of October or the beginning of November; this is done either by picking up by hand those which have fallen to the ground, or by spreading out large sheets under the trees and beating the branches with poles, so as to cause the nuts to separate from them. The latter process appears, at first sight, least expensive; but as the good nuts have to be separated from the bad (abortive) ones, it is found on closer examination to be just the con-

trary. In 1854 about 25 lbs. of nuts sold in Hanover for 1*s.* 6*d.*; 25 lbs. yield about 5 lbs. of oil, 1 lb. selling for about 7*d.* The oil is of a pale yellow colour, and has an extremely agreeable taste. It is often adulterated with Walnut oil; the latter is even sold as Beech oil, and that may account for the difference of opinion entertained respecting the quality of the Beech oil. The townspeople use it chiefly as salad oil, but the peasantry employ it generally as a substitute for butter, &c., and only when there has been a good harvest of nuts, for burning in their lamps. The husks (epicarpia) are, after the oil has been expressed, made into cakes about 9 inches square and 1½ inch thick; these are used for combustibles, and not given, as some people imagine, as food to cattle. Both the oil and the cakes alluded to are exhibited in the Museum at Kew. *Hooker's Journal of Botany.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Some of the early Chrysanthemums will probably be getting past their best, and these should be replaced at once, as the plants have but a very shabby appearance when the beauty of the flower is over. While the principal collection is in bloom a selection should be made of the best and most useful sorts, for there are many worthless varieties in cultivation, and it is better to grow duplicates of the really good kinds than to retain such as are but indifferent, merely for the sake of having a long list of names. Give timely attention to providing a succession of bloom with which to keep this house gay, and avoid as far as possible the expense of hard forcing, which is moreover so very injurious to most plants. Be careful not to let things in bloom suffer for the want of water, giving weak clear manure water to Chrysanthemums, Salvias, Camellias, &c., and use every means to preserve the beauty of specimens in bloom as long as possible. Greenhouse.—Damp and mildew are the great enemies to be guarded against here in the present state of the weather, and these must be sharply looked after, especially in the case of plants that have not well matured their growth, and are in a rather soft state. If the former is troublesome it must be got rid of by means of free ventilation on mild days, using a little fire heat at the same time, and for the latter a dry airy atmosphere is the best preventive, but the plants should be frequently examined, applying sulphur on the first appearance of the enemy. Very little water will be required here at present, but the plants should be carefully looked over about twice a week, so as to make sure that nothing is allowed to feel the want of it. If not already done, get the plants tied with the least possible delay, for it is very difficult to tie a plant so that it will not look somewhat stiff and unnatural, and the sooner all this kind of work is done the better the specimens will look when in bloom. Cold Pits.—The present is a very trying season for the inmates of these structures, and every advantage must be taken of mild dry days to give air freely, and a little must be given every day when the temperature is above freezing. Also look over the plants carefully at least once a week, and remove decaying leaves, &c., which when left only encourage damp and mildew. Scarcely any watering will be necessary here for some time to come, and the plants will be all the better for being kept rather dry at the root, but strong healthy plants will probably be found to require water occasionally to prevent the balls getting unhealthily dry, and when water must be given select a dry morning for doing so, and give air freely during the day. See that the frames are well banked up, so as to be proof against any ordinary frost, and do not neglect covering up securely at night.

FORCING DEPARTMENT.

Pineries.—Plants in bloom will require very careful management to prevent their being injured by damp, and the atmosphere must be kept dry, with a rather brisk temperature, admitting a little fresh air on every favourable opportunity; and if there is the means of admitting air over the pipes, so that it may get warmed before coming in contact with the plants, a little should be admitted constantly. Plants in bloom should also be near the glass, and where they will catch every ray of sunshine. It is nearly impossible to get fruit to swell anything like properly at this season, therefore unless a succession of ripe fruit is indispensable, and cannot be secured save by driving plants that bloomed late in autumn, these had better be kept rather quiet until the sun gains a little more power. Where an attempt must be made at present to get fruit to swell, a moist warm temperature of about 70° at night and 75° by day must be maintained, allowing it to rise to 80°, with the assistance of sunshine, and the bottom-heat must be kept regular at about 85°, taking care to keep the soil in a healthy state as to moisture. But it is difficult to get the fruit to make much progress at present, and a little time lost now will be easily overtaken in spring when the plants will enjoy a high moist temperature, and the fruit will increase more in weight in one month then than in two at present. Vineries.—As soon as the early house is closed for forcing, be careful to secure a thoroughly moist state of the atmosphere by frequently sprinkling the floors and every available surface, but as observed previously, a regularly moist state of the atmosphere is most effectually secured by means of a slight bed of fermenting materials in the house, which will also afford a little warmth, and the moisture from this is much more congenial to vegetation than anything that can be effected by the most careful use of the syringe or evaporating pans. But the most essential point in successful early forcing is securing a healthy and vigorous root action, and unless this is provided, the best and most careful management of the atmosphere will be of but little importance. An occasional application of water at a temperature of about 90° will greatly assist to infuse warmth into the soil and excite the roots, and there is no good reason why the roots of Vines for early work should not, to a large extent, be inside the house. But where this is not the case give careful attention to the fermenting material placed on the outside border, keeping it well protected from the weather and frequently turned over, and by additions, as may be necessary, endeavour to secure a steady warmth of about 60° at a foot below the surface.

FLOWER GARDEN AND SHRUBBERIES.

The weather is still comparatively favourable for executing alterations; and where these are in hand they should be prosecuted with the greatest possible despatch, taking advantage of frosty mornings, &c., for wheeling. Planting, or the removal of large trees or shrubs, cannot be finished too soon; for it is of the utmost importance that the plants should be afforded some chance of making fresh roots before the trying winds of March. See to even small plants being secured against the wind; for these are often greatly injured by being blown about after planting, which a small stake and a few minutes' work would prevent. Get in a stock of briars for budding upon next season. Let the roots be well trimmed, cutting back closely the strong ones; for these, if left, will be of little use save to furnish an endless supply of suckers. As soon as alterations are completed, and the beds and borders are put into proper order for the winter, let a little fresh gravel be put upon the walks if necessary, in order to render them firm and dry for the winter. The stock of half-hardy plants in pots for next summer's decoration must be freely exposed to the air on every favourable opportunity, and every means used to protect them from damp. Very little water will be required for some time to come, and no more should be given than will suffice to keep the plants from flagging. Keep the surface of the soil clean, and the plants perfectly free from insects.

FLORISTS' FLOWERS.

Carnations and Picotees.—By no means smother these very hardy plants, they will stand any amount of frost provided they are inured to it. Abundance of air, and a medium state of moisture is a *sine qua non.* Then give air at every favourable opportunity—rain at this season it is as well to avoid. Dahlias.—Examine the tubers, probably the labels may be getting nearly illegible, or the ties decayed; in either case, immediate attention is requisite. Tulips.—Those who had not planted at the time-honoured date (Nov. 9) would have had something to do to find a right period for intrusting their bulbs to the ground; like late sown corn they may occasionally be up to the mark, but we prefer taking time by the forelock.

HARDY FRUIT AND KITCHEN GARDEN.

If any transplanting or root pruning of fruit trees has yet to be done let this be attended to without further loss of time, and see that those exposed to the wind are securely staked before leaving them. Also get the ground prepared for fresh plantations, and the trees planted as soon as possible. Take every opportunity of pushing forward pruning and nailing. Give air freely to Lettuce and Cauliflower plants under glass; indeed the sashes should merely be used to exclude frost, and throw off rains, for they will do all the better in spring for being kept hard and stocky over the winter. If not already done make a sowing of Peas and Beans on well sheltered dry ground, and do not spare the seed of the former, for it will be some time exposed to the depredations of mice, &c. In favourable localities a second sowing may be made if the first sowing is through the ground. Take advantage of the first dry day that may occur with the ground in a rather dry state to earth up closely any of the Celery that may have outgrown the previous soiling, and be prepared to protect the ridges in case of severe frost. Dry stable litter answers very well for this purpose, but where they can be afforded, light straw or reed shutters are preferable as being more easily applied, causing less litter, and these are also useful in excluding wet. It will soon be time to be providing seed for the early crop of Celery next season, and for this purpose we know no variety equal to Cole's dwarf white. This is, as its name indicates, a dwarf variety, and cannot be grown to a large size, but where quality is preferred to size it will give satisfaction, for it is very crisp, soon blanches, and the flavour is everything that could be wished. Attend to keeping up a regular succession of Seakale, Asparagus, and Rhubarb, by introducing moderate quantities at short intervals into heat.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Dec. 6, 1855, as observed at the Horticultural Gardens.

Nov. 30—Overcast; very fine; frosty at night.
Dec. 1—Hazy; very fine, with sun; rain at night.
— 2—Cloudy throughout; rain at night.
— 3—Clear and frosty; overcast; slight shower of snow in the evening.
— 4—Foggy; drizzly; cloudy.
— 5—Clear; cold increasing from morning to night.
— 6—Slight snow; densely overcast; piercing cold wind; frosty.
Mean temperature of the week 4¾ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 29 years, for the ensuing week, ending Dec. 15, 1855.

Dec.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 9	46.0	35.7	40.8	14	0.31 in.	2	6	2	1	11	11	5	1
Mon. 10	45.2	34.2	40.2	10	0.20	1	4	2	1	7	7	4	3
Tues. 11	45.9	32.6	39.3	7	0.62	—	3	1	4	5	8	5	3
Wed. 12	45.7	34.2	39.9	12	0.26	2	2	2	1	6	9	5	2
Thurs. 13	47.0	33.2	40.1	10	0.16	1	3	4	1	8	9	2	1
Friday 14	46.2	34.2	40.2	12	0.32	2	5	2	2	8	8	4	—
Satur. 15	46.8	35.9	41.3	18	0.50	1	3	1	3	9	7	4	1

The highest temperature during the above period occurred on the 13th, 1842—therm. 61 deg.; and the lowest on the 13th, 1846—therm. 11 deg.

Notices to Correspondents.

Ailantus glandulosa: *An Old Subscriber* being about to throw a large tree of this, will feel obliged by some of our readers informing him whether or not the timber is good for building or to what other use it can be advantageously put. The tree is about 40 feet in height.

Arbutus: *A.* If you do not cut it down to the ground it will spring again. Cut off its head, leave 6 feet of the stem, and prune any laterals back to one-third of their length.

Books: *An Anxious Improver.* Cobbett's English Grammar is a good book for you; but it has nothing to do with gardening. If you want an elementary book on gardening buy *Nichol's Gardeners' Calendar*, which can be had of any bookseller. What is the "seam" mode of training?—we never before heard of it.—*K M.* There is no such book as that which you seek for.‡—*O C J.* We know of no book "on the management of a greenhouse" likely to be useful to your gardener. He cannot perhaps do better than follow the instructions relative to plant culture given by "Alpha" in our volumes for the two last years and beginning of this. They for the most part relate to greenhouse plants, the management of all the more important of which has been fully described.‡—*R D.* The last supplement to Paxton's Botanical Dictionary was published in 1853.‡

Crinums: *W J H.* Your C. amabile, as far as we can see, has been properly treated, and in time will doubtless produce flowers. C. capense is a hardy aquatic. It is bad practice to keep Amaryllids "constantly excited." They should be permitted to have a season of rest like other plants.‡

Dried Plants: *J P.* Arrange them systematically, according to the catalogue you name. Take care that all the species of the same genus are kept in the same cover: and then when you get a better book, such as Lindley's Vegetable Kingdom, you may rearrange them without loss or trouble.

Ferns: *Rusticus.* Your Adiantum seems to be suffering from too much damp combined with too low a temperature. At all events we find no trace of insect work.

Forcing House: *H.* The best way is to apply to some of the makers whose advertisements appear weekly in our columns, and ask them for what sum they will deliver such a house as you want, complete, fixing included; your village bricklayer doing the brickwork. Don't put the heating into the hands of country ironmongers, for they have not experience enough in such work to execute it properly. But why use iron? For a small house wood is better, much cheaper, and, if well seasoned good stuff, will last with care for a century. There are or were wooden houses in the Royal Botanic Gardens at Kew which must have been nearly as old, and they were as sound as on the first day of being used.

Fruits: *A B.* Your seedling Pears are of good size; but their quality is not equal to many others which ripen about the same time. Nos. 14, 20, 23, deserve, however, a further trial. The Seedling Apple from the American *Ortley* (that is the name, not Orkley) is tolerably good, and as it is an abundant bearer may deserve cultivation. If you send your Seedling Pears that are not yet ripe they will be noticed.‖

Grapes: *J H H.* We are not acquainted with the "Scotch white Cluster Grape." What is it? Are you inquiring about Grapes for wine or table? Be so good as repeat the inquiry with the explanations now asked for.

Insects: *W C S.* The minute insects found in such great numbers in a field of Wheat recently sprung up, and which were attracted beneath Turnip-tops scattered over the field, are the young grubs or larvæ of one of the many species of daddy-long-legs (probably Tipula maculosa). You cannot do better than pursue the Turnip-top trap system, removing and destroying the grubs every three or four days. *W.*

Labels: *G Bond.* Your zinc labels, with short upright supports and oval tops, painted white, and neatly lettered, are useful-looking contrivances of the kind, and with care may last a long time. Whether or not they may answer all the purposes for which they are intended, however, can only be proved by experiment.‡

Microscopes: *Amateur.* We know nothing of the instrument you mention. Nor can we insert any such statement as you have sent, unless it is consistent with our own experience.

Names of Fruits: *W B.* 1, Beurré Diel; 2, Passe Colmar; 3, 23, Glou Morceau; 4, Beurré Rance; 5, Princesse d'Orange; 7, Uvedale's St. Germain; 8, Crassane; 9, Doyenné Blanc; 10, probably Beurré Diel; 13, Easter Beurré; 14, Passe Colmar; 16, 17, Brown Beurré; 20, 21, Bishop's Thumb; 22, Brown Beurré; 24, Gansel's Bergamot; 26, Verulam; 27, Bezi Vaet; 28, Chaumontel.—*B.* 1, 3, King of the Pippins; 2, appears to be the Golden Reinette; 6, Gloria Mundi; 7, Court of Wick. —*M R.* Your Pear from Spain is the Bergamotte d'Automne, different, however, from the English Autumn Bergamot.—*H J S.* 1, Easter Beurré; 2, Glou Morceau.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J P.* We have compared your leaves with the tree in the Horticultural Garden, and can only say that if it be Pinus Sabiniana, which is not impossible, it must be a poor weakly plant from which your specimen was taken.—*J M A.* Eucharis grandiflora. There is no doubt that the disease, both in the leaves of Oncidium as well as the flowers of Phalænopsis, is produced by the cause we mentioned last week.—*H I S.* It is a variety of Red Cedar, Juniperus virginiana. All these Junipers vary greatly, like our own wild Juniper, of which a score distinct-looking forms may be selected from any hillside in limestone districts.—*N R.* Ruscus hypoglossum.—*E W H.* Common Stramonium.

White Hamburgh Grape: *E C.* At last we have received your letter, but we do not understand it. What is "the National Meeting," and who its "sale editor?" The most satisfactory answer you can give to inquiries why your Grape is not exhibited is to produce it before the Horticultural Society next year, when its true value will be ascertained and publicly mentioned. The world will not take the endorsement of country shows.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the Importation and Sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves; to our agents, Messrs. Gibbs, Bright, & Co., of Liverpool and Bristol; or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence.—ANTONY GIBBS & SONS.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 1, Adelaide Place, London Bridge.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

AGRICULTURISTS, especially such as have been imposed upon by Guano and other Manure Agents, are invited to communicate with the promoters of a MANURE CONSUMERS' COMPANY, now forming for the purpose of delivering direct from the Importer and Manufacturer genuine Manures, warranted after special analysis.—Letters to be addressed to their Solicitor, E. A. COPLESTON, Esq., 5, Mitre Court, Temple, London.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

DRAINAGE OF LAND.

MR. J. JOHNSON, DRAINAGE ENGINEER, is desirous to undertake the Drainage of Land by Contract or Commission. Temporary Tileries erected in any part of England, and Drain Pipes manufactured at moderate prices. Every description of Drainage Tools.—Abingdon Street, Westminster.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre. MR. HUMBERT (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
HENRY KER SEYMER, Esq., M.P., *Chairman.*
Offices, 52, Parliament Street, London.

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.
2. In no case is any investigation of Title necessary.
3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. EQUAL FACILITIES WILL BE AFFORDED IN EITHER CASE.
4. The WHOLE cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.
5. The term of such charge may be fixed by the Landowner, and extended to FIFTY YEARS for LAND Improvements and THIRTY-ONE YEARS for FARM BUILDINGS, whereby the instalments will be kept within such a fair percentage as the occupiers of the improved Lands can afford to pay. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The DECEMBER GENERAL MEETING will be held at the Society's House, in Hanover Square, on SATURDAY, the 15th December, at 11 o'clock in the forenoon.
By Order of the Council, JAMES HUDSON, Secretary.

PRIZE CATTLE SHOW OF THE SMITHFIELD CLUB.—The ANNUAL EXHIBITION of Prize Cattle, Seeds, Roots, Implements, &c., commences on TUESDAY MORNING and closes on FRIDAY EVENING, 11th, 12th, 13th, and 14th December. Bazaar, King Street and Baker Street. Open from daylight till nine in the evening. Admittance 1*s.*

THE BIRMINGHAM CATTLE AND POULTRY SHOW.—The Seventh Great Annual Exhibition of FAT CATTLE, SHEEP, PIGS, ROOTS, & DOMESTIC POULTRY, will be held in Bingley Hall, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December. The PRIVATE VIEW and ANNUAL DINNER on TUESDAY, December the 11th.

There will be SPECIAL TRAINS on all the principal Lines of Railway, for which see the Advertisements and Bills of the several Companies.

THE GREAT NORTHERN ASSOCIATION FOR THE IMPROVEMENT OF THE BREED OF PIGS, POULTRY, PIGEONS, AND RABBITS.—The Fourth Annual Exhibition of this Society will be held in the spacious New Market Hall, Doncaster, on WEDNESDAY and THURSDAY, the 23d and 24th January, 1856, when upwards of ONE HUNDRED AND FIFTY POUNDS will be given in PRIZES.

PREMIUMS for different varieties of ROOTS, most suitable for Feeding Purposes, have this year been added to the Schedule. The Entry closes on Saturday, December 29th. Prize Lists and Certificates are now ready, and may be had, and any further information obtained from HENRY MOORE, Hon. Sec.
40, High Street, Doncaster.—Dec. 8.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &C.
Chemistry—J. A. C. Voelcker, Ph. D., F.C.S.
Zoology, Geology, and Botany—Jas Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The First Session of 1856 will begin February 5. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances; the fee for out students is 40*l.* per annum. The College course of lectures and practical instruction is complete in one twelvemonth, though a longer course is recommended. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

OWNERS OF SETTLED ESTATES and OTHERS desirous of availing themselves of the various recent Acts of Parliament, by which they may charge their Estates with money expended in the Improvement, Conversion, and Reclamation of Land, by Drainage, Irrigation, Embanking, Inclosing, making Farm-roads, Clearing, the erection of Farm-buildings and Machinery, Planting and other Agricultural Improvements, are respectfully informed that Messrs. HEWITT DAVIS & FRANCIS VIGERS undertake to advise and furnish Plans and Estimates, and if required, will contract to do the works, and dispose of the Rent charges.—3, Frederick's Place, Old Jewry, London.

TENNANT'S SELF-CLEANSING DIAMOND-TOOTHED WHEEL GRUBBER.—The Subscribers beg to call the attention of Agriculturists to this really useful implement, which since its introduction has met with more than usual favour, and has had awarded it the highest commendations by all who have tested its merits. Parties wishing to possess this Grubber to commence the spring operations should give their orders for it now. On application a drawing of the above, with full particulars as to its mode of working, will be sent free by post.
W. DRUMMOND & SONS, Seed and Implement Warehouses, Stirling and Dublin.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

BRITANNIA WORKS, BANBURY,
AND AT
STANDS Nos. 209 to 217, Smithfield Show.

SAMUELSON'S PATENT GARDNER'S TURNIP CUTTERS have been awarded for the TENTH TIME the Prize of the Royal Agricultural Society. These Implements are so well known that they require no description—more than 60,000 having been supplied from the above Works.

GARDNER'S PATENT DOUBLE-ACTION TURNIP CUTTERS.
GARDNER'S PATENT SINGLE-ACTION DITTO.
MOODY'S GRATERS, FINE AND COARSE CUTS.
BUSHE and BARTER'S PATENT GRATER, for Fermentation.
PHILLIPS' PATENT GRATER OR MINCER.
GAUNTLETT'S PATENT GRATER, for mixing with Chaff.
SAMUELSON'S ECONOMIC CHAFF CUTTERS, for Stables and Small Occupations.
LARGE CHAFF CUTTERS, CORNES' and other Patterns as per Catalogue.
SAMUELSON'S ATMOSPHERIC AND ANTHONY'S PATENT AMERICAN CHURNS are Manufactured solely by Mr. SAMUELSON.
CORN AND MALT BRUISING MILLS.
LINSEED CAKE BREAKERS.
SAMUELSON'S REGISTERED BUDDING'S LAWN MOWERS, &c., &c.

The above may be obtained at all respectable Ironmongers and Implement Dealers in the Kingdom, of whom Catalogues and Price Lists may be procured gratis, or post free on application to B. SAMUELSON (successor to the late James Gardner), Britannia Works, Banbury; or, at Stands Nos. 209 to 217, Smithfield Show.

SMITHFIELD SHOW, 1855.

TRIALS OF STEAM-THRESHING ENGINES.—The time run by TUXFORD AND SONS' FIRST PRIZE ENGINE, and that by the Engine of Messrs. Hornsby, of Grantham, at the Carlisle Meeting of the Royal Agricultural Society, in July last, with *Fourteen Pounds* of Coals to the horse-power, was—

TUXFORD & SONS ... ... 3 hours and 47 minutes.
Hornsby & Son ... ... 2 hours and 54 minutes.

At the North Lincolnshire Society's Meeting, at Boston, in August last, TUXFORDS' and Hornsbys' Engines again came into competition, when Hornsbys' was again left a long way behind. With 14 lbs. of a very inferior kind of Coal, the time run was—

TUXFORD & SONS ... ... 3 hours and 3 minutes.
Hornsby & Son ... ... 2 hours and 43 minutes.

And had the testing apparatus which had been supplied to the Society from Grantham, not indicated the steam pressure falsely by several pounds on the inch, the difference would have shown fully twice as much to the advantage of TUXFORD'S Engine.

At the recent trials of Threshing Machines at the Paris Universal Exhibition, M. Tresca, the Government Engineer, employed as the motive power one of TUXFORD'S Portable Engines that had previously been purchased by the French Government.

The Combined Threshing, Shaking, and Dressing Machine of TUXFORD & SONS was highly commended this year by the Royal Society at Carlisle, the Bath and West of England Society at Tiverton, &c.

Illustrated Catalogues, with prices, forwarded on application to TUXFORD & SONS, Engineers, Boston, Lincolnshire.

SMITHFIELD CLUB.—BAKER STREET BAZAAR.
STANDS Nos. 153, 154, 155, and 156.

SATURDAY, DECEMBER 8, 1855.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, December	11	Smithfield Club Show at the Baker Street Bazaar.
WEDNESDAY, —	12	
THURSDAY, —	13	
FRIDAY, —	14	
TUESDAY, —	11—Central Farmers' Club	5 P.M.
WEDNESDAY, —	12—Society of Arts	8 P.M.
SATURDAY, —	15—Agri. Society of England	NOON.

THE meetings of the Smithfield Club, the Central Farmers' Club, the Society of Arts, and the Royal Agricultural Society next week, make it a busy one for agriculturists in town. The show of the first-named Society commences on Tuesday, and continues for four days. It is intended, at the annual dinner at Freemason's Tavern on the Wednesday, that the testimonial to Mr. BRANDRETH GIBBS, the Hon. Sec., shall be presented by the Duke of RICHMOND. Our readers do not need to be told of the services of this gentleman, or of the propriety of this acknowledgment of them. When speaking several years ago of the unobtrusive but really useful labours of many to whom British agriculture was indebted, Mr. BRANDRETH GIBBS was named along with Mr. PUSEY and Mr. HOLLAND—Mr. PUSEY, the Editor of the Journal of the English Agricultural Society—Mr. HOLLAND, the stay of the Royal Agricultural College—Mr. GIBBS, the director and organiser of the annual agricultural meetings and exhibitions—and no three more important agricultural services can be named. Mr. GIBBS is the worthy colleague of men standing high in the ranks of agricultural benefactors, and we are glad to know that his services are appreciated. The piece of plate which is to be presented will be on view during the show, and those who have not yet placed their names on the list of subscribers will have an opportunity of doing so at the ensuing show.

We may mention here, in reference to a corresponding subject, that the committee who superintended the movement for a testimonial to Mr. LAWES, have announced the successful termination of their labours. Of the 1390*l.* contributed, 1030*l.* have been spent on the new laboratory at Rothamstead, and 156*l.* on a candelabrum presented. We may have an opportunity hereafter of republishing

a portion of the excellent address delivered by Mr. Lawes on the occasion of the presentation.

We have been requested to announce that the intended trial of Fisken's steam-plough at Tiptree next week will not take place.

In our remarks on the Turnip crop at p. 777, an attempt was made to point out the true nature of Finger and Toe in roots. This defect was defined as a branching or forked method of growth in such roots as Parsnips, Carrots, and Turnips, as distinguished from the smooth outline and unbranched condition which mark well developed root crops.

It was attempted to be shown that a tap root (*fusiform*), with a clear and unbranched outline, is not natural to the Parsnip, Carrot, or Turnip but can only be obtained from wild plants by careful cultivation, and the general conclusion arrived at from an examination of this interesting subject is that finger and toe is not a disease in the strict sense of that term, but the natural result of the early stage of change from wildness to civilisation, and so this malformation taking place in cultivated examples is a mark of a downward tendency from civilisation to wildness.

Now, it will be seen that finger and toe is viewed as a *natural method of growth*, and not the result of *direct injury* to roots, and hence disconnected, or at least not necessarily connected, with the *injuries* it is the object of this paper to describe, namely those which result in the true anbury, and which at starting we may shortly discriminate as follows:—

Finger and Toe. — A branching or forked method of growth of roots, the branches (digitations) of which gradually lessen downwards — attacks all root crops.	**Anbury. — Irregular swellings of the main bulb, root, or its rootlets—tumour-like excrescences upon the under-ground growth of *common* and *Swedish Turnips*—not affecting other root crops.**

In tracing the history of anbury, it will be well to glance at the derivation of the term. In a book called "Cheape and Good Husbandry for the well ordering of all Beastes and Fowles," published in 1631, the anbury is described as "a bloody wart on any part of the horse's body, the cure of which is *an hote yron to seare the one plaine* to the body." These tumours are now known to be caused by insects laying their eggs in the horse's skin, which bring about swellings, in which the larvæ (maggots) of some species of flies are hatched, giving rise to what are now called *Warbles*, and the searing cures it by killing these larvæ. Hence then the original application of the term anbury to forms of the Turnip disease would appear to have been perfectly sound, inasmuch as it described a malformation in the root depending upon similar causes to those which produce the excrescences in the horse; it is, therefore, not a little surprising that modern observers should have confounded this not only with finger and toe but with all other malformations of all kinds of roots from whatever cause arising, so that all distortions of Turnips are spoken of under the heading of "finger and toe or anbury," or as "anbury or finger and toe."

Anbury, or to make the matter plain, Turnip Warbles could only have been mixed up with finger and toe as previously described for want of a systematic inquiry into the nature of the two kinds of evil, and hence wrong conclusions have been arrived at with regard not only to the causes but also the cure of both affections, and more especially when we consider that the prevailing opinion referred all malformations of roots to mechanical causes residing in the soil or manure, or both, some attributing the matter to stones, and others to long undecayed manure. But if we bear in mind that finger and toe, as proved by experiment, is sure to result in any root crop from its too frequent repetition in the same soil, or the using over and over again of own-grown seed, we have sufficient evidence of *degeneracy* being the cause of this defect. But if we grow Turnips or Swedes where we have previously had a prevalence of finger and toe in Carrots or Parsnips, it by no means follows that this affection must supervene in our Turnips, while such Turnips may be affected by anbury; and again, it does not follow that a soil or district liable to anbury would be productive of finger and toe in any root crops; but it must be here borne in mind that anbury is certain te result to a greater or less extent in some districts, a fact not to be wondered at if we bear in mind that *anbury is a malformation in the growth of the Turnip arising from injuries caused by insects*, a point now to be proved as the result of observation.

In a long series of examinations of Turnips growing on the Cotteswold hills, where the soil is almost wholly oolite, it will be found that most of the Turnips, both common of various sorts and Swedish, are disfigured by raised tubercles upon the bulbs and smaller roots at all ages of their growth; these on being cut into expose the larvæ of an insect, which ultimately arrives at the beetle known as the Turnip gall weevil, admirably figured and described by Mr. Curtis in the fourth volume of the "Journal of the Royal Agricultural Society." The parent insect it would appear lays its eggs in the substance of the Turnip root, which on arriving at the larva state subsist thereon, causing the tumour to form on the outside its dwelling. After a time the grubs eat their way out and form pupæ in the soil, in this state serving as food for innumerable small birds; and rooks oftentimes much disfigure Turnips by stocking them for these insects when in the maggot state. This then may be described as a Turnip gall of the *commoner kind*, and which will be found to prevail over large districts.

Now having taken up the idea that this simple form of excrescence or gall was due to a peculiar species of insect, it seemed reasonable that other forms should be referrable to other species in the same way that the same species of Oak presents different forms of gall over different and oftentimes limited and well defined districts, and we therefore obtained as many specimens of injured Turnips as we could command, the best examples of which were sent by the kindness of Mr. Lindsay Craigie, to whom our best thanks are due for his kindness and courtesy.

From Scotland this gentleman sent a box of specimens of Swedes very much injured, the body of the bulb presenting rough warty excrescences, and what under ordinary circumstances would have been fibrous rootlets were converted into abnormal tumour-like knobs presenting more the aspect of races of Ginger than anything else. From the rich green sand soils of Berkshire we had also some specimens of a like diseased state forwarded, but in a much earlier stage than the foregoing.

Now, on dissecting these examples, we were not surprised to find chambers in which were the caterpillars of beetles, which, upon more minute investigation, proved to belong to the rove beetle, also figured and described by Mr. Curtis in the paper before referred to; and an examination of this rough creature, which is so different from the smooth form of the larvæ of the gall-weevil, is sufficient to account for the difference in the gall it inhabits, and though the rove beetle is described as a carnivorous insect, it is not at all extraordinary that its eggs should be laid in Turnips, as many insects of this class breed in vegetable matter, and indeed the maggots of flies are even found in some of these Turnip excrescences, in such a position as renders it not at all improbable that the eggs of the rove beetles are also placed in Turnips to be near animal food.

Now it is quite true that upon cutting into the substance of any affected Turnips we could *at first discover no larvæ*, but usually the knife which was used became spotted with a milky exudation, which made us look more carefully into the substance of the tumour, and the result of this examination proved that the milky matter was caused by the breaking up of immature larvæ, sometimes of rove beetles, at others of the Turnip fly, and frequently of both together; and the difficulty attendant upon the inquiry into the nature of the excrescences appears to be that observers have usually examined only old specimens which have become decayed from the injuries they have received from the larvæ eating their way out, exposing them to wet, frost, and other atmospheric influences, and about which wounds the larvæ will be found in the mature state, most of the flies indeed having taken on the pupa form, and many of the beetles that of the perfected creatures.

That both beetles and flies lay eggs *in Turnip roots* there can be no doubt. Of the beetles the weevil lays its eggs for the most part in the body *of the bulb*, usually towards the surface; whilst the rove beetle and flies usually insert their eggs into the roots; and then these immediately begin to thicken, but altogether irregularly, and not lessening downwards, as in the smooth unbroken line presented by the forked roots in finger and toe; indeed in anbury the tumours are tuberculated, and, as before stated, resemble more the appearance of a race of Ginger than any part of a normal Turnip.

That different species of these insects should be formed in different districts we are already prepared for, and this may help to explain the varied opinions advanced in describing the malformations of Turnips to which they give rise. That these insects have as yet been but imperfectly studied all must admit, as it would require a careful investigation of infested crops from all parts of the country, and not only in one but in every stage of growth; at present, therefore, we shall content ourselves with having clearly established the difference between finger and toe and anbury, and just as the former has been shown to proceed from the many causes which tend to degeneracy, so the latter may be found to be favoured by many circumstances, the knowledge of which might enable us to arrive at what is at present an important desideratum, namely, the prevention, or at least mitigation of its now increasing evils.

YIELD OF LAST HARVEST.

Forfarshire.—Speaking of this district, the eastern coast of Forfarshire, I should say from my own experience and from conversation with my neighbours, that Wheat and Oats are quite an average yield, not equal to last year of course by a fourth, but quite equal to the last five years. Barley under the average, both in its extent and yield. An increased number of acres of Wheat were sown last year, which will make it supply above an average quantity. *Robert Colvill, Chance Inn.*

Mid Lothian.—It is rather difficult this season to obtain full information of the yield beyond one's own farm; and in preparing to fill up the returns for this parish to the Government report, I have addressed notes to mostly all the farmers in it, asking them to supply me with their views. My own belief is, that Wheat is at least one-fifth under last year (1854), but about an average; Barley one quarter per acre and 2 lbs. per bushel in weight below, and Oats also 6 bushels and 1½ lb. per bushel in weight under average; Beans an average crop; Potatoes a large crop partially diseased; and Turnips about an average, but scarcely reaching it. P.S. Do you not think that other than agricultural produce should receive some attention? For instance sugar has in the space of two months become doubled in price, said to be from the ignorance generally of the stocks held. My opinion is that stated returns of the whole raw produce and manufactured articles in the country should be regularly ascertained and published. *James Melvin, Ratho.*

Lanarkshire.—I believe Wheat does not turn out so well as was expected, and is certainly not over an average. Barley is light and ill-coloured, caused by the heavy rains in July, which lodged the crop. It is on an average 3 lbs. per bushel lighter than the same grain of last two years, and quantity not more than average. Turnips good. Potatoes giving way since lifted; were good till then. *J. Munro Mackenzie, Wishaw.*

Fifeshire.—I send you my opinion of last crop compared with average seasons, our two former crops being very large ones. Wheat an average; some fields are very deficient, but a greater extent being in crop, I think will make it an average produce. Barley an average, but little sown in this district. Oats about one-sixth below an average. Beans a large crop, but much less sown than what was sown some years ago. Upon the whole, I think it will be a little under an average produce, but this applies to a small district along the coast; a little up the country I believe the Wheat is more deficient. *John Barclay, Randerstone.*

Cupar Districts.—Wheat half a quarter less per acre than last year, but nearly a seventh more in extent. Barley also half quarter short of last year's crop, and a very little increase in breadth. Oats 5 bushels less and nearly same breadth. Potatoes very large crop, and one-fourth greater extent than last year. Disease has increased greatly since the crop was stored. *R. Russell, Kilwhiss, Cupar.*

Ayrshire.—In reply to your note of the 19th inst. (to which it is not easy to give a very correct answer), I may say that I still adhere to the opinion I expressed in answer to the queries you sent me before harvest, that Wheat will be an average, but Oats under an average. I do not think that, all circumstances taken into account, the breadth of Wheat last year was greater than formerly. The frost set in at a period when but a small breadth of land was cleared for sowing, and continued so long as to materially interfere with the spring sowing of Wheat; however, on inquiring at some of the principal grain dealers, I find they have got in more Wheat than at the same period last year. This may be accounted for by the high price inducing the farmer to realise. As to Oats there is, without doubt, a considerable deficiency; the season was very unpropitious for this crop, and the land being nearly all ploughed immediately before sowing it was more easily affected by the very dry weather we had in the beginning of summer; on light land, of which there is a good deal in this district, the Oat crop would be fully a third deficient. As to Barley there is very little grown in this neighbourhood. Potatoes proved a better crop than for some years past, with less disease. *A. H. M'Clean, Stranraer.*

Yorkshire.—The Wheat crop was much lodged; the average yield will be fully one-fifth deficient; also bad in sample, and 2 or 3 lbs. per bushel under the usual weight. The Barley crop was heavy in straw, very coarse and light grain, with a deficiency of marketable grain of a seventh or eighth. Oats are, I think, scarcely an average. Beans are a good crop, but none yet threshed in this part. The cause of the deficiency is, in my opinion, continuous rain, and an almost total want of sun during the period when the grain crops ought to have filled. The later crops of Wheat are generally better than the earlier ones, there being less rain and more sun during their blooming and filling time. As to Mr. Caird's estimate of the quantity of Wheat sown last season, I by no means agree, though I admit, there is a gradual additional number of acres sown each year—but by no means to the extent Mr. Caird states. *Peter Stevenson, Rainton, Thirsk.*

REPORT UPON THE FATTENING OF CATTLE,

KILRUSH FARM, HOLLYMOUNT, October 24th, 1855.

I now enclose an account of the trials which I made last season in the feeding of cattle. You will, I think, find them interesting, and confirmatory of what you have long advocated—the superiority of a mixed description of food, cooked along with cut straw. The result of the different kinds of feeding was quite apparent, those on raw Turnips alone having always a hard look and not exhibiting any great improvement. Those getting the "raw cake" had a better appearance, and when you handled them the n eat was found to be well put on. Those getting the "cooked cake" had always a firm but mellow appearance, the meat, however, handling somewhat softer, while those fed on part cake and part Barley meal cooked, had the same mellow appearance, but handled very firm, and manifested good mixture of fat and lean. The cattle were all fed in loose boxes, two and two in each. They had always an unlimited supply of uncut straw, so that I do not charge anything for the cut straw which those had that were getting the cooked food. The oilcake is charged at 11*l.* per ton and the Barley at 8*l.* per do., the prices of both last year. The expenses are deducted from the "selling price," such as charge for attendance, sending to market and selling, so that the net return is given. You may make what use you please of this. I can certify to its being correct, as I made the experiments under my own superintendence, weighing the materials or food for my own information and satisfaction. The following is the table of experiments referred to :—

No.	Description of food.	Date when first weighed.	Weight in cwts., qrs., lbs.	Date when last weighed and sold.	Weight in cwts., qrs., lbs.	Net return of sale, deducting expenses except artificial food.	July price.	Cost of artificial food.	Weight of Turnips consumed.	Leaving for Turnips consumed.
		1854.		1855.		£ s. d.	£ s. d.		tons. c. qrs.	Per cwt.
1	2. Cattle fed on Turnips only—12 stone each per day.	Dec. 16	23 2 0	May 1.	27 0 0	48 5 10	30 0 0	none.	20 5 0	*8*d.*
2	2. Cattle fed on 8 stone of Turnips each per day, and 5 lbs. raw oilcake each, do.	do.	21 3 14	do.	25 2 0	44 5 4	28 0 0	6 12 0	13 10 0	†8¾*d.*
3	2. Cattle fed on 8 stones of Turnips each per day, and 5 lbs. cooked oilcake and cut straw each per day, do.	do.	22 2 14	do.	27 0 0	46 5 0	29 0 0	7 2 0	13 10 0	‡9*d.*
4	2. Cattle fed on 8 stones of Turnips each per day, and 4 lbs. oilcake and 2 lbs. Barley meal each per day, all cooked, and cut straw.	do.	25 1 14	do.	31 0 14	59 0 0	34 0 0	7 16 0	13 10 0	§15¼*d.*

* This 8*d.* is a fraction above the net rate per cwt. † 8¾*d.* is also a fraction above the exact rate.
‡ The sum of 5*s.* for each beast is deducted from the net sale price for expense of fuel and cooking, but nothing for straw.
§ The same deduction for cooking is made for each beast in this lot.
No deduction or charge is made for straw, as it is fully compensated in the good manure made from the cooked food system.

In every instance the cost of the artificial food is deducted, thus :—

No. 4, net return		£59 0 0	
July price	£34 0 0		
Cost of artificial food	7 16 0		
		41 16 0	
		£17 4 0	

This sum, 17*l.* 4*s.*, goes to pay for the Turnips which those two cattle consumed, viz., 13 tons, 10 cwt., leaving 15¼*d.* per cwt. as shown by the table sent. 15¼*d.* per cwt. is 15*s.* 5*d.* a ton, so that if you take 20 tons per statute acre as an average crop in this county on the well managed farms, you have for the payment of that crop 15*l.* 8*s.* 4*d.* I do not mean to say that this sum can be always made, but I fearlessly state this, that you may easily, by judicious management, and by using the description of food which No. 4 lot was fed on, bring cattle to pay double what they would do if fed on the old system, viz., from 12 to 14 stone of Turnips per day, or from 10 to 12 stone, with an allowance of 5 or 6 lbs. of raw cake. *Francis Lawrie, in the Journal of the Agricultural Improvement Society of Ireland.*

FARM NEAR CHELMSFORD.

The completion of harvest, with the succeeding preparation of the land for future crops, has progressed satisfactorily since our last report, and the appearance of the early Broad-leaf Rye is luxuriant in the extreme. This crop invariably succeeds well if a fine tilth can be procured, and dry weather attends the preparation of the land and depositing the seed ; 2 bushels of seed per acre is amply sufficient, provided it is of home production, and growth of the last harvest ; the rubbish sold as new Rye will frequently not more than half vegetate, and care should be taken to first submit it to trial before risking the plant. The common imported varieties are also not adapted for feeding, and ought to be rejected if the new varieties can be obtained, which are not only earlier by 14 days, but also produce a much larger quantity for mowing or feeding.

Upon this farm we generally commence mowing it by the middle of the month of April ; a small quantity in the first instance being cut up with Oat straw into chaff, increasing the quantity weekly until the Rye alone is cut, and which it may be with advantage to the 1st of June, or until it is fully eared out ; we find our horses are maintained in condition by it better than by any other green crop except Lucerne or Broad-leaf Clover. Our annual consumption by this mode is about 20 acres, most of which is mown, and as it is taken off, the land is immediately ploughed and sown with Turnips, which generally succeed well afterwards.

Tares have also planted well ; with a portion designed for early use Rye is sown at the rate of 1 bushel per acre, and 8 or 10 pecks of Tares afterwards drilled ; with those for later use, winter or black Oats and tailing Wheat is sown, and the Tares drilled as with the Rye. Unless supporting plants are sown with Tares pretty thickly, they become borne down by rain, and the major portion become rotted and useless for feeding purposes.

We are just concluding our Wheat sowing, and from the rain falling profusely at the commencement of the last month the land became saturated to such an extent as to render it a task at first of more than ordinary difficulty to get in the seed, especially upon those lands on which Mangel Wurzel had been grown previously. Upon the whole, however, the work has been satisfactorily completed, and no fear whatever is entertained for the safety of the plant, which is now fast appearing.

The crop of Mangel Wurzel is very fine, and the quality excellent. Of all the new varieties the Long Orange stands pre-eminent ; it produces the greatest weight, has less tap root, and is more easily convertible than the Globe ; we estimate our crop of 30 acres at about 30 tons per acre. This will give 1800 weeks' keep for an ox of 100 imperial stones, or for 100 oxen for 16 weeks each, and if properly combined with cut Oat straw chaff may be used immediately after removal from the field ; and the leaves are also available by stripping them early as required. From the middle of October to the end of November they have formed the chief supply for 30 cows, cut up with Oat straw, and the cows have thriven well, and have eaten them with avidity. We are now pursuing the same course with the leaves of Swede Turnips, white Turnips, and cattle Drum-head Cabbages mixed as before, with a small quantity of grains added daily. Most of these items of food were until lately wasted, but now they supply the food of the milking and young stock of this farm up to Christmas or later, as frost may prevail, enabling us to keep the roots untouched for such purposes.

We have lately been threshing Wheat by the assistance of a hired locomotive steam engine, but we do not find by experience that it can be effected so cheaply as many writers have asserted, viz., 10*d.* to 1*s.* per quarter. We find that the attendant labour amounts to nearly double that sum ; in one case, with the cost of the machine at 1*s.* per quarter, it amounts altogether to 3*s.* per quarter upon mown Wheat and 2*s.* 6*d.* upon reaped ; 16 hands altogether are required, and the use of one horse continuously, and man to supply water and fuel. The consumption of coal is considerable—upwards of a ton in three days, and the cost quite as much per quarter as by horse-power, charging the horses at 4*s.* per day each. The case may be different with fixed engines, but with a locomotive engine a day's work is more or less consumed with five horses in removing it to its next station. As regards convenience at this season, we admit it to be vastly superior to horse-power inasmuch as it spares them for the other requirements of the farm.

Our Swede Turnips are very indifferent this season ; the white and green common Turnips are good, and are perhaps an exception in this district. We are now feeding the former with southdown wethers and half a pound of cake each.

The yield of our Wheat crop is good ; the crops were not beaten down to any great extent, and the quality is also excellent, averaging from 61 to 63 lbs. per bushel.

The yield of Barley and Oats is also large, but the former is deficient in quality ; our selling prices, however, are satisfactory, from 38*s.* to 43*s.* per quarter. Beans we have none, and Peas are a slight crop. The hay crop was unusually small ; but the second math of Clover to a considerable extent has compensated the deficiency ; it is, however, selling at from 5*l.* to 6*l.* a ton, a price too high to admit of its being used with profit for any description of stock.

The high price of oil-cake deters us from using it in great quantity ; 3 lbs. per head, with 4 lbs. of meal made from tailing Barley and Linseed, at the rate of 1 bushel to seven of Barley, is the maximum of this year's allowance to each bullock per day. They, however, are progressing well. We believe that a large portion of the cake is wasted whenever cattle are fed too bountifully upon it.

Home Correspondence.

The late Discussion in the London or Central Farmers' Club on Stall Feeding.—I have read with some degree of interest mingled with surprise the report of the late discussion in the London or Central Farmers' Club, on the stall feeding of cattle. The question was whether straw could be substituted for hay in feeding cattle. I am well aware of the prejudices existing amongst English farmers in this respect, for the all but universal belief among them is that hay is indispensable, and that straw is next to being useless. But with a short crop of hay in many cases very indifferently cured, with the consequent present high price of the article, and the certainty of an increased value of not less than 50 per cent. before Lady-day, it is a matter of great moment to know whether the use of hay cannot be economised, or something else substituted for it altogether. The Central Farmers' Club comprehends among its members gentlemen whose names we have always been accustomed to associate with the literature of agriculture, and with the most enlightened practical and scientific knowledge of the art ; and it was therefore with much surprise that I found no reference whatever made by them to a collection of standard practical knowledge, from which they would have derived much valuable information regarding the subject which they had chosen for discussion. The work I mean is the "Transactions of the Highland and Agricultural Society of Scotland." If any of them had taken the trouble to refer to this—certainly no obscure publication—it would have been found that in the details of all the feeding experiments and reports, Turnips and Oat straw are taken as the basis, as farm-yard manure is taken in comparative trials of manures, and that Turnips and hay will be found ranked in the list of other feeding stuffs which are reported upon. The reason of this arises from the fact that fresh Oat straw is the regular fodder used by Scotch feeders in preparing their cattle for the butcher ; and if the members of the Central Club would only look at the magnificent oxen sent to the London market from Aberdeen and other ports on the east of Scotland, they would have ample evidence that straw could be substituted for hay in feeding cattle with great propriety, and no little economy to themselves. In Scotland natural meadows are rare and do not form any regular part of farm management, as is the case in England ; the staple hay which is made being that produced by the artificial Grasses. This is reserved, I may say, entirely for the horses. The general use of straw in Scotland does not arise from the *quasi* argument once used by a person with whom I was talking over the same subject, namely that straw was employed because there was nothing else to give to the cattle. Such an observation could only arise from conceited ignorance of the subject. The Scotch farmers feed cheaper than their English brethren, whilst it is an undeniable fact that they come into the English markets with their fat cattle, and command the highest price. This should be carefully noted by the members of the Central Club, and by all interested in the question who have read the discussion. *Scotus, Worcestershire.*

Steam Cultivation.—In the *Agricultural Gazette*, November 24th, there is a letter from "Y. F. W.," urging several objections to my plan of circular tillage, all of which I shall have occasion to notice. In the meantime I should like to know by what method of calculation he makes out there are 7·16 perches lost in the triangular bit of land, arising from the conjunction of 3 circles of 84 feet radius. My experience in the field makes this piece, left untilled by the machine, nearly one half less than his estimate. *C. Burcham, London.*

The Turnip Fly or Flea.—There have lately been several communications in your Paper with respect to the modes of destroying this terrible insect. None of your correspondents, however, have said anything of a very common method in use in the Weald of Sussex, which particularly abounds with them, to the great annoyance of all Turnip growers ; and this year they have been so numerous as to cause an almost total destruction of the Swede crop, many having none after four or five sowings. I had myself a beautiful plant over nine acres in the early part of June last, and having stood the attacks of the numberless flies during a week of very hot weather, they at last became in such a state that about three more days would have been fatal to them. Being naturally anxious to save them if possible, I inquired of various people at market how to rid them of their enemies ; a good many nearly impossible recommendations were given, but an old-fashioned farmer strongly advised having them rolled with a one-horse roller very early in the morning while the dew was upon them. Willing to try so simple a plan, orders were given for a man to go out the next morning between two and three o'clock and roll them all before coming home, which was done and finished about nine o'clock. I must confess I had no great faith in its success. The day, like the preceding ones, was intolerably hot and very sunny ; about twelve I walked across the field expecting to see my enemies as usual, but was completely astonished to find that they had all disappeared, for I minutely examined the plants but found only one or two, and after that day they were troubled no more. The weather remained dry and hot for some time after, but the Swedes grew and are now a very good crop considering the dry summer we have had. I should mention that the field was in excellent tilth all over, and the only way in which I can account for the efficacy of the rolling is, that the flies at that early time were secreted under the small clods of earth, and when they were pressed down by the roller they were of course unable to get out ; the land was drilled 27 inches apart and a light rolling given after, to cover the seed. Some imagine that the earth adhering to the roller (being dewy) makes the plants dusty, and that they are then

distasteful to these insects; as however there were none to be seen above ground, I presume the former explanation to be correct. I may mention that we sowed some more Swedes later, which had to be guarded in the same way, and which also proved successful. I shall try it again next year should the flies be troublesome, and would strongly recommend your readers to do so, should they have no better method of destroying these pests. *Leisurely.*

Land Drainage.—Your correspondent "B. D. T." (page 764), in noticing Mr. Bailey Denton's remarks on drainage (page 732) more particularly in reference to the "extraordinary circumstance," mentioned by Mr. Denton, "of drains recommencing running upon a fall of the barometer, without a fall of rain on the surface," adds that "if any of your readers are in possession of similar facts, they would be doing a service to the cause of science by giving them to the public in your columns." I have known such a case, and will communicate it. Last year, after the very dry weather succeeding the harvest, the barometer fell for three or four days, but rain did not follow as might have been expected; during the next few days a few slight showers fell, with a rising barometer, but not of sufficient weight to affect drains. During the fall of the mercury several outlets upon a farm I had drained three years ago commenced running, and continued to do so till the mercury began to rise, when they gradually ceased. They had been dry for several weeks previously, and after running, as above described, became quite dry again, and remained so till the land became saturated by the winter's rains. A neighbour noticed the same extraordinary circumstance in some 3 feet deep draining on the adjoining farm. My drains had been laid with 2-inch pipes, 3 feet 6 inches deep, in furrows, but were then probably over 4 feet below the surface, the high lands having been thrown down, as they always ought to be, to secure the full benefit of deep draining. This circumstance occurred upon land called very strong clay, and which had resisted all the attempts of shallow drainers to lay it dry. The late tenant told me on quitting that it was not possible to drain it, "For," said he, "if you've 2 inches of clay above the tile, I'll warrant water will stand for a month in a horse's foot-print." This I found, before draining, to be quite true. But although I can show that I paid on entry, in May 1852, 20*s.* per acre, by hire, for ploughing up undrained stubbles for summer fallow, I cannot now persuade a stranger that it ever could have been really strong heavy clay land. Being in correspondence with Mr. Denton, about 6 months ago I wrote him a statement of this fact, about the drains running with a falling barometer, with a view to obtain his valuable opinion on the subject; I have since heard of some other cases of the same kind, and I have no doubt Mr. Denton has, in his extensive practice, been able to collect further information, but whether he has or not I can completely verify the case I have described. I quite agree with your correspondent in attributing this occurrence to the diminished atmospheric pressure before rain; and moreover, before water can by any possibility flow out of the land, the space it previously occupied must be filled up by air passing from the surface, and thus a medium of communication is formed within the soil, which is subject, in a greater or less degree, to all the changes of this ever varying climate, and acted upon by the density or lightness of the volume of air with which it is in direct contact. *George Beaumont, Jun., Bridgeford Hill, near Nottingham.*

Farm Steam Engines in Gloucestershire.—A few days since a number of the friends of Mr. Edward Drew, of Calcot Farm, a tenant of Colonel Kingscote, assembled by invitation to witness the working of a steam-engine lately fitted up and acting as a motive power to a threshing machine, mill stones, bone mill, and other farm machinery upon his occupation at Kingscote. The threshing machine is on the Scotch principle with English drum, and appears to combine the advantages of both, for in a trial of an hour and half upon mown Wheat with long straw, 20 sacks of Wheat were threshed and put up in sacks of 4 bushels and weighed 62 lbs. per bushel, with but little aid from manual labour when compared with machines in ordinary use. *H. R.*

Superphosphate of Lime.—There has been a lecture delivered by S. Grove Grady, Esq., recorder of Gravesend, upon Agricultural chemistry. This lecture was delivered at Hatfield. Mr. Grady is one of the directors of the Patent Superphosphate Compost company. The reporter gives the following. "He then discussed at length the question as to whether the phosphates, &c., &c., should be in a soluble or insoluble state, and proved by extracts from Dr. C. Remigius Fresenius' chemical analysis, and from Professor Liebig, that the insoluble were as beneficial to the full development of the plant as the soluble; for the ingredients which are soluble serve for immediate use, those which are neutral or semi-soluble exercise a more permanent action, and those which are altogether insoluble afford a prospect of future nourishment for plants, although for the time being they possess no nutritive powers. Those artificial manures, therefore, which are in a highly soluble state are not so beneficial as when they are soluble, neutral, and insoluble." I do not remember seeing any thing about semi-soluble phosphate in the writings of Liebig or other writers, neither can I see how any manures can be too soluble provided they are not washed out of the soil by the rains. Will you, Sir, be so kind as to enlighten me on these points? *From a Correspondent.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Monthly Council, *Dec. 5*: Mr. Raymond Barker, V.P., in the chair. Forty-three new members were elected.

Finances.—Mr. Raymond Barker laid before the Council the Monthly Report on the Accounts of the Society, from which it appeared that the current cash-balance in the hands of the bankers was 361*l.*

Paris Implement Show.—Mr. Evelyn Denison, M.P., as English Juror of Agricultural Implements at the recent Paris Exhibition, having transmitted to the Council at their previous monthly meeting the earliest information of the results of that exhibition in his own department, it was suggested by Mr. Branston, M.P., supported by Mr. Jonas Webb, that a document so important at the present moment to the agricultural implement makers of this country, and so important to those members of the Society, who desired, in their purchases, to avail themselves of the information it conveyed, should at once be made public; especially as the awards to which it referred had now been confirmed by the imperial edict and the premiums awarded. The Council unanimously adopted this suggestion, and ordered the publication of the following letter:—

"Ossington, Nov. 6, 1855.

"Dear Sir,—I returned on Thursday last from Paris, having concluded my business in connection with the Exhibition. My first visit occupied me for a month, my second for more than three weeks. I send you, for the information of the Council, a short account of what has taken place. The Committee, appointed by the Council, to make a selection of agricultural implements for the Paris Exhibition, executed their task, I think, with great judgment. The implements sent were not too numerous, and they were all of established excellence. The collection attracted great attention, and has been examined with increasing interest up to the latest days of the Exhibition. I will not now enter into a description of the foreign implements exhibited, nor of the vast collection of agricultural products (an opportunity for this will be afforded in a report which the Board of Trade has asked me to furnish). I will confine myself now to the results of the Exhibition, as bearing on British exhibitors and British interests. To the five principal makers of agricultural machines—

Messrs. Ransome	Messrs. Howard
" Garrett	" Crosskill,
" Hornsby	

the Gold Medal of Honour has been awarded; and to them alone, of all the exhibitors of agricultural machinery of all countries, with the exception of McCormick and Pitt, of the United States, one for his reaping machine, the other for a threshing machine. To Messrs. Ball, Bentall, Busby, Coleman, Smith & Ashby, W. Smith, the Silver Medal of the first class has been voted.

According to the French classification (carried perhaps to an extreme point of subdivision), threshing machines and tile-making machines were not included in the list of agricultural implements; they were removed to the class of general machinery, class 6. Mr. Hornsby, if he had not already gained a Gold Medal in class 3, would have had one for his threshing machine in class 6.

A Gold Medal of Honour has been voted to Mr. Clayton for his brick-making machine. I should add that medals have been awarded, by the express command of the Emperor, to the leading workmen of the establishments of successful exhibitors. After making an examination of the foreign implements, in company with Mr. Amos, it became apparent to my colleague, Mr. Wilson, and myself that our time would be best employed, both for the interests of England and of France, in endeavouring to open the trade for agricultural machinery between the two countries—France requiring improved implements, England able and willing to supply them. The high rate of duty on the importation of machinery into France amounted virtually to a prohibition. I talked to the distinguished Frenchmen who composed my class on the disadvantages of this exclusive system. To open the trade might confer some benefit on England, but it would confer a far greater benefit on France. Ultimately our class agreed unanimously to make a representation to the Imperial Government in favour of a reduction of the duty on agricultural machinery. The representation was successful. An Imperial Decree appeared in the *Moniteur*, on Friday, the 7th of Sept., making a considerable reduction in the duties on many articles of machinery, and specially reducing the duty on agricultural implements to 15 francs per 100 kilogrammes. I look upon this as a very important concession, and one which may be productive of very beneficial consequences.

"I am glad to attribute it, not so much to our representations, as to the good sense and just views of our French colleagues, and no doubt it was to their appreciation of the extent to which French interests were involved, that this decree must in a great degree be attributed. It was part of the original plan of the Exhibition, that any article exhibited might be sold, at the close, on payment of a duty of 20 per cent. *ad valorem.* The new duty is by weight, 15f. per 100 kilogrammes, equal to 2 cwt. I have procured from the French Customs the weight of some of the English machines, and I have made a comparison between the duty charged by weight, and an *ad valorem* duty of 20 per cent. On an iron plough, in which the weight of the raw material, in comparison to workmanship is considerable, the duty of weight will be something above 20 per cent. *ad valorem.* In the more complicated machines, in which labour enters more largely, as in drills, the duty will be about 15 per cent. *ad valorem.* On the whole the proposed duty by weight appears to be fully as favourable as a duty would have been at 20 per cent. *ad valorem.*

"The makers of machines, whom I had an opportunity of seeing at Paris, and their agents there, were satisfied with the proposed scale, and thought an opening had been made for the establishment of a considerable and beneficial trade. It would not become me to suggest to our machine makers the best means to be taken for occupying the new ground laid open before them. Their own enterprise and knowledge of business will be their best guides. Our American brethren have already set them an example. I understand a Franco-American Company has been set on foot, for the purpose of supplying France with M'Cormick's reaping machine.

"These, then, have been the chief results of the Paris Exhibition, as regards the Class of Agriculture:—

"1. Successful competition on the part of English Machinery, and the award to it of the Gold Medal of Honour.

"2. A great reduction of the duties on the importation of Agricultural Machinery into France, and the prospect of a new market opened to our machine-makers.

"I could not be content to conclude this short account without acknowledging the invariable courtesy and attention which have been shown me by the members of my own class, and by all persons connected with the French Commission.

"I am, yours very faithfully,
"Evelyn Denison.

"To J. Hudson, Esq., Sec. of E. A. S."

Implement Prizes, 1856.—Mr. Brandreth having moved that the consideration of the Implement Prize-sheet for next year should be postponed till the Wednesday in next week, when a special Council would be held, gave notice of the following motion: "To move, when the Implement-sheet is finally taken into consideration, that, in future, special prizes only be given in rotation for certain great classes of Implements: as an arrangement likely to prove of advantage to the Society, to the implement makers, and to the public in general; and, also, as tending to lead to greater efficiency and economy in the respective trials of implements in each year." The explanations given by Mr. Brandreth of his intended motion, and the remarks of the different members present, on the modes by which the Society's exhibition and trial of implements in each year may be rendered most effective and economical, led to an interesting discussion on this important subject.

Standing Committees.—The Standing Committees for next year having been appointed, it was ordered, on the motion of Mr. Fisher Hobbs, seconded by Mr. Brandreth Gibbs, that the chairmen of the different standing committees of the current year, report respectively in writing, to the Monthly Council in February, the number of times they have met, and the number of reports they have made to the Council.

Member of Council.—On the motion of Mr. Raymond Barker, seconded by Mr. Wren Hoskyns, the Earl of Essex was unanimously elected a General Member of Council, to supply the vacancy occasioned by the transfer of Lord Berners to the class of Trustees.

Australian Sheep.—The Earl of Chichester communicated to the Council a statement made to him from South Australia, of the great losses sustained by the flock masters in that colony from the disease of scab among their sheep. The Council directed Professor Simonds, as the Veterinary Inspector of the Society, to enter into communication with the Earl of Chichester on this subject. Professor Simonds took that opportunity of remarking that he believed the sheep of the colony had always suffered from the scab in its common form, and would continue to be exposed to the same annoyance as the native sheep of the colony extended and became mingled with newly imported animals. He thought the same treatment would succeed in Australia as employed in England. The disease arose from the presence of a special parasitical animal, which penetrated the skin of the sheep, and caused by its constant attacks their increasing irritation and annoyance. He would communicate, as desired, with the Earl of Chichester on the subject.

Lecture.—Mr. Raymond Barker gave notice that he should move at a future Council, that Prof. Simmonds be requested to deliver a lecture on the subject of skin diseases and constitutional irritation occurring among the animals of the farm from the insidious presence and attacks of parasitical animals. He made this motion both in reference to its interest and importance, and from the circumstance of knowing that Prof. Simmonds possessed a most valuable collection of magnified diagrams and drawings connected with this subject, which he had at great personal exertion and expense prepared for the service of the Society.

The Council adjourned to Dec. 12.

Farmers' Clubs.

Hatfield.—*Cultivation of the Soil.*—S. G. Grady, Esq., Recorder of Gravesend, and a director in the Patent Superphophate Compost Company, delivered a lecture at Hatfield, on "Agricultural Chemistry." The lecturer, after making some preliminary remarks, referred to the absolute dependence of the human family on the productiveness of the soil, and the misery everywhere consequent upon a deficient harvest. He contended that there was every year a deficient harvest, for the soil had never yet been induced to yield its fruits in such abundance as it ought. He then proceeded to remark that artificial manures, scientifically prepared, should contain the organic and inorganic matters which constituted the food of all plants. Night-soil and fish were forms of organic matter, whilst superphosphate of lime was a form of inorganic matter. The luxuriance of a crop might in a great degree be accounted for by the presence or absence of this essential ingredient in the soil. He urged that artificial manures, scientifically prepared, had many advantages over farm-yard manure:—1st, Because better adapted to the requirements of crops, by restoring to the soil those essential properties which chemistry enabled us to ascertain any given crop withdrew from it; and, 2dly, On account of its superior cheapness. It was a fallacy to suppose that the same land could not be made to grow the same crop for a series of years in succession. Scientifically prepared artificial manures, by restoring to the soil all that a previous crop had removed from it, enabled the land to go on producing the same crop *ad infinitum.* For instance, Wheat removed 56 per cent. of phosphate of lime from

the soil, and in order to have a good crop of Wheat again, it was necessary to restore to the soil that amount of phosphate of lime. By thus manuring the land every time, a succession of good crops of Wheat must be obtained. But this could not be done with farm-yard manure, without incurring an expenditure which the crop would not repay. Mr. Grady then dealt with the next question as to whether the superphosphates should be rendered soluble or left insoluble. He showed by passages from Dr. C. R. Fresenius and Professor Liebig, that insoluble phosphates were as beneficial to the full development of corn as the soluble; for the ingredients which were soluble served for immediate use, whilst those which were neutral, or semi-soluble, exercised a more permanent action; and those which were altogether insoluble afforded a prospect of future nourishment for plants, although for the time being they possessed no nutritive powers. It was a mistake to suppose that artificial manures were merely ephemeral. If properly prepared they were of a permanent character. The lecturer then read some testimonials to show that the patent superphosphate compost had exercised upon several crops a beneficial effect for two years in succession—that being the whole period the company which manufactured it had been in existence. He had no doubt that experience would show the effects of the manure to be of a more lasting character. Mr. Grady then adverted to the subject of agricultural leases, contending that the landlord was bound in justice to his tenant to give him such an interest in the soil he cultivated as would enable him safely to expend upon it the capital which would make it productive.

Miscellaneous.

The Area of the Old Smithfield Market, it is proposed to make the site of a large central meat market. The proposal has, it is said, received the assent of the authorities whose ultimate discussion will be final; but it will no doubt undergo the ordeal of a great deal of discussion before it can be adopted and carried out.

Calendar of Operations.

NOVEMBER.

Lammermuir Sheep Farm, *Nov.* 26.—We have had rather wet weather for some length of time, hill stock have not made so much improvement this autumn as could have been wished, and the severity of last winter can even yet be traced in the want of condition of many hirsels. They want that flush of wool which indicates freshness and vigour; thus showing that even a tolerably good grazing summer and autumn sometimes fail in repairing the damage done by a previous severe winter. Where Leicester tups were used they were put to the ewes about the 8th of this month, and the Cheviot tups on the 22d, though on some farms the tups have been kept back about a week later than usual, the backward spring of last year having taught a lesson in this respect. Cheviot wedder hoggs are now put on Turnips, but the deficiency of that crop will induce many farmers to delay putting their store sheep on as long as possible. If the weather is at all favourable hoggs can better afford to want Turnips a few weeks longer at this season than have to do without them in early spring. The loss of young sheep from what is generally termed grassill, or sickness, has been very moderate as yet, and we consider that the most fatal period of the year for this disease is nearly past. Some seasons are much worse than others for grassill, and we have also noticed that some grounds are more liable to it than others, especially if hoggs are kept in a hirsel by themselves on the same walk year after year. Instances have occurred in which this was the case to such a deadly extent that the usual system was discontinued, and the hoggs wintered on another grazing for a number of years, till in the course of time the former grazing, after being stocked with old sheep, again became comparatively safe for hoggs. They are never so liable to this disease when pasturing along with their mothers all the winter. As an instance of this, I have my ewe hoggs pasturing along with their mothers, and the wedder hoggs on a separate hill. The loss of wedders has been about four times more than the loss of ewes, and entirely from grassill. I have also in former years remarked this. The deaths from this cause generally cease when the hoggs have been two or three weeks on Turnips. *J. S. B.*

Notices to Correspondents.

Bark: *Fiddler*. You had better char it and use the charcoal as manure. It will be a very slow process to reduce it by any attempt at fermentation.

Bran: *E*. The average composition according to Professor Johnstone is—Water 13.1; albumen 19.3; oil 4.7; husk, with a little starch, 55.6; ash 7.3.

Corrugated Iron *versus* Timber and Slate. Corrugated iron roofing will cost about 5*l*. per square of the area of the building, and I have found that a building 100 feet long, and 25 feet wide out to out, measured 25 feet square, which at 5*l*. = 125*l*.; and that to cover the same building with timber and Duchess slate the roof measured 32 squares of roofing, which can be furnished for 4*l*. 5*s*. per square = 138*l*. This is a difference of 13*l*. on the roof of a building 100 feet long by 25 feet wide on the first cost; but the iron roof must be kept painted once every three years, or it soon goes to waste, which was the case with the corrugated iron roof of the Exeter railway station at Bristol, which was taken down two years ago, and replaced with Duchess slate. I have only had two iron roofs put up; all the other buildings I have put up are of red or yellow baulk, and covered with Dutch slate; and the expense of these have been per square, say—

15 cubic feet of timber ... ... at 2*s*. 6*d*. =	£1	17	6
Including sawing, labour, &c.	0	15	6
Duchess slate and labour per square	1	11	0
In all	£4	4	0

I would prefer wood and Duchess slate with a tile ridge to corrugated iron as the cheapest and best in the end. *J. M.*

Coates' Herd Book: *Anon* It is continued by Mr. Strafford, of 13, Euston Square, who publishes an additional volume every now and then as materials accumulate. Vol. XI. was issued this year.

Cottage Property: *An old Subscriber*. We are unable to say if you can obtain possession without giving notice.

Cultivation of Glebe Land: *R G T*. A healthy young man having a life interest in any property ought not to fear investing money in its cultivation. If, however, you conclude that under your circumstances you cannot be at the expense of grubbing up the land and cultivating it, then probably your best mode of turning it to account will be to grow Gorse for cattle food. Is that saleable in your neighbourhood? It is so in many localities.

Drains: *D S*. Pipes of 1¾-inch bore are large enough for the parallel drains 30 feet apart, of the largest fields, say 300 yards; and pipes of 4-inch bore are large enough for the main drains of 10 acre fields. It would not be possible to answer as definitely as you seem to desire.

Drill: *Hurstperpoint*. The water-drill contains a reservoir for liquid manure or water, as well as one for seed; and as both are furnished with contrivances for pouring out their contents as the machine proceeds, the seed is washed into the furrow instead of being deposited in the dry soil; and the advantage of such a method of sowing is shown in the experience of Mr. Ruston, jun., recently given in these columns.

Earth-nut Cake: *W C S*. The following is the passage to which you allude:—"The first sample of this cake analysed was sent to this country by Messrs. Maxwell & Co., of Bordeaux. Its composition is—

Water	11.56
Oil	12.75
Albuminous compounds	26.71
Ash	3.29
Fibre, and other matters	45.69
	100.00
Nitrogen	4.27
The ash contains— Phosphates	1.17
The ash contains— Phosphoric acid	0.08

Compared with ordinary Linseed-cake we find but little difference between the two. In some cases, no doubt, the quantity of nitrogen in Linseed-cake reaches 4.8 per cent.; but in this case the oil is generally low. In fact, cake produced from the same seed varies in composition according to the extent to which the expression of the oil has been carried; and that this modifies the composition of the Earth-nut cake is obvious from the subjoined analysis of a sample imported into Leith:—

Water	10.01
Oil	6.78
Albuminous compounds	33.85
Ash	3.78
Fibre, and other matters	45.58
	100.00
Nitrogen	5.39
In ash— Phosphates...	1.14
In ash— Phosphoric acid	0.52

In this sample the quantity of albuminous compounds is very high. Messrs. Maxwell & Co. have communicated the following information regarding the price of this cake last autumn:—

	£	s.	d.
Its price free on board at Bordeaux, per ton, is	4	12	6
Export duty	1	0	0
Freight per steamer to Liverpool, and insurance	1	8	6
Price in Liverpool ...	£7	1	0

If carried by sailing ship the price will be £6 12*s*. 6*d*. In addition to this there is the cost of landing, &c., at Liverpool."

Ewes in Lamb: *J M*. One per acre over Grass lands of ordinary quality will be able to keep in sufficiently good condition with very little else than the Grass. In severe weather a little straw chaff, over which a very little weak Linseed soup has been poured, may be given them along with a few Turnips.

Farm Accounts: *C D*. The "cash in hand" goes into a cash account, which you keep independently of any business in which you may be engaged. You may have half a dozen different occupations, and keep the accounts of each: but cash in hand goes into the Dr. side of a cash account, which you keep apart from any and every business in which you may be engaged.

Grass: *Novice*. Are you sure that the Grass has not been pulled up by crows and starlings? There is generally a good deal pulled up in autumn on poor sandy pastures. You need not fear the result.—*Scotus*. It is a Brome Grass of little agricultural value.

Guano and Lime: *J H S*. It would be perfectly safe to dress a field of Wheat with guano at the end of February which was sown with lime in October or November. The lime would not then dissipate the ammonia of the guano.

Income Tax: *J L*. You are charged in Scotland on one-third your rental as income, while we in England are charged on one-half our rental.

Mangel Wurzel: *J. Mason*. They will keep through the summer if they are uninjured during winter, without any particular care being taken of them; nevertheless, perhaps some one will say what methods in his experience have been successfully adopted for keeping Mangel Wurzel until the second year.

Mud: *Z Y X*. The mud cleared out, dried, and broken up, may be applied as a top-dressing, as you propose, with probably good effect.—Prof. Johnston's pamphlet on "Analysis" is the thing you want. It is published by Blackwood, Edinburgh.

Pheasantry: *Omega* proposes to have a pheasantry 70 ft. long. At one end we suppose he allows a space of 9 ft., to be covered in and "hoarded up," with holes for the entrance of the birds; the floor to be of hard well rammed earth. He will then have a run of 60 ft. in length, a part of which is laid down to turf, a part for fine gravel and planted with shrubs; in the centre a small well branched tree, on which the birds will rest; the run to be inclosed either by wood or brick to the height of 3 ft., and above by strong wire. Four or five hens may be allowed to one cock. We shall be happy to afford further information if required.

Potatoes in Bread: *A Subscriber* asks any of our readers to inform him how, and in what proportion, to mix Potatoes with flour in making bread.

Rape-cake, &c: *J T B*. If it contains much Mustard it is poisonous. It is undoubtedly "adulterated," and may be returned. Though it contains a little Mustard it is not necessarily poisonous, if properly cooked; and the plan is to scald it with boiling water, which coagulates that in the Mustard, which, if left to its natural tendencies, will, in cold water, assume a poisonous form. Sawdust may be used as litter, and will form good manure. Large quantities were used at Hendon for littering the large herd of cattle belonging to Mr. Tanqueray. Old lime dust may be usefully applied as a top-dressing. You need not fear its effect on manure containing ammonia, both being in the soil. The mixture there is under different circumstances from those of the laboratory. Bushe's grater cuts roots into narrow ribands; Phillips's reduces them, we believe, to a sort of sawdust.

Tobacco Juice: *J S G*. We use 15 lbs. of juice and 3 lbs. of black soap, dissolved in 50 gallons of water for every 100 sheep. Dissolve the soap in 5 gallons of boiling water; immediately add the juice, stir well, and let it stand for 24 hours; and the additional water required, and apply at blood-heat as you would any other wash, the object aimed at being to saturate the fleece at as little waste of material as possible. The above is the common rule, but as juice varies in strength and sheep vary in size, experience is the only sure guide. The method of application in general use here is dipping. The dipping trough or steep is capacious enough to hold wash for 100; into it the sheep is carefully dropped on his back with his head to an inclined plane, up which he walks to the dripper, a water-tight enclosure capable of containing 100 sheep, inclining to the steep and connected with it by the inclined plane, and from which the superfluous wash carried off by each sheep is again returned to the steep. When the dripper is full of sheep they are allowed to stand while the steep is being replenished, when they are turned out, and operations recommenced upon another 100. By this method every sheep is completely saturated, and very little material wasted. *T.*

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS and KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l*. was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill: Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—Burgess & Key, 103, Newgate Street; and 52, Little Britain, London.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s*.
M. Wedlake, 118, Fenchurch Street, London.

TURNER'S REGISTERED MALT MILLS, and PATENT CRUSHING and GRINDING MILLS.—A variety of these Mills will be exhibited at the ensuing Smithfield Club Cattle Show, Stands 63, 64, and 65.
Caution.—Legal proceeding will be instituted against any person or persons unlawfully manufacturing the above Mills, or otherwise infringing upon the Registration or Patent for the same.
E. R. & F. Turner, St. Peter's Iron Works, Ipswich.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. Treloar, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3*l*. 3*s*. The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1*s*. 6*d*. per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s*. 6*d*. per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	10	0
2½ „ long	3 „ 3 „		1	14	0
3 „ ditto	3 „ 6 „		2	8	0
3½ „ ditto	3 „ 6 „		2	12	0
4 „ ditto	3 „ 6 „		3	8	0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	14	0
2½ in. long ditto	ditto	ditto	2	18	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER and SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.
MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, London.

JAMES PHILLIPS AND CO., 116, Bishopsgate Street Without, have the pleasure to hand their present prices of

GLASS FERN SHADES AND STANDS.

	s.	d.	With	s.	d.		s.	d.	With	s.	d.
6 in. diam.	2	0	stands	3	0	12 in. diam.	6	0	stands	8	0

11 "	4	0	"	7	0						

FERN CASES, with Ferns complete, suitable for the Drawing Room, from 25*s.* each.

AQUARIUMS, with French polished stands, from 10*s.* each. Vase-shape ditto, on glass pedestal standing 23 inches high, 17 inches diameter, 25*s.*

Extract from *The Cottage Gardener.*

"Fern Shades.—Many delight in seeing their beautiful Ferns introduced into the domestic circle; but without some such protection as these shades it would be impossible to preserve them. The shades of which we speak are glass cylinders with a domed top, which are placed on a glass pot wherein the Ferns have been planted, and they form on a small scale a pretty imitation of a Wardian Case."

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, HELY & WARING, Managers, 296, Oxford Street, London.

HOT AIR, GAS, VESTA, JOYCE'S STOVES. Stoves for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10*s.* each to 30 guineas. His variety of register and other Stoves, Fenders, and Kitchen Ranges, is the largest in existence.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

SAYNOR AND COOKE'S KNIVES *may be procured from* Messrs. Sutton and Sons, Seed Growers, Reading, *who have for many years been supplied direct from* Messrs. Saynor's Manufactory, *and none others are kept on* Messrs. Sutton's Premises.

CROCUS, TULIP, AND HYACINTH BASKETS, with Wire or Zinc Linings, for suspension or for table stand; also Bracket Baskets made and Japanned in a variety of colours and designs, by W. Richards, Imperial Wire Works, 370, Oxford Street. Conservatories fitted up.

Window Blinds and Wirework of every description.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. Seeley (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

NEAT, DURABLE, AND WELL EXECUTED LABEL FOR NAMING PLANTS.—The Advertiser will forward on the receipt of a stamped envelope, containing two postage stamps, a Zinc Label, neatly painted, lettered in *Oil paint*, as a specimen for those who may require a number; they can be supplied at 2*d.* each.—Address F. H., at Mr. Bond's, Walcot, Salop.

IRON BUILDING AND ROOFING WORKS.
Gas Street and Berkeley Street, Birmingham.

JOHN HENDERSON PORTER, Engineer and Contractor, Patentee of a new system of constructing (cheaply and expeditiously, by ordinary labourers) Portable Buildings and Sheds—formed of ordinary planks or boards—peculiarly suitable for Farm purposes. A Model Shed has recently been erected in the Agricultural Department of the Crystal Palace at Sydenham. Corrugated and Galvanised Iron Roofs and Roofing Plates, Eaves, Gutters, Rain-water Pipes, Tanks, Fences, &c.—London Office, 1, Riches Court, Lime Street.

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late Stephenson & Peill), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.

HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4*s.* 9*d.* each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5*s.* 3*d.* each.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangel, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to Fowler & Fry, Bristol, Licensed Makers of Corne's Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street, Westminster

NEW LABEL.—In consequence of the great variety of Counterfeit Labels of A. ROWLAND & SONS' MACASSAR OIL, now in circulation, and which so nearly resemble the original as frequently to deceive the unwary—they have employed those eminent artists Messrs. Perkins, Bacon, & Co., who, at great cost, and by a peculiar process of their own, have succeeded in producing from steel "A NEW LABEL," which cannot be forged. It is composed of a section of an engine-turned circle, repeated 130 times, and forms an original lace-work ground, upon which is engraved in white letters, "UNDER THE PATRONAGE OF THE COURTS OF EUROPE," with an embossed profile of Her Majesty "THE QUEEN," lately specially taken for the purpose, and which surmounts the words (also in white letters) "ROWLANDS' MACASSAR OIL, for the growth, restoration, and for beautifying the Human Hair." Under which is the Signature of the Proprietors in Red Ink, "A. ROWLAND & SONS."—Sold by them at 20, Hatton Garden, London; and by Chemists and Perfumers.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 30 years have been held in constant and increasing public estimation as the purest farinæ of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, Robinson, Bellville, & Co., Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6*d.* and 1*s.*; and Family Canisters, at 2*s.*, 5*s.*, and 10*s.* each.

SISAL CIGARS, SISAL CIGARS, SISAL CIGARS!

GOODRICH'S CIGAR, TOBACCO, AND SNUFF STORES (Established 1780), removed to 407, Oxford Street, near Soho Square. A Box, containing 14 fine Sisal Cigars for 1*s.* 9*d.*; post free for 27 stamps. None are genuine unless signed "H. N. Goodrich."

FRENCH MODERATOR LAMPS.—A very large and superior stock now on sale at DEANE, DRAY, AND CO.'S (Opening to the Monument), London Bridge.

Established A.D. 1700.

HEAL AND SON'S EIDER DOWN QUILTS; also GOOSE DOWN QUILTS, from 8*s.* 6*d.* to 24*s.* List of Prices and Sizes sent free by Post. Heal & Son's Illustrated Catalogue of Bedsteads and Priced List of Bedding also sent post free.—196, Tottenham Court Road.

AMUSEMENT FOR WINTER EVENINGS.

MECHI'S FOLDING BAGATELLE TABLES afford, in an eminent degree, a means of varied amusement combined with instruction. Each table is constructed for playing four highly entertaining games. Prices complete from 3*l.* 15*s.* to 12*l.* 10*s.* Telescope stands for ditto with adjusting screw legs, 2*l.* 5*s.* to 3*l.* 10*s.* each.—112, Regent Street; 4, Leadenhall Street, London; and Crystal Palace.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. The same prices charged at all the Establishments.

THE EDUCATIONAL MICROSCOPE.
Price 10*l.*
See leading article in the *Gardeners' Chronicle*, Nov. 24, 1855.
Manufactured by Smith & Beck,
To whom
The Council Medal of the Great Exhibition of 1851, and
The First Class Medal of the Paris Exposition of 1855,
Have been awarded,
"For the excellence of their Microscopes."

An illustrated Pamphlet giving a full description, price, &c., of the Educational Microscope forwarded on receipt of 6 postage stamps.—6, Coleman Street, London.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the strongest, best, and cheapest safeguards extant.

Milner's Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.

Circulars free by post.

MARK YOUR LINEN.

THE PEN SUPERSEDED.—The most easy, permanent, and best method of marking Linen, Silk, Cotton, Coarse Towels, Stockings, Books, or anything else, is with the PATENT ELECTRO-SILVER PLATES. By means of this novel invention a thousand articles can be marked in ten minutes. Any person can easily use them. Initial Plate, 1*s.*; Name Plate, 2*s.*; Set of Numbers, 2*s.*; Crest Plate, 5*s.* Sent free to any part of the kingdom (on receipt of stamps), by the inventor and sole patentee, T. Culleton, Heraldic Engraver to the Queen and Royal Family, 2, Long Acre, one door from St. Martin's Lane.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, Metcalfe, Bingley, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

Caution.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

Metcalfe's ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL, Prescribed with complete confidence by the Faculty for its purity, efficacy, and marked superiority over all other kinds.

It is entirely free from nauseous flavour, and being invariably and carefully submitted to chemical analysis—and only supplied in sealed bottles to preclude subsequent admixture or adulteration—this Oil possesses a guarantee of genuineness and purity offered by no other Cod Liver Oil.

Extract from "THE LANCET," July 29, 1854.

"Dr. de Jongh gives the preference to the Light Brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod Liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT BROWN OIL OVER THE PALE OIL WE FULLY CONCUR.

"We have carefully tested a specimen of the Light Brown Cod Liver Oil prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, & Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold only in bottles, capsuled and labelled with Dr. De Jongh's Signature, without which none are genuine, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. De Jongh's sole Consignees; and by many respectable Chemists in town and country.

Half-pints (10 oz.), 2*s.* 6*d.*; Pints (20 oz.), 4*s.* 9*d.*; Quarts (40 oz.), 9*s.*; IMPERIAL MEASURE.

FOGGY WEATHER.

COLDS, COUGHS, ASTHMA, INFLUENZA, and DISEASES of the CHEST and LUNGS, arise chiefly from alternations of Temperature, and appear to be most peculiar to this climate, especially in damp foggy weather, and during the winter months; while persons of every age and station of life are alike subject to attack.

SPENCER'S PULMONIC ELIXIR

will be found a never-failing source of comfort and ease from suffering; enabling invalids to breathe with freedom during the keenest frost and thickest fog. In fine, it possesses every property which can be beneficial in cases of coughs, colds, asthma, and all complaints of the chests and lungs.

*** Ask for Spencer's Pulmonic Elixir.

Prepared only by T. Roberts & Co., Crane Court, Fleet Street, London; and sold wholesale and retail by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in the Kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each. *** The bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

Now ready, gratis, and postage free,

A LIST OF SURPLUS COPIES OF RECENT WORKS withdrawn from MUDIE'S Select Library, and offered at greatly reduced prices for cash.

CHARLES EDWARD MUDIE, 510, New Oxford Street, London; and 76, Cross Street, Manchester.

LAND DRAINAGE.

MR. BAILEY DENTON, ENGINEER TO THE GENERAL LAND DRAINAGE COMPANY, offers the following publications, which may be had by post (stamps being sent with the order) of W. P. MERCHIM, 20, Parliament Street, London.

1. LAND DRAINAGE AND DRAINAGE SYSTEMS. Second issue (1855), price 3*s.*
"The best practical treatise we have yet seen." *Agricultural Gazette.*—"A very able treatise." *Mark Lane Express.*

2. TABLES OF COST OF LABOUR AND MATERIALS. Price 1*s.* 6*d.* For the Pocket.

3. RELIEF OR SURFACE MODELLING, as Suggestive of Drainage and the Profitable Use of Drainage Waters. Second Edition (1850), price 3*s.* 6*d.* Medals R. A. S. E., 1840, and Exhibition, 1851, were awarded for this method of Modelling.

GENERAL DRAINAGE AND THE DISTRIBUTION OF WATERS. A Paper reprinted from the "Westminster Review" (1842). Price 2*s.* 6*d.*

Also, THE DRAINER'S A LEVEL FOR THE USE OF WORKMEN. Price 32*s.*

Mr. BAILEY DENTON'S engagements do not preclude him from Designing or Superintending the Drainage of Estates on terms to be ascertained of him at No. 52, Parliament Street, London.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

FOR THE BENEFIT OF SUFFERING HUMANITY.—A retired gentleman having cured himself of Deafness, Defect of Sight, and General Debility, after suffering upwards of 25 years, thinks it his duty to make the remedy known for the benefit of the afflicted; he will therefore forward the particulars for the cure of the same on receipt of a twopenny stamped envelope properly directed.—Address Rev. J. JOHNSTONE, 1, Park Terrace, Heavitree, Exeter, Devonshire.

HOLLOWAY'S OINTMENT AND PILLS WONDERFULLY EFFICACIOUS FOR THE CURE OF WOUNDS.—Mr. Woodall, of Barlby, near Selby, was afflicted with an abscess on the back of his neck for a considerable time, and notwithstanding he was under the treatment of a most eminent surgeon in the neighbourhood, yet he could not by the various remedies applied heal the wound. He, therefore, determined on giving Holloway's Ointment and Pills a trial, and by these invaluable medicines alone he has been perfectly cured, and is now in excellent health.—Sold by all Medicine Vendors throughout the world; at Prof. HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODS, Malta.

TO MARKET GARDENERS.

TO BE LET, within two miles of the Ashford Station, on the Windsor and Richmond Railway, a newly-built four-roomed COTTAGE, with Kitchen and Offices, Cowhouse, Piggery, &c., together with a productive Orchard and Garden, and 12 acres of Arable Land, suitable for a Market Garden.—For particulars, apply to C. CHARLES HORNE, Esq., The Grove, Staines, Middlesex.

TO BE LET, on Lease, the FREEHOLD ORNAMENTAL COTTAGE AND SMALL GARDEN, with Goodwill of the Business as LANDSCAPE AND CONSULTING GARDENER, successfully carried on during many years by the late Mr. THOMAS DIGGLES, at Singleton Brook, Higher Broughton, near Manchester.—Apply to Mrs. DIGGLES as above.

N.B. Upwards of an acre of Garden Ground adjoining the above may be obtained by a satisfactory tenant, at a moderate rental.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

TO BE SOLD, at a low price, 60 or 70 very superior FRUITING and SUCCESSION PINE PLANTS, principally Queens. Also 12 dozen pots of Strawberries for forcing, promising an abundant crop. Particulars and prices may be known on application to G. EDWARDS & SON, Nurserymen, Wells, Somerset.

CANNES, SOUTH OF FRANCE.

TO BE SOLD, completely furnished, in one of the warmest, driest, and most healthy and agreeable localities for invalids in all Europe, that beautiful Marine Residence and Grounds known as the CHATEAU ST. GEORGES, fit for the immediate reception of any nobleman's or gentleman's family, and situate one mile west of the town and port of Cannes, within a few minutes walk of the chateau of the Right Hon. Lord Brougham, and 20 miles south-west of Nice. The property faces the Mediterranean, which forms its southern limit, while its northern boundary is the grande route from Italy to Marseilles, from which latter town it is only 14 hours' by posting, or 11 hours' by the steamers, and there are also two diligences daily each way, in connection with the railway from Paris to Marseilles, which is now opened throughout, and the distance is performed each way in 20 hours—total travelling from London to Cannes, 47 hours.—For particulars and viewing plans, apply to Messrs. GREEN, Estate Agents and Auctioneers, 28, Old Bond Street.

Sales by Auction.

EXTRA POULTRY SALE ON WEDNESDAY, 12TH DEC.

MR. J. C. STEVENS begs to notify that he will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on WEDNESDAY, 12th December (being during the week of the London Cattle Show), at 12 o'clock precisely, a selection of first-class POULTRY and PIGEONS, comprising some extraordinary Vulture hocked White Cochins and Black and Buff Cochins, Spanish Dorkings, Bramas, Malays, very choice Gold and Silver-laced Bantams. The Pigeons include some first-rate Carriers and Pouters from Mr. Balt's renowned stud.—Catalogues had by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

PEAR TREES.

CULTIVATED BY MR. DE JONGHE, OF BRUSSELS.

MR. J. C. STEVENS will sell by Auction at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 18th December, at 1 o'clock precisely, 500 PEAR TREES, 3, 4, and 5 years, grafted on Quince and Pear stocks and trained as pyramids and Dwarfs, including the best varieties amongst the hardy novelties cultivated in Belgium, where they are still scarce.—May be viewed on the morning of Sale, and Catalogues had.

IMPORTANT SALE OF DRIED PLANTS.

MR. J. C. STEVENS has received instructions to Sell by Auction at his Great Room, 38, King Street, Covent Garden, during the month of JANUARY next, all the Valuable Collections of DRIED PLANTS, which have been formed by the Travellers employed by the Horticultural Society of London during the last 40 years. The Herbaria consist of the Collections formed by Douglas, Hartweg, Fortune, Forbes, Geo. Don, Parkes, Potts, and others in North America, Mexico, Peru, Brazil, Chili, and other parts of the Globe. Catalogues are in preparation.—38, King Street, Covent Garden, Dec. 8.

IMPORTANT SALE OF DUTCH BULBS,

CONSIGNED FOR ABSOLUTE SALE FROM ONE OF THE PRINCIPAL GROWERS IN HAARLEM.

MESSRS. PROTHEROE AND MORRIS will sell by Auction at the Mart, Bartholomew Lane, on FRIDAY, December 14th, at 12 o'clock, Eight Cases of DUTCH BULBS, comprising 31,000 Crocus, 23,140 Tulips, 4000 Gladiolus, 2300 Iris, 1780 Narcissus, 2000, Anemones, 758 Hyacinths, and 180 Fritillarias, &c.—On view the morning of Sale. Catalogues may be had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, December 13th, at 12 o'clock, a first-class collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Anemones, Crocus, Tulips, Snowdrops, Ranunculuses, Gladiolus, &c.; also a selected assortment of fine Standard and Dwarf Roses, including Hybrids, Bourbons, Chinas, Noisettes, &c.; and American Plants, comprising Hybrid Rhododendrons; Ghent and other Azaleas, Kalmias, Andromeda floribunda, beautifully furnished with bloom buds.—On view the morning of Sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

Just published, the Second Edition, with Additions, price 5s. 6d. cloth,

SCHOOL BOTANY; or, THE RUDIMENTS OF BOTANICAL SCIENCE.

400 Illustrations. 8vo. Price 5s. 6d. half bound.

Bradbury & Evans, 11, Bouverie Street.

Lately Published,

THE ELEMENTS OF BOTANY, Structural and Physiological. With a Glossary of Technical Terms, and numerous Illustrations. 12s. cloth.

This completes the series of Elementary Botanical Works by Professor Lindley, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of The Elements of Botany, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12s.

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5s.

Bradbury & Evans, 11, Bouverie Street.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14s.,

MEDICAL AND ŒCONOMICAL BOTANY; or An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'Vegetable Kingdom' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

Bradbury & Evans, 11, Bouverie Street.

Just published, price 1s. 6d.,

EXPERIENCE IN DRAINING. By Hewitt Davis, Government Inspector and Surveyor under the Drainage Act.—See Farming Essays, No. 3.

London: Longman, Brown, Green, & Longmans.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By John Lindley, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures: such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: Longman, Brown, Green, & Longmans.

Printed by William Bradbury, of No. 13, Upper Woburn Place, and Frederick Mullett Evans, of No. 20, Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be Addressed to the Editor.—Saturday, December 8, 1855.

THE BRIGHTON AND SUSSEX HORTICULTURAL SOCIETY'S EXHIBITIONS OF PLANTS, FLOWERS, and FRUITS, for 1856, are fixed to be held as follows:—The Summer Show, on the 25th and 26th of June, and the Autumn Show on the 3d and 4th of September, on the same grand scale as in former years.

Thomas Attree, Esq., Chairman of the Committee.
E. Spary, Superintendent of the Exhibition.
Edward Carpenter, Secretary.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.
HORTICULTURAL ERECTIONS on the best improved principles.
*** An extensive stock of Fruit Trees, Ornamental Shrubs, Evergreens, Forest Trees, Roses, and Thorns.

NOTICE TO GRAPE AND PINE GROWERS.

SHOULD THIS MEET THE EYE of any party having PINES (not under 2 lbs. each), and GRAPES of both colours to dispose of, they are invited to forward the same immediately to George Taylor, Jun., Fruit Salesman, Grand Stand, St. John's Market, Liverpool.

Good Quality Indispensable.—Terms, *Cash*.

NEW CONIFERÆ AND SPECIMEN EVERGREENS.

RICHARD SMITH has a fine stock of all the best Ornamental EVERGREEN TREES and SHRUBS for Lawns, Shrubberies, or for single specimens.—Priced Lists will be sent on application.—Nurseries, St. John's, Worcester.

STANDARD AND DWARF TRAINED FRUIT TREES.

RICHARD SMITH begs to inform the Trade and the Public generally that he has a fine stock of flat and well trained FRUIT TREES of all the best and most popular sorts (true to name), which he will be happy to sell at very moderate prices.—Priced Lists will be sent on application.

Nurseries, St. John's, Worcester.

PINUS BENTHAMIANA.—The finest plants yet offered of this noble long-leaved hardy PINE. They are from Seed, and from 12 to 18 inches high, 7*s*. 6*d*. each. Price per 100 to the Trade on application.

Hugh Low & Co., Clapton Nurseries, London.

PICEA AMABILIS.—Seedlings of this fine hardy species have been for a long time desirable, as in grandeur of appearance it is scarcely excelled by PICEA NOBILIS. We have much pleasure in offering stout plants, three years old, 6 to 9 inches high, at 31*s*. 6*d*. each.

Hugh Low & Co., Clapton Nurseries, London.

THUJA GIGANTEA.—We are again induced to offer this fine tree during the present planting season. It is from the Upper Waters of the Sacramento (in California), where it attains a height of 140 feet. It has been proved to be perfectly hardy in this country; the foliage is most beautiful, resembling some of the most graceful species of Lycopodium. The plants now on sale are in vigorous health, and average from 10 to 16 inches in height. Price 31*s*. 6*d*. each.

Hugh Low & Co., Upper Clapton Nurseries, London.

27, Great George Street, Westminster.

ROBERT M. STARK begs to intimate that his CATALOGUE of HOLLYHOCKS, ROSES, &c., for the season is now ready. and may be had on application. A variety of rare and interesting plants, including Ferns, has been recently added to his collection. Garden and Flower Seeds of the most approved sorts.

Edinburgh—Edgehill Nursery; and 145, Princes Street.

TO THE SEED TRADE.

ABRAHAM HARDY and SON, Seed Growers, Maldon, Essex, beg to announce that their WHOLESALE PRICED CATALOGUE OF SEEDS and early Potatoes is now ready, and may be had post free on application.—Dec. 15.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.

☞ The Catalogue describes the colohrs of the Rhododendrons.

The American Nursery, Bagshot, Surrey.—Dec. 15.

AMERICAN PLANTS.

WATERER and GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.

Knap Hill Nursery, Woking, Surrey.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.

American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway, where conveyances may be had.

GEORGE JACKMAN begs to state his PRICED CATALOGUE of choice CONIFERS, HARDY EVERGREENS and ORNAMENTAL TREES, which are well grown, and constantly removed, also Roses, Standard, Dwarf, and dwarf-trained Fruit Trees, and Forest Trees, can be had on application by enclosing one Postage Stamp.

G. J. respectfully invites persons planting to pay a visit to his extensive nursery, one and a half mile from Woking Station, South Western Railway, where all trains stop, and conveyances can be had.—Woking Nursery, Woking, Surrey.

FLOWER AND VEGETABLE SEEDS.

JAMES CARTER and CO. beg to announce that they will publish, on 1st January, 1856, their TWENTY-FIRST ANNUAL CATALOGUE OF FLORICULTURAL, VEGETABLE, AND AGRICULTURAL SEEDS, acknowledged to be the most comprehensive yet compact Annual Catalogue of Seeds extant. It has been subjected to a careful and elaborate revision, in order to ensure the greatest possible correctness. Forwarded free of charge, and post paid, upon application.

James Carter & Co., Seedsmen, 238, High Holborn, London.

HARDY HEATHS.

WATERER and GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

NEW BEDDING PLANT.

Double White Petunia "Imperial" (true).

MESSRS. WILLIAM ROLLISSON and SONS can now supply good plants of the above-named at 5*s*. each. This extraordinary, new, and beautiful variety can be strongly recommended, and doubtless will become an universal favourite, both as a bedding and conservatory plant, being of excellent habit, fragrant, and the flowers as double as a Carnation or Gardenia blossom.—The Nurseries, Tooting, London.

TO THE TRADE.

NEW PURE WHITE COLLINSIA.—The price per ounce of this new and beautiful ANNUAL can be had on application.

J. G. Waite, Seed Merchant, 181, High Holborn, London.

NEW TURNIP.
WAITE'S "ECLIPSE," PURPLE TOP YELLOW HYBRID TURNIP.

THIS new and distinct variety is a hybrid between the Purple Top Swede and Purple Top Yellow Scotch Turnip; it possesses the properties of the Swede, and may be sown much later. Coloured Drawings of this splendid Turnip may be had on application, or may be seen at the principal Seed Establishments throughout the kingdom. The Seed can be obtained of all respectable Seedsmen, price 3*s*. per lb.—A liberal allowance to the Trade.

J. G. Waite, Seed Merchant, 181, High Holborn, London.

WAITE'S DANIEL O'ROURKE PEAS.—The best Early Pea in cultivation can be supplied in any quantity, and price had on application to J. G. Waite, Seed Merchant, 181, High Holborn, London.

NEW EARLY PEA.

COTTRELL'S SEBASTOPOL.—The earliest and best Pea cultivated, price on application. Also the New Early Wonder Pea, early as frames and wonderful cropper, large pods. To be had only of Dawe, Cottrell, & Benham, 3, Lawrence Pountney Lane, and 36, Moorgate Street, London.

EARLY PEAS, ETC., ETC.

KENNEDY and KEMPTON respectfully inform their Patrons and Friends that they have just received their Stock of Vegetable and other Seeds, all of this year's growth, from the most eminent Growers.—Address Kennedy & Kempton, Bedford Conservatories, Covent Garden, London.

"GYMNOGRAMMA LEPTOPHYLLA."
Or the Annual Maiden-hair Fern.

BERNARD SAUNDERS, Cæsarean Nursery, Jersey, will be happy to supply six growing plants of the above pretty little Fern, in a small box, postage free, to any amateur wishing to possess it, for 2*s*. 6*d*.—Dec. 15.

CHARLES SHARPE and CO. beg to acquaint the trade that having harvested their stocks of SEEDS they will be glad to forward prices on application.

Nursery and Seed Establishment, Sleaford.—Dec. 15.

NEW DOUBLE WHITE PETUNIA—"IMPERIAL" (true).

CHARLES TURNER will be able to supply strong Plants after the 1st of January of this beautiful new variety, which is as double as an Oleander, and fragrant. Plants 3*s*. 6*d*. each, with a considerable reduction to the trade if a dozen are taken. C. T. begs particularly to recommend it, as it is not only a novelty but also a valuable bedding plant.

Royal Nursery, Slough.

EARLY VEGETABLE SEEDS.—All the Select Kinds for immediate sowing, growth of 1855, may be had of James Carter & Co., Seedsmen, 238, High Holborn, London.

WHEAT FOR LATE AND SPRING SOWING.—Samples with prices of Red Hybrid, Nursery, Browick, and other kinds of Seed Wheat will be sent free on application to Mr. H. Raynbird, Basingstoke.

SCARLET RHODODENDRONS.

J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine bushy Plants of the above 2 to 3 feet high, in Pots, well set with Flower buds.—Price 10*s*. 6*d*. each.

PEARS GRAFTED ON THE QUINCE AS PYRAMIDAL SHAPED TREES.

J. and J. FRASER beg to announce that their Priced List of the above is now published, and may be had post free on application.

J. & J. F. have sold a large number of these Trees for the last three years, and have received numerous letters from gentlemen in the country speaking in very high terms of their productiveness. They can therefore recommend them with greater confidence to the notice of their friends and the public in general.

Lea Bridge Road, Essex.

DUTCH FLOWER ROOTS, GOOD AND CHEAP.

WILLIAM DENYER, Florist, will send out the following for Ten Shillings:—

Myatt's Victoria	30*s*. per 100, or 5*s*. per doz.	
Myatt's Linnæus	30*s*. per 100, or 5*s*.	"
Mitchell's Royal Albert ...	30*s*. per 100, or 5*s*.	"
Howard Prince Albert ...	60*s*. per 100, or 9*s*.	"
Hawke's Champaign	12*s*.	"
Large two year planted Roots for Forcing ...	12*s*.	"
Extra strong SEAKALE Roots for Forcing	10*s*. per 100.	

Apply W. Myatt, Manor Farm, Deptford.—Dec. 15.

BUSBY'S STOCKWOOD GOLDEN HAMBURGH GRAPE.

MESSRS. VEITCH and Son in reply to the many inquiries they are constantly receiving as to when plants of this splendid new Grape will be ready for distribution, and for the information of the public, beg to say that the stock of eyes they have just received from Mr. Busby is sufficiently ample to justify the belief that it will be ready for delivery in the autumn of 1856, at the price previously announced, 21*s*. each. All orders already given have been duly registered, and will be executed strictly in rotation, and the same rule will be observed with reference to all future orders. Consequently the earliest orders will secure the strongest Vines.

Nurseries, Chelsea and Exeter, Dec. 15.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH

GOOD MATERIALS AND WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

FERN CASES, with Ferns complete, suitable for the Drawing Room, from 25*s.* each.

AQUARIUMS, with French polished stands, from 10*s.* each. Vase-shape ditto, on glass pedestal standing 23 inches high, 17 inches diameter, 25*s.*

Extract from *The Cottage Gardener.*

"Fern Shades.—Many delight in seeing their beautiful Ferns introduced into the domestic circle; but without some such protection as these shades it would be impossible to preserve them. The shades of which we speak are glass cylinders with a domed top, which are placed on a glass pot wherein the Ferns have been planted, and they form on a small scale a pretty imitation of a Wardian Case."

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

Kensal Green, Harrow Road, London.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

PUBLIC INVITATION.

HEATING EXTENSIVELY BY ONE BOILER.

JOHN WEEKS & Co., King's Road, Chelsea,

HAVE this Season the pleasure of being able to refer to several other extensive Establishments where they have fixed ONE BOILER to do the same work which hitherto has taken from six to twelve boilers.

All the world knows the highly respectable firm of Messrs. Edward Henderson & Co., of the Wellington Nursery, Wellington Road, St. John's Wood, and as that Establishment is open to the public Messrs. John Weeks & Co.'s Hot-water Apparatus will now have a chance of being fairly tested and impartially represented during this winter. Messrs. Edward Henderson & Co. have now adopted what is called the "One Boiler System." At their extensive Nursery any gentleman or horticulturist can see the Hot-water Apparatus of several extensive ranges of Hothouses, all connected to one boiler. We will here quote Mr. Edward Henderson's own words, showing how he approves of Messrs. J. Weeks & Co.'s system of heating by hot water. He says:

"*I am more than satisfied with the extraordinary results of what* Messrs. John Weeks & Co. *have done for me in heating a great number of our hot-houses from* one boiler. *It is almost impossible for me to express my satisfaction sufficiently strongly. The effect and great saving produced is truly wonderful; less than two sacks of coke in 24 hours is all that is used to heat a variety of hothouses, &c., nearly 800 feet in length, and these various houses are to some extent widely separated, as 300 feet stand in one direction, 150 feet in another, 200 feet in another, and so on, including our large newly laidout winter garden.*"

Messrs. John Weeks & Co. can also refer to several extensive private establishments, where their Hot-water Apparatus can be seen in operation, and in every case with the same favourable results. J. W. & Co. also adhere strictly to all their former statements relating to their one boiler system, and most respectfully solicit a visit to their Garden Establishment at Chelsea, which consists of Hothouses, Greenhouses, Conservatories, Pits, &c., the whole measuring 1000 feet in length, exposing to the atmosphere upwards of 16,000 superficial feet of glass, the whole heated by one boiler, 5 feet high by 3 feet 6 inches in diameter, the water in the various houses circulating through 5000 feet of Hot-water Pipe.

The accompanying sketch represents our improved Upright Tubular Boiler, with hollow furnace bars. The large surface which this Boiler exposes to the immediate action of the fire renders it of such extraordinary power.

John Weeks & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers.

At our two establishments horticultural science is fully carried out in all its branches, combining all the improvements of the day. We have always in stock ready for immediate use a very extensive variety of horticultural erections; also Forcing Pits and Frames of all sizes. See our Illustrated Catalogues on Horticultural Building and Heating by Hot Water; also of all the best Stove and Greenhouse Plants; also of the best Vines, Pines, Peaches, and other Fruit trees.

John Weeks & Co., King's Road, Chelsea.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, Hothouse Builder, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility Gentry, and the Trade, in most of the counties in England.

NEW EARLY MARROW PEAS. Harrison's Glory (blue) & Harrison's Perfection (white.)—These extraordinary Peas, which are nearly similar in habit, are as early as Double-blossomed Frame, about 3 feet in height, full of large pods which cluster from the bottom to the top of the haulm, and are equal in flavour to Knight's Marrow. Samples of the haulm may be seen at the following firms in London, of whom only they can be had, in quart packets at 5s. each:—

Batt, Rutley, & Silverlock, 412, Strand.
Beck, Henderson, & Child, Middle Wharf, Adelphi.
Hurst & M'Mullen, 6, Leadenhall Street.
Minier, Nash, & Nash, 63, Strand.
Noble, Cooper, & Bolton, 152, Fleet Street.
Jacob Wrench & Sons, 39, King William Street, City.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by John Waterer at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

WATERER AND GODFREY respectfully invite the attention of parties engaged in Planting to their fine Stock of the following HARDY ORNAMENTAL TREES, &c.

Araucaria imbricata, 2, 3, 4, 5, 6, 7, and 8 feet high, in quantities, all stocky well grown plants; the larger sizes especially it would be difficult to match.
Cedrus Deodara, 1½, 2, 3, 4, and 5 feet, by the thousand; do. a fine lot of larger, 6, 7, and 8 feet; do. some magnificent Trees, 10 to 15 feet. These are all in a famous condition for Transplanting, having been annually removed.
Cedars of Lebanon, 3, 4, 5, and 6 feet; do. a few splendid Trees, 10 and 12 feet.
Cedars Red Virginian, 5 to 8 feet.
Cedars, variegated white, 2, 3, and 4 feet, one of the handsomest variegated plants we know. We have a large stock. It is extensively planted at Elvaston Castle.
Cryptomeria japonica, fine plants, 4 to 7 feet.
Cupressus macrocarpa or Lambertiana, 3, 4, 5, 6, 7, and 8 feet. Nothing can be handsomer than some of the specimens of this fine hardy plant.
Juniper, Chinese, 2, 3, 4, and 5 feet; a fine lot of large plants, 6 to 8 feet.
Do. Irish, upright, 3, 4, 5, and 6 feet; do. larger, up to 8 and 10 feet. Our stock of the two last mentioned Junipers we believe to be quite unequalled, the Irish especially; the larger sizes are perfect columns.
Do. recurva, 3, 4, 5, up to 8 feet.
Do. hispanica or thurifera, 2, 3, and 4 feet.
Abies Douglasi, 2, 3, and 4 feet. A fine lot of large and very handsome plants, 7, 8, 10, and 12 feet.
Picea nobilis, several hundreds of nice plants, 1½ to 2 feet, well grown, and with good lead. None are grafted. A few taller specimens up to 6 feet.
Do. Nordmanniana, a large quantity of remarkably handsome plants, 1½, 2, 3, and 4 feet. Nothing can exceed the vigour of these plants, and all from seed.
Do. Pinsapo, magnificent plants, 4 to 7 feet high, in perfect health.
Pinus insignis, 1½ to 3 feet; a few good specimens up to 7 feet.
" Lambertiana, from seed, 4, 5, and 6 feet.
" Cembra, 3, 4, 5, up to 10 feet.
" Montezumæ, fine plants, 4 and 5 feet.
" macrocarpa, 2 and 3 feet, from seed.
Weeping Larch, clean, stems good, heads 7 feet high.

The following 10 varieties form a very singular group. They are of dwarf habits; the well known Abies Clanbrasiliana may be taken as the type of the whole. We believe our collection to be quite unique, and, we may add, most interesting.

Pinus strobus pumila (the dwarf Weymouth).
" sylvestris pumila (the dwarf Scotch).

Abies Clanbrasiliana	Abies pumila	All dwarf varieties of the Spruce Fir.
" compacta	" diffusa	
" pygmæa	" Gregori	

Picea pectinata pygmæa (the dwarf Silver Fir), Hudsoni.
Yew, common English, 3, 4, 5, 6, and 7 feet, in large quantities.
Do. upright, Irish, 4, 5, 6, and 7 feet; some splendid plants, 8 to 12 feet.
Do. Dovaston or Weeping, a great many fine plants, worked on straight stems, 7, 8, and 10 feet high, with good heads.
Do. adpressa, 2 and 3 feet.
Do. do., worked on common Yew, as standards.
Do. gold striped, 1½ to 2 feet, by the thousand.
Do. do., a splendid lot of plants, 4 to 6 feet.
Do. do., worked as standards on the common Yew, 8 to 10 ft. high.
Do. do., worked on Irish Yews, 6, 7, and 8 feet high.
Do. elegantissima, or new gold striped; a large quantity, 1½ to 2½ feet, and also worked as standards on the common and Irish Yews. We may safely assert our stock of Golden Yews is unsurpassed.
Do. yellow berried (true), very beautiful when in fruit as we have it, 1½ to 3 feet.
Libocedrus chilensis, 2 to 3 feet, very handsome and bushy.
Thuja Wareana, fine bushes, 3, 4, 5, 6, and 8 feet. This is one of the most useful, and, at the same time, ornamental hardy plants we possess.
Do. American, for hedges, doubtless the very best, 4, 5, and 6 feet.
Do. aurea, or Golden Arbor-vitæ. This plant originated at this Nursery; it has now, as it deserves, become a universal favourite. Our stock of it enables us to offer a choice of many hundred fine specimens, from 1½ to 3 and 4 feet high, and as much through—in fact, perfect globes.
Wellingtonia gigantea, a few of the finest plants in the country, being near 1½ feet high, and as much wide.
Hollies variegated, by the thousand, 2, 3, and 4 feet high. Some splendid Plants, 10 to 15 feet high.

We may here remark with reference to the large specimens alluded to in this Advertisement that every one of them is in a condition to transplant, and travel any distance with perfect safety. They have one and all been annually removed in our Nursery, and in soliciting a personal inspection of our stock, we believe we are justified in stating it offers a choice which is to be found in but few establishments of its kind in this country.

The Nursery may be reached in 40 minutes by Train from the Waterloo Station; and the South Western Railway Company having a Branch on to the North Western, enables us to send plants to all parts, in trucks throughout, without packing and other extensive additions.

Knap Hill Nursery, Woking, Surrey.

DENYER'S NEW PROLIFIC GREEN MARROW PEA.—A fine variety for succeeding the first early Crops. Very hardy, and one of the greatest cropping Peas in cultivation. It obtained the first prize at the Hastings and also at the St. Leonard's Horticultural Exhibitions.

From the Dean of Battle.—"The sample of Peas you sent me surpasses in beauty of colour and richness of flavour any that I have ever met with."

From Mr. Waters, Gardener to Lady Webster, Battle Abbey.—"I have examined the growing stock of your new Pea, and find it crops abundantly, the pods being a good length, very broad, and well filled. It is also a fine flavoured and beautifully green-coloured Pea."

From Mr. Bunyard, Maidstone.—"My opinion of the new Pea is, that it is a distinct sort, a good cropper, and for colour I do not know its equal."

From Mr. Parks, late Nurseryman and Seedsman, Dartford, Kent.—"I am much pleased with your new Pea. It certainly is a very fine cropper. The Peas are large, and the pods completely filled. It will when known become a superior Pea for market."

Price 3s. 6d. per quart. Post Office orders payable to William Denyer, Seedsman, Battle, Sussex. May also be had through the London and other seedsmen.

WALTON NURSERY, LIVERPOOL.

To Noblemen and Gentlemen Planting New Pleasure Grounds, or Improving Parks or Drives, and to Companies Planting Public Parks or Cemeteries.

W. SKIRVING begs to offer his extensive Stock of TREES and SHRUBS of various sizes, adapted either for immediate effect or for extensive new Plantations, where smaller sized and less expensive plants are required. In addition to his general stock of the leading kinds of Trees and Shrubs, which is allowed to be the most extensive in England, he this season offers upwards of a hundred thousand of the two most valuable Trees lately introduced, the ARAUCARIA IMBRICATA and CEDRUS DEODARA, of various sizes, from one to six feet.

W. S. invites any one wanting considerable quantities of Specimen Trees and Shrubs to inspect his collection and obtain prices on the spot, as the mere height of such trees (as quoted in lists) gives no idea of the value of well grown select plants for choice situations.

N.B. A few hundreds of the larger sized and finely shaped plants of the Araucaria imbricata and Cedrus Deodara have been grown in tubs, to secure their travelling in safety to great distances in this country, or to any part abroad.

Priced Lists will be sent on application.

WEST OF ENGLAND HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENT.—*The* Proprietors *have during the past summer considerably enlarged their Offices and Seed Warehouses at a considerable expense, so as to be enabled to execute all orders with regularity and dispatch.*

With increased exertion, redoubled energies, and more assistants, they hope to give the greatest satisfaction to all who honour them with commands.

William E. Rendle & Co., Seed Merchants, Plymouth.

RENDLE'S PRICE CURRENT FOR 1856.

RENDLE'S PRICE CURRENT AND GARDENER'S DIRECTORY FOR 1856, *is just published by Messrs. Simpkin & Marshall and can be obtained through any Bookseller in the United Kingdom, or from the Proprietors,* William E. Rendle & Co., *Seed Merchants, Plymouth, price Sixpence, or free to purchasers of Seeds.*

The present Edition is printed the same size as the "Florist," and will contain 120 pages, and be found even more complete than the former Editions.

It contains a valuable Descriptive List of KITCHEN GARDEN SEEDS, with prices affixed to every article, and in addition to these descriptions there are short and concise cultural remarks for every kind of *Vegetable*, pointing out the best varieties for *Early, Medium*, and *General Crops*.

The List of FLOWER SEEDS has been much improved, and contains descriptions of all the leading sorts, with directions for sowing seeds, and other useful practical remarks; and in this department Mr. Errington has written expressly for the work an original article on ANNUAL AND OTHER FLOWER SEEDS, which will be read with much interest.

The Calendar of Operations for the whole of the year has also been revised, and will be found even more useful than the one in the last edition.

The Almanack is now a prominent feature of the "Price Current," and a page is devoted to every month.

Full detailed lists are given of the quantities and descriptions of seeds sent in the "Collections of Seeds."

The following Original Articles *have also been contributed, for which the Proprietors have to return their sincere acknowledgements.*

FLORICULTURE. By Mr. John Edwards, the Secretary to the National Floricultural Society, and Editor of the "National Garden Almanack."
VEGETABLE FORCING. By Mr. Robert Errington, Gardener to Sir P. Egerton, Oulton Park, Tarporley.
RENDLE'S TANK SYSTEM OF HEATING. By Mr. John Dobson, late Gardener to Mr. Edward Beck, Isleworth.
GRAPE DISEASE AND MILDEW. By Mr. James Cuthill, of Camberwell.
ON NATURAL AND ARTIFICIAL MANURES. By Mr. J. B. Lawes, the celebrated Agricultural Chemist.
ON THE PORTABLE AND MINIATURE FRUIT GARDEN. By Mr. Niven, of the Garden Farm, Drumcondra, near Dublin.
ON THE CULTIVATION OF THE CUCUMBER. By Mr. Joseph Hamilton, Author of the "Hamiltonian System of Pine Growing."
LIST OF A FEW OF THE BEST FRUIT TREES GROWN AT WOOLATON, the seat of Lord Middleton. By Mr. J. Haythorn.
MIGNONETTE, CULTURE OF. By Mr. William Melville, Gardener to the Earl of Roseberry, Dalmeny Park.
NEW AND ECONOMICAL MODE OF HEATING GREENHOUSES, ORCHARD HOUSES, &c. By Mr. Niven, Garden Farm, Drumcondra.
ROTATION OF CROPS. By Mr. Robert Errington.
SELECTION OF KITCHEN GARDEN SEEDS. From the "Scottish Gardener and Magazine of Horticulture and Floriculture."
THE OSAGE ORANGE. Introduction and Cultivation of.

In addition to the above will be given short directions for the CULTIVATION of FLOWER SEEDS, with modes of TESTING their GROWING QUALITIES. Also a descriptive list of all the newest introductions for the present year.

A Description of the CEDRUS DEODARA, with an engraving kindly lent by the proprietors of the "Florist;" and a few remarks on the Dioscorea Batatas, by Samuel Curtis, Esq., the proprietor of Curtis's "Botanical Magazine."

Copies of the above edition can now be obtained through any bookseller in town or country, or from the Proprietors, price 6d. each, or free to all purchasers of seeds.

WILLIAM E. RENDLE & CO.,
Seed Merchants, Plymouth.
Established 1786.

NEW ROSES.

J. AND J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine Standards of the following beautiful NEW ROSES:—

	s.	d.		s.	d.
Belle Lyonnais	5s.	0d.	Vicomtesse Laure de Gironde	5	0
Comtesse d'Orleans ...	5	0	Madame Masson	7	6
" Vaillant	5	0	" Theodore	5	0
General Jacqueminot ...	3	6	" Cambacères	5	0
Gloire de France	3	0	" Vidot	7	6
" de Vitry	5	0	" Hector Jacquin ...	3	6
Madame Guinoiseau ...	3	6	Lord Raglan	5	0
Mademoiselle Aline Gibbon	3	0	Madame Place	5	0
Prince de la Moskowa...	5	0	Panaché d'Orleans	5	0

Souvenir de Madame Lille	3	6	Triomphe de Paris	3	6
			Gloire de Dijon (Tea) ...	3	6

Melanie Willermoz (Tea) ... ... 3s. 6d.

For a full description of the above see Catalogue, which may be had on application.—Dec. 15.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1856 *is now published, and can be obtained through any Bookseller in town or country, price 6d., or from the Proprietors,*

William Edgcumbe Rendle & Co., Union Road, Plymouth.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 15, 1855.

Now that curiosity is excited by the discussion respecting marvellous cases of prolonged vitality in seeds, showers of land shells, and the like, the following abridgment of a paper by Mons. Duméril in a late number of the Comptes rendus will be read with interest, and may give rise to useful reflection.

It appears that a stone mason in the Pas de Calais, at work upon a cornice formed of calcareous stone, made what he thought a curious discovery. While hammering away at the cornice his chisel struck a place softer than the rest and chipped off a fragment of the stone, which laid open a small hole, one half of which fell to the ground and was lost, but the other remained undisturbed. In the space which remained he observed a blackish body speckled with white, looking like a fly which seemed as if enveloped in cobweb or the silky matter of a caterpillar; the whole of this was imprisoned in a true shell. The body was carefully removed and placed on a piece of glass. At first it was taken for the dead remains of some organic body. But presently it exhibited signs of life; wings, the stumps only of which had been visible, expanded by degrees; and the black body, marked by some cross bands of dirty white, became yellow here and there, especially on the thorax and upper posterior portion of the body. It appears that the observation of these phænomena extended over a period of 25 days, when Dr. Danvin, a medical man on the spot, communicated them to the Academy of Sciences, along with a very circumstantial account of the nature of the limestone, which had been quarried above a year before, and worked up (*mise en œuvre*) 18 or 20 days afterwards.

"It is curious," remarked the learned gentleman, "to find vitality thus preserved in the midst of a block of limestone raised from 16 or 17 yards below the surface of the earth. Fortunately the hole in which the living insect was found was far enough below the surface to secure it from destruction by the frost of last winter." And he went on to compare this occurrence with seeds which have germinated after many years, toads found alive in stones, and the like.

When the insect, carefully preserved in a vial, in the midst of cotton wool, was shown to M. Duméril, he recognised it as the common *Odynerus* (or *Vespa*) *muraria*. This and the allied species burrow in sand and clay, or take possession of cavities elsewhere, where they gather together the bodies of spiders and other soft-bodied social insects; although in their perfect state they live only upon the honey of flowers. In the midst of this heap of soft-skinned victims the grub of the wasp is hatched. Let us hope, adds M. Duméril, that the insects thus assiduously collected as food for the young wasp are either dead or rendered insensible before being carried to the hole inhabited by the footless creature eventually to be hatched as a winged insect. "Often I have seen," he adds, "such wasps suddenly strike against the web of a spider in order to bring him out by the unexpected shock, when they seize him by the back, pierce him with their sting, snip off his legs, which remain sticking to the web, and immediately carry him away through the air with a velocity perfectly astonishing." Such are the habits of these solitary wasps.

It is certain that in all cases an egg is first deposited by them in a hole secured against external injury, that in this place the grub finds all the nourishment it wants as soon as it is hatched, and that the parents, before abandoning their young and the food they have stored up for it, carefully close the opening with a solid cement composed of sand or pieces of earth held together by saliva which they

throw up and employ in so smoothing the place as to render it invisible to their many natural enemies.

The grub, furnished with nothing but its jaws, for legs it has none, finds itself in the midst of live animal matter suited for its subsistence, consisting of the mutilated and paralysed bodies of spiders, caterpillars, and the soft larvæ of other insects, which form an abundant larder of fresh meat. Amidst this abundance it undergoes its transformations, changes to a chrysalis, and finally emerges as a perfect wasp, exactly like its provident parents, which, as we have seen, take such good care of it.

Here, then, we have a natural explanation, and let us add a beautiful one, of Dr. Danvin's marvel, which, like many others, when examined by men of sufficient intelligence, turns out to be a natural fact, the whole history of which was perfectly well known to science.

Some weeks since we reported fully upon the experiments made in this country with the Chinese Yam. A short statement by M. Naudin enables us to show what the French have this year accomplished.

We are informed that sets planted in 1854 were raised in the beginning of last November. They had therefore passed the severe winter of 1854-5 in the open ground, without protection, and sustained no injury from the 22 degrees of frost (10° Fahr.) experienced in Paris last January. The question of the hardiness of the plant is thus reduced to certainty.

Six plants taken up on the 2d Nov. and weighed immediately, gave the following result:—

No. 1	... ...	0.340 kilos.
2	... ...	0.260 „
3	... ...	1.260 „
4	... ...	1.640 „
5	... ...	1.535 „
6	... ...	1.500 „
		6.535 „

or above 13¾ lbs., which is equal to rather more than 2 lbs. 4 oz. each root on an average.

The roots were some forked some undivided, owing, as it would seem, to the former having met with stones in the ground; on an average, they were nearly 19 inches long. For the most part they were longer than those grown in 1854.

Experience has again shown that the Chinese Yam should be planted very close. Six or seven inches from plant to plant is enough. They are so long, and form so few side roots that it is more important to get as many of them as possible than to grow them to a great size. Roots 3 or 4 lbs. in weight are by no means the most profitable. They need not be bigger than Carrots, and require no more room than that root. It is however necessary to have them on good high ridges for the sake of getting them up without trouble.

Such seem to be the conclusions of the French, and they coincide sufficiently with our own to render the proper cultivation of this plant no longer a matter of uncertainty. That it is quite hardy seems clear.

Horticulture has sustained a loss by the death of Mons. Pescatore, of Paris. Having some years since acquired the rich collection of Orchids formed by Mons. Quesnel, of Havre, he rapidly increased it till it became the most important in France, if not on the Continent. It was from his Chateau de la Celle de Saint Cloud that were drawn those continued supplies of rare plants which gave so much interest to the late French Exhibition; and to his munificent patronage the Pescatorea, a splendid work named after him, owed its existence. We regret to report that M. Pescatore died the other day in Paris at his house in the Rue de St. Georges, after a long and painful illness.

New Plants.

154. Tecoma velutina.

Among the supposed varieties of Tecoma stans, enumerated by De Candolle, is one called *velutina*, which is evidently the plant now before us. That learned botanist had obtained it from the garden of Parma, but was uncertain whether to refer it to *T. stans* or *mollis*. If the latter has nearly entire leaves as is stated, then it must be different from this in which they are strongly serrated. From the former its soft downy leaves and much larger flowers separate it. Mr. Skinner, who presented its seeds to the Horticultural Society, informs us that it is called Bucaro, and is "one of the finest plants known in Guatemala. Its luxuriance is wonderful; it grows well with a temperature of 68°, but is finest when the thermometer ranges from 75° to 78°." It is certainly a plant of uncommon beauty. Associated with leaves like those of the Ash, but sometimes simple, sometimes ternate, and sometimes pinnate, are great terminal racemes of magnificent yellow flowers, in no respect inferior to those of an Allamanda. Add to this that although a shrub, it was in full flower in nine months from being sown. Mr. Skinner says that it blossoms in Guatemala from bottom to top, and during a large part of the year. Some hundreds of plants have been given away by the Horticultural Society.

ON SOME NEW VARIETIES OF THE SWEET POTATO (BATATAS EDULIS).

(Communicated by Colonel von Siebold).

The sweet Potato or Batatas was already known in the middle of the 16th century. It is a plant of ancient cultivation, originally proceeding from tropical countries. But it gradually overstepped their northern limits, penetrating into various lands of the temperate zone, and we find it cultivated in Carolina, in Japan, and China, in which two last named countries it entirely takes the place of our Potato. It succeeds perfectly within an annual isothermal line of 12° Reaumur (59° Fahrenheit); and northern Spain, the south of France, Italy, Greece, Rumelia, and the lands comprised in the parallel of Constantinople and Tiflis, would prove a second fatherland for it. The Batatas has long been cultivated in Portugal and Spain, and a considerable trade in it is carried on along the coast of Malaga. As a plant of ancient cultivation in a variety of climates, at a greater or less elevation above the sea and in very different soils, the Batatas have necessarily more or less improved. Varieties have been developed suited to warmer or colder climates, and the form and colour of the leaves, flowers, and tubers is, among the Batatas, as diversified as in the Potato itself, which has become gradually diffused over the whole world. Climatological circumstances, and the nature of the soil, have also had their influence on the quality and flavour of the root.

Hitherto we have only known in Europe a few kinds established in Spain and Portugal, and some Isle of France or Guadaloupe varieties, cultivated here and there in the south of France. Some gardeners of Paris and Rouen have raised from them tubers of considerable size and a good flavour. If in our colder climates the culture of the Batatas requires more care than that of the Potato, it is nevertheless well worth the trouble of raising it in our gardens, and in warmer regions it may be planted in the open fields with far more advantage than the Potato; for there the haulms and leaves, which may be cut down several times without injury to the tubers, afford an excellent forage; cattle, pigs, and horses willingly take to the Batatas haulm and grow fat upon it. In St. Domingo it is the chief food of domestic animals; and in Japan, where the arable land, so limited in extent for the overcrowded population, is taken up by the culture of grain and vegetables, the dense foliage of the Batatas is an indispensable fodder for cattle and horses. The young shoots and leaves may be used also as vegetables. The tubers may be eaten, like Potatoes, boiled, roasted, or fried in oil or butter, whilst the unripe roots may be preserved with sugar. Father Manuel Blanco, in his "Flora de Filipinas," says that the country people make of the Camotas (as the Batatas are there called), a kind of chocolate soup, and that the tubers are excellent when roasted before the fire. Parmentier, a member of the Institute of Paris, observes "Les Batatas, en un mot, peuvent se prêter à toutes les formes que le luxe de nos tables a imaginées." The saccharine principle of the Batatas promotes fermentation, and may be used for the preparation of spirituous liquors. The writer of these notes has daily eaten Batatas in Japan for several years; when boiled they are an excellent appendage to the delicious fruit of those regions, and if roasted they rival the best Italian Chesnuts. The Japanese kinds are distinguished by being very mealy, and, boiled in their skins, they burst like our best Potatoes. As as article of food they are all over Japan much more highly prized than the Yams (Dioscorea batatas and D. japonica), which do not boil so mealy and have a mawkish taste, like Scorzoneras and Jerusalem Artichokes.

After repeated attempts for many years, the writer at length succeeded, in the month of June of the present year, in receiving direct from Japan the best varieties of their Batatas, and in multiplying them in the horticultural establishment of Siebold and Co., at Leyden, with so much success, that already in the present autumn strong offsets can be supplied to botanical gardens, nurserymen, and amateur gardeners.

The best sorts of Batatas in Japan are—1, the Satsuma-imo, that is, the Batatas from the district of Satsuma; 2, the Aka-imo, or red skinned; 3, the Siro-imo, or white-skinned; aud 4, the Hanaboke-imo, or Quince-flower-coloured Batatas, that is, of the colour of the flowers of the Cydonia japonica. We now possess in our garden all these four kinds. For all countries which have an isothermal annual and July temperature with that of Japan, the introduction of these improved varieties will be as important as was once the introduction of the Potato from Peru into Europe. For such countries the culture of the Batatas will be more advantageous than that of the Potato, which, it is well known, does not succeed so well in hot climates. But also for climates of a lower annual temperature, say of 8° Reaum. (50° Fahrenheit), these improved sorts may be of great advantage in kitchen gardens. As there are other vegetables which we obtain earlier by sowing them in hot-beds and planting them out in the open air, so can we also prepare the Batatas in hot-beds for their open air cultivation. Experiments made with that view in the Jardin des Plantes at Paris in the end of last century, and latterly in the neighbourhood of New York, have been attended with success. But what has proved the best method is to make offsets from tubers planted very early in hot-beds or in heated plant-houses. For this purpose cuttings are taken from the young shoots and planted out in hot-beds, or in the open air if protected from cold and from the sun. One root will thus supply several hundred offsets. The causing the roots first to shoot in the hot-beds, and then to remove them to the open air, or the cutting up of the root itself, has proved less advantageous, as the abundance of fermenting matter in the roots causes them to rot very easily. Their multiplication by rooted cuttings has been found to be the surest and best method. They like a loose, rather sandy than clayey soil, and require strong manuring. In Japan the soil is manured with decayed fish, and the young plants are copiously watered with a liquid manure carefully prepared from vegetable and animal matter.

We thus recommend our Japanese Batatas to gardeners and agriculturists as a new vegetable; and if we encourage our correspondents in planting them we do it in the persuasion that the culture of the Batatas will be attended with as much advantage as that of other fine vegetables, such as Cauliflowers, Asparagus, Artichokes, &c., and that these our new Japanese kinds, although they may not in our climate form a substitute for the Potato, will nevertheless prove quite as nutritious, and a much more palatable article of food than the Chinese Yam (Dioscorea batatas) now so much recommended as a substitute for the Potato, and, we repeat, will supply our cooks with a most desirable material for made dishes.

PRECAUTIONS TO BE TAKEN IN REARING SEEDLING PEAR TREES.

To prevent confusion in a nursery of seedling fruits, and indeed in collections in general, it is advisable to direct the greatest attention to their cultivation with the view of bringing them into a bearing state before propagating them, or giving away grafts. If, when the period of bearing is at hand, the following characteristics of the tree are observed, viz., a straight, upright, substantial stem, not too tall, branches and shoots somewhat erect, forming, however, tolerably wide angles, a portion of them being furnished with spines and blunt spurs, some of which also appear on the stem and upper parts of the tree, there is a probability of the seedling proving good. If the fruit set well in spring, notwithstanding the frosts and vicissitudes of weather which occur at that season, and if from three to eight flowers of which the truss may be composed shall set as many fruits, there is a probability of its being both hardy and productive. The stalk should have a firm attachment to the spur, so that the fruit may not be readily blown off by the wind. The fruits should be of fine form and good size. Those formed on the stem will always be larger than those on small branches or slender elongated spurs, and will likewise prove of better quality. The fruits from the successive and final gatherings should be carefully marked, in order to ascertain the difference when they come to be tasted, and to discover their mean time of ripening. A single production of fruit and only one tasting are not sufficient for the proper determination of the quality of a variety and its mean period of ripening. Several successive crops in different kinds of soil are necessary in order to appreciate the fertility, quality, and the period of ripening of a new variety.

When in the first year of bearing, vigour, hardiness, and a certain degree of productiveness are observed in a seedling, and when the fruit fulfils the requisite conditions as regards size and flavour (these will be spoken of further on), it is advisable to graft the variety on the Pear stock for dwarfs and standards, and on Quince for Quenouilles.

In order to preserve in the seedling all the qualities above enumerated, it is necessary to take vigorous cuttings (as we have proved in former communications) from the upper part of the seedling tree, and from the shoots nearest the places where fruits were borne.

A graft worked on a strong Pear stock at the height of 6 or 7 feet, and properly treated, will be in a favourable condition for exhibiting in the third, or at all events in the fourth year after grafting, the character of the seedling variety. Nevertheless, the properties, and more especially the form of the fruit, cannot be ascertained with all that degree of certainty which is desirable until the grafted tree, well established and vigorous, in good soil, shall be subjected to a proper system of pruning.

A tall-stemmed Pear stock before being grafted, will have nearly arrived at the age at which it would bear fruit, of some sort, at the part where it is to be worked with a graft taken from that part of the seedling where fruits were first produced. This being the case, it is easy to perceive that the graft will produce wood on which fruit-bearing spurs will be formed in a few years, and that fruit will be produced of perfect form, and as excellent in point of flavour as those of the seedling tree.

A bud inserted near the ground in a Quince stock—if it take, for some varieties do not succeed on that stock—will likewise fruit in the third or fourth year after being worked. On the Quince, the wood of a variety of Pear may acquire a different tinge, but the form of the fruit is generally the same. Occasionally, however, the fruit of some varieties worked on the Quince becomes larger, is produced in greater abundance, and acquires a richer flavour than that grown on the seedling tree. But these are exceptions to the general rule, and may

perhaps be partly attributed to the sort of Quince, for of this there are several varieties, the influence of which on the graft is as varied and decided as that of different varieties of the wild Pear employed for stock. In general but little attention is paid to this circumstance, which, however, is the cause of many of the failures which occur in cultivation, and to an extent which, we think, requires to be noticed in a special article.

The bud, or graft, placed on the lower part of a wilding intended to form a dwarf pyramid, although taken from the upper part of the seedling, must undergo the influence of the young stock on which it is worked, and must produce wood for five or six years before its organs of fructification can be formed. During this interval there is time to ascertain whether the tree is inclined to become a fine dwarf pyramid rather than a tall one. At the end of three or four years we may certainly find out from the more or less vigorous growth of the variety whether it should be classed amongst the sorts which should be trained against a wall, rather than as a pyramid, or whether from its strong growth and hardiness it is adapted for a standard, and for being cultivated on a large scale for orchards.

From what has been stated, it appears that from the time when the tree first comes into bearing till that at which a description of the tree and its fruit can be correctly and definitely made, a period of ten years must elapse; and before a sufficient number of healthy and vigorous trees can be sent out, another interval of five years must be allowed, making altogether 15 years from the time of coming into bearing. Until then, only the raiser and a few privileged friends should taste the fruits. Before a variety sent out to the public can be generally distributed, tried in different localities and in various seasons, and its merits generally ascertained, a period of 20 years will have elapsed from the time of its first fruiting. It was so with the Passe Colmar, Beurré d'Hardenpont [Glou Morceau], Beurré Rance, Urbaniste, Beurré Diel, Beurré Bosc, Marie Louise, Conseiller de la Cour, Josephine de Malines, Soldat Laboureur, Ne plus Meuris, and several others of a more or less recent origin. Such will also be the case with several more modern varieties of which the qualities have been ascertained by competent judges, from several years' production. It is much better, we think, to rely upon the results of careful examinations than to adopt hasty conclusions, not founded on established facts. *J. De Jonghe, Brussels.*

VEGETABLE PATHOLOGY.—No. XCIX.

398. Sphrigosis * (*Rankness*). — That different varieties of the same species possess very different degrees of fertility is a fact universally recognised by cultivators, nor is it less true that different individuals of the same variety, especially where the plants have been raised from seed, exhibit similar peculiarities. Some plants of the Stone Pine, for instance, as stated by Ré, which produces a favourite fruit in Italy, are distinguished by a peculiar green, and by their almost complete unproductiveness. In our more common fruit trees these tendencies may be much amended by adapting the stock properly to the variety, and a further check may be given to over luxuriance by judicious root pruning. Sometimes, however, the evil is of a different description, and depends upon the excessive rankness of particular shoots which increase at the expense of others, are indisposed to bear and destroy that symmetry which is necessary to insure that perfect exposure of the fruit to light and air which is necessary to insure complete success, and which is justly the pride of the cultivator. Where this arises from the excessive development of particular buds, much may be done by the root pruning mentioned above, and by judicious shortening or removal of the shoots, accompanied by timely disbudding; but these rank shoots feeding at the expense of others, and known under various names, as robbers, branches gourmandes, wasserreiser, succhione, &c., do not always arise from the development of normal axillary buds, but from adventitious buds, and in such cases the evil lies still deeper, because they often differ in quality from the normal branches. On the Mulberry tree, for instance, they exhibit sometimes digitate leaves while every other leaf is simple; in other cases they are variegated, while in others they produce smooth branches where the mother plants have thorns, or branches more highly thorny than the matrix.† Such branches besides are naturally inclined to sterility, and bear sometimes a degenerate fruit. They are, in fact, one of the modes in which variations occur in cultivated plants, and sometimes afford objects of cultivation endowed with properties which make their perpetuation useful. What it is which gives them such an extreme degree of luxuriance it may be difficult to say, but their analogy with shoots produced from trees which have been headed down indicates some accidental increase of nutriment at the point of origin of the mother bud, and it is evident that as under ordinary circumstances multitudes of little twigs are checked in their growth, and ultimately perish in consequence of the superior development of neighbouring branches, the production of such shoots, especially where they are numerous, must have a tendency to weaken the more normal portions. It is obvious that the most certain remedy will be to cut off such shoots to their very base, and to disbud every new germ which arises from the new bark which covers the wound, for similar shoots often arise at this point, and if the disposition still continues severe root pruning and abstinence of all manure must be adopted. As the most useful varieties of trees and vegetables arise in general from constitutional debility, it is natural to suppose that where shoots endowed with peculiar properties arise from the over-nutrition of some latent bud, there will be a tendency to revert more or less to the original condition of the plant from whence the variety was derived.

399. Where the stock is naturally more vigorous than the graft, and at the same time there is a natural tendency in it to throw out suckers, adventitious buds are often developed in the stem and roots which, if not timely removed are highly prejudicial to the graft, and may ultimately induce its decay. Though it may be impossible always to overcome this, it is under careless cultivation alone that any real evil can arise. *M. J. B.*

* From σφιγγαω, I am of vigorous growth.

† Meyen believes that Gleditschia macracantha and G. ferox have arisen in this way from G. triacantha. It is, however, believed that these plants are of Chinese and not of American extraction. Both are probably forms of G. sinensis.

TRADE MEMORANDA.

We have often warned the public against the strangers who annually visit this country to sell their spurious horticultural produce; but the warning is in vain. People are too much enamoured of what is strange and novel, and low priced, to resist the temptation to buy. Curiosity, moreover, impels them to part with their coin, although they cannot but feel that it goes in a hopeless venture. Nevertheless, we warn them once more to take care of their pockets, and not to believe one word of the pompous announcements which we find are again resounding from Southampton to Edinburgh.

Home Correspondence.

Comparative Value of the Timber of our two Native Oaks.—In common with every one connected with foresting, I am glad to see that this vexed question is at length to be settled. Have you happened to notice that in Dr. Th. Hartig's work on "Forest Trees," the details are given of an experiment to ascertain the weight of the timber of the two kinds? The results of that trial go far to confirm what you have so often stated regarding the superiority of the white or stalkless-fruited Oak. A tree of each kind was selected of the same age, 130 years, and growing near one another in a close wood on a strong loamy soil with clayey subsoil. The (Rhenish) cubic foot weighed in pounds:—

	White or stalkless-fruited.		Red or stalked-fruited.	
	Fresh.	Thoroughly dried.	Fresh.	Thoroughly dried.
Heart wood from lower end of trunk	63.2	46.4	62.0	39.4
Sap wood from lower end of trunk	57.6	38.7	56.6	33.4
Heart & sap wood from upper end of trunk ...	58.4	44.3	58.0	40.3
Branch wood, 8 in. diam	65.0	42.0	53.5	36.0
" " 5 in. diam	60.5	39.0	55.1	36.8
" " 3 in. diam	58.86	38.4	54.5	32.0

The bark was removed in all cases, and the wood, after being split up thin, was baked in a heat of 60° Reaum. In 1851 some one asked in the *Chronicle* the meaning of the word Durmast: if a reply was given to that question, I have failed to notice it. Is it the name of a place, or is it a descriptive word applied only to the Oak? The last half of the word is apparently Saxon, and mayhap the common German word, dürr, has something to do with the first half. *W. S., Kirkaldy.*

Protection of Wall-fruit Borders.—It is perhaps as desirable that the roots of fruit trees should be shielded from the chilling rains of autumn as that the nascent bloom and foliage should be protected from the nipping

frosts of spring. The prospect of a good yield in the following year is generally admitted to depend much on the wood and roots being well ripened, and early put to rest; but in cold and wet autumns this can hardly be the case, and consequently it has been observed that the crop of the year following such a season is usually a meagre one, and in some cases perhaps an entire failure. Indeed, it may be doubted whether in the majority of autumns in this uncertain climate the roots of fruit trees, at least the more delicate kinds, are so well ripened as they might be; and hence the average produce, one year with another, may be considerably less to say nothing on the point of quality or flavour, than the trees would be capable of yielding if they had the advantage of unchangeably dry autumns to ripen the wood and roots. Would not, moreover, the result and consequence of the wood and buds being more perfectly matured and hardened in autumn be the production of more vigorous blossoms in spring; more certain of setting; more capable of resisting the action of frost, and less susceptible of blight from that or any other cause? But how is protection from unseasonable moisture to be obtained? or, restricting the question to wall-fruit trees, how are the borders to be protected from rain at such times or seasons as it may be desirable that they should be, without depriving the trees of that beneficial element at other times, when it is necessary to their growth and healthful vigour? I think the accompanying plan is calculated to answer this end, and might with advantage be applied to walls having a south, south-west, or south-east aspect, should the expense not be found an obstacle to its adoption. Let W represent the section of the wall facing the south, with the fruit tree trained against it; P is one of a series of posts fixed along the border, at such distance from the wall as it may be desired to protect the roots from rain; R is one of a series of thin rafters or plates of wood fixed in the top of the wall, at the distance of 4, 5, or 6 feet from each other, as may be found most convenient, and fastened in front into the plate or beam that connects the tops of the posts. The axes or pivots of the Venetian boards or shutters S work in these plates, having a motion in the direction indicated by the dotted quadrant; by which means, when shut, they overlap each other in the direction of the wall, and form a close roof, carrying off the rain to the back of the wall. The advantages of this mode of protection are—that, being a permanent structure, not requiring constant removal, much labour is saved; neatly executed and painted, instead of being a deformity, it may be rendered rather an ornamental appendage to a garden—rising in front, it admits light, sun, and air freely to every part of the wall and border; rain may be admitted to, or excluded from, the border, or from any particular portion of it, according as it may be desired; and while undue and excessive moisture is guarded against, the border enjoys the full influence of sun and air; the Venetians being closed, a greater amount of heat may be concentrated on the wall and border and made conducive to the ripening of the fruit and wood; and lastly, by this means protection may be afforded to the spring blossom. *J. H. H.*

Agaricus cepæstipes.—For the purpose of keeping a Vinery damp in summer, I have built on the floor, with loose bricks, square places which are filled with dead leaves, and soaked with water from time to time. It is about three years since the leaves were renewed. The other day I saw, peeping from among the bricks, just on a level with the surface of the leaves, a white Agaric, which expanded into a decided specimen of Agaricus cepæstipes. On referring to Berkeley's description, I see no habitat but "bark beds in stoves." This raises a curious question—Where did my Mushroom come from? I have no bark bed nor stove within a long distance of the shrubbery, from which these leaves were swept. They have also been three or four years in the Vinery without any appearance of this Agaric. Is it possible that if the spores had germinated in the open air, instead of under glass, they might have produced the allied forms known as Agaricus procerus or cristatus? Can we conceive a plant, whose original parent is as old as the creation, inhabiting only artificial glass houses? These are questions easier asked than answered, but still deserving consideration. *G. S.*

Heating.—Your "Constant Reader, Bentley," at page 806, cannot do much with his hot plate, seeing that the utmost effect derivable is only equivalent to 6 feet in length of 4-inch pipe of the same temperature. I propose a very cheap experiment: let him get a sheet iron plate the same area as his chamber, say 30 inches by 30 inches, have 4 or 6 inches of its depth turned upwards in front; lay four half-bricks on his present hot plate, and then slide in this sheet iron plate to within 6 inches or 1 foot of the back of his chamber. My idea is that of splitting his 4-inch aperture into two of 2 inches each. The air of his house would go in at the under side of this new sheet, getting warmed in its passage, and return by the upper channel into the house. I believe this very inexpensive experiment would give him all he could get, but let him not expect too great results; he cannot have more than what adding 3 feet to his flow return pipe would effect. If he tries this will he state the result? *Granta.*

The Osborne Shells.—I am sorry that Mr. Winchester was displeased with the tone of my last communication. I can assure him that I had no intention that it should be considered offensive, neither do I deny the fact that the appearance of these snails may be difficult to account for, more particularly in the absence of any precise description of the spot in which they were found. But Mr. Winchester must bear in mind that before we are asked to believe that these shells came down in a shower of rain, we must have positive proof that they did so. Natural science is surrounded with difficulties of this kind, and I need only refer Mr. Winchester to the admirable communication of Dr. Hooker in your last Number to show how even men of the highest scientific attainments may be deceived by appearances. In the absence of positive proof, the best negative evidence we can get must be used. Mr. Winchester will not entertain the proposition that they came from

beyond the limits of our atmosphere, or that they could by any possibility be retained in a mass of aqueous vapour or clouds; were they then carried by the revolving action of the storm from the ground in which they were located, and removed bodily to the court-yard of her Majesty's palace at Osborne? Why are we asked to believe this? We have heard of no Moss, or detritus, or broken sticks, or tiles, slates, or mortar being found with them. Would the storm have selected the shells alone, and placed them upon the clean, well swept, and poisoned yard? Even supposing that the position of the court-yard were such as to forbid the supposition of their being out on a feeding excursion, as suggested in my former communication, there are many other roads open to solve the question before we arrive at the improbable or non-natural. Are there no trees, or tops of walls, or roofs to the house from which they could have been swept by the wind? No crevices in the slates—no gutter to carry off the water from the court-yard, by which they might have found ingress? Why choose the most difficult when there are so many more probable modes of solving the question? Mr. W. says they were not in the court half-an-hour before they were found. Were they looked for? Why, they were not 3 lines long and hardly 1 broad. How easy then to have escaped detection! Mr. W. says I have not accounted for the dead shells. A little reflection will tell him that if they were carried up by a whirlwind, and deposited like rain by their specific gravity, that the live and dead shells ought not to be found together. To a casual observer, however, live shells might easily be mistaken for dead ones, because the mollusk will sometimes not stir for a long time, and you cannot always see it when coiled up. They certainly did not take an excursion and "leave their shells behind them," for the mollusk never separates from its shell. I hope Mr. Winchester will find out the whole matter. I am glad to find he has taken up the study of natural history. Let him go into the nearest wood at Osborne and collect carefully a quantity of Moss from the ground, and place it in a bag. When he gets home let him shake it a little at a time on to a sheet of white paper, and look at the detritus which falls thereon through a magnifying glass. He will not only find Zua lubrica, but probably Helix pygmea and aculeata (a most beautiful little shell, covered with little spines), Azeca tridens, Achatina acicula, Pupa edentula, &c., &c. The examination will well repay the trouble. *C. R. Bree, Stricklands, Dec.* 10.

Growing Vines in Pots.—The following remarks on this subject carefully carried out will be found to produce satisfactory results. The first week in January select eyes from well-ripened wood, fill a few shallow pots, or seed-pans, with a mixture of two parts turfy loam, one part peat and a little leaf mould; in each pot insert 10 or 12 eyes, plunging them in a bottom-heat of 90°, maintaining a moist atmosphere, and keeping the top-heat at from 68° to 72°. In four weeks' time they will have emitted roots sufficient to enable them to be potted singly in 4-inch pots; secure good drainage, and let the compost be as before, except that farm manure should be substituted for leaf soil. Plunge them in the same bottom-heat and as near the glass as circumstances will admit; syringe lightly a few mornings, and let the night temperature range from 65° to 70°, with an advance of from 5° to 8° during the day, when air must be admitted to insure a strong, robust, yet short-jointed growth. The shoots will be two feet long by the first week in March, tie them carefully, and repotting will also be necessary, but before doing so see that the roots are in a moist state; shift into a 9-inch pot, and plunge again in bottom heat, letting the atmospheric heat range from 68° to 72°; syringe also in fine afternoons; from this period never allow the house to be closed. The air during night should be admitted through small iron ventilators in the front wall, and it should come in contact with the heating apparatus, so as to prevent cold draughts; increase the amount of air as soon as the thermometer rises 3° or 4° in the morning. The plants will now grow vigorously; attend to pinching laterals, leaving one leaf, and stop all tendrils; the latter, if neglected a few days, will cling to adjacent Vines, and often cause the plants to lose their leaders, which I have proved to be highly injurious instead of beneficial, although some recommended them to be stopped two or three times during their growth. About the second week in April the shoots will be from 4 to 5 feet long, transfer the plants then to their fruiting pots, which should be 16 inches in diameter, but 1 inch more or less is immaterial. Let the compost be 3 parts strong turfy loam, 1 part good farm manure, to which add a small quantity of bruised bones. The bottom-heat may now be permitted to decline gradually to 80°; stop the leader when 7 feet long; allow the laterals to ramble a little, which will tend to strengthen the Vines. At the same time freely admit light and air; water alternately with liquid manure and clear water; when the Vine begins to change colour remove part of the laterals; keep the foliage clean and healthy, and by the beginning of July the wood will be ripened, then remove the remaining laterals. Transfer the Vines carefully to a south aspect in the framing ground, or other convenient place. Set the pots on coal ashes, or on a piece of slate or other flat surface, mulching with Moss or Fern, and they may remain there until the end of September; then lay them on their sides, and in October, when convenient, prune and dress them with sulphur, soft soap, lime, &c.; place them on their sides in some hole or corner, covering with straw until the third week in November, then remove the loose soil, top-dress with equal parts turfy loam and farm manure, introduce them to the forcing-house, and plunge them in a bottom-heat of 70°. Let the atmospheric heat be from 50° to 55°; syringe daily 2 or 3 times; give air freely on all favourable opportunities, to insure the buds breaking strongly about the end of December, then raise the temperature gradually 5°, both bottom and top; syringe in fine mornings, but be careful to get the foliage dry before sunset; stop the shoots one joint above the fruit, selecting 6 or 8 of the strongest and disbud all others. They will be in flower by the first week in February. Maintain a dry temperature not lower than 65° at night, advancing 10° during the day. Keep the air in motion, shake the Vines two or three times daily until set, maintain a moist growing atmosphere, syringing no more over head. In many instances there will be two or three bunches on one shoot, but leave only the largest, you will have six or eight bunches on each Vine weighing as many lbs. Thin the berries well, be liberal with manure-water, preferring that from sheep-dung gathered from the pasture. They will show signs of colouring about the end of March. Diminish the moisture as usual at this stage, and give air freely. The fruit will be ripe by the second week in May, when you may expect an abundant crop, good in quality, and in the brief period of 16 months. Black Hamburgh and Muscat of Alexandria will give the greatest satisfaction. *Archd. Henderson, Gardener to W. C. Hemming, Esq., Spring Grove, Bewdley.*

Holly Plunder.—If it comes within the scope of your Paper I wish you would call attention to the subject of Holly. At this season of the year no tree bearing berries within 30 miles of London is safe; the owners must either watch them at night or expect to find them mutilated or destroyed. The plunder has become quite wholesale. Parties go about with horse, cart, and saw; the trees are marked in the day, and before the following morning they are cut to pieces and deposited in Covent Garden Market. It may be said I think that the whole trade is one of robbery, and if you called attention to this it might cause the police to interfere, and save from destruction thousands of trees which at this moment are unusually loaded with berries. *J. B. Lawes.* [Certainly the police are responsible for this sort of robbery. We protect ourselves with spring guns.]

Knives.—I send you a drawing of a knife that I have used many years, and for general purposes I have not seen one I think to supersede it; the length altogether is 8 inches, the thickness of the back and rivet 3-16ths of an inch; the haft is the root of some kind of tree, and perfectly round, smooth, and easy to the hand. There are three sizes of them, one larger and one smaller than the one figured, and manufactured by Holmes & Son, Rotten Row, Derby; it is, however, many years since I bought it there, and I do not know if the same party still continues to manufacture them or not. Their strength is such that they will stand almost any kind of work, and not clumsy either. *Rich. Rilott, Nurseryman, Donington, by Spalding, Nov.* 29. [The pattern of this knife is a good one; though we should say that the blade was a full 16th of an inch too narrow near the point.]

Societies.

Linnean, *Dec.* 4.—The President in the chair. J. F. Champion, Esq., D. Anbury, jun., Esq., R. Halme, Esq., J. Lee, Esq., L.L.D., Lester Lester, Esq., and J. Townley, Esq., were elected Fellows. Among the presents were a series of 65 coloured drawings by native artists of Indian plants and animals, prepared for the late Sir E. Impey, and presented by Mrs. Impey, through Col. Sir P. Cautley, C.B.; also photographs of 10 species of British Ferns, by Mrs. Glaisher, presented by Mr. E. Newman; and Dr. Hooker's beautiful illustrations of Himalayan plants. The following papers were read:—1. Extracts of two letters addressed to the President by H. Evans, Esq., of Darley Abbey, near Derby, relative to seals killed by him on the western coast of Ireland. 2. Supplementary observations on some genera and species of Balanophoreæ, by Dr. Hooker. The paper formed a continuation of Dr. Hooker's monograph on the structure and affinities of this order, and consisted of observations on the species of Mystropetalon, and Cynomorium.

Entomological, *December* 3. J. Curtis, Esq., F.L.S., President, in the chair.—Donations of entomological works from the Entomological Society, Professor Leuckhart, the Society of Arts, &c., were announced. A notice of a curious species of thrips collected in India by Captain Hamilton in jungle, was communicated by Mr. Newman, who also described a considerable number of minute moths captured in the province of Victoria, New South Wales, by Mr. Oxley, the majority of which were very similar in structure and colour to those of our own country, with the addition of a distinct new genus, to which the name of Boydia hispidella was given. Mr. Newman also communicated a note on the habits of the common prawn observed in Mr. Warrington's marine vivarium, with a view to disprove the opinions which have been entertained respecting the use of the antennæ, which Mr. Newman regarded as organs of smelling. Mr. Edwin Shepherd exhibited a fine pair of the beautiful Trochilium scoliæforme, a species not previously known to inhabit this country, and which were captured in North Wales, near Llangollen, during the past summer by Mr. Ashworth. The president read notes accompanied by beautiful drawings of the following rare insects:—Hygrotus bisulcatus, Curtis (described in the Annals of Natural History, still unique); Apion Curtisii of Kirby's manuscripts, which had remained unique until found at Little Hampton and Bury Hill, near Arundel, by Mr. S. Stevens; a remarkable variety of Vanessa Urticæ, from Hampstead; a singular variety of a Sphinx larva supposed to be that of S. celera; and notes on the genus Conops. Mr. Stainton read some remarks on the spirit with which scientific books should be read and studied. Mr. S. Stevens exhibited various beautiful Lepidoptera sent by Mr. Plant from Natal, together with drawings of their transformations. Mr. Plant also made some observations on the habits of the Paussidæ, which he had observed in ants' nests, where, contrary to the received opinion, they appeared to be strictly guarded as prisoners, and not voluntary guests.

Notices of Books.

Popular Astronomy. By François Arago. Translated from the original, and edited by Admiral W. H. Smyth and Robert Grant, Esq., in 2 vols. Vol. 1. Longmans. 8vo. pp. 707.

It is not often that men so well versed in science as the late M. Arago will condescend to attempt to impart to those who know nothing of the matter anything like satisfactory knowledge. Such men usually address themselves to persons already more or less well acquainted with what they themselves so well know. According to some it is impossible to popularise science; according to others science popularised is science degraded. Far different, however, were the views taken by the highly gifted author of the remarkable book before us. His steady aim was to spread a knowledge of the science of which he was so great a master amongst those who had had no such education as by astronomers in general was thought absolutely indispensable to its study.

In his introductory address delivered in 1846, M. Arago said that it was a great, a solemn experiment which he and his hearers were about to continue together. The experiment was made. A course of lectures was given, the necessity of any previous mathematical knowledge was expressly disclaimed, and nothing was taken for granted by the lecturer. A similar course had been given before and was given afterwards, and the substance of 18 courses delivered in 18 consecutive years is now laid before the public in the work of which the first volume is already translated. The work in its present form demands, it is true, no knowledge of mathematics, but any person who does not possess such knowledge must proceed step by step, and must concentrate his whole attention on each step as he advances. The first book sets forth certain ideas on geometry necessary to the understanding of what follows. Then there is a book on mechanics and horology; after that come the elements of optics, and lastly we have the great treatise on astronomy. Every proposition is stated with great clearness, and every step which is made is a logical deduction from what has preceded. The reader, moreover, has not to rest contented with vague generalities; the whole subject is gone into in detail, and even curious speculations are not passed unnoticed. The following is the great astronomer's mode of dealing with the question,—Is the sun inhabited?

"If this question were simply proposed to me, 'Is the sun inhabited?' I should reply, 'that I know nothing about the matter.' But let any one ask of me if the sun can be inhabited by beings organised in a manner analogous to those which people our globe, and I hesitate not to reply in the affirmative. The existence in the sun of a central obscure nucleus, enveloped in an opaque atmosphere far beyond which the luminous atmosphere exists, is by no means opposed in effect to such a conception. Herschel thought that the sun is inhabited. According to him, if the depth of the solar atmosphere in which the luminous chemical action operates should amount to a million of leagues, it is not necessary that the brightness at each point should surpass that of an ordinary aurora borealis. In any case the arguments upon which the great astronomer relies, in order to prove that the solar nucleus may not be very hot, notwithstanding the incandescence of the atmosphere, are neither the only nor the best that might be adduced. The direct observation, made by Father Secchi, of the depression of temperature which the points of the solar disc experience wherein the spots appear, is in this respect more important than any reasoning whatever.

"Dr. Elliott had maintained, as early as the year 1787, that the light of the sun arose from what he called a dense and universal twilight. He further believed, with certain ancient philosophers, that the sun might be inhabited. When the Doctor was brought before the Old Bailey, for having occasioned the death of Miss Boydell, his friends, Dr. Simmons among others, maintained that he was mad, and thought that they could prove it abundantly by showing the writings wherein the opinions which we have just cited were found developed. The conceptions of a madman are in the present day generally adopted. The anecdote appears to me to be worthy of figuring in the history of science. I am indebted for it to the article on Astronomy by Dr. Brewster, inserted in the 'Edinburgh Encyclopedia.'"

The translation we need hardly add is excellent, and if, as we hope, the second volume has an ample index, the public will at last be in possession of what has long been wanted—an admirable work on astronomy fitted for persons besides those already well acquainted with the subject.

Garden Memoranda.

Harleston Hall, near Grantham, the Seat of —— Gregory, Esq.—The educated and refined taste of the late Mr. Gregory Gregory was employed not only in the erection of his princely mansion at Harleston, but in the building and embellishment of the cottages of his more humble neighbours and tenants. The present road to the Hall is through the village of Harleston, and the attention of the visitor is immediately arrested by the many picturesque examples of cottage architecture situated in the village. In deviating from the ordinary, and by no means attractive style of cottage, usually built for our agricultural labourers, Mr. Gregory has not interfered with the comfort of the cottager, or in attempts at improvement, merged into extravagant or injudicious decoration. The cottages are good substantial structures, of varied rustic character, and are pleasingly and irregularly disposed throughout the village; most of them are characterised by the picturesque addition of porches, over which handsome climbing plants are trained, and fronting many of these cottages are the old-fashioned draw-wells, contrived by the elegance of their construction to lend a picturesque feature to the trim and well kept gardens which we see on every side.

Entering the domain from the village, we shortly reach the kitchen garden, which occupies a very prominent position by the road leading to the Hall. In ordinary cases that portion of a garden devoted to the cultivation of fruit and vegetables is put out of sight as much as possible; Mr. Gregory took a novel view of that arrangement, and determined upon giving to that department of his garden, which should be of the first interest and utility, not only a prominent position, but adequate architectural embellishment, so that it should maintain the peculiar character of the mansion, and be worthy of the purpose to which it was devoted. Accordingly we find extraordinary architectural features introduced into the garden; amongst the most noticeable are numerous massive piers richly ornamented with carved Ancaster stone, which relieve the height of the walls, and give great character and grandeur to the garden—the embellishment of the walls with stone—the worked conical copings—stone niches—the great height of the walls—and the peculiar plan of the garden. Viewed as an attempt to give a new and important character to a kitchen garden, it is certainly of great interest and stands unique in garden architecture.

COTTAGE AT HARLESTON.

The first deviation from the customary style of kitchen garden construction is observable in the peculiar form of the garden, which is pentagonal in its arrangement. The outer walls are 20 feet in height, and are elegantly coped with stone; they are constructed with flues to heat the whole extent of wall; the panels of the wall fronting the approach road are faced with stone. On the south-west side of the garden a semicircular arrangement of massive and ornamental stone piers projects from the garden, the spaces are protected with iron railings, and in the centre is a gateway intended as the principal entrance. Within the garden there is a second wall 18 feet in height, which assumes the same shape as the external wall. The garden is intersected with straight walks, radiating from this central entrance; the walks necessarily pierce the interior wall, and at the point of intersection the ends of the walls terminate in three successive massive piers richly embellished with stone; between the two last, and on each side of the walk are elaborately carved stone niches intended for vases or statues.

Borders appropriated to flowers are on each side of the principal walk; this conducts us to the forcing-houses, situated at the north extremity of the garden, but which, owing to the peculiar plan of the garden, are not seen from the entrance. The range of houses (not including the temporary structures which are at present employed in connection with it) consists of three principal Vineries, 50 feet in length each; these are of very light and elegant construction; the sashes are of copper, like the Frogmore houses, but there are no sliding lights to the houses, ventilation being secured by a clever arrangement of ventilators in the back wall; there are recesses in the back wall that Vines planted there may be retarded while forcing is going on in the house; this arrangement must often prove advantageous. The Vines in these houses are remarkably vigorous and fruitful. Mr. Wade has been very succesful in fruiting the Gromier du Cantal Grape, which is much liked by his employers. The Frontignans have been remarkably good; the Hamburghs, Muscats, and St. Peters' are very fine and well ripened. We remarked a very excellent Black Grape as large as the Hamburgh—very distinct in foliage, which Mr. Wade calls one of the varieties of West's St. Peter's; the same Grape is grown and esteemed in the neighbourhood under the name of the Black Alicant. Whatever the name it is certainly a most valuable variety; it keeps as long as the St. Peter's Grape, is very fruitful and handsome. The range is extended and embellished by a central structure, built to allow the introduction of specimen plants, or to afford a resting place for visitors.

Behind the range of houses are sheds, Mushroom houses, &c., &c., and a large space of ground intended as a framing ground. Returning through the kitchen garden we remark the healthy and vigorous condition of the wall trees. Mr. Wade employs the materials from some old glass structures to cover some of the Peach trees. Great variety of aspect is secured by the arrangement of the walls, and very great upward space is secured to the trees. The natural soil of the garden is dry, but it has been brought into excellent condition by the introduction of fresh soil. Leaving the kitchen garden we enter the road leading upward to the Hall, which is distant about a quarter of a mile.

A short distance from the kitchen garden a lodge of very beautiful design and workmanship spans the approach road; this is also built of Ancaster stone. Proceeding towards the hall, which is built on the slope of a hill facing to the north, we enter by a straight road the grand court, and the extent, magnificence, and finished beauty of detail of the noble building becomes strikingly evident. The late Mr. Gregory was well versed in the architectural riches of his own as well as other countries, and he has borrowed the most beautiful features from our finest Elizabethan mansions, and embodied them in the construction of the present splendid example of that picturesque style of building. On each side of the entrance gates—which are of wrought iron, and of great beauty—are handsome stone lodges, richly embellished with carved stonework; a wing of the building runs down the east side of the court, a superb flanking tower stands at the angle of the west side. The centre of the court is laid down with turf, protected by massive iron posts, and the space in the angles of the court is raised and planted with Berberis aquifolium; a very fine effect is obtained from the large masses of this handsome evergreen, heightened just now by rich clusters of its purple berries peeping from its dark green foliage.

Leaving the court, we ascend to view the private gardens by flights of steps, guarded by a balustrade ornamented with vases, and lions couchant in white marble. We gain first the bowling-green, which is the commencement of a number of successive terrace flats cut out of the slope of the hill; numerous stone seats are arranged about the green, and a tower, corresponding to the court tower, flanks its extreme west angle. A second flight of steps conducts us to a level space of considerable extent, traversed by broad walks; quaint flower beds are cut out on the turf; a bank of evergreens bounds this garden to the west. Flights of steps, with an excellent contrivance for vases independent of the balustrade, pierce this screen of shrubs, and passing up a sheltered walk, bounded by borders rich in herbaceous and spring-blooming plants, we again ascend steps which lead us to a tower commanding views of the Hall, gardens, and a great extent of level country adjoining the vale of Belvoir. Belvoir Castle is also a prominent feature in the landscape west of the Hall. Near this tower is an Italian garden, in which is a curious stone framework for climbing plants. From this point we pass along the face of the hill, which now dominates the mansion, and is cut into slopes and terraces, some of the former covered with Ivy, others with Berberis aquifolium, and attaining a majestic square terrace we have an opportunity of inspecting the south front of this magnificent mansion; new features of beauty and interest are seen, and we can better realise the great extent of the Hall from this point of view. We should add that the building is entirely constructed of Ancaster stone. The terrace from which this view is obtained is of elegant proportions, and exhibits great constructive skill. It may be called the fountain terrace, that character being given it by a beautiful white marble fountain placed in the centre. The terrace is further embellished with marble vases, and is accessible from the mansion by two flights of steps. At the base of this structure is a second terrace, on which is placed an immense sculptured marble stand for flowers and numerous vases.

The conservatory is on the south-west angle of the Hall and adjoins it. The character of the mansion is preserved as much as possible in its construction. There are five divisions in the conservatory, one for Palms, a second for stove plants of another character, a third for Orchids, and departments for Camellias, Orange trees, and greenhouse plants. The interior arrangements are as yet incomplete. The idea of subdividing a conservatory and appropriating the divisions to as many classes of plants, is novel and excellent. It gives the gardener an immediate opportunity of exhibiting plants of every class to his employer, who, as in this case, can step at once from his drawing-room to inspect them. To complete our inspection of the garden, we reascend the terrace steps, and passing up the abrupt slope, fashioned into terraces, we reach a walk nearly at the crest of the hill, by the side of which are clipped Yew trees; this walk leads to others in the wood which crowns the hill, and into which it was the intention of Mr. Gregory to have extended the pleasure-grounds. The view from this elevated position, embracing the Hal., the various towers, terraces, and gardens merging off into a distant and diversified landscape, forms a picture unsurpassed in its way by any view we are acquainted with.

A very beautiful building, calculated by its style and embellishments to carry out the character and magnitude of the place, is situated a short distance to the east of the Hall; it contains the stables, coach-houses, and residences for persons in that department; it is most conveniently situated, and sufficiently concealed by a wood which here approaches the Hall. The interior arrangements and conveniences of the Hall are commensurate with its external grandeur, the same excellent taste pervades everything. The banqueting-hall is said to be the finest in the kingdom; the grand staircase is the most remarkable and gorgeous thing of the kind in existence. For many years Harleston was denied to visitors; the present proprietor, who is proceeding with the work left incomplete by the death of his lamented predecessor, kindly permitted, during the last summer, the Hall to be shown one day in the week, and very many curious visitors availed themselves of a long-coveted privilege. No one visiting Harleston should fail to see the old manor-house which is on the estate. It is extremely picturesque, and indubitably one of the most ancient manorial halls in England.

FLORICULTURE.

The Chrysanthemums in the Temple Gardens have this year been the subject of universal admiration, showing that with proper skill and care a magnificent display of these gay flowering plants may be had every autumn in perfection for weeks together, even under the murky atmosphere of London. Time was, we are told, when red and white Roses bloomed profusely in these venerable gardens. If Mr. Broome, the gardener, has failed to flower these now as in days gone by, he at least manages annually to produce an excellent substitute in the shape of a glorious display of Chrysanthemums. How this is effected the following memoranda, kindly furnished to us by Mr. Broome, will explain:—The plants are all taken out of the ground after they have done blooming, and put in by the heels till spring. The borders are then dug up from 18 inches to 2 feet deep, taking care to throw the bottom spit or subsoil on the top. Six inches under the top from 3 to 4 inches of cow dung is put; this serves as a mulching to retain the moisture in the hot summer months better than anything else, and keeps a good foliage on the plants. The old roots are next divided, and the strongest suckers planted singly. This operation is performed at the latter end of March and April. As soon as they grow up to 9 or 10 inches they are pegged down, and kept in that condition till the middle of August. This keeps them short, and allows annuals and summer flowering plants to grow between them. Mr. Broome then begins to take off all lateral shoots as soon as they are formed, and continues to do so till they show their crown bud. He then disbuds them, choosing the best and healthiest bud for flowering. By the latter end of August the roots have found their way to the surface of the ground; from 3 to 4 inches of rotten dung or rich mould are then laid on the top, taking care to supply the plants with plenty of water daily, which is best done in the evenings, as it prevents them from flagging during hot sunshine on the following day. It must be borne in mind that this treatment is for specimen plants, with not more than three or four blooms on one stem. Plants not grown for the sake of large flowers or for specimens are planted singly, but their laterals are not removed; they are, however, treated in all other respects the same, except the disbudding. If grown in pots, for ornamenting the greenhouse, they should be treated as Pompones are managed. The latter are found to require more protection from frost than the large-flowering kinds. They are, therefore usually

covered over with a little leaf mould or litter till March. As soon as they grow 4 or 5 inches the suckers are removed, choosing the best, and put in 6-inch pots. When rooted, and 7 or 8 inches high, the heart is taken out with the thumb, being careful not to remove more than just the very heart, which leaves two or three joints more than if pinched off in the usual way. As soon as they throw out laterals 4 or 5 inches they are taken out again in the same way. If these can be stopped twice all the better, but it should never be done later than the beginning of September. Single plants in pots are preferred, as they bloom better and do not throw up so many suckers to rob the mother plant. Cuttings struck in March do quite as well as suckers, if not better. As soon as the plants in the 6-inch pots are well rooted, they are removed into large ones, where they are to bloom, taking particular care to supply them with plenty of water. If this is neglected two or three times, they lose their foliage, and flower scantily and bad. When the pot is well filled with roots, liquid manure is given and continued at short intervals till they bloom. The liquid used is the slops of the house, such as soap-suds and those of the chamber, diluted with water 70 per cent. At first it is used twice a week, gradually increasing it till at length it is given every day, *i. e.* when they show bud. It should by no means be put on too strong, as it causes the plant to grow rank and coarse, and to bloom indifferently. The compost used for potting is strong loam with plenty of oyster-shells pounded small mixed with it. If the latter are not to be got a little leaf-mould may be used. Cuttings struck in September will bloom in December for late flowering. The names of such varieties as succeed best out of doors will be given next week.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c. — Now that winterly weather appears to have fairly set in, let this house be kept as gay as the resources at command will admit, and everything about it perfectly clean and neat, for the show-house is more attractive, and likely to be more closely scrutinised in severe weather when the out-door gardens are devoid of interest than at any other period of the year; therefore every plant in bloom that can safely be trusted in this house should be brought here, and no labour spared that may be necessary to have every leaf, pot, bed, or border perfectly clean; and, if not already done this autumn, the woodwork, glass, and walls, &c., should also be thoroughly cleaned. Orange trees, or any other plants that may not have been recently potted should have a little of the top soil removed, and be top-dressed with light rich soil, so as to give the surface of the balls a fresh clean appearance; and the house must be carefully gone over every morning, removing all decaying flowers and leaves, &c. Indeed, the same attention ought to be bestowed upon this house in the way of keeping everything in it clean and neat, as if it were the principal room in the mansion, especially at this season. But to keep a house well furnished with handsome plants in bloom at this season, and everything about it in perfect order, is an impossibility where there is not sufficient accommodation for growing plants, and also an ample command of labour, and it is very frequently the case that the show-house is much too large in proportion to the accommodation for growing plants with which to furnish it. And where this is the case it will generally be found good policy to secure a tolerable display for the winter season, if at the expense of keeping the house somewhat bare when flowers are plentiful out-of-doors, and if plants in flower are scarce their effect will be greatly enhanced by proper arrangement, and strict attention to order and cleanliness.

FLOWER GARDEN AND SHRUBBERIES.

In the present state of the weather little can be done here beyond the preparation of composts and wheeling these and manure upon the places where they will be wanted. Roses that are perfectly hardy may be pruned, and if any of the shrubberies want thinning this may also be done. See to getting a good stock of pegs, stakes, labels, &c., ready, and put past in sizes ready for use whenever they may be wanted. Also get the whole stock of pots used for bedding stock washed, if not already done, so that there may be the least possible hindrance with these little matters when the busy season comes. Look carefully to the stock of bedding plants in cold pits, keeping them well covered up against frost, and giving air whenever the weather will allow.

FORCING DEPARTMENT.

Pineries.—Where the bottom-heat is wholly dependant upon tan or other fermenting material it is very apt to decline too much at this season, when the temperature of the atmosphere is being kept rather low. And if this is found to be the case a few inches of fresh tan should be put on the surface, which will generally be found sufficient, but if the beds have not been renewed lately, and have got worn out, it will probably be necessary to remove the plants and add a considerable quantity of tan or leaves. Where shed room can be spared, a quantity of tan should always be kept in readiness for such work in winter, as if used fresh from the tan-yard it is almost certain to starve the roots before fermentation commences, and then heats too violently. Let no trouble be spared, however, which circumstances may render necessary to secure a steady bottom heat so as to preserve the roots in health, for if the roots get injured it will be in vain to expect the plants to make vigorous growth in spring. Be especially careful of those expected to start into fruit soon, for if the roots of these are injured now there will be little chance of getting the fruit to swell well. Vineries.— Use fire-heat sparingly in houses where the fruit is ripe, but sufficient must be used to prevent the moisture of the atmosphere being frozen to the glass inside the house, for if this is allowed to happen the moisture on thawing is liable to drop upon the bunches, injuring the bloom and causing the berries to decay. Admit air on every favourable opportunity, and examine the bunches often and carefully, so as to make sure of removing decaying berries the moment it can be perceived that they are affected. Where forcing is fairly commenced be careful to maintain a properly moist state of the atmosphere, and this must be especially attended to while severe weather lasts, particularly where the buds are bursting. The evaporating troughs must be kept constantly supplied with water, and the paths, bed, &c., should be frequently syringed, and it will also be advisable not to have the tender foliage too near the glass until the weather changes. If fermenting material is used for warming the border, this must be well covered with dry litter to protect it from the frost, and turned occasionally, adding some fresh as may be necessary to keep the heat in the border regular. It will be advisable, however, to have some dung and leaves thrown up to heat, as there would be some danger of chilling the bed by turning it in the present state of the weather, and mixing it with the dung or leaves which had not commenced fermenting. Houses which it is intended to commence forcing the beginning of next month should also have some fermenting materials placed on the borders so as to encourage the roots a little before the Vines are excited, which will be of great service towards getting the buds to push strongly and without loss of time.

HARDY FRUIT AND KITCHEN GARDEN.

Orchard trees of large size are much neglected about many places as to pruning, the heads being allowed to get so thick of wood that fruit cannot be expected save from the points of the outside shoots, and except when the crop gets accidentally thinned to something considerably below an average crop, the fruit is small and indifferent in quality. Dry frosty weather offers a favourable opportunity for getting these properly trimmed, as men can work at this with comfort, when nailing would be very cold work, and advantage should be taken of the first spare time to give these a careful pruning. The heads should be liberally thinned, cutting out all branches which cross the others and dead pieces, and leaving the shoots sufficiently far apart that light and air may have free play among those left when the foliage is on. In removing large branches, care should be used to make close clean cuts, and if the wood is coated with strong thick paint this will help to prevent its decaying before the wound gets healed over. Get all kinds of fruit bushes pruned, the prunings cleaned off, and the ground manured ready for digging when this can be done. Also take advantage of leisure time to thoroughly examine the fruit stores, and remove any that are found to be decaying. Of course the frost must be excluded from here, but on no account use fire heat, unless the temperature cannot otherwise be kept above freezing. Admit a little air on mild days, especially after keeping the room shut for some time; but as the fruit will now give off but little moisture very little air will suffice to keep the atmosphere dry, and no more than may be necessary to do this should be given. Take advantage of every safe opportunity for admitting air to Lettuce, Cauliflower, &c., in frames, for a slight frost is less injurious to these than a confined damp atmosphere. Get manure wheeled upon spare ground where it is wanted, and attend to providing a good supply of this necessary article in successful kitchen gardening, turning the root heap, and well soaking it with strong manure water, and getting all the prunings and other refuse which cannot be otherwise quickly converted into manure, charred.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Dec. 13, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 16th, 1849—therm. 58 deg.; and the lowest on the 16th, 1853—therm. 7 deg.

Notices to Correspondents.

Climates: *G H.* We are at a loss to learn in what the resemblance consists between the climates of England, N. America, and Australia. To us they seem quite different. The plants of the two last, especially the last, therefore are far from being at home with us, and cannot be grown to profit.

Cantua dependens: *A R C.* Treat it as a greenhouse plant in winter and as a stove plant in summer.

Diseases: *J W.* Your Vine leaves are infested with that form of Cladosporium herbarum which is known under the name of Fumago. You cannot remedy the matter now, but you may prevent its occurrence next year by repeated syringing, which washes off the sugary secretion on which the mould is developed, taking care at the same time that your houses are properly ventilated. *M.J. B.*

Gardeners: *A Sub.* No disputes should arise about what vegetables a gardener is entitled to under his agreement. We apprehend that he cannot claim a supply of any which are not raised by himself. Field Potatoes would therefore be excluded, like field Turnips, Carrots, &c.

Garden Pots. We have received from Mr. Pope, of 2, Bath Street, City Road, a sample flower pot, which he lately registered, "the object of which is to convey water into the centre of the pot, so that the root may receive nourishment." We regret to be obliged to say that we see no advantage whatever in the contrivance; but we do see some disadvantage.

Grapes: *J H H.* We find that a Scotch White Cluster Grape did formerly fruit near London, but so long ago that we had forgotten it. That it should have gone out of cultivation was the result of its undoubted inferiority in all respects to the Pitmaston White Cluster and the Royal Muscadine, both of which ripen as well near London. The former would probably suit you. There is no other hardy white Grape known to us. Among blacks, the best of the perfectly hardy kinds are the Burgundy Black Cluster, or Auvernat, and the Miller's Burgundy. The Early Black July, or Morillon Noir, is still hardier, but its bunches are too small for table. None of these are new, nor do we know of any hardy novelty in the class of Grape Vines. A correspondent says with regard to the Scotch White Cluster —"I have it here (Scotland), a good sweet hardy Grape, ripening to a fine amber colour. It is a great bearer. I had my Grapes named by Mr. M'Intosh, of Dalkeith. I see the Grape mentioned in Mr. Rivers's catalogue. It is early and prolific, but hangs long; firmish flesh."

Horizontal Trellises: *An Old Subscriber* is desirous of knowing if any successful trials have been made of a plan suggested some eight years ago by Mr. Ker, Cheshunt, for growing Peaches, Pears, &c., on very low trellises, and covered with glass, lying as near the ground as a Melon-frame, the sides of the structure being left open. His object is to learn if any previous experience elsewhere would encourage him to make trial of ripening late Pears in Scotland by Mr. Ker's plan. So far as Peaches are concerned, we know that Mr. Ker obtained them in plenty; and of course any one else may do the same if employing the same skill. But we remember no trials of Pears.

Moles and Mice: *Amateur.* You can do nothing more than trap them in some one of the hundred ways which all country people know how to employ.

Names of Fruits: *A W.* 3, Bezi de Montigny; 4, Doyenné Blanc; 5, Verulam; 6, Ne Plus Meuris; 7, Gansel's Bergamot; 8, Hacon's Incomparable; 10, St. Germain; 11, Easter Bergamot; 12, Bishop's Thumb; 14, Ormskirk Bergamot; 15, probably Old Colmar; 17, 18, Uvedale's St. Germain; 19, Chaumontel; 1, Dumelow's Seedling; 2, Alexander; 3, Crimson Queening; 4, Minshall Crab; 9, French Crab; 10, Hughes' Golden Pippin; 11, Scarlet Crofton.—*W Barratt.* C C, Hacon's Incomparable; M, Uvedale's St. Germain; N, Glou Morceau; N N, Catillac; S S, Bishop's Thumb; V, Easter Bergamot; the seedling Apple, large enough, but badly shaped, cannot be recommended.—*Z.* 19, Barcelona Pearmain; 20, Hawthorden; 21, Reinette du Canada; 24, Rymer; 26, Scarlet Crofton; 28, Royal Russet; 36, Pearson's Plate; A, King of the Pippins; B, Wheeler's Russet; C, Api Gros; F, Early Nonpareil; H, Parry's Pearmain; M, Turk's Cap; N, Norfolk Stone Pippin; O, like Hoary Morning; Q, Hubbard's Pearmain; P, the Pear is worthless; and so is the other Pear, except perhaps for stewing.—*J H S.* 1, 2, 3, 4, Beurré Diel; 5, Glou Morceau; 6, Gansel's Bergamot; 7, Aston Town; 8, Passe Colmar; 9, Swan's Egg; 10, Marie Louise; 11, Brown Beurré; 12, Chaumontel; 2, Hoary Morning; 3, Hollandbury; 7, Barton Russet; *J M B.* 3, Marie Louise; 4, Beurré d'Aremberg; 5, Glou Morceau.—*N H G.* 4, 5, 9, Winter Nelis; 6, 8, 11, 19, 23, 33, 37, Glou Morceau; 7, Napoléon; 10, Ne Plus Meuris; 16, Marie Louise; 17, St. Germain; 18, Brown Beurré; 20, Gansel's Bergamot; 21, 28, 34, Beurré Diel; 31, Beurré d'Aremberg; 40, Autumn Bergamot; 42, Passe Colmar.—*Old Sub.* 1, Beurré Diel; 2, 3, 6, 10, Glou Morceau; 5, Winter Nelis; 7, 12, Beurré Diel; 8, 9, Napoléon; 11, Althorp Crassane. Grape—White Nice.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*G M & Co.* Eurybia microphylla.—*M Busby.* One is a piece of Hakea Baxteri; its whole beauty resides in its singular foliage. The other is some Mirbelia with which we are unacquainted, and is probably a handsome flowering shrub.—*T S P.* It is Feverfew—which we suppose signifies febrifuge—for that is its effect. Botanists call it Pyrethrum Parthenium.—*Box.* Cotoneaster frigida, Pilea herniarioides.

Orchard Houses: *Ignoramus.* You will find full information upon this subject in a little pamphlet called Rivers on Orchard Houses, published by Longmans. Consult, in addition, the remarks lately made in our columns, p. 611.

Seeds: *E B.* We believe they belong to some Sorghum, perhaps officinale.——*Anon.* Sow Peony seeds as soon as they are ripe.

The Ancient Oak: *Eben.* You are right. The specimen was rough, and examined by candlelight; we have now had it polished and more carefully scrutinised. The medullary rays are in a singular state of contortion. If you look at the calculation of age made last week as regards the Oak from Stirling Castle, you will see that a very small piece of wood from the outside of an old tree, when the growth is extremely slow, affords no data by which to judge of age. You make 40 rings in 2¼ inches; we make 45 in one piece and 49 in another; and it is probable that we are both wrong, so uncertain is it whether in a specimen like yours the real rings can be at all distinguished. The Stirling Oak gained 5 inches in diameter in 40 years; but it did not gain half an inch in the 10 years between 80 and 90. Undoubtedly your tree must have been very old; and that is all that can be said.

Valuators: *A Sub.* He must be an uncommonly clever fellow who on the 4th April can value a crop of fruit to be produced in the succeeding autumn. Nonsense.

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents, the insertion of whose contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the Importation and Sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves; to our agents, Messrs. Gibbs, Bright, & Co., of Liverpool and Bristol; or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence.—ANTONY GIBBS & SONS.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 1, Adelaide Place, London Bridge.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than any other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

OWNERS OF SETTLED ESTATES and OTHERS desirous of availing themselves of the various recent Acts of Parliament, by which they may charge their Estates with money expended in the Improvement, Conversion, and Reclamation of Land, by Drainage, Irrigation, Embanking, Inclosing, making Farm-roads, Clearing, the erection of Farm-buildings and Machinery, Planting and other Agricultural Improvements, are respectfully informed that Messrs. HEWITT DAVIS & FRANCIS VIGERS undertake to advise and furnish Plans and Estimates, and if required, will contract to do the works, and dispose of the Rent charges.—3, Frederick's Place, Old Jewry, London.

LAND DRAINAGE BY CONTRACT, in Large or Small Quantities, undertaken by THOMAS SCOTT, Land Agent, 5, Charing Cross.

DRAINAGE OF LAND, BOGS, ETC.

MR. HUMBERT, of Watford, Herts, supported by unquestionable references and testimonials, offers his services to proprietors about to execute works of drainage, which he will undertake personally to lay out and superintend, and to supply the forms and attendances necessary to obtain the certificate of the Inclosure Commissioners where such is required, at a charge of 5*s.* per acre and his travelling expenses; or he will contract to perform the whole work to the satisfaction of the Commissioners at a fixed price per acre. Mr. HUMBERT (having been more than 15 years established in business as a Surveyor and Land Agent) has found that wet heavy soils can be usually, carefully, and thoroughly drained, with pipes 4 feet deep, at 4*l.* per acre and upwards, inclusive of every expense.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Offices, 52, Parliament Street, London.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George T. Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir Samuel Morton Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., M.P.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.

2. In no case is any investigation of Title necessary.

3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. EQUAL FACILITIES WILL BE AFFORDED IN EITHER CASE.

4. The WHOLE cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.

5. The term of such charge may be fixed by the Landowner, and extended to FIFTY YEARS for LAND Improvements and THIRTY-ONE YEARS for FARM BUILDINGS, whereby the instalments will be kept within such a fair percentage as the occupiers of the improved Lands can afford to pay. WILLIAM CLIFFORD, Sec.

ROYAL AGRICULTURAL COLLEGE,
CIRENCESTER.
Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &C.
Chemistry—J. A. C. Voelcker, Ph. D., F.C.S.
Zoology, Geology, and Botany—Jas Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The First Session of 1856 will begin February 5. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances; the fee for out students is 40*l.* per annum. The College course of lectures and practical instruction is complete in one twelvemonth, though a longer course is recommended. Prospectuses and information can be had on application to the Principal.

PURE AND CHEAP BREAD.—Flour Mills for Family Use.—Grind your Wheat.—Pure Bread, and do away with medicine entirely, besides effecting a saving.

MARY WEDLAKE'S FLOUR MILLS, 4*l.* 10*s.* and upwards. Washing Machines, 6*l.* 10*s.*; Mangles, from 50*s.*; Chaff-cutters and Oat-crushers. Book on Feeding Horses, 1*s.*
118, Fenchurch Street, London.

ECONOMY OF FERMENTATION.

BUSHE'S PATENT ROOT GRATER, manufactured by FOWLER AND FRY, Temple Gate, Bristol, entirely supersedes the necessity of Cooking Turnips, Mangel, and other Roots; it effects a saving of 30 to 40 per cent. of the Roots, besides that of fuel. Price 3*l.* 10*s.* Printed testimonials and directions may be obtained gratis by applying to FOWLER & FRY, Bristol, Licensed Makers of CORNE'S Patent Chaff Cutters and General Agricultural Implement Makers and Dealers. The Root Grater may also be seen in the Agricultural Department of the Crystal Palace, Sydenham.

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late STEPHENSON & PEILL), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.
HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4*s.* 9*d.* each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5*s.* 3*d.* each.

IRON BUILDING AND ROOFING WORKS.
GAS STREET AND BERKELEY STREET, BIRMINGHAM.

JOHN HENDERSON PORTER, ENGINEER and CONTRACTOR, Patentee of a new system of constructing (cheaply and expeditiously, by ordinary labourers) Portable Buildings and Sheds—formed of ordinary planks or boards—peculiarly suitable for Farm purposes. A Model Shed has recently been erected in the Agricultural Department of the Crystal Palace at Sydenham. Corrugated and Galvanised Iron Roofs and Roofing Plates, Eaves, Gutters, Rain-water Pipes, Tanks, Fences, &c.—London Office, 1, Riches Court, Lime Street.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

TENNANT'S SELF-CLEANSING DIAMOND-TOOTHED WHEEL GRUBBER.—The Subscribers beg to call the attention of Agriculturists to this really useful implement, which since its introduction has met with more than usual favour, and has had awarded it the highest commendations by all who have tested its merits. Parties wishing to possess this Grubber to commence the spring operations should give their orders for it now. On application a drawing of the above, with full particulars as to its mode of working, will be sent free by post.
W. DRUMMOND & SONS, Seed and Implement Warehouses, Stirling and Dublin.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
PROTECTION FROM MORNING FROST.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS AND KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—BURGESS & KEY, 103, Newgate Street; and 52, Little Britain, London.

BRITANNIA WORKS, BANBURY,
AND AT
STANDS Nos. 209 to 217, Smithfield Show.

SAMUELSON'S PATENT GARDNER'S TURNIP CUTTERS have been awarded for the TENTH TIME the Prize of the Royal Agricultural Society. These Implements are so well known that they require no description—more than 60,000 having been supplied from the above Works.
GARDNER'S PATENT DOUBLE-ACTION TURNIP CUTTERS.
GARDNER'S PATENT SINGLE-ACTION DITTO.
MOODY'S GRATERS, FINE AND COARSE CUTS.
BUSHE and BARTER'S PATENT GRATER, for Fermentation.
PHILLIPS' PATENT GRATER OR MINCER.
GAUNTLETT'S PATENT GRATER, for mixing with Chaff.
SAMUELSON'S ECONOMIC CHAFF CUTTERS, for Stables and Small Occupations.
LARGE CHAFF CUTTERS, CORNES' and other Patterns as per Catalogue.
SAMUELSON'S ATMOSPHERIC AND ANTHONY'S PATENT AMERICAN CHURNS are Manufactured solely by Mr. SAMUELSON.
CORN AND MALT BRUISING MILLS.
LINSEED CAKE BREAKERS.
SAMUELSON'S REGISTERED BUDDING'S LAWN MOWERS, &c., &c.

The above may be obtained at all respectable Ironmongers and Implement Dealers in the Kingdom, of whom Catalogues and Price Lists may be procured gratis, or post free on application to B. SAMUELSON (successor to the late James Gardner), Britannia Works, Banbury; or at Stands Nos. 209 to 217, Smithfield Show.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1856 *is now published, and can be obtained through any Bookseller in town or country, price 6d., or from the Proprietors,*
WILLIAM EDGCUMBE RENDLE & Co., Union Road, Plymouth.

The Agricultural Gazette.

SATURDAY, DECEMBER 15, 1855.

THE agricultural meetings of the week have been exceedingly successful. The Smithfield Club's show has attracted its thousands, who, if not greatly edified, have at any rate enjoyed a rare opportunity for converse in the presence of objects likely to make it agriculturally instructive.—The London Farmers' Club has held its annual meeting, and Mr. BAKER, of Writtle, one of its most intelligent members, has read before them a useful lecture on one of the most important subjects that can occupy the minds of farmers or of landowners.—The Society of Arts has assembled its hundreds to hear the paper on Land Drainage which we give in another page.—And to these we might add that the Royal Agricultural Society of England has held one of its annual meetings, were it not that it is barely more than a meeting *pro formâ*, held and conducted simply because it is down in its charter that it is to be held and conducted. What a pity it is that a Society possessed of such means and influence should not turn them to account at a time when London is full of its members, and when every other society which has any claim on the attention of farmers is doing its best to make use of the opportunity. The Society of Arts has but a casual connection with the farming interest, and but few of its members are farmers—yet it selects the week of the Smithfield Show for drawing attention to one of the most important departments of the *art* of agriculture; it scatters its invitations, we may say, over the length and breadth of the land, in order to secure the attendance of those interested in the subject; it organises a discussion which shall embrace every opinion and practice that has been advocated in connection with it; and it accordingly succeeds in not only teaching its members but interesting them in its own success and prosperity. It would be greatly to the advantage of our national agricultural Society if its members, too, were assembled, not for mere formal gatherings, for which a few chairs around a table in the end

suffice, but for mutual instruction on some agricultural topic so as to let us not only know but feel that the Society is really alive and active.

The reports elsewhere will inform our readers in reference to the Smithfield Show and the meeting at the Society of Arts. Of the paper read at the London Farmers' Club by Mr. Baker, we shall attempt here to give a very brief and condensed account. Mr. Baker referred to the demands upon agriculture made by the increasing population of the country:—There was no possibility of increasing the area of production, but the difficulty could be overcome or at least postponed by improved cultivation—and his subject, the Management of Landed Property, was thus among the most important which could engage the attention of an agricultural audience.

The difficulties of landlords owing to the absurd conditions and character of the tenure were referred to, and the results of these conditions were depicted:—No land was so well cultivated but that it might be yet improved, while the condition of very much presented a picture which he would gladly conceal if he could—the energy and capital of the English farmer were the remedies, and these must be called forth by terms of occupation calculated to encourage them—the amount of rent demanded should be diminished, if so tenants of capital could be obtained, and security should be afforded for that capital by leases and valuation of unexhausted improvements on their termination.

Mr. Baker then discussed in succession the improvements needed by land in a state of nature before it could properly be offered for occupation by a desirable tenantry:—The buildings of the farm were first referred to—their central position and their arrangement upon a proper plan: the drainage of the land was insisted upon, and the shares of landlord and tenant in its execution were pointed out: the provision of roads and the enclosure of fields were alluded to. The character of the lease and its provisions one by one were reviewed; the amount of rent is fixed upon an assumption of prices, but as these cannot be assumed with certainty, it is safest to leave a portion at least to fluctuate with the price of grain. The specification of a rotation of crops is desirable only in the case of an ignorant tenantry; the time-honoured clauses of old leases in reference to Flax, Potatoes, and other forbidden crops, ridiculous enough now when manures can be purchased and carried so abundantly and so easily, were exposed; covenants on quitting, simply on the principle of fairness between the owner and outgoing tenant were suggested. Mr. Baker advocates a system by which the incoming tenant has to pay his predecessor largely for manure and crop, his object being to insure the thorough cultivation of the land up till the very close of the lease.

The paper concluded with reference to the advantages to an estate of intelligent labourers, and the great addition to its value by the erection of well planned and well placed cottages upon it. The interests of the labourers themselves, and that of the occupiers and the owner as dependant upon them, were discussed by Mr. Baker in a very liberal spirit; due regard being had to the existing character and habits of the peasantry, especially those of the eastern counties, to whom we suppose Mr. Baker more especially referred.

It was the main purpose of the lecturer to state the evils of faulty and ignorant land agency, and these were very ably reviewed and illustrated. That they affect large estates, whole provinces of land in this country at present, few will deny, and it is a great service done when one of such large and long experience as Mr. Baker undertakes to expose them.

THE SMITHFIELD CLUB.

This Club held its usual annual show of fat stock and implements during the past week at the Baker Street Bazaar. We have been looking since our return from the yard at a series of sketches by Mr. C. F. Welles of animals exhibited 14 and 15 years ago, and we must confess that he would find no such animals now as he did then for the employment of his very clever pencil. But this is not to be regretted. The drawings before us are those apparently of very well bred cattle, but of beasts which have been spoiled for food by excessive feeding; and specimens of over fatness are rarer now than they were in 1841. The show this year is hardly up to the average either we believe in number or quality. The Devons, with which the catalogue commences, are scarcely so numerous as they have been, and they are, we think, unusually small. This is no drawback in the eyes of butchers, however, and they are always sold the first of the animals exhibited. There is a very remarkable show of Hereford oxen, and probably the prize ox shown by Mr. Niblett, of Bristol, was never surpassed for even and uniform excellence. The shorthorns are not so good a show as last year. The prize ox is, however, an animal of remarkable quality, and might well be taken as a true representative of the breed. The brother of this animal ("Romeo") has just been declared winner, at one of the most important shows in America, of the prize for the best short-horn bull. The one fulfils his destiny by furnishing probably 15 cwts. of beef for the Christmas dinners of some 10 dozen Londoners in this year 1855, and the other by influencing the quality of such dinners for many years to come on the other side of the Atlantic.

The gold medal for the best ox in the yard is carried off by this ox, No. 46, bred by the Marquis of Exeter. The gold medal cow is carried off by Mr. Ambler, of Halifax, the winner of the gold medal at Birmingham last year. The prize cow then, as now, was a pure white, and remarkable for the evenness of flesh with which her well-built frame is covered. The second prize cow, Mr. Stratton's, is a roan, much less evenly covered and certainly not equal to the other. They stand close together, and the judges cannot have found much difficulty in their decision. Mr. Ambler's cow is just about eight years old, and has had two calves. There is a not very remarkable show of Scotch and Welsh stock.

The show of sheep and pigs is as remarkable as ever. Some enormous specimens of fat pigs are exhibited, and the extraordinary precocity of the smaller breeds is also well illustrated. Mr. Rigden, Lord Walsingham, and the Duke of Richmond exhibit the qualities of the Southdown as successfully as ever. Mr. Foljambe is as usual successful in long-woolled sheep, along with Mr. Bradshaw, Lord Berners, the Marquis of Exeter, and Mr. Hewer, and Mr. Overman is remarkably successful with his cross-bred stock.

The following is the award of the judges:—

CATTLE.

Class I. Devon Steers, not exceeding 3 years old.—25*l.*, the Earl of Leicester. 10*l.*, H.R.H. Prince Albert.

Class II. Devon Steers, over 3 years old.—25*l.*, Lady Elizabeth Reynell, of Avisford House, Arundel. 10*l.*, H.R.H. Prince Albert.

Class III. Devon Heifers, not over 4 years old.—15*l.*, Mr. John Tucker, of Staplegrove, Taunton. 5*l.*, Mr. T. W. Fouracre, of Durston, Taunton.

Class IV. Devon Cows, over 4 years old.—20*l.*, H.R.H. Prince Albert. 10*l.*, Mr. John Coate, of Hammoon, Blandford.

Class V. Hereford Steers, not over 3 years old.—25*l.*, Mr. Isaac Niblett, of Filton, Bristol. 10*l.*, Mr. Edward Longmore, of Adforton, near Ludlow.

Class VI. Hereford Oxen, over 3 years old.—25*l*, Mr. William Heath, of Ludham Hall, near Norwich. 10*l.*, H.R.H. Prince Albert.

Class VII. Hereford Heifers, not over 4 years old.—15*l.*, Mr. Joseph Phillips, of Ardington, near Wantage.

Class VIII. Hereford Cows, over 4 years old.—20*l.*, Mr. J. H. Gurney, of Catton Hall, near Norwich. 10*l.*, Mr. Joseph Phillips, of Ardington.

Class IX. Short-horned Oxen, not over 3 years old.—25*l.*, the Rev. J. Holmes, of Brook Hall, Norwich. 10*l.*, Earl Spencer, K.G.

Class X. Short-horned Oxen, over 3 years old.—25*l.*, the Marquis of Exeter. 10*l.*, Mr. T. Mortin, of Ashford Ford, Staines.

Class XI. Short-horned Heifers, not over 4 years old.—15*l.*, Mr. W. Aldworth, of Frilford, near Abingdon. 5*l.*, Mr. C. P. Duffield, of Marcham Park, Abingdon.

Class XII. Short-horned Cows, over 4 years old.—20*l.*, Mr. H. Ambler, of Watkinson Hall, near Halifax. 10*l.*, Mr. R. Stratton, Swindon.

Class XIII. Scotch or Irish Oxen, of any age.—10*l.*, Mr. John Grove, of Ferne, near Salisbury.

Class XIV. Scotch or Irish Cows of any age.—5*l.*, the Rev. Joseph Arkwright, of Harlow, Essex.

Class XV. Welsh Steers of any age.—20*l.*, Colonel Pennant, of Bangor. 5*l.*, Sir R. Williams, Bulkeley, Beaumaris.

Class XVI. Welsh Cows of any age.—The prize is withheld.

Class XVII. Oxen of other pure breeds of any age.—10*l.*, Messrs. Charles Neame & Sons, of Selling, Faversham, Kent.

Class XVIII. Cows of other pure breeds of any age.—10*l.*, Mr. W. Heath, of Ludham Hall.

Class XIX. Oxen of cross or mixed breeds not over 3 years old.—15*l.*, the Earl of Radnor.

Class XX. Oxen of cross breeds over 3 years old.—15*l.*, Mr. James Taylor, of Nigg, near Park Hill, Ross, N. B.

Class XXI. Cross-bred heifers not over 4 years old.—10*l.*, Mr. Edward Waters, of Stratford-sub-Castle, Salisbury.

SHEEP.

Class XXII. Wether Sheep, long-woolled breeds under 22 months old.—20*l.*, Mr. R. L. Bradshaw, of Burley-on-the-Hill, Oakham. 10*l.*, Mr. G. S. Foljambe, of Osberton Hall, Worksop. 5*l.*, Lord Berners, of Keythorpe Hall.

Class XXIII. Ditto, ditto, Sheep to be under 220 lbs. in weight.—20*l.*, Mr. G. S. Foljambe, of Osberton Hall. 10*l.*, Mr. R. L. Bradshaw, of Burley-on-the-Hill. 5*l.*, Marquis of Exeter.

Class XXIV. Wether Sheep, long-woolled breeds (not being Leicesters) under 22 months old.—10*l.*, Mr. William Hewer, of Sevenhampton, Highworth.

Class XXV. Cross-bred Wether Sheep under 22 months.—10*l.*, Mr. John Overman, of Burnham Sutton, Norfolk. 5*l.*, Mr. John Hitchman, of Little Melton, near Tetsworth.

Class XXVI. Ditto, ditto, under 220 lbs. weight.—10*l.*, Mr. John Overman, of Burnham Sutton, Norfolk.

Class XXVII. Wether Sheep, short-woolled breeds, under 22 months old.—20*l.*, Mr. William Rigden, of Hove, Brighton. 10*l.* Lord Walsingham.

Class XXVIII. Ditto ditto, under 200 lbs. weight.—10*l.*, the Duke of Richmond, K.G.

Class XXIX. Wether Sheep, short-woolled breeds, under 34 months.—20*l.*, the Duke of Richmond, K.G. 10*l.*, Mr. H. H. Lindsay, of West Dean, Chichester.

Class XXX. Wether Sheep under 22 months, short-woolled breeds (not being Southdowns).—10*l.*, Mr. John T. F. Pain, of North Houghton, Stockbridge, Hants.

PIGS.

Class XXXI. Pigs of any breed above 13 and under 26 weeks old.—10*l.*, Mr. John Coate, of Hammoon, Blandford. 5*l.*, H.R.H. Prince Albert.

Class XXXII. Above 26 and under 52 weeks old.—10*l.*, H.R.H. Prince Albert. 5*l.*, Mr. John Coate, of Hammoon, Blandford.

Class XXXIII. Above 12 and under 18 months old.—10*l.*, Mr. Stewart Marjoribanks, of Bushey Grove, Watford. 5*l.*, Sir John B. Mill, of Mottisfont Abbey, Romsey, Hants.

GOLD MEDALS.

The Gold Medal to the exhibitor of the best steer or ox in any of the Classes. The Marquis of Exeter, K.G., of Burghley Park, Stamford.

The Gold Medal to the exhibitor of the best heifer or cow in any of the Classes. Mr. Henry Ambler, of Watkinson Hall, Halifax.

The Gold Medal to the exhibitor of the best pen of one-year-old long-woolled sheep in any of the Classes. Mr. R. L. Bradshaw, of Burley-on-the-Hill, Oakham.

The Gold Medal to the exhibitor of the best pen of one-year-old short-woolled sheep in the 27th, 28th, or 30th Classes. Mr. William Rigden, Hove, Brighton.

The Gold Medal to the exhibitor of the best pen of pigs in any of the Classes. Mr. John Coate, of Hammoon, Blandford.

EXTRA STOCK.

The Silver Medal to the exhibitor of the best beast. Mr. John Overman, of Burnham Sutton, Norfolk.

The Silver Medal to the exhibitor of the best long-woolled sheep. Mr. G. S. Foljambe, of Osberton Hall, Worksop.

The Silver Medal to the exhibitor of the best short-woolled sheep. Lord Walsingham, of Merton Hall, Thetford.

The Silver Medal to the exhibitor of the best cross-bred sheep. Mr. Charles Howard, of Biddenham, Bedford.

The Silver Medal to the exhibitor of the best pig. Mr. Stewart Marjoribanks, of Bushey Grove, Watford.

JUDGES.

Cattle and Long-woolled Sheep.—John Buckley, William Hesseltine, Robert Smith.

Cross-bred Short-woolled Sheep and Pigs.—Henry Fookes, John Clayden, Thomas Hawkins.

The Show of Implements and vegetables in the galleries above the cattle, and of steam threshing machines on the ground floor, is as large and as multifarious as ever. We do not, however, notice anything new, unless it be the admirable practice adopted by Mr. Ransome of pricing every article exhibited in a readable manner. A plough for 2*l.* 14*s.* placed in a prominent position appeared to us to deserve it both for the quality of the article and its cheapness. Chaffcutters, Linseed-crushers and flour mills, and corn and cake crushers, are appropriately enough the principal articles exhibited—and there is a fitness in directing the attention chiefly to those machines employed in preparing the food which is to make the beef and mutton exhibited below. As we walked round we noticed the grinding mills exhibited by Mr. Loyd, of Shoreditch—the carts and ploughs exhibited by Mr. Busby, of Bedale,—the horizontal Turnip cutters of Mr. Phillipps, though we did not notice his Turnip grater. Mrs. Wedlake had a large stock of implements present. Messrs. Howard, of Bedford, exhibited their admirable ploughs and harrows; Mr. Gibbs had a stand of magnificent Turnips, Mangel Wurzel, and other roots. Skirving, Sutton, & Lawson had also stands—the first remarkable for his Swedes—the second for a quantity of very large specimens, especially of Mangel Wurzel; the third for collections of Grasses and grains: we may refer here to the very interesting framed specimens of Triticum and other grains, showing all the parts of the plant in a most instructive manner. Burgess & Key and Dray & Deane exhibit large quantities of implements—their rival reapers, &c. Garratt and Hornsby and Smythe & Holmes have specimens of their drilling-machines. Crosskill exhibits carts, and Bell's reaper, his root-washer, &c. Root-graters were shown in considerable numbers by Fowler and others, chiefly on Bushe and Barter's principle; Samuelson exhibits Turnip-cutters and chaff-cutters; and steaming apparatus is shown by Stanley, of Peterborough, and draining apparatus by Clayton, of the Atlas Works close by. Baysford, of Drury Lane, shows his peculiar spring carts and carriages. Messrs. Richmond & Chandler exhibit their well-known chaff-cutters, corn-bruisers, &c. Chandler exhibits his liquid manure drill. Smyth & Ashby show their hay-maker, chaff-cutter, &c. Barrett & Exall show their small threshing machine and other implements. Coleman exhibits a number of scarifiers. Felts and tents are exhibited by M'Neill & Croggon. Manure makers are represented by the Superphosphate Compost Company. And many other manufactures and machines were present; but the above will show that the opportunity afforded by the meeting of the Smithfield Club has not been lost for any want of alacrity and energy on the part of English agricultural machinists.

THE MIDLAND COUNTIES EXHIBITION.

Birmingham, *Dec.* 13.—The general interest attaching to the meeting here is greater than that excited by the Smithfield show. The large show of poultry, the extensive collection of sorts exhibited, the better show of pigs, more than make up for the deficient number of cattle in the hall, and for the absence of agricultural implements. The roomy comfortable place of meeting is a point, too, in which the Midland Counties Association have greatly the advantage of the Smithfield Club. The show of cattle contains some animals that would have carried off prizes at Baker Street, but on the whole it was not equal in quality to its rival. The gold medals were both carried off by Herefords—and by Herefords of remarkable quality. The classes of Shorthorns and of Herefords contained some animals which are exceedingly and unevenly fat, such as have almost disappeared from the Smithfield exhibitions. On the other hand the Devons are equal in quality, and the longhorns are tolerably well represented—a class which has no standing at Baker Street at all. The show of sheep was very good, Lord Walsingham being very successful with his Southdowns, and for the other prizemen we refer to the list below. The show of pigs is remarkably good, the large and small breeds both being remarkably well represented. In the same division of the hall with the cattle is a very capital collection of roots and enormous Cabbages. This is a very useful addition to the exhibition, and attracted a good deal of attention. The first prize was carried off by the Elvetham long red Mangel Wurzel, grown from Messrs. Suttons' seed.

The great attraction of the exhibition, however, is the poultry show, which contained an unprecedented number of birds (almost 5000), many of the classes being in themselves more numerous than the entire collection of many provincial poultry shows. Thus, of coloured Dorkings—chickens of 1855—no fewer than

150 pens appear, and a magnificent show of birds they are. The large Dorkings and Cochins, the elegant Hamburghs, and the Polands, are all admirably represented; and no one needs to have been ashamed of failing of distinction in such a competition. We have not room for the prize list of the poultry show. It occupies 16 closely printed pages in the published catalogue, containing 165 separate awards beside commendations, and beside the premiums given to 16 classes of pigeons.

The following is the award of prizes for cattle and sheep:—

CATTLE.

Class I. Hereford Oxen.—10*l.* and Gold Medal, Mr. William Heath, Ludham Hall, Norwich. 5*l.*, Lord Atherton.

Class II. Hereford Steers.—10*l.*, John Naylor, Esq., Leighton Hall, Welshpool 5*l.*, Mr. Edward Longmore, Adforton, near Ludlow.

Class III. Hereford Cows.—10*l.*, Mr. S. W. Urwick, Leinthall Starks, near Ludlow. 5*l.*, Mr. J. Smith, Scheleley Walsh, Worcestershire.

Class IV. Hereford Heifers.—10*l.* and Gold Medal, Mr. E. Price, Court House, Pembridge. 5*l.* Mr. Pitt, Chadnor Court, Dilwyn.

Class V. Short-horned Oxen.—10*l.*, Colonel Pennant, Penrhyn Castle. 5*l.*, H.R.H. Prince Albert.

Class VI. Short-horned Steers.—10*l.*, Mr. J. Robinson, Thirsk. 5*l.*, Lord Leigh.

Class VII. Short-horned Cows.—10*l.*, Viscount Hill. 5*l.*, Mr. Herbert, Powick.

Class VIII. Short-horned Heifers.—10*l.*, Earl Howe. 5*l.*, Viscount Hill.

Class IX. Devon Oxen and Steers.—10*l.*, H.R.H. Prince Albert. 5*l.*, Mr. William Heath.

Class X. Devon Steers.—10*l.*, Mr. J. C. Halse, South Molton. 5*l.*, H.R.H. Prince Albert.

Class XI. Devon Cows. 10*l.*, Mr. A. Umbers, Weston Hall. 5*l.*, H.R.H. Prince Albert.

Class XII. Devon Heifers.—10*l.*, H.R.H. Prince Albert.

Class XIII. Long-horned Cows or Heifers.—10*l.*, Mr. Burbery, Wroxhall. 5*l.*, Mr. P. F. Hussey, Wyrley Grove, Walsall.

Class XVI. Fat Heifers.—10*l.*, The Moira Colliery Company, Ashby-de-la-Zouch. 5*l.*, the Duke of Beaufort.

Class XVII. Scotch or Welsh Oxen or Steers.—10*l.*, Mr. W. Heath. 5*l.*, A. Campbell, Esq., Monzie Castle, N.B.

SHEEP.

Class XXI. Leicester Wethers, 22 months old.—10*l.*, G. S Foljambe, Esq., Osberton Hall. 5*l.*, Mr. R. L. Bradshaw, Burley-on-the-Hill, Oakham.

Class XXII. Ditto ditto, exceeding 22 but not exceeding 34 months old.—10*l.*, Mr. G. Turner, Barton, Exeter. 5*l*, the Marquis of Exeter, K.G.

Class XXIII. Long-woolled Sheep, not being Leicesters. Wethers, not exceeding 22 months old.—10*l.*, Mr. W. Slatter, Stratton, near Cirencester. 5*l.*, Mrs. S. West, Green Hill Farm, Bletchington.

Class XXIV. Ditto ditto, Wethers, exceeding 22 but not exceeding 34 months old.—10*l.*, Mr. R. Beman, Morton-in-the-Marsh.

Class XXV. South and other Down Sheep, Wethers not exceeding 22 months old.—10*l.*, Lord Walsingham. 5*l.*, Lord Walsingham.

Class XXVI. Ditto, ditto, Wethers 22 but not exceeding 34 month old.—10*l.*, Lord Walsingham. 5*l.*, Lord Walsingham.

Class XXVII.—Shropshire short-woolled sheep, Wethers not exceeding 22 months old.—10*l.*, Mr. J. B. Green, Marlow, Herefordshire. 5*l.*, Mr. H. Smith, jun., Sutton Maddock, Shiffnall.

Class XXVIII. Ditto, ditto, Wethers exceeding 22, but not exceeding 34 months old.—10*l.*, Earl of Aylesford. 5*l.*, Mr. W. Masfen, Walsall.

Class XXIX. Cross-bred sheep, Wethers, not exceeding 22 months old.—10*l.*, Mr. A. C. Keep, Wollaston. 5*l.*, Mr. A. C. Keep.

PIGS.

Class XXXI. Fat Pigs, not exceeding 10 months old.—10*l.*, C. C. Dormer, Esq., Rousham. 5*l.*, Mr. J. Wyley, jun., Rugeley.

Class XXXII. Fat Pigs, not exceeding 15 months old.—10*l.*, Mr. George Turner, Barton, Exeter. 5*l.*, Duke of Sutherland.

Class XXXIII. Fat Pigs, exceeding 15 months old.—6*l.*, R. Benyon, Esq., Reading. 3*l.*, Mr. C. Holland, Seabridge, Staffordshire.

PRIZES FOR BREEDING PIGS.

Class XXXIV. Pigs of a Large Breed, exceeding 3 and not exceeding 6 months old.—10*l.*, Mr. J. Smith, Henley-in-Arden. 5*l.*, Mr. E. Harrison, Great Charles Street, Birmingham.

Class XXXV. Pigs of a Small Breed, exceeding 3 and not exceeding 6 months old.—10*l.*, the Rev. M. Shaw, Rougham, Bury St. Edmund's. 5*l.*, R. H. Watson, Esq., Wigton, Cumberland.

YIELD OF LAST HARVEST,

Westmorland.—The gloomy predictions respecting the late crop of Wheat which prevailed through a great part of summer, were in some degree allayed by the fine harvest weather which, commencing in the latter end of August, continued until the principal part of the crop was safe under "thack and rape." In fact not a single day's interruption took place during the entire month of September, both the autumn and spring sown Wheat being carted in the very best possible condition. Rust and mildew to some considerable extent made their appearance during the wet weather which prevailed in August, more particularly in red Wheat, but the clear atmosphere and dry light winds which succeeded had the effect of checking these, yet the samples where these cases occurred are small and shrivelled, weighing not more than 58 lbs. per bushel, whilst the finer samples of white escaped with less damage, and come into the market fully 63 lbs., and in some instances even a higher weight, affording from their excellent condition satisfaction to the miller. From the various and conflicting opinions existing with respect to the extent of the crop it is impossible to arrive at any exact data as to the produce of last harvest, in fact men's minds have been so agitated by the peculiar features of the time, and the constant upward tendency of the corn markets, as to almost prevent sober calculation; yet taking the appearance of the stack yards, everywhere crowded, our own experience over a pretty large extent of crop, and the best opinions existing, we are led to the conclusion that the yield, although not equal to the crop of 1854, will still reach a fair, perhaps full average of former years, and a great portion thereof in prime condition for immediate use. In consequence of the high prices ruling, and the fine dry weather so favourable for the ploughing after Turnips, a much greater breadth of land than usual has been seeded with Wheat the present autumn, and this no doubt has contributed to enhance the value of prime samples, which have been sold as high as 98*s.* in the market; less, however, for that purpose will now be required, and we fully expect to see the demand assume a more steady attitude without any material reduction of rates. Barley, though bulky, is certainly short of an average crop, and the quality by no means first-rate for malting purposes; whilst Oats from the immense spread of stacks everywhere observable must reach a full crop, but the quality is short of former years, and the deficient weight per bushel will be a drawback on the value of this grain.

Lincolnshire.—The crop of Wheat in this neighbourhood will this year in my opinion be under an average. We have here three descriptions of soil—clay, loam and fen; some of the clay lands, well drained and highly cultivated, have produced a full average quantity of corn but where badly farmed or inefficiently drained the yield has not been so good as usual. Loamy land seems to have fared best, as excepting on a few neglected spots it is generally reported to have yielded an abundant harvest of Wheat of good quality; but the bulk of land about here is fen soil, on which scarcely a good crop was seen. Many acres were ploughed up and sown with Oats or Coleseed, and a large quantity might as well have been ploughed up, for in several instances the corn that was gathered would scarcely pay the expense of getting. The crop of Wheat in the fens must be regarded as very inferior both in quantity and quality, and considering the great extent of the fen country, that it is nearly all arable land and that it is generally very productive, I consider this falling off in the Wheat crop must tell greatly on the gross produce of the kingdom, which I do not think is compensated by any additional appropriation of land to the growth of Wheat, neither do I think diminished consumption will be resorted to so far as to occasion a material reduction in price. One clay land farmer tells me his Wheat will average 3½ quarters per acre instead of 4 quarters; a good fen farmer says he shall not have so much Wheat as usual by 200 quarters. Wherever the joint effects of frost and wind injured the Wheat plant during the spring, the consequences were perceived at harvest day and proved in threshing. *John Whitwell, Peterborough.*——I shall take an extensive district with which I am well acquainted, having resided in it all my life, and frequently passing over many parts of it; I mean the Great Level of the Fens, and the marshes lying between the Fen and the Great Estuary of the Wash. It comprises 680,000 acres, a great portion of which is peat, black, moory soil. Owing to the absence of rain to any extent in the autumn of 1854, followed by one of the driest winters almost ever known, and frost the most severe, the Wheat plant on all the light soils, *i. e.* peat, silt, gravelly clays, clays bare-fallowed, and light loams, was very seriously injured, and in many instances destroyed. In many parts of the Fens the light dry peat was blown away by stormy winds, the ditches were levelled, and the black dust lodged in large black ricks, like snow ricks, except in colour; much land was ploughed and resown, or sown with spring cropping, and on the remaining was left the thinnest plants ever remembered. On the light loams and soils of greater consistency the plant recovered pretty well and prospered tolerably till the flowering commenced, when most disastrous winds and rains beat down the crops and irrecoverably damaged the ear in its most critical season, that of flowering. The spring crops received more or less damage at this period, but upon the whole the crops of Oats, Beans, and Peas, the chief spring crops of the district, are not very unsatisfactory. Oats are light in weight, and not an average crop in produce. (What is an average crop in these days?) Beans produced a strong healthy plant, but from the causes above stated do not yield well. Peas, likewise, have less plant, podded tolerably well but ripened irregularly and deep away. But Wheat, that staff of human life, I believe I am correct in stating, and I am confirmed in this statement by the deliveries to merchants, &c., at all the district markets, is one of the worst crops ever harvested in this extensive district, certainly not yielding more than three-fifths of last year's produce, and of a quality so inferior as to weigh less by from 4 to 6 lbs. per imperial bushel. The quantity of flour obtained is of course in proportion, but I understand it yields as much as can fairly be expected from such light weights of Wheat. *John Clarke.*——In answer to your inquiries respecting the yield of Wheat this past harvest, I beg to say I think from my own observation and what I can learn from others, that this neighbourhood is fully one-fourth less than last year and one-fifth less than an average of years. Barley is equally as deficient. Oats are very little grown. *F. A. Sowerby, Aylesby, Great Grimsby.*

Northamptonshire.—I am still of the same opinion that the Wheat crop is not an average, although I am willing to admit that the Wheat does yield better than anticipated at harvest. Barley quite an average crop, but rough in quality. Beans and Oats about an average. I believe I am justified in saying that more than the usual quantity of corn has been brought to market. *W. Gray, Courteen Hall.*

Warwickshire.—With respect to the probable yield of the late harvest in the case of Wheat, the variety of causes attendant upon that peculiar season make it a difficult matter to arrive at a proper conclusion. A considerable portion of the plant upon light soils, as also the elevated portion of fallow Wheat, was destroyed by the severity of the frost in spring, and when replanted gave a sad return of both quantity and quality, very different to the usual spring sown crop. Where a good plant was retained (as particularly upon Bean brash or early ploughed turf which had been heavily pressed by the clodcrushers, &c., at the time of planting) upon some of the best Wheat soils, with good farming, there was promised at the commencement of June a great crop, but in consequence of the storms laying them before the completion of blossoming, they yield a less return than lighter crops which remained standing; yet some early sown and early variety of Wheat which had fully blossomed before the storm, return a good yield. Some poor clay soils yield from 8 to 24 bushels per acre, whilst others produce from 15 to 40 bushels. From the causes above stated, in this district the general yield I think must be at least 6 bushels less than an average after allowing for the extra breadth sown, which was of little amount, as the six-course system is greatly adopted. The heavy crops of Barley were much laid and do not produce equal to bulk, yet I think the crop an average. The Bean crop decidedly under an average. *W. Gibbs, Stratford on Avon.*

Essex.—The yield of the crops in this county may be considered better than had been anticipated, and the yield will upon the whole be about the same as that of 1854. In that year the heavy dry land was deficient in plant, and the yield was indifferent; in this year all that portion, by far the largest, has a full crop, but the light land portion of the county is defective. Taking the yield of the county together, it will afford more than an average growth of Wheat, which is estimated to be 3 qrs. 6 bushels per acre. The yield this year, I think, may fairly be taken at four quarters, the weight 60 lbs. to 62 lbs. per bushel, and for the most part the samples come in good condition; the top price at Chelmsford on Friday 7th was 86*s.* fine rough chaff white, and 81*s.* for red. A large quantity of Wheat has already been threshed, and it is presumed that the deliveries will now fall off, as threshing Barley will be resorted to; the yield of that grain is good—the average will be about 6 quarters, but the quality is inferior, one-tenth to one-eighth being taken out to render it marketable. Oats are a good crop, above an average by about 6 bushels per acre. Beans on the heavy land an average crop, but Peas are deficient. The quantity sown exceeded an average last year; the fine season and the anticipated high price of Wheat increased the breadth to about 10 per cent., but that may be considered the maximum. *R. Baker, Writtle.*——It is the opinion of myself and some neighbours that the Wheat crop of Essex is a full average crop—on the tenacious and undrained heavy land far superior to last year—but not so good either on the mixed soils of higher quality or the chalky clays. Beans are a full average crop, much better than last year. Barley a full average (some injured in sample) and so are Oats. Potatoes very much more abundant than last year. Mangel Wurzel good. Turnips a general failure. My own crops are heavier in every respect (excepting Turnips) than those of last year. *J. J. Mechi, Tiptree.*

Buckinghamshire.—I beg to say that from what I know, and from all I gather from the persons who go about with steam threshing machines (and from all accounts they have never been more busy than they have been since harvest), that the yield of Wheat in this immediate neighbourhood has been quite an average one. More than this, I have never heard one person complain of a bad yield. Barley is said to be rather under an average. Oats are not much grown, but the few acres sown are reported to have yielded well. Beans an average crop. I think this immediate neighbourhood, consisting chiefly of strong land, was highly favoured in regard to the Wheat crop. It certainly did not lose plant in spring as those crops did sown on light soils. I have threshed 26 acres of Wheat (Spalding), and it yielded 40 bushels an acre. This includes first, second, and third qualities. I had 36 bushels of best Wheat per acre. *W. G. Duncan, Stony Stratford.*

Hampshire.—In answer to your inquiry respecting my opinion of the yield of the Wheat crop in this locality, I have no hesitation in repeating my conviction (which I have several times expressed through our local press) that taking an area of 25 square miles round this city the Wheat crop is short, in bushels, of an average very nearly one-third, and more than a third of the crop of 1854; that as compared with last year, it is further short in weight of four pounds per bushel on the average, which on the quarter of Wheat (8 bushels) is a good half bushel, being 1-16th deficiency on the crop in weight alone, irrespective of one-third deficiency of bushels. Our estimated usual average in this district is about 26 bushels per acre. In 1854 we grew 28 bushels. I am quite at the extreme quantity when I say that 18 bushels is the average quantity grown this season. My qualifications for thus publicly stating these unwelcome, yet truthful facts, are a tolerably long life passed uninterruptedly in very extensive farming pursuits, my opportunities as an agricultural valuer for closely inspecting the growing crops, an unlimited acquaintance with the agriculturists around me, and the means of obtaining the most confirmatory of all evidence, that from the many owners of steam-threshing machines (with which our county swarms) and the united testimony of all which have been worked in this district

is to a rather less quantity per acre than I have named. You will perceive, sir, I am writing in a somewhat positive strain; but having previous to harvest predicted the failure, as our county papers will show, I have been at some pains to see how far results have borne out my predictions; unfortunately, I find them fully verified. Any man at all accustomed to the inspection of Wheat fields was aware of the many untoward circumstances at work (I am speaking of this county) from the very time of blossoming—ice on the 21st June, the very midst of that season; the Wheat fly, the parent of the yellow maggot, as busy as bees in a flower garden; the old black sort of blight, first affecting the straw, with black spots of fungi absorbing the juices, and consequently shrivelling the grain; heavy thunderstorms, prostrating the already smitten crop, rendering it more susceptible of mischief;—here was a combination of evil from which the results are not at all surprising, and they are as I have stated them. I am happy in this opportunity of entering my earnest protest against the delusions enunciated by Mr. Caird, through the columns of the *Times;* his letters are full of assumptions, but in which I look in vain for one single established fact, as regards our usual average growth, the consumption, and more particularly of this year's produce, and how any man of practice could have ventured to assume an extra planting of one-fourth in acreage of Wheat, in the face of an iron frost from January the 12th to the 6th of March, the only period during which any sensible increase could have been sown, throughout which the plough was frozen to the earth, and after which it was too late and useless to sow Wheat, is a matter of astonishment to all reasoning men; there were very many acres ploughed up in various parts of the country killed by the frost, and I very much question whether, on strict investigation, it would not appear that the acreage thus lost to the country did not quite equal that sown over and above the usual quantity. I believe Hampshire is one of the worst affected counties this year; but I know there are many others very bad, and it is curious to note on almost every farm, the great difference in produce in the various fields on the same occupation and very near together, with very little difference as to the time of sowing; we find 26 bushels per acre growing alongside of 12 bushels, the one being a fair sound sample, the other tailing corn, and what is still more strange the best manured lands, with the heaviest crops of straw, although standing upright, yield much worse than those of a moderate bulk, and more lightly dressed. When you have received the information you are seeking from the various correspondents, you will be in a position to draw a faithful conclusion as to our stock and probable wants. Testing these by Hampshire alone, our position would be alarming indeed; and I am inclined to believe, taking in the few, if such are to be found, whose yield shall come up to Mr. Caird's own reported produce, your balance sheet will show a requirement of at least five millions of quarters over and above our own growth to carry the nation on till the harvest of 1856, a good Potato crop notwithstanding. *T. Twynam.*——The Wheat crop in this district between Southampton and Lymington rivers is not over two thirds of an average crop; some fields in Fawley parish as low as 8 bushels per acre, of a very bad quality. None of us can thresh out more than half the usual quantity per day; the cause I believe to be a blight just before harvest, owing to an over luxuriant growth and thin plant on the gronnd. Barley a good average crop, rather over than under; Oats the same. *J. Eames, Lymington.*

Dorsetshire.—Having a large agricultural connection in this county, besides being a buyer of corn, I have an opportunity of knowing something of our produce, and I am happy to say our yield of Wheat turns out better in quality and quantity than was expected at harvest. I think we had about one-tenth more land under Wheat than in average years, and I now think in this county the quantity per acre is about an average, but much less than last year. Less land by one-tenth of an average under Barley and Oats, but the quantity per acre an average of each. *R. Damer, Dorchester.*

Home Correspondence.

Potatoes in Bread.—In reply to the inquiry of a "Subscriber" as to how and in what proportion to use Potatoes with flour in making bread, I beg to state my plan, as follows:—first place in a pancheon or paste-bowl 15 lbs. of flour near the fire to warm; take 5 lbs. of good Potatoes, those of a mealy kind being preferable, peel and boil them as if for the table, mash them fine, and then mix with them as much cold water as will allow all except small lumps to pass through a coarse sieve into the flour, which will now be ready to receive them; add yeast, &c., and mix for bread in the usual way. This plan I have followed for some years, finding that bread made according to it is much superior to that made of flour only, and on this ground alone I would recommend its adoption, even if Potatoes were the same price as flour; but in addition to that, taking the present high price of flour, and moderately low price of Potatoes, here is a saving of over 20 per cent., which is surely an object worth attending to, if only by those of limited means. *E. B., High Peak of Derbyshire, Dec.* 11.

Produce of a Potato.—I beg to state that about the third year of the Potato blight I made a similar trial from a large Potato accidentally procured from a vessel from France. I planted it the first week in May. It was long and full eyed, weighing nearly a pound, from which I raised 31 plants at distances of 18 inches in a single row. At the end of August I found them diseased, and "although very unripe" I removed them, in number 273, 60 of which weighed 56 lbs., the others were very small. The total weight was over 60 lbs., and I believe, under favourable circumstances, it might have been 40 lbs. more. I think it possible to get 3 bushels from the like bulb. It is not the Potato alone that will give us (with high cultivation) an almost incredible increase. In Peas I have it verified. On the 24th of last April I put in a single row of 30, 15 inches apart, and they were harvested in August; the produce of these 30 Peas was over 11,000; five of them gave 2693 perfect Peas, viz.:—

1	621	2693,
2	540	
3	527	
4	505	
5	500	

the straw of which (rather over 3 feet in length) I have here, and shall be pleased to forward the same for the inspection of Professor Lindley, &c. *William Harrison, New Romney.*——In reply to your correspondent of the 24th ult., I add, that having adjourned to a field at the home farm of Mr. Ed. Smith on the 3d of October last, I witnessed crops of Potatoes evidencing an admirable system of culture. In looking over the varieties grown, my attention was drawn to one entirely distinct from any known in cultivation. Upon an intimation from Mr. Smith, I learned this peculiar growth belonged to a hybrid seedling, named by its raiser Smith's Prolific Kidney. At my desire one root was dug up, when 39 good sound tubers appeared; 31 were of a large size, the remainder, excepting two, fit for culinary purposes. The weight of the root was 18 lbs. (the tubers being washed clean previous to weighing). I further ascertained that the parent of this produce was a small firm tuber, weighing 5 oz.; also, that this had received precisely the same cultivation as the general crop. *J. R. T., Gardener to G. S. Wintle, Esq., Hucclecote Gardens, near Gloucester.*

Societies.

Society of Arts, *Dec* 12.—*On the Progress and Results of the Under Drainage of Land in Great Britain.*—The following is an abridgment of the Paper on this subject read before this Society by Mr. Bailey Denton. The discussion which followed the reading of the paper we hope to give next week:—

In selecting the subject of drainage as a topic for consideration, at a moment when war and its consequences upon the corn-producing countries of Europe have brought the price of Wheat to 11*s.*6*d.* per bushel, and the price of bread to 10*d.* the loaf, the council of this Society have been doubtless influenced by a desire to extend the knowledge we possess of an art which has been rightly esteemed the foundation of agricultural improvement, and the most simple and certain means by which the produce of the soil may be increased. If we consider the deprivations which seem to be multiplying upon us, we shall be led to appreciate more sensibly the importance of the present inquiry, and we shall be struck with the fact, well known but too little reflected upon, that in proportion as extremely high prices move the community at large to desire that the capabilities of our native soil should be more fully developed, in order to increase its produce of food, so do many owners of that soil abate their zeal in pursuit of improvements necessarily admitted, though but partially performed, during the more pressing difficulties of extremely low prices. If this should sound like mere assertion, the evidence afforded by the expenditure in drainage, under the Government loan, will leave no doubt on the point, for in 1852, when Wheat was 40*s.* 9*d.* per quarter, the expenditure was 412,269*l.* 15*s.* 6*d.* It became in 1853, when Wheat rose to 53*s.* 3*d.* per quarter, 334,115*l.* 13*s.* 3*d.*; and declined still further in 1854, when the price was 72*s* 5*d.* per quarter, to 316,220*l.* 7*s.* 4*d.*, or about 100,000*l.* less than in 1852. This fact, in its reference to the particular subject of drainage, is the more to be lamented, because the operation may be considered essentially to rank among the obligations of the owner and not the occupier of the land, and it is so necessary to found the present discussion upon a right understanding of this important point, that I must be pardoned for dwelling upon it. It is hardly 12 months ago since I had an opportunity of introducing this subject to the attention of the London Central Farmer's Club, the members of which are for the most part tenant farmers; and it was then suggested to me, that, however convincing the evidence might be in proof of the profitable results from systematic drainage, and however interesting in themselves the details of the necessary operations, it was so manifest that drainage, to be satisfactory, must be done effectually and permanently, and must therefore involve such a much larger outlay than a tenant farmer could be expected to make, that my statements should be rather addressed to the owners than to the occupiers of land. The whole tenor of the discussion on that occasion went to show, that considerations of expediency were paramount with those whose interest in the soil was limited by the nature of their tenancy, while it was contended that principle should rule with those whose interest in the soil was permanent and secure.

The object to be arrived at by both parties is to secure the best effect with the utmost durability. Already it has been made apparent that the short term of 22 years [during which the repayment of an expenditure on drainage is an annual charge upon the land] with all the advantage of the low rate of interest of the Government loan, has necessitated a charge upon the tenants which many, even of the most enlightened, are indisposed to bear as a standing increase of rent,—or it has caused dissatisfaction on another and worse ground, viz., that the works themselves have been inefficiently done from a predetermination to limit their cost to such an amount as will be repaid by a given charge. I refer to the experience of this fact because it is manifest that the extension of the art of draining will very materially depend upon the rate of instalment charged upon the tenants, and however profitable individual cases of drainage may be shown to be, the benefit to the nation will be inappreciable, unless we satisfy the tenants generally that during all the vicissitudes of times they can afford to pay the increased rent they are to be charged. The advantage of a lengthened period will be shown by comparing the increased rent a tenant would have to pay to liquidate the expenditure of 5*l.* per acre in 50 years and 25 years. In the former case the increased rent would be from 4*s.* 6*d.* to 5*s.* 3*d.* per acre,* and in the latter from 6*s.* 6*d.* to 7*s.* 2*d.* The difference is nearly 50 per cent. Now if drainage is substantially done, there is no reason whatever to doubt that it will last at least 50 years, and it follows, therefore, that the period of repayment may extend, if need be, to that period.

Mr. Denton then, after some remarks on the increased productiveness of drained land, proved by cases drawn from his own experience, gives the following illustration of the general progress of land draining:—

To understand clearly the advance we have made, and the extent of work yet to be done, the whole country should be divided geologically into three great characteristic areas.

A curved line drawn from Exeter to Berwick will make a very close give and take division between the western and middle districts, and the lower margin of the chalk, commencing at Weymouth in Dorset, and ending at Flamborough Head in Yorkshire, will form an excellent boundary between the middle and eastern districts.

1st. The western and north-western or Alpine district includes the mountainous granite, mica, and slate rocks with the trap rocks, clays, and debris associated with them, and the conglomerate clay and loam of the red sandstone which cover a wide breadth of the lower-lying portions of the district.

The district is made up according to *Table* I. (next page).

The system of drainage applicable to this district being for the most part occasional or "spring drainage," the expenditure will be brought rather below the cost of parallel or uniform drainage. Where parallel drainage has been deemed necesary in the valleys of the granite district, the cost has been generally high, owing to the large quantity of bolder stones and rock fragments which crowd the debris of which the soil is constituted. In the clay slate valleys, too, the cost has been found to be very great, owing to the necessity of breaking through and blasting protruding rocks, frequently bringing the cost as high as 7*l.* or 8*l.* per acre. The drains in the hill sides, however, being at comparatively wide intervals will be executed at from 2*l.* 10*s.* to 4*l.* per acre, and the average cost of the whole will thereby be much reduced. It may be assumed that the quantity of land permanently drained in this district by means of borrowed capital and by private outlay, does not exceed 300,000 acres, and that 35,000,000*l.*, will be required to perfect the under-draining of the remaining 7,725,000 acres of wet land. 2. The middle district, including all the secondary strata from the basis of the Devonian, Cambrian, and Cumbrian ranges up to, but exclusive of, the chalk formation, comprises the mountain limestone, the coal measures, the new red sandstones, and magnesian limestone, the lias, the oolitic strata, and the portion of the green sand with the gault lying to the west of the main ridge of chalk.

The counties, parts of counties, and parts of Wales and Scotland (*Table* II.), make up the middle district.

This district, consisting of nearly nineteen millions of acres, comprises soils of every degree of tenacity and porosity, from the stiffest clays to the freest sands. About one half, or eight millions of acres of the cultivated lands, and lands capable of improvement, are believed to be either clays or loams requiring drainage on the parallel system, with more or less distance between the drains, and about 3½ millions of acres are of comparatively porous matter, which require occasional drains, or drains at very wide intervals, to free them of the water upheld by the underlying clays. Some of the stiffest clays, however, particularly patches of the red sandstone clay, some deep beds of the lias and Oxford clays, and the Ganet, require very close drainage to be effective. An interval of 6 or 8 yards is quite wide enough for these soils. The necessity of thus increasing the number of drains in some places will counterbalance the comparatively small cost of the occasional drainage of the water-logged strata, and will bring the average cost of the whole to 5*l.* per acre. We cannot assume that there are less than ten millions of acres in this district still to be drained. This is, supposing that 415,000 acres have been already permanently drained, and on such assumption it will require 50,000,000*l.* to perfect the under-draining of the district. 3d. The eastern district includes the chalk (the uppermost formation of the secondary strata)—the green sand which surrounds the Weald clay—the Wealden clay and Hastings sands, and the tertiary and post-tertiary formations, which comprise the London and plastic clays—the Bagshot sand and associated clay, the crags of Norfolk and Suffolk, the rich deposits of Holderness in Yorkshire, and the more recently recovered fens of Norfolk, Cambridgeshire, Huntingdonshire, and Lincolnshire. Bolder and transported clays are very frequently found in this district also, covering the out-cropping strata. The counties or parts of counties (as stated in *Table* III.) make up the district.

A very wide portion of this district is chalk, and requires no draining. A considerable portion, too, consists of the fens, of which I have estimated only half as requiring under-draining. Already the prejudice against under-draining these lands is giving way, where the vegetable matter is shallow and the underlying clay comes closer to the surface. The deep peat, or "black fens," may be considered sufficiently well-drained by open dykes, and have not been included in the foregoing statement. I may remark, however, that where under-drainage has been tried, it has been found to consolidate the soil and improve the quality of the corn grown. The whole breadth of the fens in the several counties is about 700,000 acres. Of the denser clays we have in this district the Wealden and the London clays; the former of which covers 650,000 acres, and the latter 1,500,000 acres, all of which requires parallel and close drainage. Besides these clays we have a very large space covered with the clays and loams of the Bagshot sand, and with bolder and diluvial clays of every degree of tenacity. As the metropolis and suburbs are included in this district, I have assumed that 450,000 acres have been permanently drained, leaving 4,000,000 acres requiring draining, the cost of which cannot be estimated at less than 22,000,000*l.* The summary (*Table* IV.) gives the totals of the districts.

Thus we see that there will still be required 107,000,000*l.* for the under-drainage of Great Britain, towards which the balance in hand of the Government Loan 1,471,216*l.* is applicable, leaving the sum of 105,528,784*l.* to be provided from private sources. Of this it may be assumed that four-fifths, or about 80,000,000*l.*, will be required on loan, and that the collected capital of incorporated drainage and insurance companies will be the future source of supply; for it is hardly to be supposed that the legislature will again sanction the advance of public money for the particular benefit of one class of the community, after experience has shown that private companies are able and willing to lend money upon the lowest rate of interest ruling in commercial affairs."

Mr. Denton proceeded to discuss the question of *Deep and Shallow Drainage:*—

Drainage, to be perfectly satisfactory in its effect upon the soil, must render it uniformly permeable to the full depth of the drains. The soil midway between them must be in the same condition to receive and infiltrate the rain that falls upon it, as the soil nearest the drains. If this is not accomplished, they are not producing that united effect which should be sought for and obtained, and there is no more certain way of producing *an irregular condition of soil,* than by placing the drains so far distant from each other, that the influence of one drain cannot perfectly meet the influence of another. Cases have been quoted as failures

* Five shillings per acre increased rent will be met by the following increase of produce, upon a 4-course system of husbandry, independent of all benefit from the improved condition of the soil for tillage and seeding:—

Turnips,	20	bushels at	3*d.*	per bushel.
Barley,	1¼	"	4*s.* 0*d.*	"
Beans,	1⅓	"	3*s.* 9*d.*	"
Wheat,	¾	"	6*s.* 8*d.*	"

of deep-draining, in which a desire to keep down the cost has led to an indiscreet widening of the distance, and the unsatisfactory result to which I have referred has proved that the increased depth of drains will not compensate for increased distance, and that soils which should be drained 24 feet apart, cannot be sufficiently well drained at 40 feet apart, let the depth be what it may. But the effect has been no other than this,—the principle of depth has remained unshaken. It has simply proved that good draining is not to be done for as little money as bad.

Among the instances of this species of partial failure, I may state that I have been obliged in several instances to introduce intermediate drains when I have been over careful of expenditure, and have placed those first laid out 30 feet, where they ought to have been 25 feet apart.

It is a common assertion, "that water cannot get down through clays," but in no one instance has it been successfully shown that water will disobey the laws of gravitation, or will fail to descend through any clay soil, however absorbent and retentive, to an approximate level with drains of reasonable depth (not less than 4 feet), if they be placed sufficiently near each other to counteract such absorbent and retentive properties, and to meet the effect of atmospheric humidity in maintaining them in force.

Frequently has it fallen to my lot to meet men retaining prejudices in favour of shallow draining, on clays which they have declared to be so stiff and retentive, that it was impossible water could find its way down, and so dense and dry in the subsoil, that no water could be gained from cutting into it. These clays have nevertheless been drained from 4 to 5 feet deep, and water has flowed copiously from the outlets; still the advocates of shallow draining, when asked "from whence comes the water?" reject this simple proof of their error.

The following extract of a letter will show that land carefully drained 18 inches deep with tiles, becomes, in a few years, as wet or even wetter than before. It is from Mr. Macvicar, of Barkwith, in Lincolnshire. He says—"I have met with several cases of shallow drainage which at first have been followed with beneficial results, and have become after a time inoperative. Thus, in the parish of Colsterworth, a field of strong retentive clay land was drained in 1842, at a depth of 18 inches; for a time the land was apparently laid dry, but in succeeding years it showed symptoms of returning wetness. I saw the field last week; it is sown with Wheat, and, though water-furrowed, the land is saturated with water. I examined the outlets, which were running very slowly, although I believe the drains are open."

I have never yet heard a satisfactory reason for land returning to a state of wetness after being dry. One thing, however, is proved by Mr. Macvicar's case, and that is, that it is not merely by the substitution of the durable pipe for the perishable thorn that the surface of land can be rendered permanently dry, as the shallow drainers say. It will be observed that it is about 14 years since this specimen of permanent shallow draining was done. This length of time accords with the period which is generally understood to be the time which elapses before bush-draining would be renewed.

As an advance upon the extremely shallow drainage of 18 inches and 24 inches depth, we find Mr. Denison, Mr. Milward, and several other gentlemen of high repute, draining from 2 feet 6 inches to 3 feet deep, and they still, I believe, express themselves satisfied with the result; but, as drains of the medium depth of 2 feet 6 inches to 3 feet cannot fail to do some good (and, perhaps, a lasting one, so far as the discharge of water goes), the fact that the result has been satisfactory to those who performed the work does not prove that such medium depth is the best. On the contrary, I hope, by referring to a few facts, to show that drainage as shallow as 30 inches or 36 inches, fails to provide for all the objects in view.

Three important advantages attend deep drainage beyond the primary object of discharging superfluous water. The first is—the increased quantity of soil ameliorated and rendered serviceable to vegetation: the second—its improved temperature; and third—the removal of the pipes beyond the reach of deep cultivation, and beyond the reach of annual vegetation, to stop the drains by the growth of roots within them. With regard to the first advantage, it can hardly be necessary to say that the staple of ærated soil, into which the roots of plants can travel and seek their food, cannot be too deep. Every inch of additional drainage gives 100 tons of active soil per acre, rendered, by drainage, so free and porous, as to gain fertility from the rain passing through it, and from the solution of the ingredients of the soil, and from the manure which is brought down from the surface by the rain.

Mr. Denton then passes on to discuss Mr. Trimmer's plan of Keythorpe drainage. He says:—

Allowing for a difference in the mode of carrying this into execution, this method is based upon the same principle as Mr. Baker, of Writtle, has enunciated, viz., that if there be a porous soil only 2 feet deep, resting on an impervious subsoil, nothing is gained by carrying the drains into the latter.—All practical men—I mean practical men, qua drainage—will at once dispute the assumption that there exists any clay subsoil at a depth of 2 feet below the surface which is impervious, and that, therefore any system founded on it is nothing more or less than an indirect mode of shallow draining, aiming only at the discharge of water, without seeking any of those collateral advantages just referred to. Lord Berners, the owner of the Keythorpe estate, having certain lands in hand, commenced his draining operations by causing numerous holes to be dug. By observation and experiment, which appears ultimately to have led to a definite practice, his lordship was enabled to arrange his drains so far distant from these holes as just to suffice to draw the water out of them. Mr. Trimmer explains the mode adopted to be a system of draining by pipe channels transverse to certain ridges and furrows found to exist between soil and subsoil.

Without venturing to deny the statement of so sound a geologist as to the existence of these subterranean ridges and furrows, and without presuming to deny that Lord Berners has rendered his land dry for the time being, I am content to state what appear to me insuperable objections to the general adoption of the Keythorpe system. The first is, that the depth of the drainage must necessarily depend upon the depth of the furrows, whether they be 18 inches or 10 feet deep (if they are found to exist of sufficient regularity to become applicable as drains at all). We have the evidence of what has been done at Keythorpe, showing that they are sometimes found to lie only 18 inches deep, one-tenth of the drains being that depth.

Lord Wharncliffe's plan of compromising between the deep and shallow systems is thus referred to:—

It is called the combined system of deep and shallow drainage and has been described by his lordship, in the "Journal of the Royal Agricultural Society," in the following terms:—"I determined to combine with the fundamental 4 feet drains a system of auxiliary ones of much less depth, which should do their work above, and contribute their share to the wholesome discharge, while the under current from their more subterranean neighbours should be steadily performing their more difficult duty. I accomplished this by placing my 4 feet drains at a distance of from 18 to 20 yards apart, and then leading others into them, sunk only to about 2 feet beneath the surface (which appeared upon consideration to be sufficiently below any conceivable depth of cultivation), and laying these at a distance from each other of 8 yards. These latter are laid at an acute angle with the main drains, and at their mouths are either gradually sloped downwards to the lower level, or have a few loose stones placed in the same intervals between the two, sufficient to ensure the perpendicular descent of the upper stream through that space, which can never exceed, or, indeed, strictly equal the additional 2 feet."

In order to give you the most authentic account of the results of this system, I will read you the following extracts from a letter I have just received from Mr. William Hunt, of Wortley:—

"I am now able to give you my opinion of the success of the same system of draining upon the Carleton property, belonging to Lord Wharncliffe. The combined system has succeeded most admirably there. The soil generally is a strong loam for about one foot in depth, then a stiff clay subsoil, but I found on making trial pits in several parts of each field, that at the depth of about 3½ feet, and between that and 4 feet, the clay was a little more porous, although below that depth it became quite stiff. I, therefore, set out the 4 feet drains according to his lordship's usual practice, by 20 yards apart, with the 2 feet drains slanting into the 4 feet at 8 yards apart.

"The tenants were at first much averse to the combined system, but they are now highly in favour of it in preference to the regular system at whatever depths, and they are now preparing to sow Turnips next season, where such practice was never thought of previously. The rapid manner in which the surface has become dry after the heaviest falls of rain, has quite surprised all parties who have witnessed the effects of the combined system of draining at Carleton. I have no doubt but 4 feet drains, placed at regular distances, would have drained the land I have named, but the cost would have been much higher, and what is of greater importance than the expense?"

Mr. Denton lastly gives some directions for determining the intervals between drains which he would advise to be adopted:—

In determining the distance between drains, it is necessary not only to have regard to the nature of the soil, but to the amount of annual rain-fall and the frequency of rain. A practical knowledge of the different clay of the different formations enables the draining engineer to determine pretty accurately the draining properties of each. To enable a landowner whose experience is comparatively limited to form a judgment on the subject, I may venture to refer to a means of mechanical analysis which I have found useful, and which I explained last year. See Land Drainage and Drainage Systems, page 23. The proportions of sand and clay were ascertained by washing a given quantity in a flat-bottomed medical phial. The sand subsides below the clay and is visible through the glass. The existence of lime was ascertained by means of acid. If it effervesces lime exists, and if the lump dissolves very rapidly, there will be a considerable proportion of lime in the soil. The capabilities of the soil to expand and contract were ascertained by weighing and measuring a given quantity at different times and under their different conditions of wetness and dryness. In cases of difficulty recourse should be had to the chemist. The necessity of a careful examination into the draining properties of clays will be seen by a statement of the comparative cost of draining

at different widths. Taking labour at 7*d.* per rod, and pipes and haulage at 22*s.* 6*d.* per 1000, the cost will be as follows:—

At 18 feet apart	£7	18*s.*	4*d.*
21 "	6	16	3
24 "	5	19	8
27 "	5	6	9
30 "	4	16	5
40 "	3	12	1

Experience shows that a consideration of the amount of rain-fall is a matter of much moment in determining the width between drains. It does not appear, practically, to govern the size of the pipes to be used, for if the ends of the pipes can be made to join securely, and the fall is good, the smallest sized pipes will be sufficiently large. But in proportion to the rain-fall, all other considerations being equal, should be the distance of the drains apart, in order that the condition of the soil may be sufficiently free and active at all times to absorb and discharge the maximum amount that can fall on its surface. We find from sundry careful records that 141 inches may be taken as the average annual rain-fall of the wettest place in Cumberland, while 19½ inches may be taken as the average fall in Essex. It is not enough to ascertain the quantity of rain that falls, we should know the prevalent periods of continuance of rain and moisture, for in accordance with the length of time intervening between rains will be the opportunity for soils to undergo these changes of condition which are essential to complete development of draining, and which conduce to an improved "climate of the soil itself."

We find that the average number of days in the year in which rain falls in the wettest districts of Cumberland is 210, and at Castle Hill, in Devonshire, is 191 days, while at Chiswick, the average number of wet days in the year is 124, with an average fall of 24 inches. Luckily, however, the clay soils of the west and north-west of England are comparatively open and porous, and thus counteract the humidity of atmosphere under which they exist. With respect to the direction of drains, I believe very little difference of opinion exists. All the most successful drainers concur in the line of steepest descent as essential to effective and economical drainage. Certain exceptions are recognised in the West of England, but, I believe it will be found as practice extends in that quarter that the exceptions have been allowed in error. There is much difference of opinion as to the adoption of an equi-distant parallel system in lands of the ridge and furrow form. In arable land, the most successful drainers throughout the country disregard the furrows, whereas we find the majority of those in the midland counties leaning to the adoption of the furrows as the course of the drains in grass lands. The same difference of opinion prevails as to the use of collars. Some good drainers object to them on account of the cavity left between the collars, but the majority approve of them, and would use them in all soils were it not for the additional cost. In sandy and gravelly soils they are indispensable. With regard to the admission of air to the heads of drains, as advocated by Mr. Simon Hutchinson, very few think it advisable, while some go so far as to say it is decidedly injurious.

Upon the question of outlets there appears to be much difference of practice, where there should be none. In the whole process of draining there is nothing so desirable as permanent and substantial work at the point of discharge, so as to reduce to a minimum the ill effects of inattention on the part of tenants, and the neglect of communication between present and succeeding owners. It is considered that the more frequent the outlets the more active the drainage, but as every additional outlet involves additional cost in erecting and care in preserving them, prudence suggests that the number of acres draining to one outlet should never be more than 20 or less than six, if the form of the land and size of the fields will permit of these limits. On this arrangement, iron pipes, with suring gratings, set in mason, may be provided at the cost of 1s. per acre. If these several objects be borne in mind in carrying into operation the main principle of adequate depth, there will be but little chance of failure. Having perfected the work, one thing still remains to be done. A plan or record of the lands drained, and the position of the drains is necessary; and in order that such a record may be preserved for future generations, it is desirable that a national office, connected with the Tithe and Inclosure Commissions, should be set apart for the purpose. It would be invidious to point out instances in which recent works of drainage have already become useless from change of ownership and the indifference of successors. The cost of planning the drains after execution need not exceed 6d. to 9d. per acre, where a map of the lands already exists, and after we have spent £5 per acre in draining, does it not appear the very height of folly not to preserve a record of so expensive an object at a cost of 6d. per acre?

Calendar of Operations.

DECEMBER.

Hexham, *Dec.* 6.—November has kept up its character of "gloomy and dark" till within a few days of its close, which rendered Turnip storing and Wheat sowing a somewhat delicate operation. By taking advantage of the few fine days, especially those at the close of the month, we have succeeded in getting all our roots intended for cattle stored in good condition, and a portion of the land sown with Wheat, and hope with a week of the present fine weather to have the whole sown in good condition. The Turnips for our sheep we purpose to store in heaps of convenient size, and scattered at commodious distances over the ground on which they are grown, so as to preserve them from the frost and vermin, and have always a command of fresh unfrozen food for the sheep during winter. From the damp state of the weather our Wheat after seeds was not all sown till towards the middle of last month, and to all of it we applied either farm-yard manure, superphosphate, or guano. Our cattle have been on Swedes since the middle of last month, and are doing well on Turnips and straw alone, except those most forward in condition, which are getting 5 lbs. of cake each in addition. In course of a week we hope to be able to give them all a mash of minced Turnips, meal, cake, and cut straw, but no hay, which is by far too expensive to be given to cattle. The crop threshes out very indifferently both as to quantity and quality, especially the Wheat, and this is a very general complaint all over this district.

Notices to Correspondents.

Bread: *J T B* asks if any of our subscribers can give a novice any information as to the best method of making the brownest bread. His cook does not succeed in it, and yet she makes capital white bread.

Cocoa Nut Matting: *R C L.* It is spread on the barn floor without straw and lasts several years. The cattle seem to do very well with it.

Improvement of Grass Land: *Inquirer.* You had better pare and burn it and grow a crop of Turnips, and thoroughly clean the land before laying it down in the following year with a mixture of suitable seeds.

Poultry: *A. Z.* It is, in our opinion, a bad thing to give fowls egg-shells. They supply nothing that is not equally furnished by lime, and especially bricklayer's rubbish, old ceilings, &c. Never do anything that has a tendency to make them eat eggs. They are apt scholars. They do well in the place you describe, provided the floor of the roosting-house be of earth. If they find worms in a natural way they are good food, but it is a bad plan to give them by the handful. The colour of a golden Poland cock is not very essential, provided it be uniform, and the spangling regular, the legs a good clear blue, and the wing well laced. The top-knot should not have too much white.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK Manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Priced Lists of Plant Tubs and Boxes forwarded on application

LIQUID MANURE.

PATENT LIQUID-MANURE DISTRIBUTOR or WATER-CART, for the Distribution of Guano, &c., warranted not to clog up or otherwise get out of order. It has Waterproof Joints, and will scatter its Liquid from 12 to 15 feet wide. It will work equally well on hilly or on level land without any alteration. It is thoroughly adapted for Drill Crops or Pasture Land, or for Watering Streets.—Full particulars may be obtained of the Patentee, Isaac James, Tivoli, Cheltenham.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1¼ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1½-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1½ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.

2½ " short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	14	0
2½ in. long	ditto	ditto ditto	2	18	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER and SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. Roe (late Freeman Roe), Hydraulic Engineer, 70, Strand, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark, (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

C. STEPHENSON, late STEPHENSON and SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

CROCUS, TULIP, and HYACINTH BASKETS, with Wire or Zinc Linings, for suspension or for table stand; also Bracket Baskets made and Japanned in a variety of colours and designs, by W. Richards, Imperial Wire Works, 370, Oxford Street. Conservatories fitted up.

Window Blinds and Wirework of every description.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. Seeley (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

NEAT, DURABLE, AND WELL EXECUTED LABEL FOR NAMING PLANTS.—The Advertiser will forward on the receipt of a stamped envelope, containing two postage stamps, a Zinc Label, neatly painted, lettered in *Oil paint*, as a specimen for those who may require a number; they can be supplied at 2*d.* each.—Address F. H., at Mr. Bond's, Walcot, Salop.

TRANSPARENT SHEETING, a substitute for Garden Mats, nearly two yards wide, 1*s.* per yard run—much approved; thick Canvas ditto, 1*s.* per square yard; strong Tarpaulings for Carts and Waggons, 2*s.* per square yard; serviceable second hand ditto, 1*s.*; Waterproof Capes, to protect a man from wet while stooping down, 3*s.* each; second hand Policemen's Capes, fresh dressed, 18*s.* and 24*s.* per dozen; Horses' Waterproof Loin Cloths, lined with woollen, 7*s.* each; Driving Aprons, 7*s.* each; India Rubber Coats, 16*s.*; Oiled Coats, 7*s.* 6*d.*

R. Richardson, 21, Tonbridge Place, New Road, London.

WIRE FENCING, less than 2-inch mesh, in various widths, from 15 inches to 6 feet wide, at 6¾*d.* per square yard; 3-inch mesh, 4*d.* per square yard; 4-inch mesh, 3*d.* per square yard. Galvanized Wire Fencing, 1*s.* per square yard, 1½-inch mesh. The above Wire-work is made by machinery, and is the cheapest article of the kind in England.

R. Richardson, 21, Tonbridge Place, New Road, London.

NETTING FOR SHEEP FOLDS.

WILDEY and CO., Holland Street, Blackfriars Road, London, are the original introducers of the COCOA-NUT FIBRE SHEEPFOLDING NETS, which 14 years' experience has proved to possess the most extraordinary durability when exposed to alterations of weather. Cocoa-nut fibre will wear out several sets of *tarred hemp netting*, and is so light that a herdsman may with ease carry 200 yards of it.

Wildey & Co. were awarded a Prize Medal for this Netting by the Royal Agricultural Society in 1842, at the Exhibition of all Nations, in 1851, and at the Exposition Universelle, Paris, 1855. Sold in Nets of 50 and 100 yards long, 42 inches high, by the Manufacturers, Wildey & Co., at the Cocoa-nut Fibre Works, Holland Street, Blackfriars Road, London.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. Treloar, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the strongest, best, and cheapest safeguards extant.

Milner's Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47a, Moorgate Street, City.

Circulars free by post.

DISH COVERS and HOT WATER DISHES in every material, in great variety, and of the newest and most recherché patterns. Tin dish covers, 6*s.* 6*d.* the set of six; block tin, 12*s.* 3*d.* to 28*s.* 9*d.* the set of six; elegant modern patterns, 34*s.* to 58*s.* 6*d.* the set; Britannia metal, with or without silver plated handles, 76*s.* 6*d.* to 110*s.* 6*d.* the set; Sheffield plated, 10*l.* to 16*l.* 10*s.* the set; block tin hot-water dishes, with wells for gravy, 12*s.* to 30*s.*; Britannia metal, 22*s.* to 77*s.*; electro-plated on nickel, full size, 11*l.* 11*s.*

THE PERFECT SUBSTITUTE FOR SILVER.—The real NICKEL SILVER, introduced 20 years ago by William S. Burton, when PLATED by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Fiddle Pattern.	Thread or Brunswick Pattern.	King's Pattern.

HOT AIR, GAS, VESTA, JOYCE'S STOVES. Stoves for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10*s.* each to 30 guineas. His variety of register and other Stoves, Fenders, and Kitchen Ranges, is the largest in existence.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

THE LIFE AND EPISTLES OF ST. PAUL. By the Rev. W. J. CONYBEARE, M.A., late Fellow of Trinity College, Cambridge; and the Rev. J. S. HOWSON, M.A., Principal of the Collegiate Institution, Liverpool.

"We doubt if any modern literature possesses a treatise more complete or satisfactory in its design and execution.....It is no small merit of the work that, while it extracts information from every source, an admirable spirit of Christian faith, accompanied by a manly love of truth and soundness of judgment, characterise it throughout. While its hand is in every German treatise, its heart is thoroughly English; and its effect will everywhere be to confirm those great central truths round which it has grouped the accessory and subordinate matter.....The sacred chronicle has never before had such diligent and loving labour bestowed on it."—*Edinburgh Review*.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Just Published, in Crown 8vo, price 7*s*. 6*d*.,

The **Athenæum** may be ordered of any Bookseller.

NEW LABEL.—In consequence of the great variety of Counterfeit Labels of A. ROWLAND & SONS' MACASSAR OIL, now in circulation, and which so nearly resemble the original as frequently to deceive the unwary—they have employed those eminent artists Messrs. PERKINS, BACON, & Co., who, at great cost, and by a peculiar process of their own, have succeeded in producing from steel "A NEW LABEL," which cannot be forged. It is composed of a section of an engine-turned circle, repeated 130 times, and forms an original lace-work ground, upon which is engraved in white letters, "UNDER THE PATRONAGE OF THE COURTS OF EUROPE," with an embossed profile of Her Majesty "THE QUEEN," lately specially taken for the purpose, and which surmounts the words (also in white letters) "ROWLANDS' MACASSAR OIL, for the growth, restoration, and for beautifying the Human Hair." Under which is the Signature of the Proprietors in Red Ink, "A. ROWLAND & SONS."—Sold by them at 20, Hatton Garden, London; and by Chemists and Perfumers.

FOGGY WEATHER.

INVALIDS, whose ailments are increased by damp and foggy weather, will find SPENCER'S PULMONIC ELIXIR a never-failing source of comfort and ease from suffering; enabling them to breathe with freedom during the keenest frost and the thickest fog. In fine, it possesses every property which can be beneficial in cases of Coughs, Colds, Asthma, and all complaints of the Chest and Lungs.

ASK FOR SPENCER'S PULMONIC ELIXIR.

Prepared only by T. Roberts & Co., Crane Court, Fleet Street; and sold wholesale and retail by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sanger, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in the Kingdom. In bottles at 1*s*. 1½*d*. and 2*s*. 9*d*. each; the bottles at 2*s*. 9*d*. contain nearly as much as three small ones.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 30 years have been held in constant and increasing public estimation as the purest farinæ of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6*d*. and 1*s*.; and Family Canisters, at 2*s*., 5*s*., and 10*s*. each.

HOLLOWAY'S PILLS ARE UNDENIABLY THE FINEST MEDICINE IN THE WORLD FOR BILE AND INDIGESTION.—In all cases of Deranged Stomachs, Determination of Blood to the Head, Bile, Sick Headache, Liver and Stomach Complaints, there is no medicine known that will give such immediate relief as these renowned Pills; young and old, rich and poor, patronise them, and so many cures are effected by their use, that their praise is sounded from the temperate clime to the frigid zone; in truth, persons who travel consider them a necessary requisite.—Sold by all medicine vendors throughout the world; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna, and H. HOODS, Malta.

TO GARDENERS AND OTHERS.

TO BE LET, Eight Miles from London, about an ACRE of NURSERY GROUND, with 150 Fruit Trees, six years planted. Also Pigsties, Stables, Yard, &c., with Apartments in adjoining House. Has a good frontage to main road; would suit any person wishing retirement—Apply 6, Old North Street, Theobald's Road.

TO BE LET, with immediate possession, the BOWATER NURSERY, being the only Nursery in or near the town of Woolwich, comprising Seed Shop, two Greenhouses, two Brick Pits stocked with soft-wooded plants, Seed Loft, Packing Shed, about 1½ Acre of Ground partly covered with choice Fruit trees, which nearly pay the rent. Coming in about 100*l*., or by valuation; very satisfactory reason for letting, &c.—Apply at the Seed Shop, or if by letter, address to G. S., as above.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

TO NURSERYMEN, GARDENERS, AND OTHERS.

TO BE DISPOSED OF, by Private Contract, the LEASE, GOODWILL, and STOCK of Birch Field Nursery, eligiby situated about two miles from the centre of the town of Birmingham, out of the borough, on the turnpike road to Walsall. It occupies an area of about 2 Acres, the rent is very low, and the Stock of an ordinary and useful character. There is a Cottage, Stable, Greenhouse, and other necessary conveniences for carrying on an extensive and profitable business.—For further particulars, and to treat, apply to Mr. JOSEPH JAGGER, Bank, High Street; or to Mr. C. H. JAGGER, Solicitor, Cannon Street, Birmingham.

CANNES, SOUTH OF FRANCE.

TO BE SOLD, completely furnished, in one of the warmest, driest, and most healthy and agreeable localities for invalids in all Europe, that beautiful Marine Residence and Grounds known as the CHATEAU ST. GEORGES, fit for the immediate reception of any nobleman's or gentleman's family, and situate one mile west of the town and port of Cannes, within a few minutes walk of the chatean of the Right Hon. Lord Brougham, and 20 miles south-west of Nice. The property faces the Mediterranean, which forms its southern limit, while its northern boundary is the grande route from Italy to Marseilles, from which latter town it is only 14 hours' by posting, or 11 hours' by the steamers, and there are also two diligences daily each way, in connection with the railway from Paris to Marseilles, which is now opened throughout, and the distance is performed each way in 20 hours—total travelling from London to Cannes, 47 hours.—For particulars and viewing plans, apply to Messrs. GREEN, Estate Agents and Auctioneers, 28, Old Bond Street.

TO NURSERYMEN, GARDENERS, ETC.

TO BE SOLD, 10 ACRES OF FREEHOLD LAND FOR 150*l*., at Farnham, Surrey, adjoining a Nursery, and an allotted Estate of a Building Society. Good Roads, good Water, Enclosed, and level Title, from Government. No Agent need apply. Purchase-money may be paid by instalments, or the whole let on Lease.—Those requiring an answer to enclose a directed stamped envelope to M. M., Office of this Paper.

TO BE SOLD, Pure Bred WHITE CHINESE and THOULOUSE GEESE.—Birds of this or last year. Apply to P. DUTTON, Delamere, near Northwich.

POULTRY.—To those who wish to IMPROVE their BREED by giving New Blood from the best strains, this being the time for so doing.—Apply for particulars to A. G., Post Office, Watlington, Oxon.

Sales by Auction.

PEAR TREES.

Nursery and Seed Establishment, Cottingham, (A.D. 1788); Hull Branch Junction Street.

GARDEN SEEDS.

MESSRS. MARTIN and SON, having received their bulk of CULINARY and FLOWER SEEDS direct from the Growers, are enabled to furnish an article of the best quality, the growing properties of which are tested before sending out, and no order executed from an inferior stock.—Nursery and Seed Establishment, Cottingham (A.D. 1788), Hull Branch Junction Street.

TO THE TRADE.

NEW PURE WHITE COLLINSIA.—The price per ounce of this new and beautiful ANNUAL can be had on application.

J. G. Waite, Seed Merchant, 181, High Holborn, London.

WAITE'S DANIEL O'ROURKE PEAS.—The best Early Pea in cultivation can be supplied in any quantity, and price had on application to J. G. Waite, Seed Merchant, 181, High Holborn, London.

NEW EARLY PEA.

COTTRELL'S SEBASTOPOL.—The earliest and best Pea cultivated, price on application. Also the New Early Wonder Pea, early as frames and wonderful cropper, large pods. To be had only of Dawe, Cottrell, & Benham, 3, Lawrence Pountney Lane, and 36, Moorgate Street, London.

NEW SORTS OF PEAS.

SUTTON and SONS can supply Denyer's Early Marrow, Harrison's Glory, Harrison's Perfection, Epps's Lord Raglan, Sutton's Early Champion, Prizetaker, and others.

Sutton & Sons can also supply every Horticultural novelty which may from time to time be advertised in this Paper, by whomsoever introduced, though they of course cannot recommend any article until they have had time to test it in their Nursery and trial ground.

EARLY PEAS.

THEDAM'S FAVOURITES having been tested against the earliest varieties grown in this locality, Five Pounds are offered for 1 bushel of any sort that will come quicker, prove more prolific, and better adapted for the London Market. May be sown directly, or the first week in March.—Apply to Mr. T. K. Thedam, Little Braxted, Witham, Essex, by whom trials are solicited; and with any person having a forward variety, and wishing to test their respective merits, samples will be exchanged.

P.S. A few Quarters of home-grown Scimetars also for sale.

NEW EARLY MARROW PEAS.

Harrison's Glory (blue) & Harrison's Perfection (white.)—These extraordinary Peas, which are nearly similar in habit, are as early as Double-blossomed Frame, about 3 feet in height, full of large pods which cluster from the bottom to the top of the haulm, and are equal in flavour to Knight's Marrow. Samples of the haulm may be seen at the following firms in London, of whom they can be had, in quart packets at 5s. each:—

Batt, Rutley, & Silverlock, 412, Strand.
Beck, Henderson, & Child, Middle Wharf, Adelphi.
Hurst & M'Mullen, 6, Leadenhall Street.
Minier, Nash, & Nash, 63, Strand.
Noble, Cooper, & Bolton, 152, Fleet Street.
Jacob Wrench & Sons, 39, King William Street, City.

EXCELLENCE, ECONOMY, AND CONVENIENCE.

SUTTON'S COMPLETE COLLECTIONS

OF

KITCHEN GARDEN SEEDS FOR ONE YEAR'S SUPPLY.

GENTLEMEN who do not employ a professed Gardener, or who may prefer ordering their Seeds themselves, will find it most convenient to order one of SUTTON'S COMPLETE COLLECTIONS, which are so assorted as to contain he proper quantities of the best kinds to supply a family for the whole year.

The entire charge for the largest Collection (No. 1) is £3.
Do. do. Collection (No. 2) is £2.

And complete Collections for smaller Gardens may be had at proportionately lower sums.

The No. 1 Collection contains 20 quarts of the best sorts of Peas, 10 quarts Garden Beans, 5 pints French or Kidney Beans, and all other Vegetable Seeds in due proportion.

N.B. If any kinds of Seeds are already possessed they should be named, that we may omit them and increase the quantities of others in lieu of them. Those purchasers who may prefer making their own selection are recommended to apply for our GENERAL SEED CATALOGUE for 1856, which will be sent post free. It contains all the newest and best kinds of Kitchen Garden and Flower Seeds yet introduced, many of them from the Continent, with the prices affixed to each article.

SUTTON & SONS, Seed-Growers and Merchants, Reading, Berks.

MESSRS. JOHN DICKSON AND SONS, 32, South Hanover Street, Edinburgh, having purchased from Mr. Girdwood his entire stock of seed of the CHIRK CASTLE TURNIP, referred to in the under-noted certificate of the Royal Caledonian Horticultural Society, beg to intimate that they are now ready to send it out, and respectfully solicit orders from their friends, which will receive receive prompt attention.

"Experimental Gardens, Edinburgh, 10th March, 1855.

"Excerpt from Minutes of Prize Committee of the Caledonian Horticultural Society of this date:—

"Thanks were voted to Mr Girdwood for exhibiting specimens of a Turnip grown by him at Corstorphine, and known in some parts of England by the name of Chirk Castle, Black stone, which when boiled were pronounced by the Prize Committee to be of excellent quality, and a valuable culinary vegetable. In addition to its superior quality it stands the winter without injury, and even at this date is equal to the White Dutch Turnip in succulence and flavour.

(Signed) "J. H. Balfour, *Secretary.*"

A limited quantity can be supplied to the Trade; price on application.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by John Waterer at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica: Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. Seeley (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

LIGHT, CHEAP, and DURABLE ROOFING.—CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates. Can be laid on with great facility by farm servants or unpractised persons. Price 1*d.* per square foot. Croggon's Patent Non-conducting Felt, for covering steam boilers and pipes, saves 25 per cent of fuel. Samples and testimonials sent by post, on application to Croggon & Co., 2, Dowgate Hill, London, who also supply ship-sheathing felt and inodorous felt, for damp walls, and lining iron houses, and roofs generally, to equalise the temperature.

TRANSPARENT SHEETING, a substitute for Garden Mats, nearly two yards wide, 1*s.* per yard run—much approved; thick Canvas ditto, 1*s.* per square yard; strong Tarpaulings for Carts and Waggons, 2*s* per square yard: serviceable second hand ditto, 1*s.*; Waterproof Capes, to protect a man from wet while stooping down, 3*s.* each; second hand Policemen's Capes, fresh dressed, 18*s.* and 24*s.* per dozen; Horses' Waterproof Loin Cloths, lined with woollen, 7*s.* each: Driving Aprons, 7*s.* each; India Rubber Coats, 16*s.*; Oiled Coats, 7*s.* 6*d.*

R. Richardson, 21, Tonbridge Place, New Road, London.

WIRE FENCING, less than 2-inch mesh, in various widths, from 15 inches to 6 feet wide, at 6¾*d.* per square yard; 3-inch mesh, 4*d.* per square yard; 4-inch mesh, 3*d.* per square yard. Galvanized Wire Fencing, 1*s.* per square yard, 1½-inch mesh. The above Wire-work is made by machinery, is the cheapest article of the kind in England.

R. Richardson, 21, Tonbridge Place. New Road, London.

NETTING FOR SHEEP FOLDS.

WILDEY AND CO., Holland Street, Blackfriars Road, London, are the original introducers of the COCOA-NUT FIBRE SHEEPFOLDING NETS, which 14 years' experience has proved to possess the most extraordinary durability when exposed to alterations of weather. Cocoa-nut fibre will wear out several sets of *tarred hemp netting*, and is so light that a herdsman may with ease carry 200 yards of it.

Wildey & Co. were awarded a Prize Medal for this Netting by the Royal Agricultural Society in 1842, at the Exhibition of all Nations, in 1851, and at the Exposition Universelle, Paris, 1855. Sold in Nets of 50 and 100 yards long, 42 inches high, by the Manufacturers, Wildey & Co., at the Cocoa-nut Fibre Works, Holland Street, Blackfriars Road, London.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark, (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

Kensal Green, Harrow Road, London.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

PUBLIC INVITATION.

HEATING EXTENSIVELY BY ONE BOILER.

JOHN WEEKS & Co., King's Road, Chelsea,

HAVE this Season the pleasure of being able to refer to several other extensive Establishments where they have fixed ONE BOILER to do the same work which hitherto has taken from six to twelve boilers.

All the world knows the highly respectable firm of Messrs. Edward Henderson & Co., of the Wellington Nursery, Wellington Road, St. John's Wood, and as that Establishment is open to the public Messrs. John Weeks & Co.'s Hot-water Apparatus will now have a chance of being fairly tested and impartially represented during this winter. Messrs. Edward Henderson & Co. have now adopted what is called the "One Boiler System." At their extensive Nursery any gentleman or horticulturist can see the Hot-water Apparatus of several extensive ranges of Hothouses, all connected to one boiler. We will here quote Mr Edward Henderson's own words, showing how he approves of Messrs. J. Weeks & Co.'s system of heating by hot water. He says:

"I am more than satisfied with the extraordinary results of what Messrs. John Weeks & Co. *have done for me in heating a great number of our hot-houses from* one boiler. *It is almost impossible for me to express my satisfaction sufficiently strongly. The effect and great saving produced is truly wonderful; less than two sacks of coke in 24 hours is all that is used to heat a variety of hothouses, &c., nearly 800 feet in length, and these various houses are to some extent widely separated, as 300 feet stand in one direction, 150 feet in another 200 feet in another, and so on, including our large newly laid-out winter garden."*

Messrs. John Weeks & Co. can also refer to several extensive private establishments, where their Hot-water Apparatus can be seen in operation, and in every case with the same favourable results. J. W. & Co. also adhere strictly to all their former statements relating to their one boiler system, and most respectfully solicit a visit to their Garden Establishment at Chelsea, which consists of Hothouses, Greenhouses, Conservatories, Pits, &c., the whole measuring 1000 feet in length, exposing to the atmosphere upwards of 16,000 superficial feet of glass, the whole heated by one boiler, 5 feet high by 3 feet 6 inches in diameter, the water in the various houses circulating through 5000 feet of Hot-water Pipe.

The accompanying sketch represents our improved Upright Tubular Boiler, with hollow furnace bars. The large surface which this Boiler exposes to the immediate action of the fire renders it of such extraordinary power.

John Weeks & Co., King's Road, Chelsea,
Horticultural Builders and Hot Water Apparatus Manufacturers.

At our two establishments horticultural science is fully carried out in all its branches, combining all the improvements of the day. We have always in stock ready for immediate use a very extensive variety of horticultural erections; also Forcing Pits and Frames of all sizes. See our Illustrated Catalogues on Horticultural Building and Heating by Hot Water; also of all the best Stove and Greenhouse Plants; also of the best Vines, Pines, Peaches, and other Fruit trees.

John Weeks & Co., King's Road, Chelsea.

NEAT, DURABLE, AND WELL EXECUTED LABEL FOR NAMING PLANTS.—The Advertiser will forward on the receipt of a stamped envelope, containing two postage stamps, a Zinc Label, neatly painted, lettered in *Oil paint*, as a specimen for those who may require a number; they can be supplied at 2*d.* each.—Address F. H., at Mr. Bond's, Walcot, Salop

---

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late Stephenson & Peill), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.

HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4*s.* 9*d.* each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5*s.* 3*d.* each.

TO FLORISTS AND OTHERS.

J. JONES, Iron Merchant, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. Jones, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

TENNANT'S SELF-CLEANSING DIAMOND-TOOTHED WHEEL GRUBBER.—The Subscribers beg to call the attention of Agriculturists to this really useful implement, which since its introduction has met with more than usual favour, and has had awarded it the highest commendations by all who have tested its merits. Parties wishing to possess this Grubber to commence the spring operations should give their orders for it now. On application a drawing of the above, with full particulars as to its mode of working, will be sent free by post.

W. Drummond & Sons, Seed and Implement Warehouses, Stirling and Dublin.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, HELY & WARING, Managers, 296, Oxford Street, London.

STRONG HORTICULTURAL SHEET GLASS from 2*d.*; and HARTLEY'S PATENT ROUGH PLATE, from 4½*d.* per foot. CROWN or SHEET SQUARES, in 100 feet boxes, under 10 by 8, 12*s.* 6*d.*; above, 16*s.* 8*d.* per box. FOREIGN SHEET, in 200 feet cases, 34*s.* per case.

PERFORATED VENTILATING GLASS from 1*s.* 6*d.* per foot. TILES and SLATES from 6*d.* each. MILK PANS, 21*s.* per dozen. HELY'S HAND CHURN, 5*s.* 6*d.*; WARING'S BUTTER SLABS, 10*s.* each. Glass Fern Shades, Bee Glasses, Cucumber Tubes, Hyacinth Dishes, Propagating Glasses, Hand Lights, &c. Flower Labels, 7*s.* per 100, and the New Aquarium, 10*s.* each.—Catalogues free.

JAMES PHILLIPS AND CO., 116, Bishopsgate Street Without, have the pleasure to hand their present prices of

GLASS FERN SHADES AND STANDS.

FERN CASES, with Ferns complete, suitable for the Drawing Room, from 25*s.* each.

AQUARIUMS, with French polished stands, from 10*s.* each. Vase-shape ditto, on glass pedestal standing 23 inches high, 17 inches diameter, 25*s.*

Extract from *The Cottage Gardener.*

"Fern Shades. Many delight in seeing their beautiful Ferns introduced into the domestic circle; but without some such protection as these shades it would be impossible to preserve them. The shades of which we speak are glass cylinders with a domed top, which are placed on a glass pot wherein the Ferns have been planted, and they form on a small scale a pretty imitation of a Wardian Case."

FOREIGN AND ENGLISH SHEET GLASS WAREHOUSE,

87, Bishopsgate Street, Without.

T. MILLINGTON supplies the above SHEET GLASS in any size or substance, packed in 100, 200, or 300 feet cases. Same as supplied to Mr. Rivers and the leading men of the day. Reduced tariff, boxes included.—Per 100 ft.

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

NEW DOUBLE WHITE PETUNIA—"IMPERIAL" (true).

CHARLES TURNER will be able to supply strong Plants after the 1st of January of this beautiful new variety, which is as double as an Oleander, and fragrant. Plants 3s. 6d. each, with a considerable reduction to the trade if a dozen are taken. C. T. begs particularly to recommend it, as it is not only a novelty but also a valuable bedding plant.

Royal Nursery, Slough.

TO GENTLEMEN ENGAGED IN PLANTING, AND TO NURSERYMEN.

STEPHEN SHILLING begs to offer good Transplanted PLANTS and TREES of the following at very low prices, when a quantity of either sort are taken:—

3,000 Arbor-vitæ, 3 to 7 feet.	1,000 Horse Chesnuts, 8 to 12 ft.
10,000 Spruce Firs, 4 to 10 feet.	5,000 Beech, 6 to 10 feet.
10,000 Tree Box, 2 to 5 feet.	15,000 Rhododendron Ponticum, in variety, 1½ to 4 feet.
1,000 Limes, 6 to 10 feet.	

The whole of the above are well worthy of attention, being good in quality, the Evergreens of good healthy colour and bushy. All applications will have immediate attention.

North Warnborough Nursery, near Odiham, Hants, 2½ miles from Winchfield Station, South Western Railway.—Dec. 22.

THE BIRMINGHAM ROOT SHOW.

SUTTON'S PRIZE MANGEL WURZEL.—SUTTON'S ELVETHAM LONG RED, and SUTTON'S SELECTED YELLOW GLOBE.

These superior kinds of Mangel Wurzel took the first prize in each class at the Birmingham Great Root Show (open to all England), on the 11th, 12th, 13th, and 14th of December, and the same kinds, exhibited on Messrs. Sutton's stand at the Baker Street Show, would doubtless have been equally distinguished if Prizes for Roots had been given on that occasion.

J. Sutton & Sons, Seed Growers, Reading, Berks, have at present a good stock of Seed of the above, which they are selling at moderate prices according to quantity required. Early orders are requested to prevent disappointment.

Sutton's New Seed List, with Price, may now be obtained, post free.

DENYER'S NEW PROLIFIC GREEN MARROW PEA.—A fine variety for succeeding the first early Crops. Very hardy, and one of the greatest cropping Peas in cultivation. It obtained the first prize at the Hastings and also at the St. Leonard's Horticultural Exhibitions.

From the Dean of Battle.—"The sample of Peas you sent me surpasses in beauty of colour and richness of flavour any that I have ever met with."

From Mr. Waters, Gardener to Lady Webster, Battle Abbey.—"I have examined the growing stock of your new Pea, and find it crops abundantly, the pods being a good length, very broad, and well filled. It is also a fine flavoured and beautifully green-coloured Pea."

From Mr. Bunyard, Maidstone.—"My opinion of the new Pea is, that it is a distinct sort, a good cropper, and for colour I do not know its equal."

From Mr. Parks, late Nurseryman and Seedsman, Dartford, Kent.—"I am much pleased with your new Pea. It certainly is a very fine cropper. The Peas are large, and the pods completely filled. It will when known become a superior Pea for market."

Price 3s. 6d. per quart. Post Office orders payable to William Denyer, Seedsman, Battle, Sussex. May also be had through the London and other seedsmen.

WALTON NURSERY, LIVERPOOL.

To Noblemen and Gentlemen Planting New Pleasure Grounds, or Improving Parks or Drives, and to Companies Planting Public Parks or Cemeteries.

W. SKIRVING begs to offer his extensive Stock of TREES and SHRUBS of various sizes, adapted either for immediate effect or for extensive new Plantations, where smaller sized and less expensive plants are required. In addition to his general stock of the leading kinds of Trees and Shrubs, which is allowed to be the most extensive in England, he this season offers upwards of a hundred thousand of the two most valuable Trees lately introduced, the ARAUCARIA IMBRICATA and CEDRUS DEODARA, of various sizes, from one to six feet.

W. S. invites any one wanting considerable quantities of Specimen Trees and Shrubs to inspect his collection and obtain prices on the spot, as the mere height of such trees (as quoted in lists) gives no idea of the value of well grown select plants for choice situations.

N.B. A few hundreds of the larger sized and finely shaped plants of the Araucaria imbricata and Cedrus Deodara have been grown in tubs, to secure their travelling in safety to great distances in this country, or to any part abroad.

Priced Lists will be sent on application.

HORTICULTURAL ESTABLISHMENT, RIO DE JANEIRO.

MESSRS. RANGEL and MOSER have always on hand and ready for exportation, a large and magnificent Collection of ORCHIDS, BROMELIAS, ARBUTUS, PALMS, FERNS, and SEEDS of all the rarest and most valuable Brazilian plants at the following prices:—A Collection of 100 magnificent ORCHIDACEOUS PLANTS, in large masses consisting of 50 species, the greater part Cattleyas and Lælias, many new and not described. Price 75*l.*

A Collection of 50 different kinds of BROMELIAS, BILBERGIAS, ÆCHMEAS, PINES, &c. &c. Price 8*l.*

A Collection of 50 SHRUBS, of the latest Brazilian species, such as Rhopalas, Henteria coccinea, Psychotria, Talaumas, Drymis, Hamelias, Bignonias, and others well cultivated. Price 20*l.*

A Collection of 20 species of PALMS, amongst which are Corypha cerifera and others of showy appearance, Mauritia venifera, armata, Attaleas, Geonomas, Astrocaryum, Diplothemium, Enterpe oleracea, Cocos flexula, Bactris, &c. Price 20*l.*

A Collection of 20 species of TREE and other FERNS. Price 10*l.*

A Collection of 100 different species of SEEDS of the rarest plants of Brazil. Price 5*l.*

All the above-named plants will be delivered in the most perfect state, cash payments on delivery. Orders are requested to be forwarded as early in the year as possible, so that the plants may reach England at a proper season.—Direct, under cover, to Her Majesty's Agent for Packets, Rio de Janeiro.

FIVE HUNDRED BUSHELS OF POTATOES TO THE ACRE.—This enormous crop was grown last year by a gentleman in Surrey, and out of which there were only five bushels diseased; nearly all the quantity were large-sized, some weighing 2 lbs. and 1 oz., and not above three bushels of Chats out of the whole. This Potato was originally reared in Scotland, and is called by the grower the Scottish Champion, and has again proved to have surpassed all other sorts, both in quantity, quality, and freedom from disease, as will be seen by the testimonials.

The price is 2*l.* 2*s.*, inclusive of the sack of three bushels, delivered free at the South Western Railway Station in London.—Apply by letter, post-paid, to Mr. William Gowland, 4, Crooked Lane, London Bridge, London; or to Thos. B. Atkinson, Seedsman, 64, High Street, Worcester, where further testimonials can be obtained.

All orders must be accompanied by a remittance.

"Sir,—In answer to yours respecting the Scottish Champion Potato, I beg to say it is quite equal in flavour to the York Regent, is very productive, boils very white and mealy. In fact, of the sixty-seven varieties of Potatoes grown by me in the way of experiment this season I consider it the best, and shall plant it for my next general crop.—Your obedient servant,

"Edward Bennett, Gr. to Sir Offley Wakeman, Bart.,
"Perdiswell Hall, Worcester."

NEW TURNIP.

WAITE'S "ECLIPSE," PURPLE TOP YELLOW HYBRID TURNIP.

THIS new and distinct variety is a hybrid between the Purple Top Swede and Purple Top Yellow Scotch Turnip; it possesses the properties of the Swede, and may be sown much later. Coloured Drawings of this splendid Turnip may be had on application, or may be seen at the principal Seed Establishments throughout the kingdom. The Seed can be obtained of all respectable Seedsmen, price 8s. per lb.—A liberal allowance to the Trade.

J. G. Waite, Seed Merchant, 181, High Holborn, London.

SCARLET RHODODENDRONS.

J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine bushy Plants of the above 2 to 3 feet high, in Pots, well set with Flower buds.—Price 10*s.* 6*d.* each.

NEW ROSES.

J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine Standards of the following beautiful NEW ROSES:—

	s.	d.		s.	d.

Melanie Willermoz (Tea) ... ... 3*s.* 6*d.*

For a full description of the above see Catalogue, which may be had on application.—Dec. 22.

EARLY LETTUCES.—The largest and quickest growing LETTUCES are "SUTTON'S SUPERB WHITE COS," and "SUTTON'S SUPERB GREEN COS." The Editor of the *Gardeners' Chronicle*, in a critique on Lettuces, says of the first of these—"This is the very best Cos Lettuce, very large, leaves hooded at the top, so that they close in without tying; blanching white, crisp, so excellent that one would suppose no higher degree of perfection could be obtained as regards a Summer Lettuce." And of the other he says—"Sutton's Superb Green Cos: This very much resembles the preceding, but is a darker green, and hardier, therefore is preferable for sowing early in spring, and also for autumn use."

Seeds may be had (if ordered immediately) in packets 1*s.* each, post free.—Address, Sutton & Sons, Seed Growers and Merchants, Reading, Berks.

TO CUCUMBER GROWERS.

SUTTON'S BERKSHIRE CHAMPION is not only one of the most prolific Frame Cucumbers, as shown by several correspondents of the *Gardeners' Chronicle* (as see *Gardeners' Chronicle*, page 693), but is also of fine flavour, and so handsome that it invariably takes the Prize when exhibited in competition with other leading kinds. Seed can be supplied 1*s.* 6*d.* per packet (if ordered immediately); other fine sorts 1*s.* per packet, as see Catalogue, which may be had post free.

Sutton & Sons, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 22, 1855.

That the seeds of improved species of fruits and vegetables will not invariably perpetuate their improved quality is a well-known fact. They may reproduce a variety possessing very great similarity, or may give rise to farther improvement; or, on the contrary, they may bring forth a degenerate race, marked with the symptoms of a return towards the original wild species. But in propagating a plant otherwise than by seed, as by a single bud, or by some portion containing several buds, the plant or plants so produced are each considered to possess all the properties of the one from which the germs in the form of buds were taken. Moreover, the essential properties have been supposed to be retained by the original seedling, as well as its derivatives, except by seed, during the whole period of their existence. A memoir, however, has recently been brought under the notice of the Academy of Sciences by M. Dureau de la Malle which would seem to lead to a different conclusion. The case is thus stated by the author.

"Return of a comparatively modern variety of Pear, Doyenné Galeux, to one more ancient, the Doyenné Blanc, otherwise called Poire de cire or de Belle fille. This beautiful glossy Pear, of a pale golden yellow colour, tinted with vermillion, and which on that account is called *Poire de Belle fille* in Maine and Anjou, is well known. But a handsome exterior is seldom an indication of internal goodness, and this fruit, beautiful as it is, has a soft woolly flesh, like that of a large Turnip. The *Doyenné Galeux*, on the contrary, is smaller; its skin, which is greenish-white, is marked with black specks; its form is not so regular, but its skin is fine, and its flesh is close-grained, rich, juicy, melting, and very sugary, with a peculiar perfume, which is somewhat musky when the skin under one of the specks begins to decay. The fruit will keep for two months, a property which early Pears rarely possess. Nevertheless, at Paris, the beautiful has excluded the good from the shops of the fruiterers, where I have often sought, but never found it. For the last 150 years, scarcely any other variety of summer Doyenné except this excellent Pear, which passes for the best of its season, has been propagated in the province of Le Perche.

"The kitchen garden at Landres, in the commune of Mauves, about 20 seconds south-west of Paris, and at an elevation of 393 feet above the level of the sea, was filled, when my father purchased it in 1783, with espalier trees of the Doyenné Galeux, trained horizontally. They were all from 30 to 50 years old, and two of them are still alive.

"The late severe winter, 1854-5, in which the extreme lowest temperature was about 6° below zero, Fahrenheit, at Landres, whilst at the Paris Observatory it was never lower than 11½°, Fah., enabled me to determine the period of the introduction of this variety in Le Perche; and it appears from the oldest stem to have been at least 120 years ago.

"My two trees of the Doyenné Galeux were covered with flowers this spring; but the late frosts, and damp fogs of April and May, prevented both of them from bearing fruit. Nature, however, does not readily give in. On the second flow of sap in July and August, the shoots produced flowers, and six fruits were ripened. These proved to be the true *poires de cire*, or *Gros Doyenné blanc*, as regards both skin and flesh. The stalk was short and thick, as in all the Doyenné Pears. The shape alone was somewhat changed; it had assumed the Calebasse form of the Bon Chrétien, and of a bitter variety of the Chaumontel.

"Now, my two Pear trees are at least 120 years old; I may therefore conclude that in the reign of Louis XV. the *Doyenné Galeux* had existed in the province of Le Perche, and that in all probability it has been derived from the *Doyenné Blanc*, an older variety, which on account of its size and beauty must have been the first cultivated. This sudden return of a variety to a primitive state, as I have shown, appears to me analogous to that which takes place with regard to some of our animals and birds which have passed from the domestic to the wild state."

M. Dureau de la Malle then notices the case of an Arab mare producing a mule with the quagga; she then had two foals at different times by an English horse, the first of which appeared like a sort of quagga mule; and the second still bore a striking resemblance to the quagga, *son premier mari*, although from this the mare from the first had been altogether separated.

The author also refers to the circumstance of the domesticated pigs of Europe assuming, when left to freedom in America, the character of the wild pigs of India. These zoological matters do not, however, bear exactly on the case of the Pear.

The Doyenné Galeux is not mentioned in Duhamel, but is described by Noisette, *Manuel du Jardinier*. The tree received from him into the collection of the Horticultural Society proved to be the same as the Doyenné Gris; when grown under equal circumstances no difference could be detected; and according to Downing all the trees of the sort in question which were received in America proved likewise the Doyenné Gris. The latter, we believe, is only the Doyenné Blanc in a particular condition, and not a distinct seminal variety. Two seedlings may very much resemble each other; but when grown side by side there is generally some marked distinction in the wood, leaves, or flowers. But no such distinction exists between those parts respectively in the so-called varieties of the Doyenné Blanc, Gris, and Galeux. We, therefore, conclude that M. Dureau de la Malle is right in supposing the latter has been derived from the Doyenné Blanc. At the same time we may state that we have had probably more opportunities of seeing fruits from late or second blossoms, in consequence of the first being killed by frost, than occurs in Le Perche; and we find them smoother skinned than those from the regularly formed buds; the fruit also assumes an elongated form. But the unusual appearance is merely caused by unusual circumstances of a sudden description, and is only temporary. The individual remains essentially the same; though we admit that it may be so modified year after year by circumstances as to assume the character of an apparently distinct variety, and retain it with some considerable degree of permanence.

We read as follows in the *Builder* of 1849, while speaking of Greensted Church, Essex, restored by Messrs. Whyatt and Brandon, architects:—"The interest due to this little structure arises from the material of which it is constructed, from its undoubted antiquity, and from the strong evidence that exists of it having been built as a place for the reception of the corpse of St. Edmund on its return from London to Bury St. Edmunds in the year 1013. The inclosing walls of this building are apparently of Oak, and not of Chesnut, as has been supposed by some."

Could any correspondent in the neighbourhood obtain for us a piece a few inches cube, of one of the timbers of this remarkable edifice, which we believe

were shortened in the process of reparation? It would be a highly interesting addition to the evidence now collecting with reference to the Oak used in our ancient buildings.

New Plants.

155. Cucurbita Perennis *Asa Gray.*

I know nothing about the vegetation of Cucurbita perennis in the north of France, but in the south there is no plant with which I am acquainted that is more calculated to cover a wall rapidly. For instance, I have seen a single plant cover a surface of 16 square yards in three months. Cucurbita perennis is superior to other climbing plants, in that it covers both sides of the wall at the same time, whatever may be its length. The following are the curious phenomena presented by its vegetation.

At the commencement of winter the stems of the plant die, but its enormous roots remain alive in the ground; in the spring they begin to grow and throw out vigorous shoots from all sides, spreading themselves out on the wall and forming a large fan. Towards the month of August these shoots become very long and thin; their leaves become smaller and more distant; their tendrils are little developed, and their flowers less numerous. When the shoots have passed beyond the top of the wall, their own weight carries them down on each side. The mass of shoots forms a new and pleasing covering which conceals the darker leaves of the lower parts of the plant. But what is still more important, these shoots descend vertically in a more or less sloping direction, until they reach the ground. They then run along its surface and carpet it in the same way as they covered the wall. If a shoot leaves the wall and comes in contact with a hole or uneven part, it penetrates it, and immediately turns out again; but roots are developed at the convex part of the bend, strike into the ground, and thus form a natural cutting, which may be detached from the mother plant. This cutting is not formed on the surface of the ground, even when the shoot is buried; in order to make it root it must be bent. Experiments which I have made satisfy me as to this. I laid a glass tube, closed at one end, horizontally before a shoot which was running along the ground; the shoot entered it, reached the bottom, turned back twice at right angles, and came out by the same aperture at which it entered. Upon examining the bent part at the bottom of the tube, I found that the roots were developed at the convex part. If there had been soil at the bottom of the tube, it is clear that the plant would have taken root in it.

I have many times placed pots of earth below the shoots descending vertically. When they reached the pot they ran along the earth, which I took care to keep damp, and passed over it without taking root. But if I had placed upon the pot a stone the size of my fist, which would have forced the runner to bend back sharply upon itself, it would have taken root very well. The easiest way was to bend it back and fix it in the ground by means of a piece of stick in the form of a V reversed. The convex part then formed roots. I have often placed various obstacles upon the ground before the shoots, such as tiles, bricks, and stones; the rooting has always taken place when the bend has been made abruptly in contact with the earth, and never under any other circumstances.

All these facts show by what means this plant covers so rapidly both sides of a wall, whatever its length may be. Plant one a foot before a wall, or still better before a trellis; it will throw out its branches on all sides, which will reach the top, then fall down on both sides of the wall or trellis, come in contact with the soil, penetrate all the uneven places at the foot of the wall, take root there, and form as many plants for the next year. It is evident that the wall will be more quickly and regularly covered if the gardener takes the trouble to peg down the shoots wherever he wishes a new plant to be established.

Cucurbita perennis deserves to be ranked amongst ornamental plants. Its large cordate lanceolate leaves have a beautiful velvety appearance; its flowers, which open in the morning, have a sweet fragrant odour, but they fade quickly under the influence of the sun. Its fruit is a small round gourd, first green, then yellow, about the size of a large Montreuil Peach. *Ch. Martins, Prof. of Medicine at Montpellier; in the Revue Horticole.* This very remarkable plant is not mentioned in the last number of the Bon Jardinier, and seems to be little known. It is described in the *Plantæ Lindheimerianæ* of the learned Dr. Asa Gray, and appears to be a common Texan species growing in low places. It would seem to be worth introducing for the purpose of forming a temporary or permanent covering to old walls, trellis work, &c.

ENTOMOLOGY.

THE SEYCHELLES DORTHESIA.

It is a curious circumstance that several of those tribes of insects which are the greatest pests to the horticulturist, are also the greatest puzzles to the systematic entomologist. The earwig (Forficula) which eats the petals of many flowers, and gnaws the Apricot and other fruits, is to this day of doubtful locality in the classification of entomologists, by some authors being regarded as forming a distinct order, and by others as portion of the Orthoptera. The aphides, those myriad tribes which infest every plant, from the Oak of the forest to the tenderest annual, present more remarkable peculiarities in their reproductive system than are to be found in any other known animal. The thrips, like the Forficula, is so singular in its structure as to be equally unsettled in its classificational rank, having recently been formed into a distinct order, whilst the Coccidæ, including the mealy bugs and scale insects, in the remarkable transformations to which the males alone are subjected, are amongst the most anomalous of the insect tribes. The last-named family, placed by Latreille at the end of the order Homoptera, has also been raised into a separate order by some recent writers, and contains two distinct groups of species according to the condition of the adult females. In one group, exemplified by the common scale insects (Aspidiotus Nerii and Cacti, &c.), and the true Cocci or Cochineal insects, which are employed as dyes, the females as they approach the full size gradually lose all traces of their legs and antennæ, and become fixed immoveably to the surface of the plants on which they feed, their bodies shrivelling up and becoming a convex covering to the mass of eggs which are deposited beneath. The other group contains the mealy bug, Pseudococcus Adonidum, &c., the Dorthesiæ, and some other less known genera, in which the females, although never acquiring wings, retain their limbs and also their activity throughout their lives, although it is not often that the latter is employed, as the insect is satisfied to remain in one place so long as that situation supplies it with food.

The genus Dorthesia, named after M. Dorthez, a French naturalist of the end of the last century, is one of considerable interest. The males are elegant little two-winged creatures, with a thick bundle of very long delicate white straight filaments at the extremity of the body, forming a thick tail; the substance of these filaments appears to be waxy secretion, with which so many of these insects are more or less clothed, and of which an example of excessive development occurs in the Chinese Wax insect lately illustrated in our entomological series. The females, on the contrary, are flat insects, nearly of a rounded form, emitting thickened flakes of this waxy material from the sides of the body, which give them somewhat the appearance of tortoises in miniature. Unacquainted with the males of this genus, Dr. Leach formed the females into a separate genus, to which he gave the name of Cionops.

To this genus belongs an insect which Sir W. J. Hooker was kind enough to place in our hands at the beginning of October last. It had been imported on the leaves of a Palm from the Seychelles islands, and had spread slightly over other plants in the same case. Fortunately it was perceived on opening the case, and was carefully destroyed. Had the plants, on the contrary, been placed without due caution in the stoves, they would doubtless have quickly propagated, and a new pest would have been added to our list of obnoxious insects. Its size and general appearance will be perceived in the figure of the fragment of a small Palm leaf in the upper part of the accompanying woodcut. The two lower figures represent magnified figures of the insects, which are doubtless full-grown females, and their appearance is more elegant than ordinary in this tribe, the general colour of the body being fleshy pink covered with a white powder, and with larger tufts of a yellow secretion, having the appearance of closely pressed cotton wool arranged in several series along the body on the upper side (as shown in the right-hand figure), and in larger flakes arranged transversely (as seen in the left-hand figure, representing the under side of the body). The antennæ are short and 12-jointed, each having a small ocellus-like black eye near its base; the legs are moderately short, and terminated by a single claw.

The mouth, as usual, is placed between the base of the fore legs, and contains several fine threads, which the insect is able to protrude to a considerable length, thrusting them deeper and deeper into the substance of the plants on which it subsists. In addition to the little tufts of woolly-like wax, the body is also rather thickly clothed with long thin filaments of a similar material. It is unfortunate that we could discover no traces of the male insect, either in the pupa or perfect states. We propose for the species the name of Dorthesia Seychellarum. *J. O. W.*

VEGETABLE PATHOLOGY.—No. C.

400. Sphrigosis, Accidental and Organic (2, *Rankness*).—Besides the forms of this disease described in our last Number, arising, as far as we know, in most cases from constitutional peculiarities, there is a state of the malady common amongst cereals which proceeds from more palpable causes. It is not indeed asserted that the rankness of plants producing luxuriant barren shoots from the normal eyes may not arise sometimes from too nutritious soil, but as they occur where the soil is not so evidently nutritious, and since the effect of animal manure, if Schultz's views are correct, is exercised more in the stimulation of the organs of fructification than on the shoots and foliage, it is clear that the malady must be considered as in a great measure constitutional, and much more, when it is principally the adventitious buds which are influenced. In fact, the two causes are often so combined that it is impossible to estimate them precisely.

401. Excessive luxuriance in a crop amounting to what is known under the name of rankness, arises in many cases doubtless from the supply of particular manure, from a more than ordinary profusion of the more common dressings, or of the usual constituents of the soil, as in ground newly converted. Under such circumstances Wheat and Barley will exhibit a luxuriance which may in the end deceive the hopes of the farmer, or from a dressing of sulphate of lime the Clover layers may afford a supply of fodder, which answers the purpose of the farmer where his object is to obtain abundance of foliage and stem, without perfect development of seed. Such luxuriance may, it is clear, be carried to a dangerous extent, where, as in Peas and Beans, the production of fruit is the main object. With thin sowing there is however little danger from such luxuriance, and in such plants as Turnips, if the intervals between the individuals are wide enough, where there is a luxuriant top there is generally a good root beneath. Potatoes may be stimulated by an abundant supply of guano to produce large quantities of tubers; but the salesman who has once been unfortunate enough to buy them will not readily receive a second supply from the same quarter, as they are peculiarly liable to decay, and sometimes perish within a few days of delivery, as happened a year or two since with an enormous crop in Essex, of which I received an account from parties personally cognisant of the facts.

402. The effects of over manuring in pastures are constantly visible in the coarse green patches which are so obstinately refused by cattle. It is commonly said that such Grass is refused because it is sour. There does not, however, appear to be any foundation for this notion, but there is no doubt something about it which does not suit the palate of the cattle, and perhaps this may consist in an excessive development of chlorophyll to the diminution of other matters more grateful to their palates. The imperfectly organised Grass which grows under trees is equally distasteful, and probably the same comparative absence of saccharine and other nutritious matter may render it unpalatable. It would be worth inquiring what proportion the nutritious matter in Clover raised under the influence of gypsum bears to that in the shorter and less luxuriant produce of common cultivation.

403. There is, however, another cause of rankness in vegetables which in most cases admits of no remedy. In pastures this arises from the action of the larger fungi, which exhaust the soil behind them while they stimulate the vegetation which is immediately in front, thus producing the appearance known under the name of fairy rings. The manure of the decayed fungi is here probably the cause of temporary luxuriance, though the formation of chlorophyll is generally stimulated by the introduction of mycelium into vegetable tissues. This is the case with those parasitic fungi which attack cereals. Plants of Wheat, for instance, which have been inoculated with Bunt are distinguishable from very early growth, and a very vigorous appearance is equally the forerunner of smut, rust, and mildew. In the disease of the Rice plant described by Ré under the name of Carolo, the cause is probably the same, if we may judge from description alone. It is again notorious that those Potato crops which are most ravaged by the murrain exhibit a peculiar luxuriance before the appearance of the parasitic Botrytis. This applies, of course, only to those cases in which the mycelium is developed in the midst of the tissues. *M. J. B.*

SOUTH AUSTRALIAN GARDENING.

As much disappointment and misery have arisen from serious misrepresentations which have been promulgated about the Colonies of Australia, all of which differ greatly in character, I venture to give your readers a true account of one of them. And first permit me to allude to some letters which you inserted last year from Mr. M'Arthur, of Camden, near Sydney, N.S. Wales. His favourable remarks, though all true, must not be taken as a criterion of that place. He possesses, perhaps, the very best and oldest garden in the whole colony, and in the best situation. His Orange trees are superb; his fruits selected with great care and treated with much judgment; he is the A 1 of wine-makers and of producers. The Colony of Victoria is a pastoral but not agricultural or horticultural country; I believe that there is scarcely an acre of good land within 5 miles of Melbourne. The Grapes, too, are very inferior to ours. There is the least possible regard paid now to gardening; there

the gold fields absorb all attention and all labour; and I have not heard of a greenhouse in the whole colony. Now for ourselves; and the remarks which I shall make are for the most part applicable to all these colonies.

The people of all young countries are utilitarians; they cultivate for family use or profit, but rarely for ornament. If you ask what flower they like best, it is the Cauliflower; if you urge the planting of forest trees, the reply is, "Why should I plant for others hereafter?" If you object to a tree because it is short-lived, you hear, "Oh, it will last my time." Thus we have very few forest trees; there are Oaks, Elms, Ash, Poplar, and two or three more, grown by two or three persons, and also a few ornamental Firs, and that is all. I believe that there is not a Birch, Beech, Hornbeam, Larch, Scotch Fir, Evergreen Oak, Tulip tree, Plane tree, or Cedar in the whole colony. Nor yet have we imported from the Cape of Good Hope, New Zealand, or elsewhere, any equivalents for them. Of fruit trees we have a goodly number, but people plant for the most part the rapidly-bearing though short-lived trees, as the Apricot, the Peach, &c., which grow as dwarf standards, and do not remain in perfection more than 12 years. In their season Peaches and Apricots are about 2*d.* each. Apples are now 2*s.* 6*d.* a pound; Oranges, 8*d.* each. Grapes are very excellent; the finest Muscats. Frontignans, Damascus, Grand Turque, Raisin des Dames, and Constantia Grapes ripen in the open air. Melons are magnificent in growth, but rarely of good sorts, as may be supposed from all varieties being grown together, and the seed never changed. These things are all very cheap.

The nursery trade languishes except in the case of fruit trees, of which there is an enormous sale. Root-grafting, done over the fireside in the evenings, is very common; Almonds, moreover, grow large enough in one year to graft the second, and the trees become saleable the same season at three or four shillings each. All the trees here are dwarf standards; the wind is too high for tall trees, at least the gardeners say so, but I rather think the true reason is dwarfs are got out of hand soonest.

As to ornamental gardening, the colony is at a very low ebb, which is partly owing to the climate, where sometimes no rain falls for 4 or 5 months, and partly to indifference. There are no pot plants here in windows or houses. There are only, I believe, 3 greenhouses in the colony, and no hot-house properly so called; thus there is no collection of tropical plants, very few succulents—Orchids, Heaths, Camellias; no Rhododendrons or Azaleas; no Ferns; about 50 varieties of Rose; 8 or 10 of Fuchsia; 3 or 4 Pæonies; none of the Cistus tribe; only 8 or 10 varieties of Chrysanthemum and Pelargonium; 2 ornamental Ribes; no Box edging; no Stonecrops; and very few annuals or bulbs, except Cape bulbs. The ornaments of our gardens are chiefly Oleanders, and there are magnificent China Roses, the Oxalis tribe, Sparaxis, Ixia, double-flowered Peach, Almond, and a few others. Let not therefore the English gardener be deceived by too favourable representations. It is a noble colony for Wheat and wine, rich in its mineral resources and its flocks, in its magnificent soil and its splendid prospects. But our tracts of country are over large, and general drought hangs over all. There is no rotation of crops, no winter Turnips and spring Wheat, no Cabbages succeeded by Onions; all is green and luxuriant for six months—all brown and scorched for the other six; the thermometer often stands above 100°, and the soil is hard as a stone. There is no gardening then except picking fruit, which is truly and indeed the gardener's harvest, for he may pick 100 dozen of Apricots from a tree six years' old, and Grapes 15 tons to the acre; but present prices cannot be expected to last, as the planting year by year far exceeds the increasing demand. Gardeners have been told that they can get 20*s.* per day here as wages; but the teller has not the candour to add that it is only perhaps for a fortnight in the year, and given then only by a few persons to get their grafting done quickly. These statements are deceptive and therefore wrong. *A Constant Reader at the Antipodes, Aug.*, 1855.

POINTS OF EXCELLENCE IN A SEEDLING PEAR TREE.

The principal object of raising seedling Pear trees being to obtain varieties suited for cultivation in orchards in the coldest climates of our regions, it is of the greatest importance that the trees should be possessed of great vigour, and that they should be decidedly hardy and productive. The fruit should also be of a fine form, should possess the requisite degree of flavour, and should ripen in long succession.

The handsomest form of Pear is acknowledged by all amateurs to be that known as the Colmar. In fact, a fine fruit of the Colmar type, such as the Beurré Gris, Urbaniste, or Winter Nelis, offers, amongst all the known varieties of Pear, the most attractive object to the eye of even a very common observer. This class of Pears, well and regularly grown, and furnished with a footstalk in proportion to the size of the fruit, neither too long nor too slender, combines all the conditions of the finest form. Next to the Colmar, the most pleasing form is that of a fine Bergamot; then that of a Doyenné, Bon Chrétien, Bezi, Calebasse, and, finally, that of a Rousselet. These seven forms are very distinct, and easily recognised when the fruits acquire their full development.

Amongst the new varieties there are several which approach the form of those just enumerated, and it would have aided the memory as well as classification of them if they had been designated by the above generic names. The ignorance of some who have been in too great haste to designate these varieties by proper names only has produced a confusion much to be regretted by deviating from the elementary rules of a rational system of classification.

It must be acknowledged, however, that there exists at the present time several mixed or intermediate forms, which differ from those which are known and admitted as types; and in course of time others will come into existence. To one of these mixed forms Van Mons gave the appellation of Esperen, the name of his colleague, Major Esperen, of Mechlin. Bouvier, the names of Triomphe de Jodoigne (his native town of which he was also burgomaster), and Choix d'un Amateur. The successor of Van Mons called another variety without a distinct character by the name of Prévost (the name of the editor of the *Annales Pomologiques de Rouen.*) There are doubtless many distinctive denominations for forms of an unknown type; but when the fruit has the most striking characters of any type it is absolutely necessary to apply it as the generic name in preference to any other. We may add, that up to the present time no other system of classification has prevailed either in England or in Belgium; and it is best to keep to that which is generally known and admitted.

Too long and too slender a stalk is a defect in a new variety, the cultivation of which is consequently limited to a wall or dwarf pyramid. The defect depends on the size of the fruit. Whatever the vigour and hardiness of a new variety may be, if the size of the fruit be not proportionate to the strength of the stalk it becomes impossible to cultivate it successfully as a standard. This is an important consideration, and it is necessary to be satisfied upon this point before a new variety can be ranked amongst those proper for cultivation in an orchard.

The principal merit of a fruit is its flavour, which is found in the flesh, in the juice, and in the aroma. An experienced taster recognises these qualities in the different tinges of the skin. Whatever its shade or colour may be, the skin should be thin and closely attached to the flesh; the latter should be melting, buttery, without grit or fibre of any sort. From the eye to the stalk, and around the core, no strong concretions should be found. A fine white flesh, pale pink, or a slightly greenish hue, and melting like butter in the mouth are indispensable properties. The flesh should contain abundance of vinous, saccharine juice, slightly aromatic, but without too strong a perfume. These intrinsic qualities really exist in many varieties, the fruits of which ripen from September till April. We may, therefore, be permitted to hope that similar qualities may be found in recent seedlings from these varieties, combined with sufficient vigour and hardiness to suit the climates in which they have been raised. It will be easily understood that in order to obtain all these qualities in the fruit, it is essential that vigorous trees should be planted under the most favourable conditions; that they should be submitted to a rational mode of culture in a sufficiently rich soil; and that in this their roots should be for several years firmly established.

A variety combining the qualities above enumerated, ripening not all at once, but in succession during several months, showing the period of its maturity to the experienced eye by the shade of the skin and other signs, and without decaying first at the core, may be justly considered to have attained a high degree of perfection. The nearer these qualities approach such as are most to be desired, the more reason there is to be satisfied. It is however very rare to find every desirable requisite in the same variety. The highest degree of perfection indeed is very rarely to be met with amongst works resulting from the genius of man; and perhaps still more so in the productions of nature which he admires.

It is for the human mind to seek for the means of deriving the greatest possible advantages from nature, and to overcome the obstacles which it encounters. It is by the application of scientific principles, in conjunction with judicious practice, that we shall eventually obtain one or more new varieties of Pear, combining every desirable degree of perfection in our climate. Shall we be indebted for this result to chance, or to the reasoning powers of the human mind? Who can with certainty resolve this question! *J. De Jonghe, Brussels.*

Home Correspondence.

Osmunda Regalis.—There are many truly noble specimens of this Fern in Cornwall, and many in this neighbourhood grow to a large size, especially in hedge banks and other shady places where they are pretty well supplied with moisture in summer as well as during winter; it is a very common thing to see their fronds from 6 to 7 feet long, and in some favourable instances they are even longer. About 30 years ago my employer wishing to plant a low marshy piece of ground had a number of parallel open drains cut through it, a little deeper than the surface earth, which was about 1 foot thick of a fibrous, spongy, and peaty nature; and where, previous to these drains being cut, the ground could not be walked over in winter owing to its holding so much water. Osmundas had originally grown well in this situation, some of these surface drains had never been cleaned out, and many plants of the Osmunda had grown in their sides, and some of them had gradually extended themselves down into the bottom, where their roots were always moist. A few years ago I saw a number of these removed, and amongst them were some that had attained a very large size, especially the roots. One of the latter had raised itself above the adjoining ground from 15 to 18 inches, was more than 3 feet in diameter, and had nine royal crowns; its roots forming, as is well known, a close mass of a strong black wiry-looking substance. It was removed in summer when in full freshness, and took four men to carry it on a hand-barrow. Some of the other plants were about half the size of this one. A number of the largest British Ferns grow well here, and amongst others I may name one plant of Athyrium filix-fœmina, which has grown in the course of years to a very large size; its stem is about 18 inches above the ground. Near the surface it is 6 inches by 8 inches in diameter, but at about 6 inches high it suddenly swells out, so much so that at 15 inches high it is about 20 inches in diameter, having eight or ten crowns. Its stem presents a thick and compact appearance, and during the summer this plant has a very fine and graceful aspect; many of its fronds are often nearly 4 feet in length. *G. Dawson, Enys, Cornwall.*

Longevity of Seeds.—It is evident that much information might be collected on this and other subjects if observers would only take the trouble to make public the results of their investigations. Several circumstances which have come under my observation have convinced me that many seeds, when placed under certain conditions, will retain their vitality for a much longer period than they ever do when kept in the ordinary way, that is, in drawers, canvas bags, or paper packages; and one of the most striking of these is the following, which occurred in the well-known Vineyard Nursery, Hammersmith:—In the year 1823 a piece of Delaware Kale was reserved for seed, much of which was shed before and during the period of gathering; the ground was afterwards trenched to the depth of 2 feet and planted with fruit trees. After a lapse of 19 years the ground was again cleared and trenched to the same depth as before; the broken soil which remained in the bottom of the trench after the second "spit" was thrown out, and which is technically termed the "crumb," was thrown over the freshly dug surface. This "crumb," it will be observed, was the original surface soil, and it produced during the following spring an abundant crop of Delaware Kale, which was evidently produced from the seed which had been buried 19 years before, and which had preserved its vitality uninjured and unimpaired during that period, which is considerably more than double the time it will keep under ordinary circumstances and conditions. *J. R., Hammersmith.*

Cankered Pear Trees.—My soil is rather rich for fruit trees—a tenacious clayey loam from the bottom of marsh ditches, upon a well drained gravelly and sandy stratum. Here Pears and Apples bear surprisingly year after year without failure after their first exuberant growth has been somewhat checked by root pruning. I grafted an espalier Jargonelle three years since on one side with Beurré Rance, the other with Glou Morceau. The grafts of this latter must have been taken from a cankered parent, for I have not a sign or spot of canker in my garden. They never grew well, like the other sorts grafted at the same time, and are still cankered. The Pears on these are small, spotted with black patches in rather deep and irregular depressions, and altogether unlike, in size and appearance, what a good handsome Glou Morceau should be; yet after a week or fortnight's housing they are as sweet as sugar, and most deliciously melting. Do you think I should regraft the Glou Morceau side of my espalier, or is there any hope of the canker disappearing? Can one side of a tree be grafted while the other is growing? and will not this growing side be made over luxuriant by the sudden loss of one half of the tree, and during the two or three first years of the growth of the new grafts? *Novice.* [We should try the result of another year. Can't you throw vigour into the Glou Morceau by stopping its exuberant neighbour?]

Holcus Saccharatus.—The following is my method of treating this plant. Early in spring I sowed three seeds of it, only one of which vegetated; this I kept growing in the stove, shifting the plant into larger sized pots as required until June. When it was in a 15 inch pot, I then removed it to the greenhouse, the sash above it being left open for the summer. In August it sent up a large feathery panicle of flowers, 1 foot in length. From these I have gathered 2000 fine ripe seeds, as you will see by the sample I now send you. The stem or cane, which is also ripe, is 12 feet high, and 1 inch in diameter at 3 feet from the root. Would not this plant, with its long drooping foliage, answer well as an ornamental plant for the clumps or borders of the pleasure ground? It should be raised in heat early, and planted out in June. *John Southern, Didsbury.*

The Mussel Scale.—I have a quantity of Pear and Apple trees that are being destroyed by this pest. I have also a receipt of a solution which should destroy it, viz.:—Soft soap, 2 lbs., flour of sulphur, 2 lbs., leaf or roll tobacco, 2 lbs., nux vomica, 4 oz., turpentine, one gill, boiled in eight gallons of soft water down to six. If any of your readers have anything better I should feel obliged if they will make it known. *H. C. S.* [Hot-water varying from 150° to 160°, applied to the trees in mild weather when the leaves are off, is the best remedy for this insect.]

Potato Disease.—Last spring a composition advertised in your columns was stated to be a complete remedy for this disease. I was therefore induced to purchase

a quantity of it. I strictly followed the advertiser's directions as to quantity, and the Potato sets were planted directly on being taken out of the preparation. They consisted of five kinds:—Farmers' Glory, York Regents, Fluke, Ash-leaved Kidneys, and Early Golden Ball. The three last were entirely destroyed; not 30 sets vegetated. Of the Farmers' Glory about one-third came up, and about one-half of the York Regents; but both pushed weakly and late. They were got up at the usual time, when about one-third of the Farmers' were diseased, and at least two-thirds of the Regents. This remedy, therefore, said to be the result of 14 years' experiments, is not only utterly worthless for the purposes for which it was sold, but has inflicted on me a serious loss; and no doubt from some subsequent instruction sent to purchasers, the same thing has happened with others. I hope that persons who have used it will inform us of its results with them; it is really too bad to advertise such things. We had some waste land or common near this town inclosed and allotted to the freeholders about four years ago, used as common pasture; but a great part of it was grown over with Gorse and Fern, and had been so from time immemorial. A large number being small allotments were principally planted with Potatoes; that year the disease was very bad amongst Potatoes all round the town, but on the common there was scarcely one diseased. I may here observe that the land near the town is a light sandy soil, and that the common is of the same nature, with one exception. Three years ago I planted about 2 acres of the common, and when the Potatoes were got up there was scarcely one diseased, whilst the very same kind of Potato planted on some other land of mine not half a mile distant was nearly half diseased. Last year I planted about 3 acres on the common; the York Regents had a few diseased, the Farmers' Glory none, but on my other land there were many diseased; and the same facts hold good both as regards the common and the other land around the town which was planted by others. I must mention, however, a trifling exception. A gentleman who has a piece of land of several acres adjoining mine manured it excessively for Potatoes last year, and there was a considerable quantity diseased, but in no proportion to the crop of sound ones, whilst, as I have already observed, mine, which were also moderately manured with farm-yard dung, were all sound. Part of the common was a wet bog, but is now drained. It is still, however, by no means dry. I planted above half an acre of this late in the spring; when got up there was not a single Potato diseased, and they were the finest crop I had; whilst the very same sort planted on my other ground had about one-third diseased. I must observe that the tops of all the Potatoes on the common showed the disease every year, but were longer in dying down. Now, the inference I draw from these facts is, that there must be something in the ground which serves to counteract the effects of the disease to an extent that renders it almost harmless, but what is it? Corn does not at present succeed on this ground. Is the effect on the Potatoes the result of some acid? We have a remark that the ground is sour; and may it not be owing to this sourness that the disease is counteracted? Perhaps some of your chemical readers can furnish some information on the point, and suggest the means of trying some experiments, as it is now evident that if other parts have been visited by the disease this year as badly as this neighbourhood, we have not yet got rid of this mysterious malady. *Enquirer.* [In the bog lands of Ireland there never was much disease.]

The Cucumber Disease, brought forward by Mr. Ayres some weeks ago, seems to have been lost sight of, owing to the diversity of opinion existing between him and others regarding the good and bad qualities of certain sorts of Cucumbers. This digression from the most important part of the discussion is to be regretted, because anything tending to give us insight into the mysteries of this direful distemper is much to be desired. I quite agree with Mr. Ayres about the disease being non-constitutional, and that great care should be taken in preparing soil for the growth of Cucumbers; one-third of peat mixed with good loam, adding but a little dung, is the most suitable compost for the growth of healthy plants and good fruit. Mr. A. asserts that in his case the cause of disease rested in the soil. This conclusion, I fear, he will find untenable. My opinion is, that as in the case of the Potato disease, it is caused by atmospheric influence, as may be observed by the spot on the leaf of the Cucumber plant previous to the fruit becoming deformed. Information, therefore, as to the best mode of treating the plants affected will be conducive of much good. For the last two years some of the Cucumber plants grown by me have been more or less attacked. This year two plants of Syon House were put into a two-light box; both plants grew and set well, but disease attacked one of them. The fruit became deformed, and ceased to swell; of course the crop was lost. The other in the same soil, and the same sort of Cucumber, swelled its fruit perfectly. This in my case shows that the cause of the malady was not in the soil. If so, why were not both plants attacked by the malady? *David F. Cunningham.*

Wellingtonia gigantea.—The Mammoth Tree Grove is situated towards the sources of the Stanislaus, and some other rivers, in the county of Calaveras, in the state of California, about 200 miles from San Francisco. The spot is some 4550 feet above the level of that city, and 2400 feet above Murphy's, whence it is distant 15 miles, the road passing through a forest of the finest timber. The Mammoth Tree Grove contains in its valley 85 monster trees in an area of 50 acres. The "Big Tree" (not the largest tree in the grove, but the largest perfect tree) is 95 feet in circumference at the base or buttress, and 18 feet in diameter where the tree springs fairly 20 feet from the ground; it measured after it was cut down 300 feet in length. The stump was considered to be about 3000 years old. It took five men 25 days to fell the tree (which was done by boring), and three weeks to strip off the bark for a height of 22 feet. The average thickness of the bark was 15 inches; some of it 2 feet 1 inch. On the upper trail the first tree of note is the "Miner's Cabin;" it is about 80 feet in circumference, and nearly 200 feet high. It tapers up regularly, some 40 feet from the extreme base to the top of the cabin, or hollow, called the Miner's Cabin. It is open in front about 17 feet. The "Three Sisters" are a group evidently grown from the same roots. They are about 300 feet high, and together measure 92 feet in circumference. They are perfect trees, and the most beautiful group in the grove. It is 200 feet to the first limb of the centre tree. The "Pioneer's Cabin" is 150 feet high where the top is broken off. It has a small opening through the top. The "Old Bachelor" is an awful forlorn-looking tree; having many rents in its bark, and the roughest bark of any tree in the grove. It is nearly 300 feet high, and about 60 feet in circumference. The "Hermit" stands entirely by itself, is 300 feet high, and 75 feet in circumference. It is exceedingly straight, regular, and symmetrical. "Hercules" or "Empire State" is 300 feet high and 170 feet in circumference. It is the largest standing tree in the grove, and would make 725,000 feet of lumber. It, like many of the other large trees, is imperfect, being burned on the side of the trunk. The "Husband and Wife" are about 250 feet high, and each 60 feet in circumference. The "Family Group" consists of 26 trees, the father and mother and 24 children. The "Father," from appearances, was blown down many years ago. It measures 110 feet in circumference, and the supposed height, while standing, was 450 feet. The remaining length is 300 feet where it is broken off by falling against another large tree. It is 40 feet in circumference. It is hollow the entire length, and large enough to allow a person to ride into it on horseback. Near its base it contains a never-failing spring of water; nearly half of the trunk is embedded in the earth, and measures at its roots 22 feet in diameter above the ground. The "Mother" is a stately old woman, 91 feet in circumference and 327 feet high. It is the second largest tree in the grove. The 24 children are all of age, and large enough to speak for themselves. They are of average height, some standing near the Mother, yet the majority are near the Father. They are all in a real family group. The "Mother and Son" are together 93 feet in circumference. The Mother is 325 feet high; the Son 300. The "Siamese Twins, and their Guardian."—The Twins have one trunk, but the bodies separate at a height of 40 feet. They are 300 feet high. The Guardian stands by their side, is 80 feet in circumference, and 325 feet high. The "Old Maid" stands single in her grief; her head, unlike any other tree in the grove, is entirely bare, and slightly bowing. Her height is 260 feet; circumference 60 feet. "Adie and Mary" are named after two young ladies who made the first "buggy" drive to the grove. The trees are nearly 300 feet in height, and 65 in circumference, and are very handsome. There are other trees named, as "Uncle Tom's Cabin," "The Order of California," "Pennsylvania," &c. At the grove is an excellent inn, with good accommodation. Several acres have been cleared, and as the ground is very rich, and the place is much resorted to, the proprietor has every chance of making money rapidly. At the end of the dining-room is the stump of the great tree; it has been planed, and a floor having been raised to its level, forms a dark centre of 25 feet in diameter. Upon this floor the guests often dance. In this upland region the air is very fine, and the water most pure and cold, and, after suffering from the excessive heat at Murphy's and lower down among the southern gold regions, you most reluctantly descend. The wild fruits were not ripe, but in the season there are, I was told, Strawberries, Plums, and other fruits in great abundance, very good of their kind. There is fine food for cattle, and these regions, when subdued, will not be the least valuable of California. *Thomas Banister.*

Societies.

Caledonian Horticultural, *6th Dec.*—Office-bearers for the ensuing year were elected on this occasion. Prizes for Dessert Pears were awarded as follows:—The set which otherwise would have been entitled to preference (sent by Mr. Wyllie, Ninewar) was disqualified from want of the proper declaration. The prize was accordingly awarded for the next in point of merit to Mr. Morrison, gr. to R. Ainslie, Esq., the kinds being Marie Louise, Easter Beurré, Beurré d'Aremberg, Gansel's Bergamot, Glou Morceau, and Napoleon; 2d, Mr. Lockhart, Luffness, for Bezi de Quesnois, Crassane, Duchesse d'Angoulême, Marie Louise, and Doyenné Gris. Dessert Apples: 1st, Mr. Morrison, with Blenheim Pippin, Ribston Pippin, and Scarlet Nonpareil; 2d, Mr. Calder, Seacliffe, with Cambusnethan Pippin, Ribston Pippin, and Old Nonpareil. Retarded Grapes: 1st, Mr. Gavin, Hopetoun House, with White Nice; 2d, Mr. Melville, Dalmeny Park, with Barbarossa. Chrysanthemums: the Silver Medal was awarded to Mr. Laing, gr. to the Earl of Rosslyn, for beautiful blooms of Defiance, Duke, King, Lysius, Princess Marie, Queen of England, Nonpareil, Formosum, Beauty, Aragena, Dupont de l'Eure, and Two-coloured Incurved. For the finest flowered Chrysanthemum plant the prize was gained by Mr. Laing, with Annie Salter. The prize for Anemone-flowered Chrysanthemums was also gained by Mr. Laing, whose varieties were Madame Godereau, Gluck, Fleur de Marie, Astre du Matin, Madonna, and Marguerite d'Anjou. Of Pompone Chrysanthemums Mr. Laing sent Cedo Nulli; Mr. Reid, gr. to W. Wilson, Esq., Sacramento. In Red Celery three prizes were awarded: the 1st to Mr. J. Goodall; the 2d to Mr. Currier, for Manchester; and the 3d to Mr. Allan, Craig Park, for Cole's Superb Dwarf. In White Celery the 1st prize was awarded to Mr. Goodall; the 2d to Mr. Thomson, Woodburn, for Goodall's White; and the 3d to Mr. Ferrier, Eskbank, for Seymour's White. For Onions two prizes were awarded: the 1st to Mr. King, for Blood Red and Portugal; and the 2d to Mr. Henderson, Alderston, for Strasburg and Globe. In Broccoli three prizes were awarded: the first to Mr. Gordon, Niddrie, for Snow's Early White; the 2d to Mr. Logan, St. Roques, for Addison's Early Improved; and the 3d to Mr. Calder, for the same variety. The prize of two guineas, offered by Messrs. P. Lawson & Son, for the best collection of Pears, brought five competitors. The prize was gained by Mr. Anderson, Oxenford Castle, with a collection consisting of Catillac, Duchesse d'Angoulême, Marie Louise, Louise Bonne of Jersey, Uvedale's St. Germain, Spring Beurré, Gansel's Bergamot, Autumn Bergamot, Colmar d'Aremberg, Bellissime d'Hiver, Beurré Diel, Colmar, Flemish Beauty, Easter Beurré, Beurré d'Aremberg, Swan's Egg, Crassane, Leon le Clerc, Merveille d'Eté, Moorfowl Egg, Precel, Beurré de Capiaumont, Rouse Lench, Urbaniste, Glou Morceau, Gendesheim, Napoleon, Winter Nelis, Délices de Hardenpont, and Colmar Doré. Among productions contributed for exhibition only, were tubers of the new Chinese Yam (Dioscorea Batatas); a bunch of the Champion Black Hamburgh Grape, and one of the common B. Hamburgh from the same house, showing the superiority of the former, and its freedom from shanking, even when long kept; a seedling Grape, and a head of Grange's Improved Broccoli. The exhibition was also enhanced by numerous specimens of fruits, roots of Dioscorea Batatas, and other productions from the Society's garden.

Notices of Books.

In *The Handbook to the Marine Aquarium* (12mo, Van Voorst), Mr. Gosse, whose familiarity with marine animals and their habits has already gained him a wide-spread reputation, reveals the secrets of the success which has attended his important experiments in reducing the most obscure inhabitants of the sea to the dominion of man. With what skill this has been done is well known to those who visit the Zoological Garden in the Regent's Park; those who do not visit it we heartily recommend to turn their steps that way. Although we can hardly suppose that residents in inland places will encounter the difficulty and expense of maintaining a marine aquarium, yet we can believe that the long line of our seaboard will produce hundreds of admirers as well as diligent students of oceanic life, to whom the practical instructions contained in the work before us will be most welcome. We must find room for Mr. Gosse's account of his own operations:—

"If we attempt to collect and to keep marine animals alone in sea-water, however pure it may have been at first, it speedily becomes offensively fetid, the creatures look sickly, and rapidly die off, and we are glad to throw away the whole mass of corruption.

"Why is this? why should they die in our vessels when they live so healthily in the little pools and basins of the rock, that are no larger? For the very same reason that we should quickly die in a room perfectly air-tight. The blood of all animals requires to be perpetually renewed by the addition to it of the element called oxygen; and when it cannot obtain this it becomes unfit for the support of life. Terrestrial animals obtain this gaseous element from the air; aquatic animals (that is, those which are strictly such) obtain it from the water. But in either case it is principally produced by *living plants while under the action of light.* If, then, we can furnish our captives with a perpetual manufactory of oxygen, the main cause of their sudden death is removed. Of course they have other requirements, but this is the most urgent, the indispensable.

"In a state of nature, the rocks, the crannies, the pools, the sea-bottom are studded with various living plants, which we call sea-weeds; and these, under the daily stimulus of sunlight, direct or indirect, produce and throw off a vast quantity of oxygen, which, by the action of the waves and currents, is diffused through all parts of the habitable sea, and maintains the health of its countless swarms of animals.

"In an aquarium we seek to imitate this chemistry of nature. We collect the plants as well as the animals; and, a little observation teaching us how to proportion the one to the other, we succeed in maintaining, on a small scale, the balance of animal and vegetable life. Other less important benefits result from this arrangement; the creatures love retirement and shelter, and this they find in the umbrageous fronds; they delight to roam and to play and to rest in the feathery tufts,

and not a few find their favourite food in the delicate leaves of the submerged herbs.

"On the other hand, the plant is indebted to the animal for some of its supplies. The carbon, with which its solid parts are built up, is derived from the carbonic acid which is thrown off by animals in the process of breathing; a poisonous gas which would soon vitiate the water were it not taken up and appropriated by the plants.

"Such, then, is the principle on which the aquarium is founded: and any conditions under which it can be carried out will serve, provided of course they be suitable in other respects to the habits of the animals and our purpose in keeping them. I now proceed to other details on the practical management, so far as I am able, from my own experience, and that of not a few of my friends, to give them; premising that I have at present (September, 1855) at my residence at Islington, one marine tank full of animals and plants in the highest condition, the water in which, though as clear as crystal and quite colourless, has never been even removed from the vessel since it was first put in, 19 months ago. I have, also, other tanks and vases, which are respectively 17, 14, 13, and four months old. The success in establishment of these has not been achieved without some failures and losses, which yet must not be considered as unmitigated misfortunes, since they have added to my experience, and better fitted me to understand and sympathise with the difficulties of other beginners."

Modern Cookery: by Eliza Acton (Longmans).

A much enlarged edition of this useful collection of receipts has lately been published. The preface seems particularly worth attention; it deprecates the waste so common in kitchens, yet shows good cookery to be desirable for persons of limited income as well as for the wealthy. After observing that the subject, the influence of diet upon health, has recently been investigated by eminent men of science, the author continues as follows: "In arranging the present edition of this volume for publication, I have gladly taken advantage of such of their instructions (those of Baron Liebig especially) as have seemed to me adapted to its character, and likely to increase its real utility. These, I feel assured, if carefully followed out, will much assist our progress in culinary art, and diminish the unnecessary degree of expenditure which has hitherto attended its operations: for it may safely be averred that good cookery is the best and truest economy, turning to full account every wholesome article of food, and converting into palatable meals what the ignorant render uneatable, or throw away in disdain." Much may be learnt respecting economy in various parts of the volume, for example in the article "Stewing," p. 173, and "Oven Cookery," p. 178. Mrs. Acton announces her intention of publishing works on cookery for invalids and the poor, which we doubt not will prove highly valuable.

Flowers and Flower Gardens. By David Lester Richardson, *with an appendix of practical instructions and useful information respecting the Anglo-Indian Flower Garden.* Calcutta: D'Rosario. London: Smith and Elder. 8vo, pp. 232, with an Appendix of 32 pp. more.

We only notice this for the purpose of warning the public that it does not exactly fulfil the promise made in the title-page. What it does contain of Horticulture is limited to the Appendix, borrowed literally from Speede's well-known book, and as ill written, and uninstructive as can well be devised. The remainder of the volume consists of anecdotes and poetical extracts upon which we must not presume to express an opinion. The chief relation they bear to gardens appears to consist in their being arranged under the names of trees and flowers. The book is, however, intended for Indian readers, and we presume will prove more to the taste of Hindostan than of England.

Sanitary Reform and Reformers (Stanford) is a well-written, but fierce attack upon Messrs. Chadwick, F. O. Ward, and all the other advocates of converting (we should rather say of trying to convert) town sewage to profit. We are not sorry to see a clever writer and a well informed man taking this view of a great question; but we should have preferred a less acrimonious style. The pamphlet should be read by all who are engaged in this most important discussion, and most especially by the members of the new Metropolitan Board of Works.

Lawson's Gardeners' Kalendar, a broadside of the usual size, is beyond all comparison the most useful thing of the kind which has been offered to persons interested in Horticulture. It ought to be hung up in every seedshop, nurseryman's counting-house, and gardener's room in the United Kingdom. It is ornamented with an excellent litho-tinted view of the hothouses, &c, in H.M.'s Garden at Frogmore. It may be had at 1, George IV. Bridge, Edinburgh; or at 27, Great George Street, Westminster.

The Flora of the Colosseum of Rome, by Dr. Deakin (Groombridge), will we think prove acceptable to the English visiting Italy. It contains short familiar descriptions, arranged systematically, of some 400 or 500 species of plants, in the form of a well printed pocket volume. Such a work was wanted, and will probably answer the purpose of amateur travellers as a guide to the botany of Italy, and Southern France, as well as of the Colosseum.

Garden Memoranda.

Orleans House, Twickenham, the Residence of H.R.H. the Duc d'Aumale.—Within the last few years the gardens at this well-known place have been considerably improved. The extent of the ornamental ground has been increased by taking into it a portion of the kitchen garden, and planting it with evergreens, which are traversed in all directions by well formed walks; and owing to the good condition of the soil, both shrubs and Coniferous plants have made ample growth. Remarkable among the latter was a Juniperus Bedfordiana quite 12 feet high and 6 feet through, beautifully formed, and in the most robust health. On the outskirts of the lawn on the south side of the house to which the Thames, Pope's Grotto, and other objects of interest are contiguous, were also some very fine Conifers, among which was a Taxodium sempervirens at least 18 feet high, and with a trunk quite a foot in diameter at the ground. This fine specimen unfortunately lost its leader last winter, but a new one is about to be tied up to supply its place. We also remarked a noble Pinus excelsa, whose top, however, had been eaten off by the Pine beetle, some good Cryptomerias, Deodars, and Douglas Firs, together with immense masses of Portugal Laurels. One of the latter was stated on a label to have been planted by the late King of the French in 1816. In the centre of the lawn is a fountain whose jet can be made to throw water from 16 to 18 feet high, and in connection with the house is a lofty conservatory, which, when there is company, is lighted up at night. This is chiefly occupied with large growing plants such as Camellias, some of which, as the old double white and double striped, are now in full bloom and very gay. Here was also the Heliotrope Triomphe de Liège, trained up pillars to a great height; this is found to be invaluable for cutting for nosegays, being nearly always in bloom. To the east of the house is an Orangery, in which in Lord Kilmorey's time were kept some of the magnificent Orange trees that now ornament the Crystal Palace at Sydenham, but in the absence of these and other trees which it contained it has been converted into a picture gallery. This, as well as other houses about the place, was built and warmed, we were informed, by Messrs. Gray and Ormson. Not far from this spot is a short conservative wall on which are Chimonanthus, now coming into bloom, Myrtles, and Roses, &c., and in front of that a row of iron arches for Roses and hardy climbers. Under the arches are planted Irish Yews and Hollyhocks alternately, and in autumn, when the latter are in blossom, a striking effect is thus produced. A little farther on and we come to a short straight Italian walk, with dwarf walls, lined on both sides with tall Junipers, and surmounted by an iron trellis, on which Vines are trained for the shade their leaves afford in summer. This terminates in a small grotto or summer house.

In the kitchen garden the walks and borders are separated from the compartments by means of iron espaliers, and in one portion of it the wall borders are raised considerably above the level of the surrounding ground. The sloping faces of these banks, which are kept up by dwarf walls, form excellent places for growing early vegetables in spring. By putting shallow wooden frames over Lettuces in such situations, their progress is greatly accelerated, and they are fit for use very much sooner than others not so kindly treated. It is under bell-glasses or cloches, however, that the best Lettuces are grown here, and by means of these they can be had the whole winter through. The seed is sown in August, and when large enough the plants are pricked out on a warm border, five or six under each bell-glass. By means of a wooden peg, pushed into the ground, with notches in it for the edge of the bell to rest on, air is given on all favourable opportunities. As the plants increase in size so as to get too thick they are thinned out and used till at last only one or two are left, and in April and the beginning of May these are reported to be admirable specimens. All the protection they get in winter is some straw mats put over the cloches, which are also surrounded by the rakings of the shrubbery. In this way early Lettuces crisp and eatable even to the very outside-leaves are secured, and that at very little expense, for the bell-glasses in France only cost 9*d.* each, and their carriage to this country is not great. Why do not our glass manufacturers take possession of this trade! Some hundreds of these glasses are employed here just as in France.

The Batates or Sweet Potato has been cultivated here in nearly as great perfection as in the South of France, some of the tubers, the white round kind, weighing nearly 3 lbs. each, and the yield large, 24 plants being reported to have furnished 2 bushels of Batates. The manner in which this feat has been accomplished is as follows:—In March the eyes are cut out and put into 3 inch pots, filled with peaty soil, and started in Cucumber beds where there is bottom-heat. By the middle of May they have made good plants and are ready for planting out. A bed is then prepared for them in the open ground by throwing out the mould about 6 inches deep, putting some hot dung in the bottom and then replacing the soil. The Batates are then planted in a handful of peat, 12 in a row, 30 feet long, and 3 feet wide. Bell-glasses are put over them, and in the case of those grown here were kept on all the summer, but Mr. Gabriel Darragon, the French gardener to the Duke, is of opinion that when the weather has become warm they might be dispensed with. This then is all the care they received, and the result was as has been already stated, that the two rows or 24 plants produced 2 bushels of tubers—a yield which must be acknowledged to be highly encouraging. In addition to the value of the tubers, which are considered a great delicacy, the haulm is very luxuriant, and cows are extremely fond of it. Those therefore who wish to experiment on the growth of the Batates must take care to have the rows a good distance apart; 3 feet has been found to be too little.

The glasshouses here consist of Peach houses and Vineries, pits for Pines and plants, a stove for plants, and a neat span-roofed greenhouse, all heated by one boiler. One of the Vineries is provided with a double front, in which the Vines are retarded till it is desired to bring them into the house. Early Vines planted in the same Vinery are trained point downwards from the back towards the front. These are forced so as to furnish ripe fruit by the beginning of June, while those then introduced from the front yield a crop in August, and in this way the same house is made to produce two crops in one year. Heliotropes are grown in the houses in large quantities. They have all been cut back, and are now beginning to push afresh.

FLORICULTURE.

Out-door Chrysanthemums.—After eight years' experience in the culture of this flower, I have selected from some hundreds of sorts the following for out-door cultivation, and I may add that they may all be relied upon to give satisfaction; at least they have never failed to bloom profusely with me. To persons wishing to grow large specimens and incurved flowers the following are the best: Blush and Pink—Queen of England, King, Alfred Salter, Beauty, Nell Gwynne, Christine, Hermine, Trilby, Jessie, Princess Marie, Madame André, Duke. Rose—Themis, Versailles Defiance, Stafford, Phidias, Nonpareil, Pilot, Rosa mystica, Leon Leguay, Campestroni, Aregina. Orange and Rose—Anaxo, Cassy, Cyclops, Dupont de l'Eure, Lysias, Warden, Racine. Yellow—Plutus, Annie Salter, Golden Cluster, Chevalier Dumage, Cloth of Gold, Webb's Delight, Etoile d'Or. Red and Carmine — King of Crimsons, Madame Poggie, L'Emir, Pio Nono, Rabelais. White—Vesta, Defiance, Goliath, Madame Laborde, Madame Corbay, Madame Bouchalet. Purple — Rolla, Albin. The following are all excellent border flowers, but not incurved. White—Marchioness, Surprise, Lucidum, Conqueror. Yellow—Temple of Solomon, Formosum, Australe, Gerb d'Or, Queen of Yellows, Changeable Yellow, L'Ingot d'Or, Le Prophète. Red—Comte de Rantzau, Duke de Cornyliana, Claudius Ptolemy, Vortigern. Carmine — Bixio, Bossuet, Atro-rubens, De Crique. Lilac—Calypso, Princess Royal, Minerva, Webb's Queen. Crimson and Orange — Madame Cammerson, Christophe Colomb, Orlando, Aries, Auguste Mie. Anemone flowered: Yellow—Gluck, Marguerite de York, Reine Marguerite. White—Fleur de Marie, Nancy de Sermet, Madame Godereau, Salter's Reine Marguerite. Nankeen—Marguerite d'Anjou. Blush—Marguerite of Versailles. Sulphur—Eclipse, Madonna. The following Pompones grown in the open borders have all bloomed freely. Anemones: White tipped with pink—Cedo Nulli. Amaranth—Ariane. Red—Atropos. Carmine—Daphnis. Orange—Junon. Yellow—Sacramento. Blush—La Ruche. White—Reine des Anemones. Purple sorts—Lias. Lilac—Althæaflora. Rose—Finette. The following are not Anemone-centred:—Rose — Madame Rousselon, Ranunculé, Madame Maillard, President Decaisne, Précoce, Helène, Adonis, Elise Miellez. Yellow—La Roque, Solfaterre, Drin Drin, Pluie d'Or, Birrol, Le Jongleur, Le Pygmée, Coindre. Red and carmine — Bob, Grand Sultan, Brilliant, Doctor Bois Duval, Admiral Dumont Durville. Plum—Riquiqui, Piquillo. White — Argentine, Princess Mathilde, Modèle, Mont Blanc. Blush—Bijou d'Horticulture, Madame Jules d'Ivry, Graziella, Uranie. Red and Orange—Asmodée, Aurore Boreale, Criterion, Hector. Salmon—Comte Achille Vigier, Madame Ailbert. Nankeen and rose—Colibri, Jonas. Buff—Autumnum. Gold—Triomphe, Golden Drop, Cybele.
S. Broome, Temple Gardens.

Miscellaneous.

On the Growth of the Bamboo Cane, and of the Horse-radish tree.—These plants afford good examples of the powers of vegetation within the tropics in their rapid growth. I have been assured on good authority that the first, the Bamboo (Bambusa arundinacea), has been known to shoot 14 inches in the 24 hours. I measured one six days successively, one that was about 4 feet from the stool from which it sprung; during the first 24 hours it increased in height 6.75 inches; during the second, 5 25; during the third, 4.5; during the fifth, the same; during the sixth, 4 5 inches. The growth appeared to be in part terminal and in part interstitial, the space between the joints in the new shoot having lengthened. These observations were made between the 22d and 29th September, and on a plant in a comparatively poor and dry soil. A Horse-radish tree (Moringa pterygosperma) close to my house, that had sprung from seed, had in nine months from the sowing of the seed attained a height of at least 24 feet. Its trunk then exceeded in thickness a man's arm, and its branches, proportionally large, were at this time bent from the weight of its pods, some of which were ripe. It had received no culture or manure, and the soil on which it grew was stony, and nowise a fertile one. I find amongst my notes another instance of the activity of

tropical vegetation in the rapid manner in which plants right themselves on change of position. Thus in a flower-box in which weeds had taken the place of the flowers, placed on its end at 6 o'clock in the morning, I found in the short interval of 12 hours—viz, at 6 in the evening—that they, the weeds, had become bent at right angles to the soil in which they were rooted, so that the upper portion of their stems had recovered their perpendicular position. The extraordinary productiveness of a tropical climate is by many considered an inestimable advantage, forgetful of the more than counterbalancing evil arising from the astonishing growth of exhausting and often smothering weeds. The poet may sing of the

"redundant growth
Of Vines, and Maize, and bower, and brake,
Which Nature, kind to sloth,
And scarce solicited by human toil,
Pours from the riches of the teeming soil;"

but the planter knows to his cost that in no part of the earth's surface is more care and industry required than within the tropics to make agriculture profitable. *Dr. Davy in the Edin. New Philosophical Journal.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Although we have many beautiful plants which either bloom naturally at this season or require but little artificial management to cause them to do so, a scarcity of flowers is, perhaps, more commonly experienced at this than at any other period of the year. And where the display is, to a large extent, dependant upon what we term forced plants considerable foresight and attention will be necessary for some time, in order to maintain a regular supply, for plants are not so easily excited into bloom in the dead of winter as in spring, and in selecting plants for forcing every possible care should be exercised to choose such as are not likely to prove failures, for of things which are suitable for forcing many will bloom but poorly if they are subjected to a high temperature without having been allowed a sufficient time to recruit their energies after making their growth. Next to Camellias, Azaleas are perhaps the most showy plants that can be had in bloom at this season, and where there is a good stock of these to draw upon, some of the most forward plants of the commoner varieties should be placed in heat at once, moistening them over head two or three times a day. But unless plants can be selected which made their growth and set their buds early in the season, they need hardly be expected to flower so finely as under more natural circumstances in spring, and unless the buds are plump there will be some danger of the plants starting into growth instead of flowering. Dutch bulbs should be largely used for present forcing, and where hardy shrubs are forced for the decoration of this house, these should be got into flower as soon as circumstances admit, for although many of these are very showy when well bloomed, and acceptable enough when had in flower in winter, they hardly seem in place under glass in spring, after the weather becomes fine, and when more choice plants in bloom should be plentiful. Do not forget to introduce into gentle heat a good batch of Roses, choosing the most promising plants of Teas, Bourbons, and Hybrid Perpetuals, which are the best kinds for winter flowering; a gentle bottom-heat will be of great service to these as also to most other plants subjected to heat in order to get them into flower as quickly as possible, and a moist state of the atmosphere must be secured, admitting a little air freely on every favourable opportunity. Greenhouse.—Damp or insects soon do irreparable damage among soft-wooded plants at this season, and these must be very carefully attended to if they are to be carried over the winter in first-rate condition. Pelargoniums should be kept rather cool and dry, giving whatever water may be necessary on the mornings of fine days, so that the superfluous moisture may be dispelled before evening, avoiding the use of fire-heat save when necessary to prevent the temperature falling below 40°, or to dispel damp when this cannot safely be done by giving air. Keep the shoots thin, rubbing off such as can be spared, and if green fly is perceived upon any of the plants, apply tobacco smoke at once. Calceolarias require very similar treatment to the above, except that they are very subject to the attacks of thrips unless afforded a moist atmosphere, and they must be narrowly watched for this enemy and smoked lightly on two or three successive evenings if this pest makes its appearance, keeping the atmosphere moist and giving air on every favourable opportunity to prevent the foliage flagging. Cinerarias for late blooming must also be kept cool and airy, and should not be allowed to suffer for want of pot room; but these should not be trusted in cold pits after this season, for they are exceedingly impatient of frost. Forward plants of these, intended for flowering early, should be encouraged with a gentle heat, keeping them near the glass, and admitting air on every favourable opportunity.

FORCING DEPARTMENT.

Pineries.—If circumstances should render it necessary to subject a portion of the "fruiters" to a brisk temperature at once to induce them to start, the most promising plants for fruiting should be very carefully selected, and placed in a small house or pit by themselves; and, where anything like a regular supply of ripe fruit is required, several houses, or separately heated compartments, should be at command; and without this convenience no gardener can reasonably be blamed for having too many ripe at one time, and none at others. It is not by any means desirable to start more plants into fruit at this early season than may be absolutely necessary, for they will produce finer fruit later in the season than can possibly be obtained from them now; and where a separate house cannot be commanded for those which must be subjected to a high temperature, we would advise that the plants selected for fruiting should be placed in the warmest part of the house at command, filling the rest of the house with young stock. The former should be afforded a bottom heat of about 85°, and the latter about 10° or 15° lower; the atmosphere should range from 68° to 75° by fire heat, allowing it to rise 5° with the assistance of sunshine, keeping the young plants near the glass, and properly supplied with water at the root. This temperature will be considerably too high for young stock at this season, but we have seen this system practised with considerable success; and although the young plants may get somewhat drawn, they will gain substance as light increases, and the evil will be less than running the risk of starting at this early period of the season the greater portion of the plants that are at command for keeping up the supply throughout the summer. Vineries.—Until the buds are fairly broken the points of the shoots should be kept nearly on a level with the lowest part of the Vine; and if this should not be found sufficient to induce the buds to start equally throughout the length of the Vine, the rod should be bent so as to bring the most forward buds to the lowest level, elevating those that are backward. Maintain a thoroughly moist atmosphere by frequently sprinkling the floor and passages, &c.; and syringe the Vines lightly at least twice a day until the leaves begin to appear, when the amount of moisture must be moderated. Give every attention towards securing a gentle warmth for the roots; turning the litter, and adding fresh as may be requisite, and keeping it well protected from the effects of heavy rains and severe weather. Be satisfied with a moderate night temperature, until the buds begin to push, when it may be gradually raised to 60°, by the time that the leaves fairly begin to open. Peaches.—Until the trees are fairly on the move do not keep the night temperature higher than from 40° to 45° by means of fire-heat; but an advance of 10° early in the day, with plenty of moisture in the atmosphere, should be secured. Syringe the trees frequently, and secure a thoroughly moist atmosphere. Also see that the inside border is in a moist healthy state, and if this is not the case, two or three applications of tepid water should be given. It is becoming very much the order of the day to have Peach trees and most other things which are wanted for very early forcing, in pots; and this plan offers the advantage of being able to afford the roots a mild regular bottom-heat, which is of the greatest importance in early forcing, and excellent crops are also obtained. But the trees must be prepared for this purpose by having been grown some time in pots; and where these are not on hand, unless they can be purchased from the nurserymen who prepare them, nothing can be done this season except to procure and pot the trees, and prepare them for next year.

FLOWER GARDEN AND SHRUBBERIES.

Where the tenderer varieties of Roses are found to require protection, this should be applied at once, if not already done, otherwise it may soon be too late to save the plants. Also get in the stock of Briers for budding upon next year without delay, for unless these are planted before spring they seldom furnish strong shoots for early budding. Many persons object strongly to planting shrubs or trees in winter, believing that the roots if hurt at this season are liable to rot, and certainly early in autumn is a very preferable season; but with favourable weather we would not delay such work a single day, and if the soil is properly prepared by draining, &c., where necessary, as should always be done before planting, there will probably be fewer failures from planting now than if the work were delayed until March. But where the ground to be planted is of a clayey nature, and in an unkind state at present, it will undoubtedly be better to defer planting until spring, meantime using every means to improve the state of the ground; and soils of this nature should always be dug or trenched some considerable time before planting, as neither draining nor anything but exposure to the action of the atmosphere will bring them into a fit state for planting. But while we would not hesitate to plant small stuff generally at present, things which are at all tender had better be left until the chance of severe frost is past, and the transplanting of large evergreens which has unfortunately been delayed until now should be put off until the weather becomes mild in spring, especially things which are known not to be perfectly hardy. Roll walks and lawns after frost, to keep them firm and smooth. There will be comparatively little to be done in the flower garden at present, and any spare time will be well spent in going over the stock of plants in pits for next season's use, removing every decaying leaf, and where the surface soil has got green removing this and top-dressing with sandy loam. There is nothing so unfavourable to these plants at this season as damp, therefore take every opportunity of admitting fresh air.

HARDY FRUIT AND KITCHEN GARDEN.

It is always desirable to get as much of the pruning and nailing done before the approach of spring as possible, therefore lose no favourable opportunity for forwarding these operations; for besides the advantage of having so much work done before the busy season, the garden will present a much neater appearance after the wall trees are nailed, and the borders made trim, and the small fruit bushes pruned, and the ground among them turned over. See that standard trees which have been recently moved or root-pruned are firmly secured against being injured by wind, and also get any root-pruning or transplanting remaining to be done this season executed as soon as possible. Endeavour, as far as circumstances will permit, to have a good supply of Parsley under safe protection, for there is generally a large demand for this, and in the event of such a winter as last it will be impossible to save it by the ordinary protection of hoops and mats. Lettuce, Cauliflower, &c., being wintered in frames, must be freely exposed to the air on every favourable occasion. See to maintaining a regular supply of Seakale, Rhubarb, and any other forced vegetables which may be in demand, and let the supply be also as liberal as circumstances will admit, for it often happens with an irregular or limited supply that something is particularly wanted when it cannot be furnished. Look over the stores of roots occasionally to see that all are keeping sound, and be particularly careful of any Broccoli that may be fit for use or turning in. Take advantage of frosty weather to get manure wheeled upon spare ground where it is wanted, and see to keeping a good supply well rotted and fit for use when wanted.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Dec. 20, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 29th, 1827—therm. 58 deg.; and the lowest on the 28th, 1853—therm. 8 deg.

Notices to Correspondents.

Fruit Trees: *A C.* The following will suit your purpose:—Apples—Early Harvest, Golden Reinette. Ribston Pippin, Blenheim Pippin, Adams's Pearmain, Court of Wick, Scarlet Nonpareil, Boston Russet, Wormsley Pippin, Golden Noble, Mère de Ménage, Dumelow's Seedling. Pears—Williams's Bon Chrétien, Marie Louise, Louise Bonne (of Jersey), Beurré Diel, Van Mons Leon le Clerc, Glou Morceau, Easter Beurré.‖

Jerusalem Artichoke: *W. Antrim.* The proper name of this plant is the name it bears. Not find it in any book on Gardening! We cannot find any modern book on Gardening in which it is not.

Law of Tenancy: *S M B.* When you quit possession your Vines are the property of your landlord, and you cannot claim any compensation; unless you are a market gardener—or there is some special covenant in your lease. But you should consult your solicitor upon all such questions.

Leaves: *P B D.* We have for some time contemplated doing what you suggest; and probably shall.

Microscopes: *G W.* We know nothing of the maker whose advertisement you send. It is evidently a simple microscope that is offered, and not an achromatic one. Such instruments may be had of all prices, from 2*s.* 6*d.* in the form of the commonest pocket lens, up to 5*l.* 5*s.* What we have seen of low priced simple microscopes are dear at any price. If you want a very good unexpensive quasi-simple microscope, you should get a Coddington from some good maker. But our remarks were devoted to Achromatic microscopes—the only kinds of much use in the examination of minute objects.

Names of Fruits: *J J Shipston.* 1, Probably Syke House Russet; 5, King of the Pippins; 6, Anise; 7, Wormsley Pippin; 10, Court-pendu Plat. The others are like seedlings, or such as may be found in an orchard of Cider Apples.—*T B Browne.* 2, Autumn Bergamot; 4, Bequêne Musqué (stewing); 5, 7, Marie Louise; 6, Napoleon.—*T H.* The much decayed is probably the Beurré Bosc.—*F.* 1, Marie Louise; 4, Beurré Rance, and so is probably No. 2; 5, Rousselet de Rheims; 8, Winter Crassane; 9, Passe Colmar; 10, Scarlet Crofton; 13, Mère de Ménage; 14, is not the Nelson or Nelson Codlin; it seems to be the Northern Greening; 15, Reinette du Canada; 18, Wyken Pippin; 19, King of the Pippins; 20, 21, Court of Wick; 23, Golden Harvey; 25, not Clifton Nonsuch, but Bedfordshire Foundling.—*Jew:* Your Pear from France appears to be the Angelique de Bourdeaux.‖

Portable Boiler: *Sub.* We do not know where Smith's boiler can be had. Inquire of Messrs. Lawson and Co., of Edinburgh. We never saw it.

Syringing: *A Sub.* Don't use salt. What do you expect to gain by it? Do use soapsuds. Keep the skin of your trees as clean as your own—if you can. White Antwerp, Red Antwerp, and Rivers's double bearing Raspberries will probably give you all you want.

Underwood: *Enquirer.* We should not plant either Hemlock Spruce Firs or any kind of Silver, except experimentally. As you do not say in what county you live, it is difficult to say more than that you should rely upon Junipers, Yews, Hollies, Berberis Aquitolium, Hypericum calycinum, Common Broom, and, if your climate suit them, Evergreen Oaks.

*** As usual, many communications have been received too late and others are detained till the necessary inquiries can be made. We must also beg the indulgence of those correspondents, the insertion of whose contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the Importation and Sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves; to our agents, Messrs. Gibbs, Bright, & Co., of Liverpool and Bristol; or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence.—ANTONY GIBBS & SONS.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 1, Adelaide Place, London Bridge.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. PURSER, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINAGE OF LAND.

MR. J. JOHNSON, DRAINAGE ENGINEER, is desirous to undertake the Drainage of Land by Contract or Commission. Temporary Tileries erected in any part of England, and Drain Pipes manufactured at moderate prices. Every description of Drainage Tools.—Abingdon Street, Westminster.

IMPROVEMENT OF LAND.
TENANTS FOR LIFE AND OTHERS.

MR. HUMBERT, of Watford, Herts, a LAND AGENT and SURVEYOR of more than 20 years' experience, offers advice to Landowners having but limited or life interests, as to the means by which they can effect improvements without an immediate outlay; and his services in Erecting and Improving Farm Buildings, in Draining, Reclaiming, Planting, and Road-making by contract or commission, and the general Improvement of Land; also in Falling and Selling Timber, in the Transfer and Management of Estates, and the Enfranchisement of Copyholds. Mr. HUMBERT has long been largely interested in Landed Property, and is authorised to refer to his employers.

OWNERS OF SETTLED ESTATES and OTHERS desirous of availing themselves of the various recent Acts of Parliament, by which they may charge their Estates with money expended in the Improvement, Conversion, and Reclamation of Land, by Drainage, Irrigation, Embanking, Inclosing, making Farm-roads, Clearing, the erection of Farm-buildings and Machinery, Planting and other Agricultural Improvements, are respectfully informed that Messrs. HEWITT DAVIS & FRANCIS VIGERS undertake to advise and furnish Plans and Estimates, and if required, will contract to do the works, and dispose of the Rent charges.—3, Frederick's Place, Old Jewry, London.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Offices, 52, Parliament Street, London.
HENRY KER SEYMER, Esq. M.P., *Chairman.*

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.

2. In no case is any investigation of Title necessary.

3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. EQUAL FACILITIES WILL BE AFFORDED IN EITHER CASE.

4. The WHOLE cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.

5. The term of such charge may be fixed by the Landowner, and extended to FIFTY YEARS for LAND Improvements and THIRTY-ONE YEARS for FARM BUILDINGS, whereby the instalments will be kept within such a fair percentage as the occupiers of the improved Lands can afford to pay. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

ROYAL AGRICULTURAL COLLEGE,
CIRENCESTER.
Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &C.
Chemistry—J. A. C. Voelcker, Ph. D., F.C.S.
Zoology, Geology, and Botany—Jas Buckman, F G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The First Session of 1856 will begin February 5. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances; the fee for out students is 40*l.* per annum. The College course of lectures and practical instruction is complete in one twelvemonth, though a longer course is recommended. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

Mr. NESBIT is prepared to make engagements to deliver in the country a limited number of Lectures on Agricultural Chemistry during the next twelvemonth.

BIRMINGHAM CATTLE AND POULTRY SHOW.—At the ANNUAL GENERAL MEETING of SUBSCRIBERS, held at Dee's Royal Hotel, Birmingham, on the 13th of December, the Right Hon. the Earl of DARTMOUTH in the chair, the following RESOLUTIONS were unanimously adopted:—

Moved by C. M. CALDECOTT, Esq.; seconded by HOWARD LUCKCOCK, Esq.—

That the Right Hon. the Earl of Lichfield be appointed the President for the ensuing year.

Moved by HOWARD LUCKCOCK, Esq.; seconded by Mr. JOHN LOWE—

That the cordial thanks of this Meeting be given to the Earl of Dartmouth, for his courteous and kind attention to the business of the Society during the past year.

Moved by Mr. J. MATHEWS; seconded by WILLIAM JAMES, Esq.—

That the thanks of this Meeting be given to Mr. Shackel, and that he be requested to continue the office of Treasurer of the Society for the ensuing year.

Moved by C. M. CALDECOTT, Esq.; seconded by B. D. WEBSTER, Esq.—

That this Meeting unanimously concur with the Judges in reprobating the practice of trimming the fleeces of Sheep for the purpose of exhibition, as being calculated to deceive the public eye, although it cannot mislead the Judges, and requsets the Council to direct their attention to the subject, with a view of effectually repressing the practice.

Moved by Mr. T. B. WRIGHT; seconded by Mr. JOHN LOWE—

That, in the opinion of this Meeting, it is desirable that the Show of the Smithfield Club and that held in Birmingham should on no occasion take place at the same time; and that the Council be requested to take into consideration the propriety or otherwise of fixing the Birmingham Show one week earlier than that in London; and if such change appears to them to be calculated to promote the interests of the Exhibitors of Stock, and the convenience of Purchasers and Visitors generally, to make the necessary arrangements accordingly.

Moved by Mr. J. MATHEWS; seconded by C. M. CALDECOTT, Esq.—

That, in the opinion of this Meeting, it is desirable to discontinue the Annual Dinner, and to substitute in the place thereof a Lecture or Lectures on some subject connected with Agriculture, with a discussion or discussions thereupon; and that the Council for the ensuing year be requested to make the necessary arrangements for such Lecture or Lectures; and that the President be invited to preside. DARTMOUTH.

The chair having been vacated by the Earl of Dartmouth, and H. Luckcock, Esq., having been called thereto:—

Moved by C. M. CALDECOTT, Esq.; seconded by Mr. J. MATHEWS; and passed unanimously:—

That the Thanks of this Meeting be given to the President for his courteous and able conduct in the chair this day.

HOWARD LUCKCOCK.

The Agricultural Gazette.

SATURDAY, DECEMBER 22, 1855.

THE discussion on Land Drainage which followed Mr. BAILEY DENTON's paper before the Society of Arts turned more exclusively on the Keythorpe system than, considered in the interest of agriculture generally, was perhaps desirable. One expected to have heard on that occasion an extensive experience described or a satisfactory theory demonstrated in reference to the passage of water through the soil. If, in the one case, we had had the results of land drainage classified according to the circumstances under which they had occurred, so as to bring out the effects of deep and shallow conduits, of varying intervals between them, and so on; and if, in the others, we had had the laws of hydrostatics applied to the conditions under which water in the soil is placed, the discussion would have been more useful agriculturally than it has been. The debate was, however, to be renewed this week, and many of the points that we have named will, no doubt, obtain a fuller investigation at the adjourned discussion than they had previously received.

At the meeting last week Mr. TRIMMER followed Mr. BAILEY DENTON with an account of the Keythorpe drainage. Mr. HEWITT DAVIS objected to that system on the ground that the sub-ridges and furrows on which it depended were too various in their position and in their depth to be made the basis of any regular or trustworthy operations. Mr. MECHI argued for the efficiency and profitableness of deep drains with narrow intervals:—every foot of earth gained in depth was 1200 tons per acre for the use of plants. Lord BERNERS entered into long details upon the drainage of his estate at Keythorpe. His lordship had tried the various plans of drainage side by side, but none of them were satisfactory—he had spent many thousand pounds in trying shallow draining, and it had proved a failure—his success was obtained by the use of trial holes, and the placing conduits so as to take the water from the natural drains, viz. the furrows filled with the porous material overlying the subsoil. Mr. BAZALGETTE, engineer to the Metropolitan Commission of Sewers, stated very fairly, as it appears to us, the true objects of such a discussion as they were then engaged in:—

"There were a large number of gentlemen present from various parts of the country, each of whom could contribute valuable results, which, when collected, might throw considerable light upon the science of land drainage. It appeared to him that in considering the subject, the first principles to be determined were—First, what is the minimum depth to which the waters should be reduced below the surface, to render the drainage perfect. It might vary considerably in different localities, and for different purposes, and this was a question for the agriculturist to determine. It was then for the land draining engineer to ascertain at what slope the waters would percolate through various soils with sufficient velocity from this minimum depth below the surface towards his drains; and the relative distance between them and the required depth of the drains themselves would then be resolved into a question of comparative cost, and could be determined upon a sure and safe guiding principle."

Mr. BAKER, of Writtle, argued that as the water was held by the porous portions of the subsoil, there was no necessity for penetrating into the retentive beds below it; any fixed depth of 4 feet or more prescribed for the drains would be totally unnecessary further than as concerned their durability and relieving the soil to the depth of 2 feet.

Mr. CLUTTERBUCK referred to the light which knowledge of the geology of a district afforded to the drainer, illustrating it by the experience of geologist and drainage engineer in the neighbourhood of Oxford. Mr. HOSKYNS, who presided, summed up the remarks of the previous speakers against the advocates of a shallow system of drainage.

It will thus be seen that while many of the most influential authorities on the subject spoke, yet the purposes of a full discussion, such as Mr. BAZALGETTE indicated, were by no means fully served.

The only addition to existing knowledge, so far as we are aware, for which we have to thank the meeting was due to Mr. H. S. THOMPSON, who gave a very lucid and ingenious illustration of the greater quickness of the deeper drain, and as his experiment throws considerable light upon the relations of air, soil, and rain-water, we give his speech entire:—

It was known that in certain cases deep drains began to run, after rain, sooner than shallow ones, which fact had been long disputed, and when proved beyond a doubt had puzzled the highest authorities in such matters. He had been present at discussions at which Mr. PARKES and others had offered suggestions to account for it, which were not satisfactory to him. He had, therefore, had glass tubes made, of different lengths, and filled with soil, and had tested the times at which they began to drip when water was poured on them all at the same moment. If the soil was dry, the short tubes, which represented shallow drains, began to run first, but if water was again poured on the tubes before that previously poured on had all passed through, they began to drip again immediately that the second quantity of water was poured on, and without waiting for the water last used to pass through the soil. This was evidently due to the elasticity of the air confined between the free water at the bottom and that at the top of the column of earth, and in this case all the tubes, of whatever length, began to drip at the same moment. If, however, the tubes, after the first application of water, were allowed to remain some weeks, the short tubes discharged the whole of the free water, but the long ones, representing deep drained land, still retained a little free water at the bottom of the column of earth, and when water was again poured on at the top, this free water was *immediately* discharged, or the deep drain began to run; whereas the short tube, or shallow drain, having discharged all its free water, did not begin to drip for some time,—in fact, not till the water had percolated through the column of soil. He had repeated the experiment in various ways, and always with the same results. This was a small matter, but a fact, however trifling, if rightly explained, sometimes elucidated a great principle, and in this case, by tracing the course of the free water in its passage through long and short columns of soil, he had derived great instruction as to the

action of deep and shallow drains, and satisfied himself that there was no fear of making land too dry by deep draining, except in peat soils.

The tables of the Agricultural Statistics of Scotland have just been published, and we shall next week give them in a condensed form. The most material fact, and that which possesses the most immediate interest and will exert the most immediate influence, is the proportion in which the Wheat crop of the present year is stated to stand to that of 1854. Sixteen out of 85 districts return their produce as equal or superior to that of 1854, and of the remainder 35 are stated at 10 per cent. or more below that crop. Taking into account the character of 1854, as compared with the average of years, we should imagine the Scottish yield of Wheat this year to be not much below the crop in ordinary years.

Of course the character of the Wheat crop in Scotland does not much affect the supply of bread for the whole country, but the report now published is useful, as indicating the yield elsewhere under the circumstances of Scottish agriculture. How useful it is as indicating the possibility of publishing early in the season reports of our food supplies, future years will no doubt tell.

AUSTRALIAN FARMING.

Of all countries in the world perhaps none can excel South Australia in the quality of its Wheat. It does not average, perhaps, more than 15 or 16 bushels per acre, and the straw worth nothing; but the land is cheap—in very many cases, perhaps in most, it need not be ploughed above once in two or three years, being merely sown and harrowed the others. The reaping done by machine at the rate of an acre per hour soon clears the field; the corn may be threshed the day after it has been cut, and sent to market; it is then already dry enough to keep without heating. The straw burnt, or decaying upon the ground nourishes it; thus, although sowing Wheat for several years in succession is almost impossible to succeed elsewhere, here it is the usual practice. But it is not to be supposed that manure is useless—the few farmers who use it find the benefit; elsewhere the exhaustion of the land goes on slowly; it is usual in such a case to let the land lie fallow for a year or two, and break up fresh land for Wheat growing. To show the fluctuation of its price I may state that in 1850 it was 2*s.* 10*d.* per bushel of 60 lbs., and now it is 10*s.*—(the price a week ago, now lower). All grain, &c., here is sold by weight; 60 lbs. are a bushel of Wheat; 50 lbs. a bushel of Barley or grain, (the Chick Pea used instead of Beans but not grown here); 40 lbs. a bushel of Oats; 20 lbs. of pollard or bran.

The Cape Barley is much grown, and yields an abundant crop; so also does English Barley; the grain is harder perhaps than in England, and is not preferred by the maltsters, so that English made malt is a common consignment to this colony; so also are English Oats; Rye does not flourish, and, strange to say, that although Beans and Peas would succeed admirably, yet they are never grown. It is to be observed, however, as Wheat and Barley will grow upon almost all the land, another crop is the less necessary.

The climate occasions marked differences between the farm here and in England; here you will scarcely see anywhere a barn or a cowhouse, or sheds for winter feeding—very few stables even; what is the natural consequence? No warm yards covered with straw are to be seen, no litter for horses, no refuse except husks from the rick-yard, the ears being cut off by the machine close to the ears, so that there are no corn ricks at all, except in certain places or with small farmers, who are obliged to reap the corn in the usual way, and here only, of course, do you see shocks or sheaves of corn. There being no winter feeding of stock or sheep, there are no fields of Turnips, or Mangel Wurzel, or Cabbages. The land not being locked up by frost or snow is green and luxuriant all the winter. Neither the white nor red Clover, nor Tares or other green crops are grown. Summer is the season when the cattle suffer most, for as the Grasses are mostly annual, and die off about October, their dried remains, and a few insignificant weeds, are all that sustain them till the following April, when the rains set in. If any green crop is sown it is Lucerne, which succeeds admirably. There are no native Grasses large enough for hay, so that Oats are sown and cut green for this purpose. The Oat yields about 1½ tons per acre of hay which sells for (this year) 10*l.* per ton. It must be evident there is no straw or stable manure, and if there were, so great is the drought that an ordinary dung-heap would crumble into dust before the summer was out, most if not all ammoniacal properties would evaporate, and it would be of little value; also on bad roads the conveyance of manure would be expensive. Guano has been lately introduced, but in a very limited degree.

The sections of land, 80 acres, are all half a mile long and a quarter of a mile wide, and adjoin a public road; for the most part they are very thinly wooded—not more than an ordinary park in England. There are very few live fences, posts and rails or posts and wires being chiefly in use. Of forest trees there is very little variety; flowers few. The land is very rarely of a stiff clay, more often of a salt sandy structure, thirsty and barren, which all the manure that could be put upon it would not improve; very frequently of a fertile, friable rich loam of a reddish colour, and in the low lands of the finest black alluvial deposit—no chalk, no coal, no peat, no morasses or bogs, no binding gravel, and but little slate, but many minerals; such are the characteristics of our colony in agriculture. I do not allude to stock keeping; that would lead me too far away, but I have only written to give a few hints to emigrating farmers. *G. F., resident in Adelaide.*

ON BREAKING UP GRASS LAND.

I have some misgivings with regard to the sweeping way in which it has been laid down that we may break up ancient pastures, and that the artificial pastures are as productive as the ancient Grasses. I think the general impression of farmers is very much opposed to it, and any results drawn chiefly from Lancashire and the districts named by Mr. White, ought to be viewed with caution before they are adopted as applicable to the length and breadth of Cheshire. That ancient turf land of the description given by Mr. White ought to be broken up is another question; but as far as my impression goes, an ancient turf, if a good one, will do more work than any new one. You know whether it will for cheese; but I am speaking with reference to the fattening of cattle and feeding them. The question of breaking up ancient turf is now one of very great and national importance. It is very evident that we must go to some source beyond the arable land now in cultivation, to secure the supply of food to the people upon a sure foundation. Our attention has been called to this in a neighbouring county by a young nobleman of great promise, with whom I agree in some matters; I wish I could subscribe to all he says. There are 17 millions of acres of pasture land in this country, as compared with arable. We all know that pasture land, when broken up, will yield much greater crops of corn than the arable land. I should say, if a third of this land were broken up, it would yield more than all the arable land together. But the question comes, what description of turfs should we break up? I would venture as a farmer to say it is madness to plough turf land of very high quality; it is equal madness to plough turfs of very low quality, or clays of very low quality, that have good coats on their backs. Such had better remain in turfs. The class of land we may draw upon is the great breadth of wiry herbage turf land; that is, the land that ought to be brought into cultivation, and would supply an almost inexhaustible quantity of food. It is a comfort to hear Lord Sandys say we could produce three times as much as we do. What would be the consequence to every branch of industry in the country if even it were doubled? Whatever is added to the income of the country by this means must be spent in promoting every other kind of productive labour. I think the recommendation to break up ancient turf has been put too broadly; but I say, anything that is capable of conversion to green crops with advantage, may be safely and profitably broken up. It would yield more than it does, and you would have all the corn crops in addition. About cheese-making I feel less confidence. The general impression is that from cows grazing upon ancient turf the cheese is of better quality. I certainly do not concur in the assertion that the richer the land, the richer the quality; I think the practical evidence is directly contrary to it. I think that the marl and clayey marls, taking England through, make richer cheese than lands of high quality that have been greatly forced. If I am wrong, I should be glad to be set right. I am not laying this down dogmatically but rather as a channel for your own inquiry, for it is a question of too much importance not to be fully and fairly dealt with. We have heard of grazing cows on red Clover the first year; I doubt the wisdom of grazing red Clover with anything the first year. I think if I were to poll the gentlemen present, they would say as a person once said to me, "Can you get better Wheat after mowing Clover or grazing it?" I said, after mowing. I like theory and practice to go together. You think that the manure droppings would make it better, but it is not so. Nesbit says, in grazing it, you stop the growth of the plant; but in order to test it, he raised the root (after mowing a portion of the field and grazing the rest of it), cleaned and weighed it. If I remembered the result I should be afraid to state it, but it was something like ten-fold more from the mowing than from the grazing. Some attribute good cheese to artificial manures; but I say you want a series of experiments fairly conducted and honestly stated, and you ought to satisfy yourselves what kind of manures improve the quality of milk, and what deteriorate it. I guess Mr. White hit the point when he said that the cheese is more difficult to make after the application of manures; it does not, however, follow that the cheese is not better when it is more difficult to make. I recollect the case of a friend of mine in Staffordshire, who disturbed the quality of his cheese for several years after laying lime. I am now suggesting points for your consideration rather than giving advice. I do beg that you will pause before you rashly break up ancient turf of fine quality, and before you break up marly clays of moderate quality, if there is a tolerably good coat upon them. All the large class between these two may be converted into tillage land with advantage, and the public interest requires that it shall be so. What is the effect of your best Cheshire marl upon your pastures? I remember in my early life in your county, I thought that a good coat of marl doubled the fee simple. I saw good Grasses spring up like magic. But before you do so, you should make a careful analysis, for all is not good marl that is called by that name. Your marl has a great proportion of lime, which is a great criterion of value when it is free from minerals. You want a careful analysis of all the marls you have; and you should go back to the ancient system of using the best of them to improve the quality of your herbage. The old system of marling through England has been left off rashly, and we ought to revert to it. It is a grievous calamity, gentlemen, that any land situated between the Mersey and the Dee should be growing Scotch Fir. (Mr. Turnor refers to Delamere Forest). The Cheshire gentlemen could not do a wiser thing than petition the crown, and negociate for its restoration to cultivation. *Mr. Turnor at the Chester discussion.*

YIELD OF THE PAST HARVEST.

Worcester.—I beg to say that I consider the crop of Wheat in this part of the vale of Evesham extremely good. Since harvest I have threshed two fields of 34 acres—one of red Talavera, the other of a Russian Wheat—and the yield has been 13 bags or 39 bushels per acre. I have made numerous inquiries, and I find the average on the farms around me to be from 33 to 36 bushels per acre. This is certainly not the average of 1854, but for many years past. It may be objected that many farmers have grown less—that one or two in a parish may have grown this crop; but that others are far below it. I grant it; but spread the crops over the general acreage, and it will amount to what I have stated. In all the fields there are many bushels of refuse corn only fit for pigs or fowls; but whatever may be the yield or quality, the bread is certainly very good and very superior to that of last year. Besides there is a general impression that the yield is better than was expected. The Barley is an excellent crop, and the Beans and Peas, like the Wheat, turn out better than was expected; so that upon the whole I have nothing unfavourable to report, but on the contrary everything to cheer and please. *Henry Hudson, the Elms, Pershore.*

Norfolk.—In answer to yours received yesterday I beg to say that the Wheat crop in this district, and I may say county, is very deficient—full one-third. The Barley is a fair average crop, though not fine in quality. The Oats are barely an average in quantity, and quality inferior. Beans a fair crop. Peas, none of any consequence grown in this neighbourhood. The Wheat is quite as deficient in quality as it is quantity, a great deal of it not weighing more than 56 lbs. to 57 lbs. per bushel. *Thos. Brown.*

Suffolk.—In reply to your favour I beg to inform you that I consider the Wheat crop a full average, Barley above that estimation, Beans better than usual, Peas not so good, Oats very few grown in this district, Turnips and Swedes are fair crops, Mangel splendid. I have no better guide for my opinions than the common report of the neighbourhood, compared with my own experience as a farmer and maltster. I have threshed no Wheat but from my own seed, at Michaelmas, which yielded well; Barley I have threshed more, but cannot distinctly state produce per acre, as the stacking goes on without reference to separate fields; I was well satisfied with my first turn-out of Barley, both in quantity and quality, but I threshed a stack last week large enough for 40 quarters which gave but 20, it was down in the Grass; the Barleys malt kindly, but require selection in the samples offered. Wheat seed has been well done and in good time, although it appeared likely not to be finished in the usual time. *G. Edwards, Framlingham, December* 10.

Cambridgeshire: Chatteris.—In endeavouring to give a brief report of the produce of the last harvest, I will confine my observations to my own parish, which consists of about 14,000 acres of land, chiefly arable, and is situated in the midst of surrounding parishes, where the soil is similar; and consequently the remarks that will apply to this will also be applicable to several neighbouring parishes. In this parish we have two separate and distinct descriptions of soil, which we designate respectively high and fen land. The former is a strong and stiff soil, whilst the latter is very light; but the proportion of high land to fen is very small. I have now tested my own yield of Wheat on both these varieties of soil, and have also taken the opportunity of making inquiries of several other parties, to ascertain their probable produce. The result of my own experience, and of the inquiries I have made is, that upon the high lands the crop is about an average, or nearly so, but upon the fen lands the yield is deplorable. But to give figures, I place the average yield of this parish at 4½ quarters per acre. Now, taking every acre, whether high or fen land, as sown with Wheat last year, I conceive the acreable produce cannot exceed 2 quarters. But in the spring many fields on the fen land were ploughed up and sown either with green crops or spring corn; we should therefore place the yield of that which was reaped at harvest at 2½ quarters per acre. We find the quality, moreover, greatly inferior either to last or to an average year. The deficiency in weight cannot be less than 2 stones per quarter. As to any increased acreage, that is scarcely possible. As the system most generally adopted is to grow Wheat every alternate year, even where this is not pursued we find no additional land in Wheat. Barley is but little grown, and does not warrant a report. Oats and Beans are probably about an

average crop. *Alfred S. Ruston, Wenny Road, Chatteris, Dec.* 18.

Gloucester.—Wheat about 12½ per cent. or one-eighth below average, arising from the best deep lands being much laid early in the season, and the produce consequently light; and the light land having lost plant in consequence of the intense frost of last winter was too thin in patches; also the ears not well filled, from the wet weather when in blossom. The quality is, however, much better than expected. Other kinds of corn about average. *J. F. Peacey, Winchcomb, Gloucestershire.*

Hertfordshire.—The Wheat on the light lands in this district disappointed at harvest the hopes entertained by the growers throughout the spring; there is less than an average yield. But on the heavy lands the crop has proved abundant and good. Of Barley the yield is of an average quantity, but rather under an average quality. Of Oats I think the crop is satisfactory. I believe in this respect, as usually happens, that we have more to be thankful for than we care to admit. *Charles F Humbert, Watford.*

Kent.—I grow scarcely any other grain but Wheat, as you are aware, and cannot give you very positive information of my yield, except as regards the rakings, which may be a tolerably accurate criterion for the sheaf corn, as we term it. The rakings produced 11 quarters 2 bushels, being 6 gallons per acre, which should have been 15 quarters, viz., 1 bushel per acre. I have no doubt my produce will be from one-quarter to one-fifth short of an usual average growth. *M. Sandford, Dover.*

Hants.—The Wheat is a fair average crop in the inclosed districts, but much of that grown on very dry soils and exposed situations turns out very badly, and full 6 bushels per acre under the average produce. Barley is everywhere a bulky crop, and over an average produce, but the quality very inferior; and a less portion of the crop fit for malting purposes I never recollect. Oats are a good crop, although rather light in sample, yet the produce considerably exceeds an average crop. Beans and Peas under an average produce, but the sample good. *Joseph Blundell, Bursledon, Southampton.*

Carlow.—The yield of our Wheat crops in the best Wheat growing districts of this county of the past harvest is fully one-third under an average crop; Barley about one-fourth and Oats over one-third, and on some of the best Oat-growing districts the yield is from one-third to one-half under an average crop. This applies to the neighbouring counties, generally speaking, through which my engagements take me. In making these statements I speak also the sentiments of the most intelligent rent-paying farmers I so frequently meet. We want correct agricultural statistics other than those supplied the Government by our police, whose reports, no matter how honestly intended, are looked upon by every sound-thinking impartial-minded man capable of judging of such matters as little short of "a mockery, a delusion, and a snare." *Edward Carroll, Clonegal.*

Co. Kilkenny.—Having two threshing machines for hire I have had rather a good opportunity of knowing the general yield of corn this year, and my opinion is that Wheat is nearly one-fourth below average. Barley, average in quantity, but very bad in quality. Oats fully an average. *Dawson Athelward, New Ross.*

Home Correspondence.

Agricultural Economy.—One advantage (and one has need of finding advantages) of a state of war, of a deficiency of provision, is the necessary economy it forces us to use, and the impulse it gives to us to exercise our ingenuity in extending the means left to our use. When we are in a state of abundance and superfluity we become wasteful and neglectful even of the proper use of what we use. Our abundance not only does us no good, and even leads to a careless treatment of what we have, but it leaves us unprepared to meet any future difficulty in supply. This may only apply to a very great abundance, but such abundance we have had, of it we have wasted, and from it we suffer. Conceiving that bread-stuffs would always remain at an equable rate, we have indulged all our ancient predilections for an unmixed and unchangeable article, and now when such scarcity arrives we seem at our wits' ends to provide a remedy. For all of us to practise the closest economy, in our individual case, to ease ourselves of the great expense caused by present prices, is not only the duty but also the advantage of all educated and competent people; but combined with this economy and exercise of contriving powers, we must still look further, and endeavour to scan the future to determine the prospects of coming harvests, and the probable supplies of the necessities of existence. Can we really believe that future harvests will in our own country be much more productive than the present one has proved? Can we also believe that foreign supplies will come in so abundantly hereafter as to keep down our home prices? Or can we hope that superior cultivation will provide us at home with a sufficiency to balance the doubtful foreign supplies? Of the first point, I think we can hardly look forward to a greater yield on an average than we have lately received; also, that with the competition which seems likely to occur between ourselves and other countries, that the Wheat fields of America and the East will not be so exclusively our own as they have been. On the whole, then the greatest prospect of future supply seems to be derived from superior cultivation at home, yielding larger returns. Any one looking over the average yield of counties of corn per acre and comparing this with the returns made in cases of unusual care and cultivation, apart from the instances of soil, must conclude that a greater activity and perfection in the farming interest will yield the deficiency we have. It seems pretty clear that by moderate manuring and some little extra labour in cultivation we may increase our yield by 25 per cent., and attain at the same time a much more profitable rotation of crops. The first of these points attained, we are at once rendered independent of foreign supplies of grain, and the second as a reserve gives us a well grounded belief in its possibility. The only point to be attended to to attain this end is to put on the land as much of solid and mineral products as you remove. Soda, potash, lime, and nitrogen laid on in ascertained proportions will only leave to nature to turn them into food, and by keeping our accounts with our fields honestly, as a balance at our banker's, never drawing more than we pay in, we may continue on living even extravagantly, without fear of stoppage and difficulty. But we must make use of our national manures; we must turn to account the thousands of tons of general sewage which our towns and cities produce. Over and over again has this point been alluded to, but how to do so has ever been a stumbling block. Some talk of pumping it up to stations at a high level and thence distributing it to the surrounding country; then again it is proposed to consolidate the results of sewage, and to dispose of it in a soluble form to farmers everywhere; this latter seems by far the most promising plan, to carry our sewage down the river to some convenient spot and there, by a series of filters, to extract the solid matter, and by again treating this with the necessary adjuncts, as salt and gypsum, to preserve the nutritive properties, to consolidate it, and render it available for transportation to any part. The calculations on which the success of such a scheme depend seem much more likely to be realised by this than by any other. The nitrogen of one man's excrement in a year is stated to be about 1 st., capable of producing 800 lbs. of Wheat; the value of such manure must certainly be equal to 5*s.*; taking 2,500,000 as the population, 600,000*l.* appears as the product. This of course looks perfectly astounding, but we must recollect the immense value of the food that annually enters the metropolis, and remembering also that farmers well know that cattle fed on a field, and growing and increasing in weight on that field, yet render the soil more fruitful than if they had not been there, we may reasonably allow that the same would in a commercial sense prevail in a considerably less degree in the value returned for the manure restored to the fields, which even at this high estimate would not amount to barely a tenth of the value of the food consumed. Do we flinch then from the great expense and difficulty connected with the filtering of the water and collection of the solid matters? Of course it will be a very dirty job, a very nasty one, and must be done on a prodigious scale. Then, again, the solid state is by far the most useful—it is portable, it can be removed by ships or railways to any part of the country, it can be used when and where we like, and only requires the farmer to collect the water in suitable tanks in his fields, then to add his manure, and by a hose distribute it over or under his acres. Every prudent farmer who appreciates the value of irrigation would run the drainage of his individual fields into their own tanks, storing it there for days of drought, to be applied either pure or by admixture with manure. When the sewage scheme is put into execution, we may expect the full benefit of prolific production up to the standard of individual cases as at present. We may then easily produce a sufficiency for our own consumption, and may even become exporters. We shall then be free from monetary crises caused by deficiency of gold, which generally results from a demand for foreign corn. We shall then have advanced agriculture to its proper rank, and provided all classes with a sufficiency of necessaries. In fact the simple truth, the simple necessity, seems to be—sewage—plenty of sewage—turned to account. *H. C. Lloyd, Kingston-on-Thames.*

A new form of Agricultural Statistics.—At the Cattle Show of last year the description of food upon which the individual animals had been fed was stated on the same card which announced their breeder and exhibitor, as also their ages, but this year this piece of information appears to have been left out. The mere fact of an animal's having been fed on Linseed and Turnips is not in itself particularly interesting, as merely stated in that loose form there is not very much to be generalised from it; but if the exhibitor could have added to this an account of what was given daily of each kind of food, and could also state the total weight produced by a given quantity of food, we should be at once the gainers in knowing the economical fattening of the different breeds. Such an account has been kept by individual farmers in their experiments on the relation of breeds; and it has produced most valuable results. Also in an economical point of view it would be a great encouragement to know that highly bred, highly fed animals, seemingly fed only to produce the greatest perfection totally apart from expense, were yet economically fed, and realised a fair price for their expenses. For without this the cattle show loses half its advantage. It may be admirable for improving the breed and helping the perfection of parts, but if it merely produces animals of a perfection of symmetry and substance without doing so in an economical sense, it proves very useless to the great number of farmers who can only produce that which pays, and who must leave exclusively to the rich and noble the prize fattening of animals. Should this statement be made, and with the careful, scientific habits of the day it might easily be obtained, the substantial advantages of breed and food will receive a great advance, and would tell upon the popular mind much more strikingly than the unknown greatness of the present system. Given the cost price, and then every one, farmer or not, can more or less judge of the advantages of feed and breed. *Herbert C. Lloyd, Kingston-on-Thames.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Special Council, *Dec.* 12.—Lord Portman, President, in the chair.

Mr. Pusey.—On the 7th November, on the motion of Lord Portman, seconded by Colonel Challoner and Mr. Raymond Barker, the following resolution having been carried unanimously:—

"That a letter be written to the family of the late Philip Pusey, Esq., expressing the gratitude of the Royal Agricultural Society of England for his services as Chairman of the Journal Committee, and their great sorrow for his early death. That it be engrossed on vellum, and signed by the President, with the seal of the Society attached."

Lord Portman reported, at this meeting, that in pursuance of that resolution he had addressed the following letter to the family of the late Mr. Pusey:—

"The Council of the Royal Agricultural Society of England has directed me, as the President, to assure the family of the late Ph. Pusey, Esq., that the Society deeply and unfeignedly unite with them in their grief for the irreparable loss which they have sustained in the early and lamented death of their beloved father. In this bereavement the Council and the Society participate with the surviving and sorrowing members of Mr. Pusey's family; for while the recollection of parental affection and domestic virtue will long endear his memory to all the members of his family, his distinguished position when twice elected President of the Royal Agricultural Society of England, and his unceasing labours for 17 years as Chairman of the Journal Committee, will long be cherished by his surviving colleagues, and be remembered with gratitude and respect by every member of this Society. (Signed) Portman, President."

To which he had received the following reply:—

"London, Dec. 12.

"My Lord,—The family of the late Mr. Pusey have requested me, as one of the executors under his will, to express to your Lordship and the Council of the Royal Agricultural Society of England their graceful sense of the sympathy shown to them in their bereavement.

"They will not fail to appreciate duly such a communication from the Society, remembering how their father cherished the memory of Earl Spencer, its first President, and of others with whom he had the honour to be associated in its foundation.

"Of Mr. Pusey himself, it will long be remembered that to practical habits of business he joined deep philosophical thought, accurate scholarship, and genial appreciation of the arts and letters of modern as well as ancient times—that he applied a powerful intellect, with a keen forecast of the wants of his country, to develop the resources of British farming, and that, by a rare union of endowments, he did much to render science practical, and to win for agriculture a worthy place among the intellectual pursuits of the present day.

"How much labour he underwent, what forbearance and discrimination he exercised, how considerate he was of the feelings of others, how modest in the expression of his own, may never be known except to his personal friends; but some of the results of his unceasing exertions during many of the best years of his life are to be found in the Journal (to which the Council have referred by their resolution); and by that Journal at least his name will be permanently and honourably connected with the Society from the date of its commencement.

"This may not be the occasion on which to speak of his exertions for the labouring poor, or of his private virtues, but I trust that I shall be pardoned for having said thus much in response to the recognition of Mr. Pusey's services by the important public body over which your lordship presides.

"I have only further to request that you will be pleased to convey to the Council the respectful acknowledgments of Mr. Pusey's friends, and that you will accept personally their sincere thanks for the kind terms in which your letter to the family is expressed.—I have the honour to be, my lord, your lordship's faithful servant, Thomas Dyke Acland, Jun."

"The Right Hon. Lord Portman."

On the motion of Mr. Jonas, seconded by Mr. Fisher Hobbs, it was resolved that the foregoing letters be entered in the proceedings of the day, and be printed in the forthcoming number of the Journal.

Guano Substitute.—Mr. Raymond Barker having submitted the report of the Guano Substitute Committee, on a formal claim made for the Society's 1000*l.* prize, the Council adopted the opinion of the Committee that proposed substitute was not entitled to the prize offered.

Trial of Implements.—Colonel Challoner, chairman of the Implement Committee, having read to the Council the suggestions of the implement makers, who had met that committee in conference two days previously, it was carried on the motion of Mr. Thompson, seconded by Colonel Challoner, "That at future country meetings the competitive trials of implements shall be confined to certain specified classes of implements, and that it be referred to the Implement Committee to make such a classification as shall ensure the trial of every description of agricultural implement once in three years;" and on the motion of Mr. Brandeth, seconded by Mr. Slaney, "That after the word 'Implement' in the previous resolution, the words be added 'for which alone in each year prizes shall be offered.'" The Implement prize sheet was accordingly referred to the Implement Committee to report to the Council in February what prizes they would recommend to be offered at the Chelmsford Meeting.

Steam-Cultivator.—It was carried, on the motion of Mr. Evelyn Denison, M.P., seconded by Mr. Hamond: "That the sum of 500*l.* be offered by the Society for the best steam cultivator that shall be an economical

substitute for the plough or the spade, and that it be referred to the Implement Committee to consider the details of the conditions to be made for the prize."

Special Council, *Dec.* 13.—Lord Portman, President, in the chair.

Live Stock Prizes.—On the motion of Mr. Miles, M.P., seconded by Lord Feversham, prizes were unanimously voted for foreign stock of any pure native breeds of cattle and sheep, open to all foreigners, under conditions to be recommended to the Council at their February meeting by a special committee, consisting of Mr. Miles, M.P., Mr. Evelyn Denison, M.P., Lord Feversham, Mr. Jonas Webb, Mr. Fisher Hobbs, Mr. Jonas, Mr. Milward, and Professor Simonds. A sum not exceeding 120*l.* was voted for Poultry Prizes to be arranged by the Council in February. On the suggestion of Mr. Townley Parker, a class of Prizes was voted for Dray Horses. The general conditions and regulations of the prize sheet in reference to the usual prizes offered by the Society were agreed to.

Special Meeting, *Dec.* 14. — Colonel Challoner, Trustee, in the Chair. The report of the General Meeting was agreed to.

General Meeting of the Society.—The following report was read :—

REPORT.

The Society, during the past half-year, has lost 40 of its members by death, and gained, during the same period, 116 new members by election. Its list now contains—

9 Life-Governors,
140 Annual Governors,
815 Life-Meremb,
3895 Annual Members, and
18 Honorary Members.

The Council have elected Lord Berners to fill the vacancy in the number of Trustees occasioned by the lamented decease of Mr. Pusey; and the Earl of Essex to supply the vacancy in the General Members of Council, created by the transfer of Lord Berners's name to the class of Trustees.

The Society at large will have deeply participated with the Council in their sense of the great loss they have sustained in the removal of Mr. Pusey from the sphere of his invaluable co-operation, and from the direction of that Journal which has so long formed the strongest bond of union among its members. The Council have already expressed, through their President, Lord Portman, their condolence with the family of Mr. Pusey on their irreparable loss, and their grateful estimation of his devoted services to the Society.

The Carlisle Meeting has been one of the most successful of the efforts of the Society to promote and extend to remote districts the practical value arising from the trial of Implements and the exhibition of Live Stock. The lateness of the season preventing efficient trials of the Reaping Machines at Carlisle, they were postponed until the end of August, when they took place at Abbot's Leigh, in Somersetshire, on a farm of Mr. Miles, M.P., the President of the Society, who placed for that purpose the whole of his crops, horses, and men at the service of the Society; and most hospitably received at Leigh Court the official company who attended the trials on the part of the Society.

The Council have already agreed to the Live-Stock Prize Sheet for the Country Meeting to be held next year at Chelmsford, including, along with the usual prizes, additional classes for Foreign Cattle and Sheep, and a distinct division for Dray Horses; the arrangement of the Prizes for Farm Poultry and for Agricultural Implements and Machinery being postponed until February.

Mr. Miles, M.P., having in June last, as the President of the Society at that time, headed a Deputation of the Society to the French Agricultural Meeting at Paris, agreeably with an express invitation of the Imperial Government, has reported to the Council the successful results of that mission in every point of view.

The Earl of Clarendon has continued to transmit to the Society the successive returns furnished by the consuls residing in various tropical districts where guano, nitrates, and other manuring deposits are thought likely to be discovered. The Council have again expressed to Lord Clarendon their deep sense of his lordship's kindness in thus continuing to promote the objects of the Society; and they have requested Prof. Way to prepare for publication in the Journal a digested arrangement of the returns already received by the Society from the Foreign Office in reference to that subject.

A claim having at length been made in form for the Society's 1000*l.* Prize for a substitute for Guano, the Special Committee on that subject have taken into their careful consideration; and, on their report, the Council have resolved that the substitute proposed is not entitled to the Prize

Since the last General Meeting, Prof. Simonds has delivered a lecture on the Physiology of Milk-Secretion, and Prof. Way a lecture on the Value of Fish as Manure. Prof. Way is also actively engaged, as the Consulting Chemist of the Society, in prosecuting important researches under the direction of the chemical committee.

The Council have every reason, in conclusion, to congratulate the members on the position of usefulness which the Society continues to maintain, and on the success with which its operations for promoting improvement in every branch of husbandry continue to be attended. They feel the responsibility which so great a power as the Society now possesses places in their hands and entertain an anxious desire accordingly to render its operations sound and practical, at the same time that they are progressive. They confidently expect that the union of practice with science will result in the discovery of principles, and their just application, without which agriculture can never attain to the rank of a rational pursuit, but will remain a mere art, limited by routine, and capable only of slow and doubtful extension.

By order of the Council, James Hudson, Secretary.

This report having been adopted, Mr. Raymond Barker submitted the Balance-sheet of the auditors (who were re-elected to that office). Thanks were given to them, and to Professor Simonds and Way for their lectures. Colonel Challoner, in acknowledging the vote of thanks to him, as chairman, stated that the Society had never been in a more prosperous state than it was at that time.

Gloucestershire, *Dec.* 8.—The first meeting of this Society since the amalgamation of the Gloucester and Cirencester Societies, has been held at Cirencester during the past week, with a very large amount of success. The premiums offered were exceedingly liberal, and the competition was consequently spirited. At the dinner the toast of "the Successful Candidates" was responded to by Mr. Bowly, who said,—They had to catch all the improvements as they came up, and to try them, and see how far they were remunerative on their own farms. Dr. Johnson had very justly said that the only way to wealth was by persevering industry, and ever plodding on. There was nothing but plodding in farming; it was purely a plodding pursuit. They must look to great things only by the adoption of those improvements which might be small in the first instance. There was never a greater boon to the farmer than the decomposition of bones by sulphuric acid, thereby rendering a much less quantity of bones necessary for the Turnip crop. We owe that improvement to science. If it had not been for science, they would have continued using dry bones for all eternity. With regard to feeding cattle, the scientific man told them their cattle could be kept on a much less quantity of Turnips by mixing with them a larger quantity of chaff. Mr. Bowly then referred to experiments tried by Mr. Holland and Mr. Mechi, and said he himself now kept one-third more cattle upon the same quantity of Turnips than he did a few years ago. An enormous quantity of food for cattle had been made by the application of liquid manure upon Italian Rye-grass.

Mr. Mechi said he could not help remembering that what his friend Mr. Bowly had advanced he had read in his books and practised ten years ago, and ever since. He was satisfied in his own mind the great question of the day would become the possibility of feeding the British public without the help of the foreigner. There was no difficulty in doing that if the British farmer was determined to do it. He did not know whether they were aware of it, but that question was practically answered by the farming of many gentlemen present. He had his eye on many gentlemen in that room who farmed in such a manner, which if it were generally pursued would produce sufficient for our comsumption without the necessity of foreign importations. He would not refer to himself, or he might be asked how his balance sheet stood (laughter). But there were men then present who were spending more money than he was in agricultural improvement, and yet were making a profit of it. If, however, they did ask him how his balance sheet stood, he would tell them that last year he made a profit of between 600*l.* and 700*l.*, as between landlord and tenant, and this year he should exceed that amount by about 100*l.* He mentioned this not from any personal vanity, but because he thought it was right that everybody should understand that if they desired a good balance upon their expenditure they must adopt the most improved modes of procedure, and use a large amount of artificial manure, by which increased crops were obtained, and he having made that expenditure, was now reaping the benefit of it in the present high prices. But how stood British agriculture? They had millions of acres in this country of poor Grass land; and let them recollect that the average value of the produce of England was only from 3*l.* 10*s.* to 4*l.* per acre, the average rent being 1*l.* per acre. Taking the average amount of prices, he did say there were men then present who would increase that produce 300 per cent. He was quite sure the capital expended in purchased food and purchased manure would be returned. Whether they grew a large or a small crop, they could not avoid the expenses of horse labour, wages, rent and taxes; but those were infinitely heavier on a farm which was poorly farmed, than on one on which a large capital was invested in purchased food and purchased manures. He did think they had still much to do. The train he was in the previous day happened to come to a stand at Faringdon Road for a few minutes, and he saw what struck him as extremely ludicrous. There were four horses attached to a plough; and first one pulled, and then another, and very little progress was made, although there was a man to drive and another to hold the plough; and he was convinced they did not plough as much land in a given time as he could in Essex with only two horses. He had seen four horses to a plough not only at Faringdon Road, but in other parts of this county, and until he saw that practice altered, he should not consider the farmers of England that calculating class of men which some had given them the credit of being, and ready to adopt improvements.

Mr. W. G. Bennett thought if Mr. Mechi could show them that they could plough their land in that neighbourhood as well with two as four horses, he would be a great acquisition to the neighbourhood (hear, hear). He had some light and some heavy land, and if Mr. Mechi would show him that he could plough both with two horses only, he would adopt his suggestion. He was not bigotted. The agriculturists were not all clod-hoppers, nor were they all fools, he for one was open to conviction.—Mr Mechi asked Mr. Bennett if he ever tried a pair of horses.—Mr. Bennett said he had many times.

The Hon W. L. Bathurst observed, in reading over the list of prizes, there were many prizes given, but there were none offered for any person employed in agriculture. That he considered a great omission. The agricultural interest had been censured by some persons, as well as the public press, on the ground that large prizes were given for fat stock, and small prizes for spare labourers. He proposed offering the first prize of 3*l.*, formerly given by Sir Michael Beach, for the shepherd who, from a flock of more than 150 ewes, reared the greatest number of healthy lambs, in proportion to the number of ewes put to the ram. The second prize of 2*l.* would no doubt be given by some other gentleman. He was sure that one of the chief objects of all agricultural societies was to provide for the well being and advancement of the agricultural labourer.—Mr. D. Bowly, in continuation of the remarks made by Mr. Bathurst, observed that he for some years offered a prize for the man who brought up the largest family without receiving parochial relief. He had found the result to be unsatisfactory, and had discontinued the prize. He should be happy to give the second prize for the shepherd as proposed by Mr. Bathurst, for to that prize there could be no objection. His experience as Chairman of a Poor Law Union for some years had shown him that instead of giving such prizes as he had formerly offered to agricultural labourers, it was better to provide them with comfortable homes. Unless that was done the labours of the clergyman would be in vain.—Mr. Holland said, those who, like himself, had been connected with farmers in different parts of the country, and while seeing what was being done away from home, yet possessed a knowledge of what was doing at home, had an opportunity of contrasting the different methods employed by old stagers who followed their fathers, and the new comers. A great mistake which was often made was that men coming from heavy soils to light ones would work the land in the same way as they had their previous farms, and the same with persons leaving light soils for heavy soils. At an early period in his agricultural life he had adopted a principle, and that was never to throw away a practice which although it could not be explained scientifically had yet been carried out successfully. He tried to learn why a farmer with less knowledge was farming successfully, and the better educated man was continually making mistakes. Scientific knowledge had so increased and spread that they now ascertained what they were about on scientific principles, and it would occur that sometimes the practice of the farmer had been placed upon scientific principles without his knowing it. They should not throw way anything unless they could point out something better. He felt grateful to Mr. Mechi and others for working in advance of them, and if Mr. Mechi ever found himself in error, he never made a point of sticking to it. He considered they had received as much advantage from Mr. Mechi's mistakes as from his successes. He felt more than ever at the present time the necessity of scientific knowledge being spread among them. The union of science and agriculture should be closer. There was a wide field for competition, especially since the change in the laws had made competition universal; and if they would hold up their heads as the leaders of agriculture, they must take advantage of the discoveries of science. What was called science was simply a knowledge of the laws of nature, and those laws they should become acquainted with. That the farmer must do if he would continue to hold up his head in this country. They all practised at that moment a larger amount of science than they ever did before. Not in the feeding of stock alone, but that stock which had been exhibited that day could not have been brought to such perfection if it had not been for the scientific application of manure to the root crops. If they were not acquainted with the ingredients of that manure, they would be liable to lose their crops, their labour, and expenses. Some years back he was ahead of them, and they thought he was working in the dark, yet circumstances had pressed upon them the conviction that he was right, and that now they were with him. —Mr. Curtis Hayward proposed the "Royal Agricultural College, and Mr. Haygarth, the Principal."—The Rev. J. S. Haygarth returned thanks. Whatever success they had been able to achieve was attributable to the cordiality and unanimity which had always existed among them at College. Of the four chief Professors at the College, three of them were there when he entered upon the duties of Principal. Another had joined them since, and Mr. Austin. Mr. Austin had acted as a most excellent practical man. The sheep which had been shown to-day were brought up under his own personal superintendence. He had no shepherd for his master, as farmers often had, and he had taken as much care of those sheep as if they had been his own children. Mr. Haygarth then expressed the pleasure he had in bearing testimony to the good conduct of the students, whose conduct on all occasions had been what it should have been.

Wirral: *Agricultural Statistics.* — At the last monthly meeting the following resolutions were agreed to on this subject. This meeting having had brought before it, and having considered, the following documents, viz.:—1. The Reports of Sir John Walsham and Mr. Hawley on the Agricultural Statistics of Norfolk and Hampshire, 1854; 2. The Reports of Poor-law Inspectors on Agricultural Statistics (England), 1854; and 3. The Report from the Select Committee of the House of Lords appointed to inquire into the best mode of obtaining accurate Agricultural Statistics from all parts of the United Kingdom, and to report thereon to the House, together with the Minutes of Evidence and the Appendix, 1855; have resolved—

1. That the legitimate purpose of the proposed system of agricultural statistics is to inform producers of, and dealers in, agricultural produce, as frequently and as rapidly as may be, of variations in the quantity produced, from time to time, in the United Kingdom. 2. That this information, to be trustworthy, must be complete; and that to be complete, it must be gathered at one time into one place, and issued thence in such a manner as to be readily accessible to, and easily understood by, all who may think proper to avail themselves of it. 3. That the only valid objections which have been or are offered by the producers to all or any of the schemes for collecting agricultural statistics, resolve themselves into an unwillingness on the part of individuals needlessly to expose their affairs to other persons. 4. That this unwillingness, when duly inquired into, will, in most cases, be found to be justified by an unsatisfactory state of the relation of landlord and tenant; and occasionally, though less frequently, by other circumstances. 5. That whether this unwillingness to furnish the required information be or be not justifiable, there can be no doubt that it exists to an extent likely, if it be not duly cared for, to vitiate, more or less, the results of the inquiry. 6. That no compulsory enactment will be sufficient to overcome the effect of this unwillingness, so long as it takes the form referred to in the third resolution 7. That it is not essential to a complete collection, classification, and publication of the required statistics, that any such disclosure of the affairs of individuals as is objected to, should take place; and hence that those who candidly entertain such objection are justified in resisting the operation of any scheme which shall not at least render such disclosure improbable. 8 That whatever the method employed, the information demanded cannot be put into a shape adapted for its sole legitimate use—the use of the public at large—until it has all been collected into a single office in London. 9. That the less it is meddled with, in point of form, from the time it leaves the hands of the producer till it passes into such an office, the more likely is the result to be correct. 10. That it is not the end, but the method of attaining it that is objected to; and that this method will continue to be objectionable to the producer so long as he shall be required, in rendering the information called for to submit it, against his will, to the scrutiny of any person whatever in his own locality. 11. That the interference of local officers should therefore, and especially in the present state of things, be limited to the distribution of the necessary forms, the instruction of those who may need instruction in filling them up, and any assistance the authorities in London may need, after the returns have been sent in to the head office, in ascertaining (1) that each person required to make a return has made one; and (2) whether, where suspicion of error or fraud exists, the suspicion is well or ill-founded. 12. That it is not denied or even doubted, that a local inspection of details would tend to check fraud or error as sources of inaccuracy. And were the position of the tenant-farmer in general in a more

satisfactory state, the application of this check would not be objected to. But this society is strongly of opinion that, as things are, all who are interested in the formation of a sound system of agricultural statistics—and none can be more interested than the tenant-farmer himself—and shall, in a candid spirit, take the trouble to acquaint themselves with the facts, will not only see that this check is at present inapplicable, but will also recognise in its non-applicability, and the probable consequences, an additional reason, on behalf of the public interest, for every effort that may be made to place the tenant-farmer in a position better adapted to the increased wealth and intelligence of the class, and more in accordance with the spirit of the age. 13. That in order to obviate all reasonable objections on the part of the tenant-farmer, this society would suggest that each occupier, having received his schedule, and such instructions for filling up as he may think proper to require of the district enumerator, shall be at liberty either to hand the schedule, when filled up, to the enumerator, or to send it, by post, direct to the Board of Trade. And that in order to enable the officers appointed to examine and classify the schedules in London to detect the omissions or errors, the enumerators be required to send to London, with such schedules as may be handed to them, a list of the occupiers to whom they had delivered schedules, with the number of acres in the occupation of each, to be taken from the local rate-books, a measure this society believes would be practicably efficient, and satisfactory in its results to all parties. 14. That these resolutions be published, in such a manner as the Committee of Management may deem most likely to render them useful.

Signed on behalf of the meeting,
J. T. Danson, Barnston, Chairman.
W. B. Burnham, Spital, Hon. Sec.

Chester.—At the past annual meeting of this society, a succession of subjects were discussed before a very large and influential meeting of agriculturists, the matters having been arranged by a committee, so as to make the annual gathering more useful than a mere cattle show could make it. The topics on which papers were read were—1, Farm Agreements; 2, Land Drainage; 3, Laying down Land to Pasture for Cheese-making—the introducers of these subjects being respectively Mr. Humberton, Mr. Palin, and Mr. White, and each being followed by a number of practical men in criticism of the views that had been expressed. We give the opening remarks of the chairman on the occasion, and shall publish in another section of the Paper extracts from the addresses that were delivered. It certainly is very desirable that our provincial and other agricultural societies should adopt the plan that has been followed at Chester, and turn the meetings of their members to more practical account than has hitherto been done:—

A very large company having assembled in the Town Hall, the use of which had been granted by the mayor, Mr. Harry Mainwaring, having taken the chair, said:—I am right glad to see at last that agricultural societies are going to do something practical, for heretofore they have been little worth. The pigs, cows, and horses have been exhibited at 12 o'clock, we have dawdled away five or six hours, the dinner has come at six, and it has been midnight before any practical man could get up. Last year, and the year before, we had many speeches, but not one practical matter discussed. I augur from this meeting something more practical and useful. You will see from the paper that four practical subjects are going to be introduced to-day for the consideration of the meeting. Many of us now in the room have been at a lunch provided for us by Mr. Chivas and Mr. Churton, and we have learnt from them that this day will be the commencement of a new era; that Cheshire is setting an example to all England; that a day will be set apart before the show for people to learn the opinions of others and give their own. I do think a time is coming when landlord and tenant, the cultivator of the soil and the labourer, will meet together to hear some practical matters discussed. It was well said at an agricultural society's meeting I had the pleasure to be at a fortnight ago, that progress does not necessitate improvement. Now in our great rush to progress, we have overlooked improvement. In our eagerness to make quantity of cheese, for instance, we have overlooked quality. I do think from the discussions that are to take place to-day we may cause progress and improvement to go together, quantity and quality to kiss each other. I will not detain you any longer, but will just read you these few observations at the end of the paper. You are aware that the first subject will be brought on by Mr. Humberston. Other gentlemen have signified their intention to speak besides those who will read the papers.

"After the gentlemen whose names are attached to each subject have concluded their remarks, the time allotted to the registered speakers will be fixed by the chairman, to whom all observations must be addressed, and whose decision will be conclusive; that time may not be unnecessarily occupied on one subject, to the prejudice of another. The discussion on any one subject must not occupy more than an hour and a half. The committee rely on the members of the society, and the audience generally, aiding the chairman to carry out the above regulations."

Now, gentlemen, with these few words I shall introduce to your notice the first subject of the day, which is of the utmost importance to landlord and tenant in this and every county. Another rule has been just put into my hand, which I will read to you—"That no one is to interrupt the speaker." If any one wishes to speak, and will signify his wish to me, I will endeavour to accommodate him. With those few observations, I shall call before the assembly a gentleman who is universally known in Chester, and, I believe, universally respected. Mr. Humberston will read a paper and offer some observations upon "The mutual advantage of agreements for the occupation of land between landlord and tenant, as calculated to give a stimulus to agricultural improvement; accompanied with a form applicable to the present period."

We give the above address here as indicating a method of making agricultural meetings useful, which deserves to be generally adopted.

Miscellaneous.

The Irish returns of agricultural produce for the year 1854 *are now before us* The first fact that comes out is rather a startling one. It is, that the extent of tillage in 1854 was 126,341 acres less than in 1853. It is in the south and west of Ireland that the greatest decrease has occurred. The total under tillage, after an intermediate rise, has now fallen back to the amount in the year 1849. It took a great jump in the year 1850, and a lesser one in the year 1851, but in the last three years it has lost all that gain, and Ireland is as it was in that respect six years ago. But, confining ourselves to cereal crops, the return for the last year has fallen considerably below that for the year 1849. For that year it was 3,174,424 acres, but thence it steadily declined, till for 1854 it was 2,743,736, the difference being 430,688 acres less of Wheat, Oats, Barley, Rye, Beans, and Peas. Between the years 1853 and 1854 the fall is more than a hundred thousand acres. Again, the particular crop on which the difference chiefly falls is Wheat, of which there were 687,646 acres in 1849, and only 411,284 in 1854. It would, however, appear that the high prices which had already commenced on the apprehension of war had produced their effect upon Irish farmers, for there has been a considerable reaction from the lowest figure, which gave 326,893 acres under Wheat in 1853, compared with which there is a difference of 84,388 acres in favour of 1854. We can only hope that the reaction has continued, and that the preparations for this year and the next have kept pace with the preparations for the war. During the last seven years the Irish have been steadily returning to their first love—the Potato. From 1849 to 1853 the progress was from 718,608 acres to 898,733, when it would seem there was a universal resumption of confidence in the much-maligned root, for the rise in 1854 was to 989,660, or not far from 300,000 increase in six years. Flax, having made a very great start, has somehow gone back again in the last year. From 60,314 acres in 1849 it arose to 174,379 in 1853, when it fell to 151,403 in 1854. The probability is that this, like many other crops, is giving way to the reviving popularity of the potato, the export of which, we believe, is rapidly increasing. The war has apparently told on another branch of Irish produce to an unusual extent. In horses two years old and upwards there has been a decrease of 13,180—viz., from 447,543 in 1853 to 434,363 in 1854, that being probably the number exported to this country to meet the drain of the war. On the other hand, it is satisfactory to observe that the rising generation of horses more than keeps pace with the demand. In cattle the proportions are the other way, owing to the immense quantities of young cattle brought to this country by the graziers. Thus, while the increase in cattle two years old and upwards was 256,021, there was a decrease of 141,429 in those under two years. Perhaps the most significant feature, however, is the immense increase in the number of sheep from 1853 to 1854. It is no less than 579,563, and forcibly recalls the complaints, so common in our writers of the sixteenth century, of sheep taking the place of the human population. In pigs, too, there is an immense increase. Thus it is clear that the agricultural wealth of Ireland is rapidly increasing, and, with that increase, there must also be a great improvement in the condition of the people. *Times, Dec.* 11.

Calendar of Operations.

DECEMBER.

Berwickshire Merse Farm, *Dec.* 17.—Towards the end of November, the weather was fine and mild as early October, but with the present month came more seasonable frosts, and on the 6th snow showers came from N.E. A steady frost of considerable intensity kept the ground white for a week, till on Friday the wind returned to the west, and a sudden reaction swelled streams and drains to overflow. The quantity of ice thus suddenly broken up has cut up the banks considerably. The night frosts are still rather sharp, but the weather looks steady, and we have resumed our lea ploughing, with which operation we had previously made some progress, amid general complaints of over-dryness. The great deficiency in the Turnip crop has afforded too much room for Wheat sowing; and in their anxiety to forward that operation, some even whose roots were sound have carried to excess the principle of early storing, for where yet standing the bulbs have materially increased in bulk since the middle of November. In one or two instances Wheat has been tried on lea, but that only where the lease is about to expire, for in this climate, and in regular rotation, a full crop of Oats will pay nearly as well, and leave the land in cleaner and better condition. During the past storm the ewe flock required a daily feed of Turnips, to the extent of, say, 1 ton per 100 sheep; but they are now able to make their living on the pastures, and are in good condition. Hoggs have continued to do well without assistance, the bulbs alone having been covered with snow. Turnips, where sound, are of fine quality, hence cattle do well with the limited allowance of cake that the high price of that material necessitates. Horses have not stood their work well this season, owing to the bad quality of Clover hay, and in spring will require Beans, than which there is no better food (taken in moderation) for sustaining the working energy. The threshing out of the grain crops still confirms our estimate of their deficiency, both in quantity and quality. Much stress has been laid on the fact that the year's average (as shown by the Highland Society's returns) is only some two or three bushels below that of last year. But the case will be altered when it is known that, owing to the unusual plumpness of the grain, last crop was under estimate by at least four bushels per acre, while on the contrary our experience of this crop seems likely to prove their returns to be above the mark for this season. The above facts, which are true for this district, indicate a deficiency of 6 or 7 bushels per acre. Another circumstance which has very properly been noticed, is the diminished yield of flour from a given quantity of grain—the deficit amounting to about 10 per cent. It has been stated that a quarter of Wheat will supply two persons with bread for 12 months. Now if that was true of the crop of 1854, I am much afraid that on the same allowance of this year's produce the two individuals in question will be sadly down in condition before next harvest. *J. T.*

Notices to Correspondents.

Ewes: *C.* In many districts breeding ewes are fed almost wholly at the trough, and no such result follows as you speak of.

Italian Rye-grass: *Cosmopolite.* Good Rye-grass will weigh 15 to 17 lbs. per bushel. We do not know the weight of Mr Dickenson's.

Lime: *X Y Z.* When lime is mixed with soil for top dressing, we would allow it to remain in a large heap for a few weeks before spreading it out.

Philipps's Grater: *C J P.* His address, we think, is Brandon, Suffolk; but we will inquire and let you know.

Sunflower: *A Subscriber near Bideford,* having seen in a late Number an account of the quantities of oil and cake produced by an acre of Sunflowers, wishes to know what sort of land and style of culture the Sunflower requires. [There are many oil mills in the West of England, and no doubt in Devonshire.]

Erratum: "On the Fattening of Cattle," Dec. 8, immediately after the tabular statement, 15½*d.* per cwt. is said to be 15*s.* 5*d.* per ton, it should be "25*s.* 5*d.* per ton;" and the statute acre producing 20 tons of Turnips would realise at 25*s.* 5*d.* per ton (not 15*l.* 8*s.* 4*d.*, as stated), but 25*l.* 8*s.* 4*d.*

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

FIRST PRIZE REAPING MACHINE.

NOTICE.

MESSRS. BURGESS and KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—Burgess & Key, 103, Newgate Street; and 52, Little Britain, London.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s.*

M. Wedlake, 118, Fenchurch Street, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR and COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to Saynor & Cooke for their superiority of material and workmanship. Established 1738.

BRITANNIA WORKS, BANBURY.

SAMUELSON'S PATENT GARDNER'S TURNIP CUTTERS have been awarded for the Tenth time the Prize of the Royal Agricultural Society. These Implements are so well known that they require no description—more than 60,000 having been supplied from the above Works.

GARDNER'S PATENT DOUBLE-ACTION TURNIP CUTTERS.
GARDNER'S PATENT SINGLE-ACTION DITTO.
MOODY'S GRATERS, Fine and Coarse Cuts.
BUSHE and BARTER'S PATENT GRATER, for Fermentation.
PHILLIPS' PATENT GRATER OR MINCER.
GAUNTLETT'S PATENT GRATER, for mixing with Chaff.
SAMUELSON'S ECONOMIC CHAFF CUTTERS, for Stables and Small Occupations.
LARGE CHAFF CUTTERS, CORNES' and other Patterns as per Catalogue.
SAMUELSON'S ATMOSPHERIC AND ANTHONY'S PATENT AMERICAN CHURNS are Manufactured solely by Mr. Samuelson.
CORN AND MALT BRUISING MILLS.
LINSEED CAKE BREAKERS.
SAMUELSON'S REGISTERED BUDDING'S LAWN MOWERS, &c., &c.

The above may be obtained at all respectable Ironmongers and Implement Dealers in the Kingdom, of whom Catalogues and Price Lists may be procured gratis, or post free on application to B. Samuelson (successor to the late James Gardner), Britannia Works, Banbury.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street, Westminster.

CUPISS'S CONSTITUTION HORSE BALLS.—To Sportsmen, Agriculturists, Postmasters, and all Proprietors of Horses, these Balls are particularly recommended in all cases of swelled legs, cracked heels, loss of appetite, and vital energy; for Coughs, Colds, Fever or Inflammation, they are the best Medicine that can be exhibited, moreover their operation, though effectual, is so mild, that they require no alteration of diet, and if given with a bran mash on Saturday night, will not interfere with the ensuing week's regular work.

NEAT CATTLE.—The Constitution Balls are strongly recommended by many highly respectable Gentlemen (see Testimonials) for Cows and Oxen as a most valuable medicine in cases of Hove or Blown, Scouring or turning out to Grass, or from bad food, Gargate, Hide Bound, Loss of Appetite, Staring Coat, Distemper, Epidemic, or Influenza. Bullocks fat much faster by occasionally giving a Ball.

Prepared only by Francis Cupiss, M.R.V.C.S., author of the "Prize Essay on the Diseases of the Liver of the Horse," Diss, Norfolk; and sold by all respectable Medicine Vendors in Town and Country, in packets, six Balls each, 3*s.* 6*d* per packet, with a wrapper giving full directions for the use of the Balls, and Treatment of the Horse whilst taking them. Also a Pamphlet of testimonials from many Gentlemen who have used the Balls in various Complaints. Any Gentleman using the Balls may consult the Proprietor gratuitously, either personally, or by letter, post-paid.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	10	0
2½ „	long 3 „ 3 „		1	14	0
3 „	ditto 3 „ 6 „		2	8	0
3½ „	ditto 3 „ 6 „		2	12	0
4 „	ditto 3 „ 6 „		3	3	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	14	0
2½ in.	long ditto ditto	ditto	2	18	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, , Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THIS *is the Original Patent for Important Improvements in Stable Fittings, Hay-box, Manger, and Water-trough as one fixture,* including a method surpassing all others for conveying the straps and halter-weights to the back of the fitting to prevent the horse being cast in the stall.

Stable Fittings of every description, plain, enamelled, or galvanised. Also the newly invented Loose Box Fittings, Surface Gutters with moveable coverplates, Stable Posts, Ramps, Sills, and all kinds of Stable Furniture in stock.—JAMES BARTON, Iron Founder, &c., 370, Oxford Street, London.

MANUFACTURER OF KITE'S PATENT VENTILATING AND SMOKE-CURING CHIMNEY CAPS, patronised by her Most Gracious Majesty, 200 on Buckingham Palace. In use also on St. James's Palace, Windsor Castle, Government Offices, &c. &c. Zinc, 30*s.*; cast iron 35*s.* each; the latter as durable as the building itself. Drawings and Price Lists forwarded on receipt of two postage stamps.

Address BARTON'S Iron Works, 370, Oxford Street, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a arge assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

GALVANISED WIRE GAME NETTING,
6d. PER YARD, 2 FEET WIDE.

BARNARD AND BISHOP, Market Place, Norwich, in consequence of improvements in their machinery for the manufacture of the above article, have been enabled to make a great reduction in the prices.

		Galvanised.	Japanned iron.
2-inch mesh, 24 inches wide	... ...	6*d.* per yd.	4½*d.* per yd.
2-inch „ strong, do.	... ...	8 „	6 „
2-inch „ intermediate, do.	... ...	9½ „	7½ „
2-inch „ extra strong, do.	... ...	11 „	9 „
1⅝-inch „ 24 inches wide	... ...	7 „	5½ „
1⅝-inch „ strong, do.	... ...	9 „	7 „
1⅝-inch „ intermediate, do.	... ...	11 „	9 „
1⅝-inch „ extra strong, do.	... ...	13 „	11 „

All the above kinds can be made of any width (under 8 feet), at proportionate prices. If the upper half is of a coarser mesh than the lower, it will reduce the prices one-fourth.

Strong Galvanised Poultry Netting, 10*d.* per yard; Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot.

Illustrated Catalogues and Patterns forwarded by post. Delivered free of expense in London, Peterborough, Hull, or Newcastle. Manufacturers of Improved Strained Wire Cattle and Deer Fencing, Iron Hurdles, &c.

THE EDUCATIONAL MICROSCOPE.
PRICE 10*l.*

See leading article in the *Gardeners' Chronicle*, Nov. 24, 1855.
Manufactured by SMITH & BECK,
To whom
The Council Medal of the Great Exhibition of 1851, and
The First Class Medal of the Paris Exposition of 1855,
Have been awarded,
"For the excellence of their Microscopes."

An illustrated Pamphlet giving a full description, price, &c., of the Educational Microscope forwarded on receipt of 6 postage stamps.—6, Coleman Street, London.

CROCUS, TULIP, AND HYACINTH BASKETS, with Wire or Zinc Linings, for suspension or for table stand; also Bracket Baskets made and Japanned in a variety of colours and designs, by W. RICHARDS, Imperial Wire Works, 370, Oxford Street. Conservatories fitted up.

Window Blinds and Wirework of every description.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & CO., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

DISH COVERS AND HOT WATER DISHES in every material, in great variety, and of the newest and most recherché patterns. HOT AIR, GAS, VESTA, JOYCE'S STOVES. Stoves for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10*s.* each to 30 guineas. His variety of register and other Stoves, Fenders, and Kitchen Ranges, is the largest in existence.

The alterations and additions to these very extensive premises (already by far the largest in Europe), which have occupied the whole year, are now nearly completed. They are of such a character that the entire of EIGHT HOUSES is now devoted to the display of the most magnificent stock of GENERAL HOUSE IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares, Iron and Brass Bedsteads and Bedding), arranged in Sixteen Large Show Rooms, so as to afford to parties furnishing facilities in the selection of goods that cannot be hoped for elsewhere.

Catalogues, with engravings, sent (per post) free.

39, Oxford Street; 1, 1A, 2, and 3, Newman Street; and 4, 5, and 6, Perry's Place. Established A.D. 1820.

CHRISTMAS PRESENTS.—The most appropriate offerings for this Season of Festivity are those which tend to the promotion of Health and Personal Attraction; none can be more acceptable than ROWLAND'S MACASSAR OIL, for imparting a transcendent lustre to the hair, and sustaining it in decorative charm.

ROWLAND'S KALYDOR imparts a radiant bloom to the cheek, and a delicacy and softness to the hands, arms, and neck; and ROWLAND'S ODONTO, or PEARL DENTIFRICE, Bestows on the teeth a pearl-like whiteness, and renders the breath sweet and pure. The patronage of Royalty throughout Europe, their general use by rank and fashion, and the universally-known efficacy of these articles give them a celebrity unparalleled.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

*** BEWARE OF SPURIOUS IMITATIONS!

FOR THE BENEFIT OF SUFFERING HUMANITY.—A retired gentleman having cured himself of Deafness, Defect of Sight, and General Debility, after suffering upwards of 25 years, thinks it his duty to make the remedy known for the benefit of the afflicted; he will therefore forward the particulars for the cure of the same on receipt of a stamped envelope properly directed.—Address Rev. J. JOHNSTONE, 1, Park Terrace, Heavitree, Exeter, Devonshire.

DEBILITY AND NERVOUSNESS.—Encouragement to those in despair, and suffering from debility, spermatorrhœa, relaxation, nervousness, and exhaustion of the system. Advice and prescriptions, with a treatise on these diseases, for a successful course of self-treatment, by which a permanent cure of the most protracted case is effected, sent post free upon receipt of 14 postage stamps, by E. J. ROBERTS (late Army), Surgeon, 9, North Terrace, Moor Edge, Newcastle-on-Tyne.

CHRISTMAS.

THE practice of drinking "to your good health," is one alike honoured by good feeling, conviviality, and kindness. True it is that, in some cases, the friend who drinks to your good health may think no more about it; but wherever a man's health is proposed in the "loving cup," it ought to induce some reflection in the individual to whom the compliment is paid, as to whether he has himself endeavoured to preserve the invaluable boon.

A "merry Christmas" is too often marred by unwise indulgences and epicurean sacrifices. "Keeping it up" is very pleasant at the time, but it "hardly pays" in the long run. Headaches, indigestion, gout, and prostration, are in themselves exceedingly disagreeable, but indigestion leads to a frightful train of maladies. In short, it is difficult to pass over Christmas time safely and comfortably without the aid of

PARR'S LIFE PILLS.

Excellent at all times, PARR'S Pills are essentially useful now. They remove all the bad effects of high living, and the dangers of "the bottle" will be entirely mitigated by their use.

The man who is wise as well as merry knows that, even if he should go a little too far in his devotion to Epicurus and his love of Bacchus, PARR'S simple remedy will make all right again, and give him the health and energy so requisite when about to commence a new year.

PARR'S LIFE PILLS, of all medicines, is without dispute the best calculated to produce a fine flow of animal spirits, a clear head, and a ready perception.

Sold by E. EDWARDS, 67, St. Paul's Churchyard; BARCLAY & SONS, Farringdon Street; SUTTON & CO., Bow Churchyard; HANNAY & CO., 63, and SANGER, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in town and country. In boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*, and in family packets, 11*s.* each. ASK FOR PARR'S LIFE PILLS.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.
(OBTAINED THE PARIS EXHIBITION AWARD.)

COTTAM AND HALLEN,

THE Original INVENTORS of the PATENT ENAMELLED MANGER RACK and WATER TROUGH AS ONE FIXTURE, to which they have made important additions, the main features of the same being explained in the description and engraving.

A *represents* the Patent Halter Guide and Collar Rein, the ball of which is taken to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse being cast in the stall.

B The Patent Portable Seed Box can be instantly detached from the Rack without disturbing the hay. The saving of the seed in a clean and useful state, either for agricultural purposes, or mixing with the food in the manger, is alone sufficient to claim general notice.

C The Seed Box detached, made of Galvanised Sheet Iron, light and durable.

D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where space is an object, as the long portion of the bracket can be turned up out of the way when not in use.

COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—The New Illustrated Catalogue for 1856, and Estimates gratis on application.

MARK YOUR LINEN.

THE PEN SUPERSEDED.—The most easy, permanent, and best method of marking Linen, Silk, Cotton, Coarse Towels, Stockings, Books, or anything else, is with the PATENT ELECTRO-SILVER PLATES. By means of this novel invention a thousand articles can be marked in ten minutes. Any person can easily use them. Initial Plate, 1*s*.; Name Plate, 2*s*.; Set of Numbers, 2*s*.; Crest Plate, 5*s*. Sent free to any part of the kingdom (on receipt of stamps), by the inventor and sole patentee, T. CULLETON, Heraldic Engraver to the Queen and Royal Family, 2, Long Acre, one door from St. Martin's Lane.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST, BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City.
Circulars free by post.

AMUSEMENT FOR WINTER EVENINGS.

MECHI'S FOLDING BAGATELLE TABLES afford, in an eminent degree, a means of varied amusement combined with instruction. Each table is constructed for playing four highly entertaining games. Prices complete from 3*l*. 15*s*. to 12*l*. 10*s*. Telescope stands for ditto with adjusting screw legs, 2*l*. 5*s*. to 3*l*. 10*s*. each.—112, Regent Street; 4, Leadenhall Street, London; and Crystal Palace.

MR. MECHI'S NEW SHOW ROOM, at his West End Establishment, No. 112, Regent Street, extending to Glasshouse Street, is now completed, and is furnished with the newest and most approved designs of Electro-Plated DINNER, TEA, and COFFEE SERVICES, LIQUOR FRAMES, SALVERS, TOAST RACKS, SPOONS, FORKS, &c. Also a large assortment of the best London and Sheffield-made TABLE KNIVES.—112, Regent Street, London.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. The same prices charged at all the Establishments.

GIFTS of FRIENDSHIP and AFFECTION.—The almost insuperable difficulty so frequently experienced in the selection of an appropriate article for presentation which will fully convey in an acceptable, attractive, and useful form the kindly intention of the giver, and at the same time merit the appreciation and regard of the recipient, is now entirely removed by an inspection of the varied attractive manufactures displayed in the magnificent SHOW ROOMS at Mr. MECHI'S ESTABLISHMENTS, 112, REGENT STREET, and 4, LEADENHALL STREET, London; consisting of the newest and choicest patterns in Ladies' and Gentlemens' Dressing Cases, Work Boxes, Writing Desks, Dressing and Carriage Bags, Inkstands, Bagatelle Tables, Caskets, Tazzas, French Bronzes, and Bijous of the newest and most novel description. The Papier Maché Department presents a large variety of the most beautiful designs in Work Tables, Chess Tables, Desks, Blotting Cases, Inkstands, Tea trays, Pole screens, Tea poys, Envelope Cases, Multiformias, Cabinets, Tea Chests and Caddies, Jewel Boxes, &c. Table and small cutlery of every description. A Show Room, at 112, Regent Street, is devoted exclusively to the display of the best electro-plated Dinner, Tea, and Coffee Services, Cruet Frames, Liquor Frames, Salvers, Toast Racks, Cake and Bread Baskets, Fish Carvers, plated and silver Dessert Knives and Forks in Cases, Spoons, Forks, &c. The above but represents a few of the leading articles to be seen at these Emporiums. An inspection will amply repay the trouble of a visit. Same prices charged at both houses.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 30 years have been held in constant and increasing public estimation as the purest farinæ of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6*d*. and 1*s*.; and Family Canisters, at 2*s*., 5*s*., and 10*s*. each.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

HOLLOWAY'S OINTMENT AND PILLS
SUPERIOR REMEDIES FOR BAD LEGS.—Mr. John Nix, of Billericay, Essex, informs Professor Holloway that Mrs. Mary White, of Vange, had been troubled with a bad leg for more than 15 years, for the cure of which there appeared no remedy, as she had tried various means without effect, but by his persuasions she commenced using Holloway's Ointment and Pills, previous to which for 16 weeks she was unable to cross the room. These invaluable remedies however cured the leg in a very short time.—Sold by all medicine vendors throughout the world; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOODS, Malta.

Now ready, postage free,

A LIST OF THE PRINCIPAL NEW AND CHOICE BOOKS in circulation at MUDIE'S Select Library. Also, A LIST of SURPLUS COPIES of RECENT WORKS withdrawn from circulation, and offered at greatly reduced prices for cash.
CHARLES EDWARD MUDIE, 510, New Oxford Street, London; and 76, Cross Street, Manchester.

SERIES OF ARTICLES ON FORESTRY.

THE FIRST OF A SERIES OF ARTICLES ON FORESTRY, TO BE CONTINUED WEEKLY, by Mr. JAMES BROWN, author of "The Forester," will appear in the "North British Agriculturist" of the 2d January, 1856. The series is intended to embrace Arboriculture in its widest sense and to constitute what may be regarded as the Book of the Forest. Terms—24*s*. per annum; 6*s*. per quarter. Orders to be addressed to DAVID GUTHRIE, 377, High Street, Edinburgh.

THE FLORIST, FRUITIST, AND GARDEN MISCELLANY. By C. TURNER and J. SPENCER. Monthly, price 1*s*.—The last number just published, containing Index, Title Page, &c., completing the Volume for 1855, contains beautiful coloured Illustrations of new Gloxinias, a Plan of a Flower Garden, and other Engravings, besides 26 closely printed pages of Letter-press relating to Practical Gardening, by some of the most eminent Horticulturists of the day. The work has now completed its Eighth Volume, which is perhaps the best test of its utility, and, having a large circulation, offers an excellent medium for advertisers. The number and beauty of its Plates make it a delightful Christmas present. Published in Monthly Numbers at 20, Southampton Street, Strand, where Volumes, price 13*s*. 6*d*., for the present and past years can be had.

Will be published, Jan. 1, No. I. of the Second Edition of

THE COTTAGE GARDENERS' DICTIONARY, in Weekly Numbers, 1½*d*.; and Monthly Parts, 7*d*. Edited by GEORGE W. JOHNSON, Esq., Editor of "The Cottage Gardener," "The Gardeners' Almanack," &c.

This Dictionary explains, in Alphabetical Order, the Terms and Operations employed by Gardeners; Descriptions and Histories of all the Species of Fruits, Flowers, and Vegetables worthy of a place in our Gardens, Greenhouses, and Stoves, with their Varieties and appropriate Cultivation; and all its details have been prepared by some of the best practical and Scientific gardeners of England. These characteristics render it the most useful and most reliable, as it is also the cheapest work for general reference that has yet been published on English Gardening.

One very large Edition has been sold, and the present Edition, including all New Plants, with most copious Dictionary of Synonyms, is a still more valuable work of reference, both to the Amateur and Professional Gardener. It will be published in about Sixty Weekly Numbers. Price 1½*d*. each, and in Monthly Parts, price 7*d*.
London: W. KENT & Co., 51, Paternoster Row.

TO MARKET GARDENERS.
DAWLEY WALL, NEAR HARLINGTON, MIDDLESEX.

TO BE LET by Tender, for Terms of Years, about 23 ACRES of excellent GARDEN GROUND, stocked with all kinds of young Fruit Trees and Bushes in full bearing, with nearly 1000 yards run of Wall and Wall Fruit Trees. Shed and Barn room will be provided; there is also a Cottage which may be tendered for separately.—The Ground may be seen on application to Mr. W. THORNTON, at Dawley Wall (West Drayton Station, Great Western line), by whom all necessary information will be given, as well as by Mr. HADRILL, at Messrs. T. and W. RHODES', Ball's Pond, Kingsland. Tenders to be sent to Mr HADRILL, as above, on or before THURSDAY, January 10, 1856, at 11 o'clock. The advertisers do not guarantee to accept the highest, or any other bidder, unless the respectability of the parties selected shall be satisfactorily established.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

TO NURSERYMEN, GARDENERS, AND OTHERS.

TO BE DISPOSED OF, by Private Contract, the LEASE, GOODWILL, and STOCK of Birch Field Nursery, eligiby situated about two miles from the centre of the town of Birmingham, out of the borough, on the turnpike road to Walsall. It occupies an area of about 2 Acres, the rent is very low, and the Stock of an ordinary and useful character. There is a Cottage, Stable, Greenhouse, and other necessary conveniences for carrying on an extensive and profitable business.—For further particulars, and to treat, apply to Mr. JOSEPH JAGGER, Bank, High Street; or to Mr. C. H. JAGGER, Solicitor, Cannon Street, Birmingham.

CANNES, SOUTH OF FRANCE.

TO BE SOLD, completely furnished, in one of the warmest, driest, and most healthy and agreeable localities for invalids in all Europe, that beautiful Marine Residence and Grounds known as the CHATEAU ST. GEORGES, fit for the immediate reception of any nobleman's or gentleman's family, and situate one mile west of the town and port of Cannes, within a few minutes walk of the chatean of the Right Hon. Lord Brougham, and 20 miles south-west of Nice. The property faces the Mediterranean, which forms its southern limit, while its northern boundary is the grande route from Italy to Marseilles, from which latter town it is only 14 hours' by posting, or 11 hours' by the steamers, and there are also two diligences daily each way, in connection with the railway from Paris to Marseilles, which is now opened throughout, and the distance is performed each way in 20 hours—total travelling from London to Cannes, 47 hours.—For particulars and viewing plans, apply to Messrs. GREEN, Estate Agents and Auctioneers, 28, Old Bond Street.

POULTRY.—To those who wish to IMPROVE their BREED by giving New Blood from the best strains, this being the time for so doing.—Apply for particulars to A. G., Post Office, Watlington, Oxon.

FOWLS.

RENDLE'S PRICE CURRENT FOR 1856.

RENDLE'S PRICE CURRENT AND GARDENER'S DIRECTORY FOR 1856, *is just published by Messrs. Simpkin & Marshall and can be obtained through any Bookseller in the United Kingdom, or from the Proprietors,* William E. Rendle & Co., *Seed Merchants, Plymouth, price Sixpence, or free to purchasers of Seeds.*

The present Edition is printed the same size as the "Florist," and will contain 120 pages, and be found even more complete than the former Editions.

It contains a valuable Descriptive List of KITCHEN GARDEN SEEDS, with prices affixed to every article, and in addition to these descriptions there are short and concise cultural remarks for every kind of *Vegetable*, pointing out the best varieties for *Early, Medium*, and *General Crops*.

The List of FLOWER SEEDS has been much improved, and contains descriptions of all the leading sorts, with directions for sowing seeds, and other useful practical remarks; and in this department Mr. Errington has written expressly for the work an original article on ANNUAL and OTHER FLOWER SEEDS, which will be read with much interest.

The Calendar of Operations for the whole of the year has also been revised, and will be found even more useful than the one in the last edition.

The Almanack is now a prominent feature of the "Price Current," and a page is devoted to every month.

Full detailed lists are given of the quantities and descriptions of seeds sent in the "Collections of Seeds."

The following Original Articles *have also been contributed, for which the Proprietors have to return their sincere acknowledgements.*

FLORICULTURE. By Mr. John Edwards, the Secretary to the National Floricultural Society, and Editor of the "National Garden Almanack."

VEGETABLE FORCING. By Mr. Robert Errington, Gardener to Sir P. Egerton, Oulton Park, Tarporley.

RENDLE'S TANK SYSTEM OF HEATING. By Mr. John Dobson, late Gardener to Mr. Edward Beck, Isleworth.

GRAPE DISEASE AND MILDEW. By Mr. James Cuthill, of Camberwell.

ON NATURAL AND ARTIFICIAL MANURES. By Mr. J. B. Lawes, the celebrated Agricultural Chemist.

ON THE PORTABLE AND MINIATURE FRUIT GARDEN. By Mr. Niven, of the Garden Farm, Drumcondra, near Dublin.

ON THE CULTIVATION OF THE CUCUMBER. By Mr. Joseph Hamilton, Author of the "Hamiltonian System of Pine Growing."

LIST OF A FEW OF THE BEST FRUIT TREES GROWN AT WOOLATON, the seat of Lord Middleton. By Mr. J. Haythorn.

MIGNONETTE, CULTURE OF. By Mr. William Melville, Gardener to the Earl of Roseberry, Dalmeny Park.

NEW AND ECONOMICAL MODE OF HEATING GREENHOUSES, ORCHARD HOUSES, &c. By Mr. Niven, Garden Farm, Drumcondra.

ROTATION OF CROPS By Mr. Robert Errington.

SELECTION OF KITCHEN GARDEN SEEDS. From the "Scottish Gardener and Magazine of Horticulture and Floriculture."

THE OSAGE ORANGE. Introduction and Cultivation of.

In addition to the above will be given short directions for the CULTIVATION of FLOWER SEEDS, with modes of TESTING their GROWING QUALITIES. Also a descriptive list of all the newest introductions for the present year.

A Description of the CEDRUS DEODARA, with an engraving kindly lent by the proprietors of the "Florist;" and a few remarks on the Dioscorea Batatas, by Samuel Curtis, Esq., the proprietor of Curtis's "Botanical Magazine."

Copies of the above edition can now be obtained through any bookseller in town or country, or from the Proprietors, price 6d. each, or free to all purchasers of seeds.

WILLIAM E. RENDLE & CO.,
Seed Merchants, Plymouth.
Established 1786.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By John Lindley, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be: and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: Longman, Brown, Green, & Longmans.

Printed by William Bradbury, of No. 13, Upper Woburn Place, and Frederick Mullett Evans, of No. 29, Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be Addressed to the Editor.—Saturday, December 22, 1855.

GARDENERS' BENEVOLENT INSTITUTION.—The Subscribers of this Institution are earnestly requested to Vote for GEORGE KIDD, aged 71 years. His claims upon your sympathy and support are based upon his inability to obtain a living from his age and a fall while gathering fruit, by which he broke his wrist; his having brought up a family of 12 children, and his having been a Subscriber to your Institution nine years. His case is strongly recommended by

J. A. Henderson, Esq., 64, Hamilton Terrace, Edgeware Road, London (late of Pine Apple Place).
Mr. T. Gaines Battersea, Surrey.
Mr. F. Kinghorn, St. Margaret's, Isleworth, Middlesex.
Thomas Jackson & Son, Kingston, Surrey.

By whom proxies will be gladly received.

TESTIMONIAL TO MR. GLENNY, THE ORIGINATOR OF GARDEN NEWSPAPERS.—Persons desirous of promoting this object are requested to communicate with W. Watson, Esq., Treasurer, Salisbury Square; or Mr. Carrington, Hon. Secretary, West Brompton. One hundred names have been already entered.

GEO. GLENNY, Horticultural Agent, Dungannon House, Fulham, will be glad to receive all his commissions to procure, and dispose of, Stock of all kinds, in time to publish in his List for general circulation.—Dec. 29, 1855.
Trade Catalogues should be sent.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.
HORTICULTURAL ERECTIONS on the best improved principles.
*** An extensive stock of Fruit Trees, Ornamental Shrubs, Evergreens, Forest Trees, Roses and Thorns.

FINLAY FRASER, Jun. (lately with Messrs. Minier, Nash, & Co., Strand), WILLIAM RICHARDSON, and WILLIAM LEWIS GOAD (many years with Messrs. Jacob Wrench & Sons, London Bridge), beg respectfully to inform their friends, the trade, and public generally, that they have taken the premises, 82, Bishopsgate Street Within, where they intend carrying on the SEED BUSINESS in all its branches and trust by great assiduity and strict attention to merit an extended share of patronage. Their Priced Lists will be published in a few days and extensively circulated; they confidently refer to their lengthened practical experience as an assurance that the goods they offer have been selected with the greatest attention both as to genuineness and quality.—London, Dec. 29.

TO THE TRADE.
NEW PURE WHITE COLLINSIA.—The price per ounce of this new and beautiful ANNUAL can be had on application.
J. G. Waite, Seed Merchant, 181, High Holborn, London.

CHARLES SHARPE and CO. beg to acquaint the trade that having harvested their stocks of SEEDS they will be glad to forward prices on application.
Nursery and Seed Establishment, Sleaford.—Dec. 29.

TO BE SOLD, very handsome large IRISH YEWS, from 4 to 8 feet. Purchasers taking a large number will be liberally dealt with. Prices on application.—Thomas Jackson & Son, Nurseries, Kingston, near London.

HARDY HEATHS.
WATERER and GODFREY respectfully invite attention to their large stock and first-rate collection of these most beautiful Hardy Plants. Priced Catalogues may be had free on application to Waterer & Godfrey, Knap Hill Nursery, Woking, Surrey.

NEW CONIFERÆ AND SPECIMEN EVERGREENS.
RICHARD SMITH has a fine stock of all the best Ornamental EVERGREEN TREES and SHRUBS for Lawns, Shrubberies, or for single specimens.—Priced Lists will be sent on application.—Nurseries, St. John's, Worcester.

STANDARD AND DWARF TRAINED FRUIT TREES.
RICHARD SMITH begs to inform the Trade and the Public generally that he has a fine stock of flat and well trained FRUIT TREES of all the best and most popular sorts (true to name), which he will be happy to sell at very moderate prices.—Priced Lists will be sent on application.
Nurseries, St. John's, Worcester.

PEARS GRAFTED ON THE QUINCE AS PYRAMIDAL SHAPED TREES.
J. and J. FRASER beg to announce that their Priced List of the above is now published, and may be had post free on application.
J. & J. F. have sold a large number of these Trees for the last three years, and have received numerous letters from gentlemen in the country speaking in very high terms of their productiveness. They can therefore recommend them with greater confidence to the notice of their friends and the public in general.
Lea Bridge Road, Essex.

EXOTIC NURSERY, CHELSEA.
JAMES VEITCH, Jun., respectfully announces that his CATALOGUE of KITCHEN GARDEN, AGRICULTURAL, and FLOWER SEEDS, for 1856, with a List of Implements and other Garden requisites, is now published, and will be forwarded post free upon application.

J. G. WAITE'S CATALOGUE is now ready, and can be had on application.
Seed Establishment, 181, High Holborn, London.

BASS and BROWN'S new AUTUMN CATALOGUE, comprising a considerable portion of descriptive and useful information for purchasers, will be sent free by post for three penny stamps, or gratis to their customers, who may not have received them.
Seed and Horticultural Establishment, Sudbury, Suffolk.

WHOLESALE SEED CATALOGUE.
WILLIAM E. RENDLE and Co.'s WHOLESALE SEED CATALOGUE is now ready, and can be obtained by the Trade only on application, in exchange for one penny stamp.
William E. Rendle & Co., Seed Merchants, Plymouth.

THE MOST CONCISE AND USEFUL SEED CATALOGUE YET PUBLISHED.
SUTTON'S NEW PRICED CATALOGUE *is now ready, and will be sent gratis (post free) on application.* It contains select Lists of
KITCHEN GARDEN SEEDS | AGRICULTURAL SEEDS
FLOWER SEEDS | SEED POTATOES
AND BEDDING PLANTS.
Sutton & Sons, Seed Growers and Merchants, Reading, Berks.

NEW AND GENUINE SEEDS.
DAWE, COTTRELL, and BENHAM beg to announce that their Annual Catalogue of FLOWER, VEGETABLE, and AGRICULTURAL SEEDS, for 1856, is now ready, containing many New and Choice kinds, with accurate descriptions of about 1000 varieties of Flower Seeds.—Post free on application.—36, Moorgate Street, and 3, Lawrence Pountney Lane, Cannon Street, London.

PETER LAWSON and SON, Seedsmen, Nurserymen, and Wood Foresters to the Queen's Most Excellent Majesty; and to the Highland and Agricultural Society of Scotland, Edinburgh, and London.
Peter Lawson & Son beg to intimate that their Prices, Lists of Seeds, Plants, &c., for the present season are in course of Publication, and will be sent free by Post on application.
7, Great George Street, Westminster.

IMPORTANT TO PLANTERS.
EAGLE and HENDERSON, Nurserymen, Seedsmen, and Florists to the Queen, beg respectfully to announce that their CATALOGUE OF ORNAMENTAL, FRUIT, AND FOREST TREES, CONIFERÆ, &c., is now published; also their Lists of Garden, Flower, and Agricultural Seeds, all of which may be had free on application.
Shrub Bank Nurseries, Leith Walk, Edinburgh.—Dec. 29.

AMERICAN PLANTS.
JOHN WATERER'S CATALOGUE of RHODODENDRONS, AZALEAS, &c., as exhibited at the Royal Botanic Gardens, Regent's Park, London, is now published, and can be had on application.
☞ The Catalogue describes the colours of the Rhododendrons.
The American Nursery, Bagshot, Surrey.—Dec. 29.

AMERICAN PLANTS.
WATERER and GODFREY beg to announce their Priced and Descriptive Catalogue of American Plants for this season is now published, and will be sent free on application. As the collection of American Plants at this Nursery is altogether unequalled in extent or quality, purchasers will find it to their interest to pay a visit to the Nursery, which may be readily done by the South Western Railway to Woking Station.
Knap Hill Nursery, Woking, Surrey.

GEORGE BAKER begs to announce his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES is now ready, and may be had on application.
American Nursery, Windlesham, near Bagshot, Surrey, seven miles from Staines, Windsor Branch, South Western Railway, where conveyances may be had.

FLOWER AND VEGETABLE SEEDS.
JAMES CARTER and CO., Seedsmen, 238, High Holborn, London, have *now published* their TWENTY-FIRST ANNUAL CATALOGUE OF FLORICULTURAL, VEGETABLE, AND AGRICULTURAL SEEDS, acknowledged to be the best Annual Catalogue of Seeds extant. It gives a complete description of 1979 species and varieties of FLOWER SEEDS, and a most comprehensive list of VEGETABLE AND AGRICULTURAL SEEDS, *all of which* can be supplied and are, *as usual*, of *first-rate quality*. It also contains lists of TEXAN, INDIAN, AND CALIFORNIAN FLOWER SEEDS, *forming, in fact, the finest Collection of Seeds ever submitted at any one time to public notice.* Catalogues forwarded *free of charge* and *post paid* upon application.
James Carter & Co., Seedsmen, 238, High Holborn, London.

NEW ANNUAL SERIES.
KENNEDY and KEMPTON'S Scientific, Comprehensive, and Unique CATALOGUE OF FLORICULTURAL, VEGETABLE, AND AGRICULTURAL SEEDS is now published, and can be had on application, free. It will be found to comprise all the New and Rare Flower Seeds, and the Selected List of the most approved Vegetable and Agricultural Seeds ever extant. Prepared by Mr. Kempton, 15 years with Mr. James Carter, of Holborn, lately deceased.—Address Kennedy & Kempton, Bedford Conservatories, Covent Garden, London.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. Cobbett's Foreign Warehouse, 18, Pall Mall.
N.B. Printed regulations for treatment sent; also, just arrived, very moist and open Parmesan Cheeses.

TO NOBLEMEN, CLERGYMEN, AND OTHERS.
THE *most Economical and Convenient Mode of ordering* GARDEN SEEDS *is to send for one of* "Sutton's *Complete Collections for one year's supply,*" *particulars of which may be had on application, addressed*—
Sutton & Sons, Seed Growers and Merchants, Reading.

TO CUCUMBER GROWERS.
SUTTON'S BERKSHIRE CHAMPION is not only one of the most prolific Frame Cucumbers, as shown by several correspondents of the *Gardeners' Chronicle* (as see *Gardeners' Chronicle*, page 693); but is also of fine flavour, and so handsome that it invariably takes the Prize when exhibited in competition with other leading kinds. Seed can be supplied 1*s*. 6*d*. per packet (if ordered immediately); other fine sorts 1*s*. per packet, as see Catalogue, which may be had post free.
Sutton & Sons, Reading, Berks.

EARLY VEGETABLE SEEDS.—All the Select Kinds for immediate sowing, growth of 1855, may be had of James Carter & Co., Seedsmen, 238, High Holborn, London.

TO THE SEED TRADE.
SOUTHAMPTON WHITE BROCCOLI, true, saved with great care.—Price on application to Charles Dolton, Seed Grower, Speenhamland, Newbury, Berks.

SCARLET RHODODENDRONS.
J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine bushy Plants of the above 2 to 3 feet high, in Pots, well set with Flower buds.—Price 10*s*. 6*d*. each.

"GYMNOGRAMMA LEPTOPHYLLA."
Or the Annual Maiden-hair Fern.
BERNARD SAUNDERS, Cæsarean Nursery, Jersey, will be happy to supply six growing plants of the above pretty little Fern, in a small box, postage free, to any amateur wishing to possess it, for 2*s*. 6*d*.—Dec. 29.

RED BEET SEED.
EDWARD SANG and SONS, Nurserymen and Seedsmen, Kirkcaldy, beg to offer to the Trade RED BEET SEED of their own raising from carefully selected full-grown roots. The sort is very superior, producing well-shaped medium-sized roots of remarkable fine quality and colour. Prices on application.—Kirkcaldy, Dec. 29.

GLENNY'S IMPROVED BALSAM SEED, from Double Flowers, 3 inches over. Six classes, 37 stamps; mixed, 13 stamps. Sealed packets only. Trade supplied.
Geo. Glenny, Fulham.
*** A few other Seeds saved with equal care.

NEW DOUBLE WHITE PETUNIA—"IMPERIAL" (true).
CHARLES TURNER will be able to supply strong Plants after the 1st of January of this beautiful new variety, which is as double as an Oleander, and fragrant. Plants 3*s*. 6*d*. each, with a considerable reduction to the trade if a dozen are taken. C. T. begs particularly to recommend it, as it is not only a novelty but also a valuable bedding plant.
Royal Nursery, Slough.

NEW TURNIP.
WAITE'S "ECLIPSE," PURPLE TOP YELLOW HYBRID TURNIP.
THIS new and distinct variety is a hybrid between the Purple Top Swede and Purple Top Yellow Scotch Turnip; it possesses the properties of the Swede, and may be sown much later. Coloured Drawings of this splendid Turnip may be had on application, or may be seen at the principal Seed Establishments throughout the kingdom. The Seed can be obtained of all respectable Seedsmen, price 3*s*. per lb.—A liberal allowance to the Trade.
J. G. Waite, Seed Merchant, 181, High Holborn, London.

WAITE'S DANIEL O'ROURKE PEAS.—The best Early Pea in cultivation can be supplied in any quantity, and price had on application to J. G. Waite, Seed Merchant, 181, High Holborn, London.

NEW EARLY PEA.
COTTRELL'S SEBASTOPOL.—The earliest and best Pea cultivated, price on application. Also the New Early Wonder Pea, early as frames and wonderful cropper, large pods. To be had only of Dawe, Cottrell, & Benham, 3, Lawrence Pountney Lane, and 36, Moorgate Street, London.

NEW EARLY MARROW PEAS.
Harrison's Glory (blue) & Harrison's Perfection (white.)—These extraordinary Peas, which are nearly similar in habit, are as early as Double-blossomed Frame, about 3 feet in height, full of large pods which cluster from the bottom to the top of the haulm, and are equal in flavour to Knight's Marrow. Samples of the haulm may be seen at the following firms in London, of whom they can be had, in quart packets at 5*s*. each:—
Batt, Rutley, & Silverlock, 412, Strand.
Beck, Henderson, & Child, Middle Wharf, Adelphi.
Hurst & M'Mullen, 6, Leadenhall Street.
Minier, Nash, & Nash, 83, Strand.
Noble, Cooper, & Bolton, 152, Fleet Street.
Jacob Wrench & Sons, 29, King William Street, City.

A. VERSCHAFFELT, Nurseryman, Ghent (Belgium), begs to offer a NEW BIOTA, which is quite distinct from the others, and is warranted particularly hardy.
BIOTA MELDENSIS, good plants £1 15 0
" " very strong 2 10 0
☞ This fine Coniferous plant will be shortly figured in Verschaffelt's "Illustration Horticole."

A. V. also directs attention to his Journal L'ILLUSTRATION HORTICOLE, which is one of the best Floricultural works on the Continent. The last Number (12th Number of the second Vol.) is out, and contains:—
1. Genetyllis tulipifera.
2. Rose Perpetual Panachée d'Orléans.
3. Clematis campaniflora.
4. Dion edule (fruits of).
5. Dion edule (site in its natural country).
The Work can be seen and obtained of his Agent, Mr. R. Silberrad, 5, Harp Lane, Great Tower Street, London. Price 12*s*. a year.

THE KITCHEN GARDEN.

JAMES CARTER & Co., SEEDSMEN,

238, HIGH HOLBORN, LONDON,

CONTINUE to supply Collections of VEGETABLE SEEDS for large or small gardens, from 1*l.* to 5*l.* and upwards; these selections, made with the greatest care, and comprising the most useful and approved varieties, *have hitherto never failed to give purchasers the most complete satisfaction.* J. C. & Co. beg to observe that all NEW SEEDS advertised, should they *not* be in their Catalogue, can be however supplied by them at the current prices. Their CATALOGUE of FLORICULTURAL, VEGETABLE, and AGRICULTURAL SEEDS, acknowledged to be the best published, will be forwarded *free of charge* and *post paid* upon application.

JAMES CARTER & Co., Seedsmen, 238, High Holborn, London.

WATERER AND GODFREY respectfully invite the attention of parties engaged in Planting to their fine Stock of the following HARDY ORNAMENTAL TREES, &c.

Araucaria imbricata, 2, 3, 4, 5, 6, 7, and 8 feet high, in quantities, all stocky well grown plants; the larger sizes especially it would be difficult to match.

Cedrus Deodara, 1½, 2, 3, 4, and 5 feet, by the thousand; do. a fine lot of larger, 6, 7, and 8 feet; do. some magnificent Trees, 10 to 15 feet. These are all in a famous condition for Transplanting, having been annually removed.

Cedars of Lebanon, 3, 4, 5, and 6 feet; do. a few splendid Trees, 10 and 12 feet.

Cedars Red Virginian, 5 to 8 feet.

Cedars, variegated white, 2, 3, and 4 feet, one of the handsomest variegated plants we know. We have a large stock. It is extensively planted at Elvaston Castle.

Cryptomeria japonica, fine plants, 4 to 7 feet.

Cupressus macrocarpa or Lambertiana, 3, 4, 5, 6, 7, and 8 feet. Nothing can be handsomer than some of the specimens of this fine hardy plant.

Juniper, Chinese, 2, 3, 4, and 5 feet; a fine lot of large plants, 6 to 8 feet.

Do. Irish, upright, 3, 4, 5, and 6 feet; do. larger, up to 8 and 10 feet. Our stock of the two last mentioned Junipers we believe to be quite unequalled, the Irish especially; the larger sizes are perfect columns.

Do. recurva, 3, 4, 5, up to 8 feet.

Do. hispanica or thurifera, 2, 3, and 4 feet.

Abies Douglasi, 2, 3, and 4 feet. A fine lot of large and very handsome plants, 7, 8, 10, and 12 feet.

Picea nobilis, several hundreds of nice plants, 1½ to 2 feet, well grown, and with good lead. None are grafted. A few taller specimens up to 6 feet.

Do. Nordmanniana, a large quantity of remarkably handsome plants, 1½, 2, 3, and 4 feet. Nothing can exceed the vigour of these plants, and all from seed.

Do. Pinsapo, magnificent plants, 4 to 7 feet high, in perfect health.

Pinus insignis, 1½ to 3 feet; a few good specimens up to 7 feet.
„ Lambertiana, from seed, 4, 5, and 6 feet.
„ Cembra, 3, 4, 5, up to 10 feet.
„ Montezumæ, fine plants, 4 and 5 feet.
„ macrocarpa, 2 and 3 feet, from seed.

Weeping Larch, clean, stems good, heads 7 feet high.

The following 10 varieties form a very singular group. They are of dwarf habits; the well known Abies Clanbraziliana may be taken as the type of the whole. We believe our collection to be quite unique, and, we may add, most interesting.

Pinus strobus pumila (the dwarf Weymouth).
„ sylvestris pumila (the dwarf Scotch).

Abies Clanbraziliana	Abies pumila	All dwarf varieties of the Spruce Fir.
„ compacta	„ diffusa	
„ pygmæa	„ Gregori	

Picea pectinata pygmæa (the dwarf Silver Fir), Hudsoni.

Yew, common English, 3, 4, 5, 6, and 7 feet, in large quantities.

Do. upright, Irish, 4, 5, 6, and 7 feet; some splendid plants, 8 to 12 feet.

Do. Dovaston or Weeping, a great many fine plants, worked on straight stems, 7, 8, and 10 feet high, with good heads.

Do. adpressa, 2 and 3 feet.

Do. do., worked on common Yew, as standards.

Do. gold striped, 1½ to 2 feet, by the thousand.

Do. do., a splendid lot of plants, 4 to 6 feet.

Do. do., worked as standards on the common Yew, 8 to 10 ft. high.

Do. do., worked on Irish Yews, 6, 7, and 8 feet high.

Do. elegantissima, or new gold striped; a large quantity, 1½ to 2½ feet, and also worked as standards on the common and Irish Yews. We may safely assert our stock of Golden Yews is unsurpassed.

Do. yellow berried (true), very beautiful when in fruit as we have it, 1½ to 3 feet.

Libocedrus chilensis, 2 to 3 feet, very handsome and bushy.

Thuja Wareana, fine bushes, 3, 4, 5, 6, and 8 feet. This is one of the most useful, and, at the same time, ornamental hardy plants we possess.

Do. American, for hedges, doubtless the very best, 4, 5, and 6 feet.

Do. aurea, or Golden Arbor-vitæ. This plant originated at this Nursery; it has now, as it deserves, become a universal favourite. Our stock of it enables us to offer a choice of many hundred fine specimens, from 1½ to 3 and 4 feet high, and as much through—in fact, perfect globes.

Wellingtonia gigantea, a few of the finest plants in the country, being near 1½ feet high, and as much wide.

Hollies variegated, by the thousand, 2, 3, and 4 feet high. Some splendid Plants, 10 to 15 feet high.

We may here remark with reference to the large specimens alluded to in this Advertisement that every one of them is in a condition to transplant, and travel any distance with perfect safety. They have one and all been annually removed in our Nursery, and in soliciting a personal inspection of our stock, we believe we are justified in stating it offers a choice which is to be found in but few establishments of its kind in this country.

The Nursery may be reached in 40 minutes by Train from the Waterloo Station; and the South Western Railway Company having a Branch on to the North Western, enables us to send plants to all parts, in trucks throughout, without packing and other extensive additions.

Knap Hill Nursery, Woking, Surrey.

CROCUS, TULIP, AND HYACINTH BASKETS, with Wire or Zinc Linings, for suspension or for table stand; also Bracket Baskets made and Japanned in a variety of colours and designs, by W. RICHARDS, Imperial Wire Works, 370, Oxford Street. Conservatories fitted up.

Window Blinds and Wirework of every description.

NEAT, DURABLE, AND WELL EXECUTED LABEL FOR NAMING PLANTS.—The Advertiser will forward on the receipt of a stamped envelope, containing two postage stamps, a Zinc Label, neatly painted, lettered in *Oil paint*, as a specimen for those who may require a number; they can be supplied at 2*d.* each.—Address F. H., at Mr. Bond's, Walcot, Salop.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES consist of MATTING, DOOR MATS, MATTRESSES, HASSOCKS, BRUSHES, &c., and are distinguished by superiority and excellence of workmanship, combined with moderate charges. Catalogues, containing prices and every particular, free by post.—T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, HELY & WARING, Managers, 296, Oxford Street, London. STRONG HORTICULTURAL SHEET GLASS from 2*d.*; and HARTLEY'S PATENT ROUGH PLATE, from 4½*d.* per foot. CROWN or SHEET SQUARES, in 100 feet boxes, under 10 by 8, 12*s.* 6*d.*; above, 16*s.* 8*d.* per box. FOREIGN SHEET, in 200 feet cases, 34*s.* per case.

PERFORATED VENTILATING GLASS from 1*s.* 6*d.* per foot. TILES and SLATES from 6*d.* each. MILK PANS, 21*s.* per dozen. HELY'S HAND CHURN, 5*s.* 6*d.*; WARING'S BUTTER SLABS, 10*s.* each. Glass Fern Shades, Bee Glasses, Cucumber Tubes, Hyacinth Dishes, Propagating Glasses, Hand Lights, &c. Flower Labels, 7*s.* per 100, and the New Aquarium, 10*s.* each.—Catalogues free.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

POULTRY, RABBIT, SHEEP & CAT FENCING, HARE OR RABBIT NETS, ON CORDS, for Covert Shooting, 12 mesh over, 4 feet wide, 2*d.* per yard; 18 mesh over, 6 feet wide, 3*d.* per yard; 24 mesh over, 8 feet, 4*d.* per yard; each edge corded, ½*d.* per yard extra. Extra stout do., 18 mesh wide, 4*d.* per yard, suitable for Poultry Fencing. Square mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for Fencing against Fowls, Cats, &c., at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

NETTING FOR SHEEP-FOLDS, MADE OF COCOA-NUT FIBRE, a material known to possess the most extraordinary durability when exposed to the alternations of weather. It will wear out several sets of tarred hemp netting, and is so light that a herdsman may with ease carry 200 yards of it. 3½ and 7-inch mesh, 6*d.* per yard. Sold in Nets of 50 and 100 yards long, 48 inches high, by the Manufacturer, W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, Kingsland, London.

BIRD NETS, BAT-FOLDING NETS, FOR BIRD CATCHING, 5*s.* each; with Bamboo Poles complete, 20*s.* Clap Nets for Bird Catching, 12 yards long, 5 feet deep, 10*s.*; with staffs, pull line, and stop cord, 1*l.* 10*s.* Lark Nets, made square mesh, any size required, 3*d.* per square yard. A Net Trammel, 30 yards long, 5 yards wide, made square mesh, 1*l.* 11*s.*, or any less size 2*d.* per square yard.—W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, near Kingsland Gate, London.

CHEAP WIRE GAME & POULTRY NETTING.

Wide.	Mesh.	Plain.	Galvanised.
24 inches by	2 inches ...	3*d.* to 4*d.* per yard ...	6*d.* per yard.
36 „	2 „ ...	6*d.* per yard ...	9*d.* „
48 „	2 „ ...	9*d.* „ ...	1*s.* „

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size. This article is shown at the Sydenham Exhibition, where it is much admired.—W. CULLINGFORD, 1, Edmund Terrace, Ball's Pond Road, near the Gate, Kingsland.

IRON FENCE, HURDLES, ETC.

J. R. PEILL, 17, New Park Street, Southwark (late STEPHENSON & PEILL), solicits an inspection of his patterns of WROUGHT-IRON FENCE, which he is now prepared to supply upon very advantageous terms to purchasers. Every description of Ornamental Castings and Metal Works. Prices, &c., at the Manufactory as above.

HURDLES for SHEEP, 6 feet long, 3 feet out of ground, 5 bars ... ... 4*s.* 9*d.* each.
HURDLES for CATTLE, 6 feet long, 3 feet out of ground, 5 bars ... ... 5*s.* 3*d.* each.

NETTING FOR SHEEP FOLDS.

WILDEY AND CO., Holland Street, Blackfriars Road, London, are the original introducers of the COCOA-NUT FIBRE SHEEPFOLDING NETS, which 14 years' experience has proved to possess the most extraordinary durability when exposed to alterations of weather. Cocoa-nut fibre will wear out several sets of *tarred hemp netting*, and is so light that a herdsman may with ease carry 200 yards of it.

WILDEY & Co. were awarded a Prize Medal for this Netting by the Royal Agricultural Society in 1842, at the Exhibition of all Nations, in 1851, and at the Exposition Universelle, Paris, 1855. Sold in Nets of 50 and 100 yards long, 42 inches high, by the Manufacturers, WILDEY & Co., at the Cocoa-nut Fibre Works, Holland Street, Blackfriars Road, London.

BALUSTRADING FOR GARDEN TERRACES, executed in Austin's Artificial Stone, by J. SEELEY (late Austin and Seeley), Nos. 1 to 4, Keppel Row, New Road.

This work is of the same constitution as Portland Stone, and after a winter's exposure is hardly distinguishable from that material: it has been extensively used in Scotland for 20 years.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. ROE (late FREEMAN ROE), Hydraulic Engineer, 70, Strand, London.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY, WARRANTED GOOD BY THE MAKERS.

JOSEPH MAPPIN AND BROTHERS, QUEEN'S CUTLERY WORKS, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Priced Lists of Plant Tubs and Boxes forwarded on application.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CYLINDRICAL and SADDLE BOILERS in stock, also Fire and Furnace Bars, Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot-water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes.—Drawings and Prices of the above, or estimates given for the work fixed complete, on application to J. JONES, Iron Bridge Wharf, 6, Bankside, London, near the Southwark Iron Bridge.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

212° MILNER'S HOLDFAST AND FIRE-RESISTING SAFES (non-conducting and vapourising), with all the improvements, under their Quadruple Patents of 1840-51-54 and 1855, including their Gunpowder Proof Solid Lock and Door (without which no Safe is secure), the STRONGEST, BEST, and CHEAPEST SAFEGUARDS EXTANT.

MILNER'S Phœnix (212°) Safe Works, Liverpool, the most complete and extensive in the world. Show Rooms, 6 and 8, Lord Street, Liverpool. London Depôt, 47A, Moorgate Street, City. Circulars free by post.

TO GENTLEMEN ENGAGED IN PLANTING, AND TO NURSERYMEN.

STEPHEN SHILLING begs to offer good Transplanted PLANTS and TREES of the following at very low prices, when a quantity of either sort are taken:—

3,000 Arbor-vitæ, 3 to 7 feet.	1,000 Horse Chesnuts, 8 to 12 ft.
10,000 Spruce Firs, 4 to 10 feet.	5,000 Beech, 6 to 10 feet.
10,000 Tree Box, 2 to 5 feet.	15,000 Rhododendron Ponticum, in variety, 1½ to 4 feet.
1,000 Limes, 6 to 10 feet.	

The whole of the above are well worthy of attention, being good in quality, the Evergreens of good healthy colour and bushy. All applications will have immediate attention.

North Warnborough Nursery, near Odiham, Hants, 2½ miles from Winchfield Station, South Western Railway.—Dec. 29.

WALTON NURSERY, LIVERPOOL.

To Noblemen and Gentlemen Planting New Pleasure Grounds, or Improving Parks or Drives, and to Companies Planting Public Parks or Cemeteries.

W. SKIRVING begs to offer his extensive Stock of TREES and SHRUBS of various sizes, adapted either for immediate effect or for extensive new Plantations, where smaller sized and less expensive plants are required. In addition to his general stock of the leading kinds of Trees and Shrubs, which is allowed to be the most extensive in England, he this season offers upwards of a hundred thousand of the two most valuable Trees lately introduced, the ARAUCARIA IMBRICATA and CEDRUS DEODARA, of various sizes, from one to six feet.

W. S. invites any one wanting considerable quantities of Specimen Trees and Shrubs to inspect his collection and obtain prices on the spot, as the mere height of such trees (as quoted in lists) gives no idea of the value of well grown select plants for choice situations.

N.B. A few hundreds of the larger sized and finely shaped plants of the Araucaria imbricata and Cedrus Deodara have been grown in tubs, to secure their travelling in safety to great distances in this country, or to any part abroad.

Priced Lists will be sent on application.

WATERER'S AMERICAN PLANTS.—A new DESCRIPTIVE CATALOGUE is now published of the celebrated Collection of hardy Scarlet and other Rhododendrons, as exhibited by John Waterer at the Royal Botanic Gardens, Regent's Park; it will be found to contain a few practical observations on their successful management, and will be forwarded on application by enclosing two stamps for postage. Apart from its enumeration of the most popular American Plants in cultivation, a List of choice Coniferæ will be seen, embracing the latest importations of this fine and hardy tribe of Plants.

J. W. has now the pleasure to offer in large quantities, and of all heights, the following selection of CONIFERS, with the remark that they are all now growing in the open ground, are bushy and handsome as can be desired, and have been transplanted each succeeding spring, whereby no risk can be encountered in their removal from the nursery:—Araucaria imbricata, Cryptomeria japonica; Pinus Douglasi, Cembra, excelsa, Lambertiana, insignis, Jefferyana, Beardsleyi, tuberculata, &c.; Cedrus Deodara, Lebanon, and Africana; Wellingtonia gigantea, Cupressus, Juniperus, Taxus, Thuja, &c.

☞ The attention of gentlemen, public companies, and others engaged in planting, is especially directed to the foregoing; indeed, all intending planters would be well repaid by a visit to inspect our stock, as much may be seen which of necessity cannot be given within the limits of an advertisement.

The Nursery is easily reached by railway, being near the Farnborough Station, South-Western Railway, and Blackwater on the South-Eastern Railway.

The American Nursery, Bagshot, Surrey.

NEW ROSES.

J. and J. FRASER, Nurserymen, Lea Bridge Road, Essex, beg to offer fine Standards of the following beautiful NEW ROSES:—

	s.	d.		s.	d.

For a full description of the above see Catalogue, which may be had on application.—Dec. 29.

EARLY LETTUCES.—The largest and quickest growing LETTUCES are "SUTTON'S SUPERB WHITE COS," and "SUTTON'S SUPERB GREEN COS." The Editor of the *Gardeners' Chronicle*, in a critique on Lettuces, says of the first of these—"This is the very best Cos Lettuce, very large, leaves hooded at the top, so that they close in without tying; blanching white, crisp, so excellent that one would suppose no higher degree of perfection could be obtained as regards a Summer Lettuce." And of the other he says—"Sutton's Superb Green Cos: This very much resembles the preceding, but is a darker green, and hardier, therefore is preferable for sowing early in spring, and also for autumn use."

Seeds may be had (if ordered immediately) in packets 1s. each, post free.—Address, Sutton & Sons, Seed Growers and Merchants, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 29, 1855.

In the midst of the South Atlantic Ocean stands a place called Ascension Island, which Malte Brun some years since described as "a rock without water, and nearly without vegetation, but an attraction to navigators from the immense quantity of turtles that come to repose themselves on its shores, which are covered with lava and volcanic scoriæ." We have heard other visitors to the place assert that its soil consisted of what was very like broken glass bottles. When St. Helena was fixed upon as the residence of Napoleon Bonaparte, the island was occupied by Sir George Cockburn. In 1834 it more seriously attracted the attention of the English Government, who caused it to be surveyed with a view to converting it into a naval station for the African fleet. At that time about 45 acres of the mountain top furnished a scanty supply of vegetables; there were no trees, and such wild plants as existed were worthless.

By the year 1847 such progress had been made in reclaiming this desolate spot, by successive naval or marine officers, that it had begun to assume an importance far beyond that of breeding turtle for the supply of ships' companies. It had been found that the upper part, or peak, called the Green Mountain, rising 2000 feet above the surrounding sea, possessed a rich soil capable of producing a variety of esculent vegetables, and spots in the valleys were represented by Capt. Dwyer, R.M., the then commandant, as in progress towards being reclaimed. The quarters of a small party of marines had been established in this spot, where rain occasionally fell, and trees had begun to spring up. Among the latter the Bermuda Cedar, and a kind of Pinus, probably the Pinaster, were making considerable progress, and Peaches, Figs, Plantains, Oranges and Loquats, had begun to show that cultivation was anything rather than impossible. In fact Portugal Cabbages, Gourds, Pumpkins, Celery, Carrots, Leeks, French Beans, and most especially the Batatas or Sweet Potato were thriving pretty well.

At this period (1847) the station came under the notice of the late Lord Auckland, then First Lord of the Admiralty, whose very considerable horticultural experience enabled him to see that where so much had been done with small means, much more might be effected if a vigorous effort were made by the Admiralty. Persons supposed to be capable of giving useful advice were again consulted, ample supplies of various kinds were provided at their recommendation, and a gardener was, for the first time, sent out, to take charge of the land that had been reclaimed, and to do what might be possible to recover a further portion, especially of that volcanic region which up to the time in question had been found irreclaimable.

Since 1847 the plans of amelioration, sanctioned by Lord Auckland, have been steadily pursued; and notwithstanding great and unexpected difficulties caused by violent winds, periodical drought, and the ravages of insects peculiar to the island, have proved eminently successful, especially since the cultivation of the island has been entrusted to Mr. Peter Wallace, an experienced and skilful gardener, familiar with volcanic soils and tropical gardening. Nor is it a small ground of satisfaction to see that this success has been entirely in correspondence with the anticipations of Lord Auckland's advisers.

The grand difficulties consisted in the want of shelter and water, and most especially in the impracticable nature of the region, covered with hard scoriæ near the coast. Detailed instructions as to the mode of overcoming these difficulties were given to the first gardener, and we suppose were attended to by him. At all events the scoriæ are already giving way, as we learn from the fact that notwithstanding a long drought and a great scarcity of Grass the cattle were in excellent condition last June, in consequence of the abundance of dried-up Purslane, Thistles, and Tomatoes, which have now completely established themselves all over the island.

There was issued during the second quarter of the present year as follows:—

	lbs. weight.
Sweet Potatoes	12,700
Pumpkins	2,160
Cabbages	2,038
Spinach	2,098
Carrots	1,358
French Beans	150
Callaloo	150
Leeks	2,052
Salads	1,450
Bananas	320
Cucumbers	100
	24,576 lbs.

besides which 101,920 lbs. of dry fodder had been supplied to the garrison and for the use of the mountain cattle.

At the latest advices, dated Nov. 1, Mr. Wallace had in charge 50 head of Island cattle, reared from about 15 cows, 500 sheep were under the shearers, goats were breeding fast, and there were a dozen very handsome wild donkeys. Great numbers of trees were affording shelter, and something like woodland scenery was completely obtained. Above 15 inches of rain had fallen in the previous four months. The trees with which the mountain is beginning to be covered seem therefore to be doing their work, for such a quantity of rain was unprecedented.

To have thus far reclaimed Ascension is, we think, a convincing proof that the true principles of cultivation are perfectly safe guides in a place where no experience can have been gained. The instructions drawn up for the guidance of the gardener at Ascension in 1847 were framed entirely with reference to those principles, and it is difficult to conceive how any amount of personal experience could have led to more signal success.

In 1834 Captain Brandreth concluded the account of his visit in the following words:—

"When the first adventurer to this wild spot explored his way over a wide plain of cinders and ashes, where no drop of water and scarce one evidence of vegetative principle could be discovered—when he laboured up the steep and rugged mountain, and looked on the withered aspect of the scene spread in solitude around him—he must have considered the spot condemned to hopeless sterility, and regarded the sea-fowl that settled over the dark red hills near the coast as likely to remain the sole and undisputed inhabitants of these wild regions. There are doubtless many living who have visited the island when in this its primitive condition, and among the number the distinguished officer (Sir George Cockburn) who gave the first impulse to the measures which have been detailed; and if any such should chance to revisit the island now, they must be sensibly impressed with the change it has undergone, and the evidences that everywhere prevail of the industry and energy of its first and present inhabitants."

How much more applicable is that sentence now!

An extract from Hooker's Journal of Botany relating to Beech-oil (see p. 807) has led a correspondent to draw our attention to a rare old pamphlet by Aaron Hill,* a somewhat remarkable man, and a great projector, concerning whom a good account is given in Chalmers's Biographical Dictionary.

It certainly does appear extraordinary that in such a country as England, where oil has so high a value, and where mechanical power is so easily obtained, an enormous quantity of raw material should be annually allowed to waste, without any profitable use. The Beech tree, a native of these islands, or at any rate one thoroughly established here, in no part of the world occupies a larger proportional area. It constitutes a considerable part of the property of many landowners; although its timber has so low a value that it may be doubted whether it would continue to be cultivated on a large scale were it not for two circumstances—its singular beauty, and its suitability to thin land, where nothing equal to it can be as speedily reared.

Now according to Aaron Hill the real value of the tree resides in its mast. But we will quote his own words:—"There is in all the forests of England a very common tree, called a Beech tree, much larger than the Oak. There are vast woods almost everywhere, of nothing else but this Beech; most of our noblemen and private gentlemen have large quantities, and some of them several thousand acres of Beech in their own estates, as particularly the Duke of Somerset, the Earl of Dorset, the Earl of Scarborough, the Earl of Winchelsea, and an endless number more in all parts of the kingdom.

"There are within forty miles round London many hundred thousand acres of full grown, bearing Beech, almost without any other tree intermixed with them. Nothing is more common than for one of these Beech trees to bear fifty bushels of that three-corner'd Beech Mast, of which you have a sample sent you with this book, as you also have of the outward husk, in which it grows, tho' I don't reckon the husk, but the kernels only, when I say that it is a common thing for one tree to bear fifty bushels of Beech Mast. About the latter end of September, the husks, which hang like ropes of Onions, and weigh down the branches, open of their own accord, and let fall the Mast, three-corner'd as you see it, in such vast quantity, that the ground is every where cover'd over with it several inches deep.

"Some part of this the hogs devour, or in parks the deer; the rest, having no use, lies rotting on the ground, and spoils the herbage. 'Tis hardly ever known to be gather'd, and when it is, the poor have sixpence or eightpence a bushel for picking it up, and carrying it to some honest farmer's wife for a favourite hog or so, that is to be kill'd against Christmas. Now the discovery is this:—That every bushel of this common Mast, which has lain neglected and despised for so many ages, is found to yield two gallons of much better oil than that made of Olives, which the clothiers and soap-makers call *Seville oil*, or *Galipoli oil*, and for which the nation pays such prodigious sums of money to foreigners."

And then, after telling how he was cured of a bad cold at Naples by the use of oil of Almonds, he goes on to say that:—

"The similitude in taste between a new Almond and the Beech Mast, just fall'n from the trees, im-

* An Account of the Rise and Progress of the Beech-Oil Invention, and all the Steps which have been taken in that Affair, from the First Discovery to the present Time. As also, what is further design'd in That Undertaking.

"How long, ye simple Ones, will ye love Simplicity? How long, O ye Scorners, will you delight in your Scorning? And Fools hate Knowledge?—Prov."

By Aaron Hill, Esq. London: Printed in the Year 1715.

mediately brought to my remembrance the oil which had so lately cur'd my cold, and the easy manner of making it; surely, thought I, as the substance and taste of these two things are so near alike, their effects can never be so different, but that the Beech must afford as good an oil as the Almond tree. I resolv'd, however, to make an experiment, and took care in my return to get a quart or two of Beech Mast, and having hung it a whole night in a linen bag, near a small fire, to dry away that watry part which you may observe predominant in Filberds and Walnuts till they have been a good while kept, I pounded them in a mortar, and when they were reduc'd with shell and all to a proper substance, I got the apothecary's press, and went to work the same way I had observ'd him take with the Almonds. I was rather pleas'd than surpris'd to find myself so far from being mistaken, that the oil was more in quantity than had been drawn from an equal weight of Almonds, and the apothecary not knowing what it really was, after having several times tasted it, declar'd that it was the finest oil of Almonds that ever he saw drawn."

At this time Hill was at Naples.

"At last, in the year 1712, some affairs of no great consequence calling me into the west of England, I returned again about the beginning of September from Devonshire, and taking no direct road came along by Henley and the woodiest part of Maidenhead thicket, where, for 12 or 14 miles together, a man can hardly see any other kind of wood but Beech. It happened that this very year the Beech Mast grew in greater plenty than ordinary, and as I rode among the trees, I observ'd that they were almost bow'd to the ground with their burthens, and hung just as I had seen them twelve years before in the kingdom of Naples. The similitude of the two objects at once brought back to my remembrance the experiment I had then made, and I was immediately mov'd with curiosity to try if the English Beech nut might not yield an oil as sweet as the Neapolitan.

"At my return to London I made the experiment; I found it answer the utmost of my expectations; and having by inquiries of the country people before inform'd myself that there was no use for this mast, but that all which the hogs left undevour'd lay rotting on the ground, and was looked upon as not worth gathering, I made it my next business to trace out the uses of this new oil."

Eventually, in the 12th year of Queen Anne, letters patent were issued to Hill, authorising him to get up a company for obtaining oil from Beech Mast; in consequence of which an association was actually formed and shares were sold "at the Beech oil office, which is now kept at the Golden Key, a woollen draper's, in St. Paul's Churchyard, from 9 to 12 in the morning, and from 2 to 5 in the afternoon."

It does not appear that this company was prosperous; at least we find no further traces of it. Nor indeed was it one which either then or now should have been formed. It is only by the owners of Beech woods on a large scale that it could be made profitable; but in their hands we should think it ought to be productive enough to deserve attention. That the Beech mast contains oil in abundance, that its oil is easily expressed, that it would have a ready sale, and that the residuary "cake" would be applicable to the usual agricultural purposes is certain. That is to say, such is found to be the case in other countries, and there is nothing in the climate of Great Britain to justify the opinion that the case would be different here and elsewhere. In the passage which has led to these remarks it will be seen that in the North of Germany it is largely employed, even as food, although it is certainly not on account of its fitness for aliment that it seems to merit attention. On the contrary Guibourt (*Hist. des dr. simp.*, II. 600) expressly declares that in the East of France, where the mast is utilised in pretty large quantity, the oil, when fresh, contains an acrid principle which renders its use as food injurious, and that it is necessary to drive this off by gentle boiling—an operation of some difficulty.

And this is confirmed by the authors of the *Maison rustique*, who speak of it thus:—"The Beech deserves to be more extensively cultivated, on account of the oil which it produces. This oil is good for eating, or frying, and for burning in lamps. It will keep for many years, and even improves by age, if after being clarified it is put into pitchers well luted, and buried in sand as in a cellar. Some, however, say that when fresh it disorders the head and stomach. In order to make good Beech oil, the mast should be collected as it falls, and put into an airy room; but not thrown in heaps for fear of heating. When it is quite dry, it is shelled and ground for the purpose of extracting the oil. Beech-cake fattens quickly cows, pigs, and fowls."

It is therefore not as an article of human food that we invite attention to Beech oil, but because of its apparent value for burning and manufacturing purposes, and for the sake of the cake which remains when the oil is pressed out. On these accounts it would seem to be worth experimenting upon by those who live in Beech countries and can have access to an oil mill. We only regret that our attention was not directed to the subject two months ago.

New Plants.

156. Calceolaria (Jovellana) violacea, *Cavanilles — De Cand. Prodr. x.* 206.

This very pretty shrub has appeared in many gardens round London during the two last years, having, we believe, been sent to England by Mr. Van Houtte, of Ghent. So little does it bear of resemblance to common Calceolarias that no one can be surprised at its having been regarded as a distinct genus. But although its flowers are violet and the corolla split into a pair of equal gaping concave lips, yet Mr. Bentham, who has so carefully studied the order to which it belongs, is of opinion (see *De Cand. Prodr.* x. 205) that the Jovellana of Cavanilles should not be separated from the Calceolaria of Linnæus; the pouch of the latter being analogous to the lower lip of Jovellana.

At first the plants round London were small and wanted vigour, and the violet colour of the blossoms was so faint and tarnished that gardeners formed an unfavour-

able opinion of the plant; but restored health and better treatment brought out its real colours, gave brilliancy to their tints, and so increased the number of the flowers as to raise it very much in estimation, so that it now ranks among the best of second-class greenhouse shrubs, requiring precisely the same treatment as ordinary shrubby Calceolarias, and like them striking freely from cuttings. It flowers in April and May.

Our own wild specimens are from Conception in Chili, near which and the city of Valparaiso it appears to be common, forming a small entangled bush. The very hot summer of that country shows how careful we should be to give the plant a long season of warm rest. When at home it flowers in October, which corresponds with our April, long before the dry season sets in.

TRANSPORT OF ROOTS AND SEEDS TO AUSTRALIA.

I imagine that it would be worth knowing whether in the case of roots and seeds any method of packing could be adopted better than the present one of paper in tin cases, and how best the expiring vitality of some of them could be thrown into an active state. It is all very well to say that oily seeds get rancid, and that berries get mouldy; this is well known, but the object is how to counteract this, and of course first to inquire into the cause. I have sent to England for seeds and roots for several years, and if I get one seed to grow from five ordinary packets I am satisfied. I have sent to five seedsmen for the same seed in the same year, namely the pickling Onion, and altogether I have received some pounds weight, but never had a grain come up, either in the ground, a frame, or a hot-bed. A few sorts of seeds will always grow, as Peas and the Cabbage tribe, but it is very rarely that either Carrot, Parsnip, Onion, Lettuce, French Bean, &c., ever germinate.

Roots also are a sad disappointment; we have never been able to import Snowdrops, Aconites, Dog-tooth Violets, Fritillaries, Scillas, English or Spanish Iris, and very rarely a Crocus. Last year I received 2000 Crocuses, every one of which was dead. Hyacinths come better, so do Narcissi and Tulips. The Amaryllis tribe all die, Anemones and Ranunculus are uncertain, sometimes all are perfect, at others all are decayed. Last year the same post conveyed from me two nearly corresponding orders; the one tradesman despatched the order four days after its receipt in September, the other in December, or three months afterwards; the goods from the latter were all rotten, while those from the former were all good. This result might have been anticipated. The one order was executed while the weather was dry, and the roots experiencing their summer's rest or inactivity; the other when the damp weather of November had filled them with moisture, and when their natural season of growth had already far advanced.

Some persons have advised roots and seeds to be packed in sugar, others in charcoal, some in damp earth, others in some porous material which would admit a passage of air, but of course this is of no value when they are inclosed in a tin case. Most persons advise phials to be used. I have tried and seen all methods, and the result of my experience is, that phials appear to be the best, or if sent by post quills sealed with sealing-wax are as good. Berries must be sent thus to keep their moisture from rotting what they are in contact with. Sugar, by keeping off rancidity, is very beneficial in preserving Acorns, Chesnuts, Walnuts, and similar seeds. Walnuts always become rancid, Chesnuts change into a dry powder or dry rot, so much so that of 10 sacks sent not as seed but as a commercial speculation, not one among the whole quantity has been good for food, much less for seed. Yet packed in sugar I have received them safely, and so rare is the fruit that two years ago they were sold at 5*s.* each Chesnut. Last year I sent to England for a case of living plants, and directed the seeds of trees of various sorts and certain bulbs to be scattered in the mould of the case; when it arrived I had a perfect forest of Oaks, Birch, Ash, &c. The bulbs also were good, and if living plants are sent, the most perfect manner is to have the plants regularly and properly *planted* in 6 inches of soil, as close together as you like. Let the earth be covered over with moss, and wooden bars or wires put above it to keep the whole steady; such a case should always have berries or slow growing seeds scattered throughout the mould, they may perhaps grow during the voyage if near the surface; if not they will grow directly the mould is taken out and properly scattered and covered. Lily roots, Fritillaria (Crown Imperials especially), Lily of the Valley, Alstrœmerias, Tropæolums, and Cyclamens always carry well in this way.

What seems most wanted is a knowledge of the result of different methods of carrying seeds and roots to foreign countries; for example, an essential oil will prevent white mould, contact with air prevents dry rot; but air is always moist, and to prevent this evil rotting is occasioned. Now what material might be mixed with seeds to generate air without producing moisture? Would a mixture of black oxide of manganese and common salt?—would chalk and sal ammoniac?—would chloride of lime?—would any easily decomposed oxide or salt?—would bi-carbonate of ammonia, or other material effect this? Then if seeds arrive in a languid but still living state, what soaking or other treatment, save that generally pursued of a hotbed, will animate them? I have myself found charcoal and sand, watered with the drainings from old stable manure, with a little muriate of ammonia mixed with it, or else water impregnated with a very little pigeons' dung, to be an excellent mixture to grow languid seeds in. *George W. Francis, Superintendent of the Botanic Garden, Adelaide. August*, 1855.

ON HASTENING THE BEARING OF SEEDLING PEAR TREES.

More than once on seeing my numerous seedling Pear trees, inexperienced amateurs, full of superficial knowledge, have said to me, "What! you wait seven, eight, or ten years before your trees come into bearing? That is too long to wait; this is the method I would take to hasten their bearing: when a seedling has made a well ripened terminal shoot, I would bud or graft it on the Quince stock, and thus have fruit in the third or fourth year after the operation." Others recommend grafting or budding on standards, or on the lateral branches of strong pyramids in bearing. My reply was always, "Have you tried it? Have you established by experiment the superiority of this practice?" No one ever ventured in the affirmative. They had only heard that it could be done. A prejudice. I know that 20 years ago, or more, similar experiments had been tried, but without success. Desirous, however, of making sure on this point, I renewed the experiment on an extended scale. The following was the result obtained: From 15 of my most promising seedlings, and such as were best adapted for the purpose, I took good grafts in the third year, and worked them on strong shoots at 6 or 7 feet high; I also took six buds of each sort and worked them on the Quince stock; and I sacrificed five strong pyramids by grafting or budding on their lateral branches. These grafts and buds succeeded

perfectly well for several years, with the exception of four sorts which did not succeed on the Quince stock, but the others did not bear sooner than the seedlings themselves. The contrary, in fact, was the case with most of the sorts so propagated, notwithstanding that long pruning and all the other modes of hastening bearing had been resorted to, but all in vain. The cause in the opinion of highly competent men is this: every seedling Pear tree according to the nature of its constitution passes through the various stages of vegetable life before it arrives at the state in which it is in a condition to bear fruit. The stem and a part of the upper branches next to it must pass through certain phases of their growth before they acquire, either by peculiarity of constitution or by age, the properties necessary for the production of the organs of fructification. Neither the nature of the Quince stock, nor the age of a strong wild Pear stock, nor that of a tall pyramid already in bearing can change the nature of the graft or bud worked upon them.

The results of the experiments and observations made upon this subject prove that it is indispensable to make a judicious selection of grafts or buds in order to produce bearing wood. It is the strong shoots of the upper part of a tree in a bearing state, or on the point of becoming such, and derived from a variety that has already borne fruit, to which the preference should be given. By employing scions from too young trees the fruiting of those so propagated is retarded. By taking scions from an aged, weakly, or worn out tree, all its inherent faults are reproduced in the propagated plants. Here another point is touched upon, namely, the influence of the stock upon the graft and of the graft upon the stock; but this forms a different subject of consideration. *J. de Jonghe, Brussels.*

VEGETABLE PATHOLOGY, No. CI.

404. Cœnocladia* (*Natural Grafts*).—As the causes which influence the division of a uniform tissue into branches of various kinds are obscure, so is it often equally difficult to assign any reason for the appearance of a single organ where there should be two or more, or the natural union of a plurality of organs with more or less distinct traces of the several parts of which the whole is composed. Instances of the suppression of organs or of the union of one or more individuals are of ordinary occurrence in the parts of fructification even in their normal state, and are very frequent as deviations from some particular type, sometimes arising from pressure, sometimes from the hypertrophy of neighbouring organs, and sometimes again from causes wholly inappreciable.

405. Where organs are multiplied beyond the usual rule, and there is at the same time little or not sufficient increase of space, being in close apposition, while the tissues are still tender union readily takes place, and we have in consequence natural grafts or unions, as in double Apricots, Peaches, Cherries, &c. In such instances there is generally more or less distortion. Sometimes it happens that two or more buds are similarly developed, the consequence of which is a ribband-like more or less fluted stem if they grow with equal rapidity, but if the rates of growth are different the more vigorous side curls over to the weaker, and thus those curious fasciated branches are formed which have attracted the attention of most observers in the Ash, Holly, or more rarely in the Willow. Cnicus palustris, Asparagus officinalis,† the common Foxglove, and many other herbaceous plants exhibit occasionally the same peculiarity, and in such a condition often excite serious alarm in the superstitious. It does not appear that the phenomenon is in general caused by an insect, though it is not denied that such may sometimes be the case. Fasciated branches in a species of Elder are not uncommon in the United States, specimens of which I have before me, caused by the presence of Æcidium sambuciatum, which has hitherto been found only in North America.

406. Union however sometimes takes place between branches merely from juxtaposition when they are by no means in a nascent state, though according to their state of growth the union may be more or less complete. They may for instance press against each other so closely as to prevent anything like nutriment at the point of contact, the consequence of which is that eventually the new layers of wood inclose the disc of contact, the traces of which may exist during the whole life of the tree, the two portions of wood being separated from each other by a thin layer of dead bark. In such cases no real union has ever taken place. If however the bark be very young and vigorous more intimate union may exist and death may not take place at all, the bark being entirely absorbed. The inosculation of branches in many of the tropical climbers is notorious, and we have curious instances of it occasionally in our own forest trees, especially in the Beech, in which a complete network of branches may exist while all are growing with perfect vigour. A very curious tree of this description exists in my own neighbourhood, of which two figures are given under the article Fagus in Loudon's "Arboretum et Fruticetum."

407. One of the most curious cases perhaps of union is that which takes place occasionally in the roots of Fir trees. It has been observed that the stumps of some trees, after the trunk has been felled, still continue to grow, forming every year a fresh ring of wood, insomuch that the surface is gradually obliterated by the arching over of the succession layers. This appearance is described by Hartig, Meyen, and others, under the name of Ueberwallung, but it can scarcely be considered a disease. Within certain limits, the roots of felled trees will supply sufficient nutriment to carry on such growth for a time, as I have had occasion to remark in a young Ash apart from all other trees of the same species. In Firs, however, growth is continued through many years, and to such an extent as cannot be explained by a supply of assimilated matter in the still living roots. Goeppert has studied this curious matter in Abies pectinata, Dec., and has shown that the subject was not unknown to Pliny though neglected by many esteemed writers on forest trees. A translation of Goeppert's paper is given in the "Annales des Sciences Naturelles" for 1843, and is well worth consultation. It appears from his observations that perfect union frequently takes place between the roots of such trees; when, therefore, a tree is cut down, should union between some other neighbour exist, the matter assimilated by the neighbouring living trunk may supply nutriment at the expense of which life may be carried on in the stump, and that to a period limited only by the life of the nurse. *M. J. B.*

* From κοινος common, and κλαδος a branch.

† The fasciated Ash branches are noticed in Dr. Plot's "History of Staffordshire," who attributes them to too rapid an ascent of sap. In Turpin's memoir on Grafts, natural unions are figured in the case of Asparagus and Aloe. He mentions also a natural graft of two contiguous leaves of Agave Americana by the upper and under surfaces. Other instances may be found in De Candolle's "Organographie," &c.

HORTICULTURAL SOCIETY OF LONDON.

The following circular has just been issued:—

21, Regent Street, Dec. 24, 1855.

The Council of the Horticultural Society, in their circular letter of October 23, announced to the Fellows their intention of submitting to the sanction of a general meeting the views they might form of the most desirable manner of conducting the affairs of the corporation, now that the garden exhibitions have ceased to furnish funds for the maintenance of the present garden establishment.

After long and anxious consideration, the Council have arrived at the conclusion, that although the means of the Society no longer permit it to maintain a great and costly garden, yet that by some alteration in existing arrangements, and by giving the action of the Society a new direction, it may be found possible to carry out the objects of the charter with unimpaired utility. This they propose to effect by the adoption of a system of exhibition, instruction, distribution, scientific investigation, and publication embodied in the following proposals:—

1. That in place of the garden exhibitions, London exhibitions be held yearly, during the spring and autumn; and that some spacious place be hired for the purpose.

2. That Monthly Meetings be held as heretofore in Regent Street for the despatch of business, for reading papers or for the exhibition of Horticultural produce; but that medals at those meetings be discontinued, and that on each occasion, when the formal business is over, an illustrated Lecture be delivered upon some subject of Horticultural interest, which may be afterwards made the subject of discussion by the persons present.

3. That seeds be distributed as usual.

4. That by means of a Collector, or otherwise, seeds and roots be obtained from foreign countries, for the purpose of distribution.

5. That a very small Garden be maintained for the purpose of raising such seeds as may not arrive in sufficient quantity for distribution, for restoring the health of imported plants, and for experimental purposes.

6. That a regular system of inquiry into subjects of importance connected with Horticulture throughout the kingdom be established, *by means of Special Committees*, whose reports will be communicated to the Monthly Meetings, and otherwise made public.

7. That the Members of the Society be entitled to borrow books from the Library, for short periods, upon undertaking to return them uninjured.

8. That (if the funds prove adequate) the Journal be converted into a Monthly Publication, with one coloured plate in each part; which shall not be sold, but printed solely for the use of the Fellows, and regularly transmitted by post to such of them as may specially give their address for that purpose.

9. It also seems worthy of consideration whether, besides the Monthly Meetings and Exhibitions, a formal Course of Lectures, of an educational nature, upon Horticulture, Garden Botany, or allied subjects, might not prove useful and popular.

10. The Council are of opinion, that in order to maintain the receipts of the Society in harmony with the expenditure which may be rendered necessary by the adoption of the foregoing suggestions, and to take due advantage of the economy which may result from others, certain alterations in the privileges and payments of Members of the Society would become indispensable.

11. They propose that Members of the Society should, as at present, be admitted to all Exhibitions and Public Meetings, without payment, on signing their names at the entrance.

12. But that all other persons shall be required to present a ticket on entering.

13. That these tickets be issued to orders of Members of the Society at the rate of Three Shillings each for the Exhibitions, and of One Shilling each for any other Public Meetings.

14. That Members should have the privilege of purchasing such tickets at a much lower rate if taken in certain quantities, viz., ten exhibition tickets, or twenty-five ordinary tickets for a sovereign.

15. And, inasmuch as loss has been sustained by those who have purchased Garden Exhibition tickets without being able to use them in the season for which they were issued, it is proposed that the new classes of tickets shall be available during two successive seasons.

16. In connection with the foregoing alterations the Council propose to retain the present rate of subscription (namely, 2*l.* 2*s.* admission fee, and 4*l.* 4*s.* annually, paid retrospectively) wherever it is desired to enjoy all the privileges secured to Fellows by the Charter. All existing Life Members, old Three Guinea Members, and still older Two Guinea or One Guinea Members, would fall into this class; and by them every privilege which the Bye-laws permit would be exercised.

17. But in order to meet the wishes of others it is contemplated to establish a class of *Subscribers*, who, upon payment of Two Guineas annually (in advance, but without an admission fee), shall be entitled to personal free admission to the Exhibitions and Meetings, to purchase tickets at the reduced price, and to all the other privileges of Fellows, except the government of the Society, participation in the distribution of seeds and plants, and the receipt of the Journal.

The Council, being desirous that these proposals should be maturely considered by the Society before the Special General Meeting already alluded to shall be held, and being most anxious that the said Meeting should take place at a time when as large a number of Fellows as possible can be assembled, have decided upon summoning it for Tuesday, the 5th of February next, five days after the assembling of Parliament.

(Signed) By order of the Council,
John Lindley, Vice-Secretary.

THE TEXTILE PLANTS OF JAMAICA.

[We find the following highly interesting account of the textile plants of Jamaica, by Mr. Nathaniel Wilson, in the last number of Hooker's Journal of Botany. Mr. Wilson is the very intelligent and active superintendent of the Botanic Garden in Jamaica.]

The desire for growing new plants and adopting new staples is daily on the increase, and the necessity of a more varied cultivation among our agriculturists has become indispensable in keeping pace with the times and making the most of altered circumstances. I have many useful plants to recommend for this purpose before closing this report, whereby large tracts of waste land may be reopened advantageously at little outlay.

The importation of plants last year has been unusually large, and of a varied description, comprising the following genera, viz.:—

Boehmeria nivea	Rhodostoma gardenioides
Antiaris saccidora	Goethea strictiflora
Datura sanguinea	Coleus Blumei
Jatropha pandurafolia	Maranta sanguinea
Clerodendron macrophyllum	Ixora coccinea, superba
Hova grandiflora	Dipladenia splendens
Ardisia acuminata	Dipladenia urophylla
Poinciana Gilliesi	Hexacentris Mysorensis
Plumbago Capensis	Rhynchospermum jasminiflorum
Vanhouttia calcarata	Dracæna ferrea, var.
Medinilla speciosa	Pterocarpus sp. from Pulo Penang
Nematanthus longipes	Rondeletia speciosa, major
Habrothamnus Schotti	Pandanus variegatus
Dipteracanthus affinis	&c. &c.
Abutilon Van Houtti	
Gardenia Thunbergi	

The first-mentioned in the list is the celebrated Grass-cloth plant, extensively cultivated in China, and whose fibres make the finest cloth the Chinese can boast of. I have not the slightest doubt as to its perfect adaptability to this climate and soil, and in the course of a few years it may become a weed. The Antiaris is the notorious Upas tree of Java, about whose virulent properties so many fabulous statements have appeared from time to time. The Pandanus variegatus is another addition to our textile plants, and one of the most noble and beautiful plants that ever adorned a garden; the others on the list are chiefly new and interesting, collected in many parts of the world, and selected for this climate.

By the acquisition of these plants, we can now boast of possessing the finest fibres and the greatest number of textile plants in the world, hitherto of no avail to the country in general, and held of little value by individuals, but which may now be turned to the greatest account in a national point of view; the universal demand and scarcity of fibre, its high and daily increasing price, rendering the materials from which it is manufactured of the highest importance. We have many indigenous and eminently textile plants diffused over the island, but partially or not at all known to be applicable for textile purposes, except to a few gentlemen acqainted with the botany of the country. I have therefore prepared for general information 51 samples of fibres, the greater part of which are indigenous; as you will observe by the following list comprising them:—

Yucca gloriosa. Adam's Needle, 5-6 feet.
Yucca aloifolia. Common Dagger.
Bromelia Karatas. Silk-grass leaves, 10-12 feet.
Bromelia Pinguin. Pinguin.
Ananas sativa. Pine-apple.
Musa sapientum. Banana.
" var. Martinique Banana.
" *paradisiaca.* Plantain.
" *Cavendishi.* Chinese Plaintain.
" *violacea.* Violet-flowered Plantain.
" *coccinea.* Scarlet-flowered Plantain.
Heliconia Bihai. Wild Plantain.
" *Brasiliensis.* Do. of Brazil.
" *psittacorum.* Parrot-beaked ditto.
Tillandsia serrata. Wild Pine (epiphyte).
" *usneoides.* Wild Pine.
Pandanus spiralis. Screw Pine.
Agave Americana. American Aloe.
Canna Indica. Indian shot.
Triumfetta semitriloba. Common Burbark—a weed.
Malvaviscus arboreus. Bastard or wild Mahoe.
Abroma augusta. Abroma.
Kydia calycina. Tree, 25 feet.
Helicteres Jamaicensis. Screw Tree.
Guazuma ulmifolia. Bastard Cedar.
Klainhovia hospita. Tree, 25-30 feet.
Sida, sp. Shrub, 6-8 feet.
Ochroma lagopus. Down Tree.
Cecropia peltata. Trumpet tree.
Cordia Sebestena. Scarlet Cordia.
" *Gerascanthus.* Spanish Elm.
" *macrophylla.* Man-jack, or broad-leaved Cherry.
Cordia Collococca. Clammy Cherry.
Brosimum spurium. Milk-wood.
Ficus elastica. India-rubber tree.
" *religiosa.* Pepul tree.
" *virens.* Wild Fig tree.
" *Americana.* Wild Fig tree.
Hibiscus Rosa sinensis. Shoe-black tree.
" *liliiflorus.* Lily-flowered ditto.
" *esculentus.* Ochra.
" *elatus.* Mahoe.
" *latifolius.* Broad-leaved Mahoe.
" *tiliaceus.* Sea-side ditto.
Lagetta lintearia. Lace-bark.
Daphne tinifolia. Burn-nose bark.
Cocos nucifera. Cocoa-nut.
Artocarpus incisa. Bread-fruit.
Pterocarpus santalinus. Pterocarpus.
Crotalaria juncea. Rattlewor

The above list will be found to comprise fibre of such quality and colour, from the Cocoa-nut Coir to filaments resembling fine silk in strength and lustre of appearance, as cannot be surpassed. I might have extended the list to greater length, but I believe the enumeration will convince the most sceptical that this island abounds with a highly valuable description of textile plants, some of which are considered troublesome weeds. Those of a ligneous nature will annually produce two crops of shoots, from which good fibre may be obtained, requiring no machinery whatever in preparing it for market. The method I have pursued, as being the most easy and simple, is this:—Macerate the shoots until the cuticle or outer bark separates freely from the true bark: the latter will then be removed readily from the ligneous part, and requires but little labour or knowledge to wash, dry, and pack the fibre for market; this would furnish healthy employ-

ment for children, the aged and infirm, and would not diminish the amount of labour on plantations.

For the Plantain, Pinguin, and all similar herbaceous plants, machinery is absolutely necessary to separate and clean the fibre advantageously; when this desideratum is accomplished, and with one or two years' practice, there is nothing to prevent Jamaica competing with any part of the world of ten times the same extent. The inducement to do so cannot be much greater than it is at present. I find by a statistical account that the imports of Flax into the United Kingdom during 1853 amounted to 94,163 tons 14 cwt., and at the exorbitant price of 110*l.* per ton, to which the average price of foreign Flax has already risen, shows a sum of 10,358,007*l.*, which has been paid in cash for foreign Flax fibre last year; and since the prohibition of Russian hemp into European markets, prices and demand are increasing daily.

My motive for laying before you my views on this subject, and preparing the samples of fibre for your inspection, is, that I am anxious to submit to you, and through you to the agriculturists and people in general of this island, the desirability and advantages in an individual and national point of view to be derived from the adoption and extensive cultivation of fibrous plants. As I have already mentioned, the great scarcity, exorbitant price, and widely-spreading demand for fibre throughout the world, render the materials of which it is manufactured of much importance, particularly in this country, where labour is scarce and dear, and agriculture at its lowest ebb. Many of these fibres will be found of superior quality, and produced in greater abundance than any grown in temperate regions.

I have made a very moderate calculation of the produce of an established field with Plantains, which I find to be as follows:—

An acre planted with suckers, at 10 feet apart, will contain 435 plants, and the first year will produce as many bunches of fruit worth 6*d.*	£10	17	6
Each stem will yield 1 lb. of finely-dressed fibre, worth 6*d.*	10	17	6
Amounting in all to	21	15	0

There can also be raised on the same land, along with the Plantains during the first year, a crop of Yams, corn, Kidney Beans, and sweet Potatoes, worth at least 20*l.*, thus realising the first year 41*l.* 15*s.* The second year each Plantain-stool will throw up three or more suckers, the quantity of fibre will thereby be tripled, and succeeding years would add to the produce; and if the Plantain is cut before the fruit is formed, the quantity of fibre will be fully one-third more, of a far superior quality. I may here remark that the Banana is a much hardier plant than the Plaintain; it will live and thrive at an elevation where the latter would not exist. In selecting any particular variety of the Musa for cultivation, great care ought to be observed, as on this point much of the success depends.

In connection with this branch of industry, other plants, although of less importance, ought not to be lost sight of, being available in meeting a great deficiency as materials for the manufacture of paper, such as many of our very soft and spongy woods, which cannot be classed among timbers; the various and inexhaustible supply of tough Withes, Reeds, Grasses; and, perhaps superior to all, the refuse of Arrowroot, as it comes from the mill, divested of its starch; many tons of this are annually wasted, being thrown on the dunghill. The above-mentioned materials are far more likely to answer the purpose than the Bamboo, so much used in China for making paper.

I shall conclude by briefly describing another plant (the Pothos violacea), admirably adapted for all descriptions of fine straw-plaits, particularly where strength and richness of appearance are desired; its plait will be found superior to the best Leghorn plait. This plant, although an epiphyte, and growing plentifully at the roots and on the tops of the highest trees, at an elevation on the mountains not under 1000 feet, may readily be cultivated in woodlands and moist places. The part made use of is the petiole, or footstalk of the leaf, which grows from 18 inches to 2 feet long, and readily divides into strips of any dimensions, and contains a strong fibre, which the common plait made from the Fan-palm does not, and seldom retains colour long. These advantages may tend to bring the plant into notice after awhile; and, if through my humble endeavours, any of the undeveloped resources of the country are brought into notice, a happy result will be effected.

Home Correspondence.

Batates, or Sweet Potatoes.—Bearing on the subject of M. Von Siebold's communication in your last number, I may mention, if it can be of service to any one wishing to make trial of the Japanese variety of the Sweet Potato, which he eulogises so highly, that many years ago, in India, my servant on one occasion purchased a few Sweet Potatoes of a kind very different from the ordinary Sweet Potato so common in that country. They were about 4 inches long, in shape resembling a short thick sausage; when dressed the interior consisted of a fine white mealy substance, so slightly sweet as to be scarcely perceptible, and only sufficiently so to be agreeable, with a delicacy of flavour much surpassing any kind of Potato or Yam I have ever met with. I was told they were brought from Goa, the capital of the Portuguese possessions, from which I was then some 20 miles or more distant; and except on the occasion referred to I never met the same kind in India. They seem to have resembled M. Von S.'s description of the Japan varieties of the sweet Potato. *J. H. H.*

Oaks.—Your ransacking the dusty corners of the country for Oak chips, has caused me to remember that some 20 years ago I searched Bewdley Forest for curiosities in that way, and after satisfying myself that there were both Q. sessiliflora, Q. pedunculata, and Q. pubescens, with intermediate varieties too numerous to mention, a Mr. Corbet, one of my employer's wood-cutters, told me that there were but three kinds of Oak in the forest, viz., the black, the red, and the white; and that they could tell the black, if their eyes were shut when cutting it, as it was harder, and consequently worse to cut than the other two. He very kindly procured me a specimen of the wood of each kind; I cast them on the floor of our Potato shed, where they have been ever since. In the winter, as a matter of course, the doors and windows were shut. In the summer the doors and windows were open. Sometimes these specimens were among straw and Fern, which covered the Potatoes. I have frequently examined them as to their soundness; and though much has been said on the durability of the different kinds of Oak, I cannot perceive much difference in these. I herewith send you a specimen of each for your inspection. No. 1, Black; No. 2, Red; No. 3, White. *John Pearson, Kinlet, near Bewdley.* [The Red and Black Oaks appear to be Q. sessiliflora; the White Oak is certainly Q. pedunculata.]

Longevity of Seeds.—I can confirm the statements of your correspondent "J. R." that some seeds do, under certain conditions, retain their vitality for a long period. Previous to 1836 a number of plants of Lavatera arborea had been allowed to seed in my garden, a large portion of which was scattered on the ground. Since that year not a single plant has been left to flower, yet after the ground has been dug numbers of seedlings have come up annually, and I have no doubt will continue to do so for years to come. But the most remarkable instance that has come under my observation was the appearance of a great number of plants of Lavatera Olbia on the sides of a new road cut through the forest some years since. In order to raise the road in a hollow place a large quantity of soil was dug from the forest, and on this fresh turned-up earth great numbers of common plants came up the following summer, and among them many dozens of Lavatera Olbia. If the seeds of this plant were not in the soil, I know not how they could have got there. I have never seen the plant growing in any garden in this neighbourhood or elsewhere, and the portion of the road upon which the Lavatera appeared was in the centre of the forest, and not a single plant could be found anywhere except upon the newly upturned soil, which had probably been undisturbed for ages till this road was made. The plants flowered freely for a year or two, but gradually decreased in number, and six or seven years afterwards they entirely disappeared. When I first noticed the plant I sent specimens to Mr. Salmon, then residing at Thetford, and he informed me that it was Lavatera Olbia. I firmly believe that the seeds were in the soil, as I cannot suppose that they had been recently conveyed there. The plants were scattered on each side of the road for about half a mile. *Henry Doubleday, Epping.*——As you have lately published such full and interesting details on the case of the long entombed Raspberry seeds, you may like to hear that a somewhat similar instance has been observed on the Continent. Gærtner (Versuche über die Bastarderzeugung, s. 157) states on the authority of Jouannot that seeds from the graves of ancient Gauls, of the date of the introduction of Christianity (probably at the time of Clodowig in the third or fourth century A.D.) germinated and produced Heliotropium vulgare, Centaurea cyanus, and Trifolium minimum. Gærtner gives, as reference, Froriep Notizen, B. XLIII., No. 946, p. 348. It seems that no known botanist looked to the correctness of these names. *C. Darwin.*

Potato Disease.—In reference to the article in your last Number relative to this disease, there is no doubt that the reason of the preservation of the plant in bog soil is its antiseptic quality. I have proved this by setting Potatoes in some of the worst years in a clay soil, but protected by a copious drill of peat earth in the furrow. This treatment answered perfectly, whilst plants not so managed were almost destroyed by disease. *Woglog.*

Turf Pits.—In many situations by far the cheapest and not an inconvenient hot-bed or plant-preserving frame, may be made by building the sides with sods 6 or 8 inches wide, driving small stakes through to stiffen them. These sod walls may be either built solid or with holes left, *à la* Macphail, for leaf or other lining to be added when desirable. Upon the top of these walls lay a frame of wood (we use only the Larch slabs) halved into each other, and with screeds nailed on their sides to form the top frame slide, to receive and keep in their places either glass or other coverings. Simple as this may be, for a few pence you have a Mushroom, Plant, or Cucumber receptacle far more capable of keeping out frost than wood, brick, or stone. *An Old Correspondent.* [An excellent plan where sods can be had. See some editorial remarks, p. 659.]

The Holcus Saccharatus, or Sugar-cane Grass, of which you sent me seed, has, I am happy to say, succeeded here admirably. It grows 12 to 14 feet high, and it is thought that it will prove a very valuable food for cattle. I divided the seed amongst six of my neighbours, two of whom are going to sow an acre each, and two others half an acre each. In seeding propensities it is very prolific, and chickens eat it as readily as corn. *J. C., Cold Spring Harbour, Long Island, Dec.* 10.

Seedling Fruit Trees.—As several different statements have been published on how far the different varieties of our fruit trees produce seedlings like their parents, I think very interesting information might be given by some few of your correspondents who may have carefully sown named seeds and have noted the result. Jourdan (in the "Mémoires de l'Acad. de Lyons," vol. ii., p. 94, 114) states most positively that he has tried repeatedly, and that all the many seedlings which he raised from the same variety of fruit tree resembled each other in foliage and general manner of growth as perfectly as do the young plants of any wild species whatever; and therefore that they differed from the seedlings of every other variety of the same fruit tree. Hence, also, as he asserts, the seedlings of one variety can never be confounded by an experienced eye with those of another variety, being as distinct as were their parents. Moreover, he states that the fruit of seedling Pears and Apples, though differing greatly in size, succulency, and flavour from those of their parents, yet resemble them in the more important characters of form and in the nature of their seeds. On the other hand Van Mons asserts that he sometimes raised from the seed of one variety of Pear a quite distinct kind; but it now appears that Van Mons was careless in marking the varieties sown. If any one can give accurate information on this curious subject, I hope that he will be so kind as to take the trouble to do so; and will give, as far as he can, some idea what proportion of seedlings are produced which resemble their parents in foliage and general habit; for if seedlings differ from their parents only in a few rare instances, this might perhaps be attributed to an accidental cross from some neighbouring tree. Is it known whether some varieties of Pears and Apples tend to produce truer offspring than other varieties? Plums are said to come very true. Mr. Rivers, and possibly others, could probably give very interesting details on this head. *C. Darwin.*

Societies.

Linnean, *Dec.* 18.—Prof. Bell, President, in the chair.—W. Archer, jun., Esq., and W. Dickinson, Esq., were elected Fellows. Mr. Pamplin exhibited living specimens of the Argyroneta, which had been the subject of a communication at a previous meeting. Prof. Bentley exhibited a specimen in spirits of Papaver bracteatum, showing a conversion of stamens into carpels, together with some other vegetable monstrosities. The following papers were read: 1. "Notes on some West Indian seeds, washed up on the coast of Wales," by Dr. Hooker. The principal interest attaching to these seeds was said to be derived from the extension of the area over which they proved the Gulf Stream to be capable of transporting foreign bodies, it having been hitherto generally supposed that cross currents or other causes prevented any of these floating seeds from being carried into the Irish Sea. 2. "On Dictyocline, a new genus of Ferns," by Mr. T. Moore. This genus was stated to belong to the Hemionitideæ, a group distinguished by having anastomosing receptacles, and continuous linear reticulated sori. It differed from the allied genera in having the veins pinnate, and the soriferous venules transversely anastomosing between them, forming two or three series of roundish hexagonal areoles. It is a native of Assam. The provisional name of Chorizopteris was suggested for another Assam Fern which does not associate with any known genus. It has the veins uniformly reticulated, forming two or three series of oblique, unequal, elongated, hexagonal areoles, and is supposed to belong to the Acrosticheæ. Two species were noticed—C. pinnata from Assam, and C. bipinnata, from New Caledonia. The paper was concluded by some observations on the value of the receptacle as a discriminative character among the Ferns. 3. The commencement of a memoir "On the Natural History of the Glow-worm," by the late G. Newport, Esq., prepared from the author's MS. by Prof. Ellis, of University College.

Notices of Books.

We have received a volume of Sermons entitled *The Gospel in Ezekiel*, by the Rev. Dr. Guthrie (Black, Edinburgh), to which we would draw attention for the sake of the happy imagery derived from natural history, which we find scattered here and there through its pages. Upon its doctrinal merits we, of course, express no opinion. The rev. [author sets an example which we should be glad to see more generally followed; for if the object of a preacher is to produce a vivid impression upon the minds of his hearers, especially where they form a rural congregation, he will find no way to their hearts more direct than through apt illustrations derived from natural objects with which they are familiar. This was thoroughly understood by the inspired writers, but has long been too much neglected. Or if attempted, it has sometimes been with so little skill and knowledge as to render natural imagery more ridiculous than impressive. No one can say that of Dr. Guthrie, one of whose similes we take as an example:—

"Compare man with any of the other creatures of God, and how directly we come to the conclusion that

he is not the creature he came from his Maker's hands!

"Who has not had this borne in upon his mind when his feet carried him forth into the fields of nature? I pass out among our sylvan scenes; and here, on the spray of the tasselled Broom, there sits and sings a little bird; it fills the glen with melody; from his throat and throbbing breast he rings out the sweetest music, as with keen bright eye he now looks up to God and now down on the bush where his mate sits with wings extended over their unfeathered nestlings; with songs he cheers her maternal cares, and is then away on busy wing to cater for mother and her young. Next, I turn my steps to the open moor; and so soon as the intruder appears on her lonely domain, the lapwing comes down upon the wind; brave and venturesome she sweeps us with her wing, and shrieks out her distress as she wheels round and round our head; her brood are cowering on that naked waste; nor does she rest until our foot is off the ground, and even then, when the coast is clear, we hear her long wild screams, like the beating of a mother's heart when her child is saved; like the mournful dash of waves upon the shore long after the wind is down. Next I climb the mountain, when snow drifts thick from murky heavens, and, like Satan taking advantage of a believer's trials, the wily fox is out upon the hunt; every mother of the flock lies there with her tender lamb behind her; with her body she screens it from the rudeness of the storm; and with her head to the wind, and expanded nostrils snuffing the distant danger, she lies ready, the moment her eye catches the stealthy foe, to receive him on her feet, and die, like a true mother, in her lamb's defence. Such are God's creatures. The work is unmarred; the workmanship what it came from the Maker's hand; and away among these old hoary hills, remote from man, his cities, his sins, his works, his sorrows, we are out of hearing of the groans of creation; and, but for the corruption we carry with and within us, we could almost forget the Fall. Stretched on a flowery bank, with the hum of bees, the song of birds, and the chirp of the merry grasshopper in our ear, heaven serene above us, and beneath us the placid lake, where every flower and bush and Birch tree of the rock looks down into the mirror of its own beauty, the murmur of the waterfall sounds to us like an echo from the crags of the Creator's voice, 'All is very good.'"

The Natural History of the Tineina, vol. I. By H. T. Stainton, assisted by Professor Zeller and J. W. Douglas. London, Van Voorst. Pp. xiii and 338, and eight coloured plates. The text in English, French, German, and Latin.

The study of the "little moths," or microlepidoptera, as they have latterly been termed, has made great progress during the last twenty years, especially in this country, and as might have been expected a vast number of new species has been discovered, of which the continental lepidopterists are entirely ignorant. Nor has this knowledge been confined (as has too generally been the case with entomological collectors) to the capture of specimens in the perfect or winged state, but with a laudable desire to obtain a complete history of the species—as well also as to secure for their cabinets a fine series of choice specimens unrubbed by the collecting net—several enthusiastic microlepidopterists have traced many of these insects through their different stages, and have thus obtained very interesting results, both as relates to the classification of the different species and genera (it being now generally admitted that the characters derived from the transformations are as valuable as those of the fully developed insects themselves), as well as to the various plants upon which the species subsist in their caterpillar state. Amongst these observers Mr. Stainton stands pre-eminent, and the untiring zeal with which he has pursued the study in this point of view for several years past merits the thanks of every lepidopterist. The volume before us offers striking evidence of the good results arising from such a course of investigation, containing as it does the natural history of 24 species, of which the tranformations of two only had been previously observed, namely the Nepticula anomalella,* which infests Rose leaves, illustrated in one of our entomological articles (*Gardeners' Chronicle*, vol. 1852, p. 292) under the name of Microsetia ruficapitella, and the Cemiostoma scitella, the larvæ of which form the large blotches on Pear leaves,† also illustrated in our series by Ruricola (*Gard. Chron.*, vol.i., p. 261), under the name of Tinea Clerckella. No fewer than 20 other species of Nepticula are given in the present volume as well as two additional species of Cemiostoma. All these insects possess habits very similar to the two described in our pages, and are therefore objects of direct interest to the horticulturist and botanist. These 24 species are beautifully represented in the larva and perfect states, each being moreover accompanied by a figure of the leaf of the plant to which it is attached, and within which it forms its mining gallery or botch. Neither however in the present volume, nor in his volume of the Insecta Britannica, has Mr. Stainton given any figure of the chrysalides, although his short descriptions of that state both in Nepticula (p. 2), and Cemiostoma (p. 284), lead to the inference that in these two genera there are peculiarities worthy of more minute observation, and the beautiful plates of Fischer von Roslerstamm have shown us what valuable aids may be obtained from this state; we also miss the cocoons in the last two plates.

As this volume is stated to be the first of a long series (the present subscription being for 10 volumes, and a second series to the same extent being announced), we would suggest a closer mode of printing with the omission of the sectional divisions of each species with separate headings; and if it be thought necessary to publish Latin, German, and French translations of the English text, we think each should form a separate volume, so that the purchaser should not be compelled to pay for four times the necessary quantity of text.

* Although so common a species, Mr. Stainton has not cleared up the question as to the sexes of the black and yellow-headed individuals noticed in our memoir, nor has he alluded to the fact of our having reared the transverse barred species from the garden Rose.

† Mr. Stainton mentions the curious fact that this species attacks the Hawthorn and Apple as well as the Pear leaves, thus teaching that difference in the plant does not necessarily prove a difference in the species of the mining caterpillar.

To his series of works on Popular Natural History Mr. Lovell Reeve has added a *Popular History of the Palms and their allies* (square 12mo with 20 lithotinted plates). The author is Dr. Seemann, whose personal acquaintance with tropical vegetation enables him to speak with confidence respecting much of the matter contained in the volume; besides which he informs the reader that he has been very greatly assisted by many distinguished botanical travellers and others. With such advantages, aided by a ready pen, Dr. Seemann has produced a book, small if we look to its cubical contents, but large if it is measured by the amount of valuable information contained in it. Nor is it an exaggeration to say that it is the first book on the subject from the hand of one qualified to deal with it in its many aspects.

The beauty of Palms is known to every reader who cares for descriptions of tropical scenery, from the child who lingers over the tale of Paul and Virginia to the philosopher who recomputes the statistics of Humboldt; and now that Kew has become the favourite resort of Londoners, even the shop-boy who never heard of St. Pierre or the great Prussian physicist carries with him a vivid impression of their graceful forms, after wandering through the delicious Palm grove there, of which by the way we are sorry to see quite a caricature in the frontispiece of the work before us. As to their utility, Palm oil, Palm brooms, Rattans, Palm wines, Coir ropes, Sago, Palmyra bow staves, Vegetable Ivory have became objects as familiar as Dates, Cocoa-nuts, and Betel nuts have long been. To know something correctly about things so common, however rare their sources may be, has become an object of great general interest—and one which we think Dr. Seemann has satisfied. It is more; it is now a subject of very great commercial importance, as, for example, the evidence collected by the author concerning Cohune oil sufficiently proves.

Having said so much in favour of this work we must not omit a notice of its blemishes, especially since we hope soon to see a new edition in which they may be avoided. Of the likeness of the Palm-house at Kew we have just spoken with no greater severity than it deserves. Instead of representing the beautiful foliage of that charming place it is a picture of such dead burnt-up vegetation, that if it were really like truth, the Palm-house must be a furnace in which nothing living could exist. The other plates are better; but some reference should be made to the sources whence they are derived, and they should be placed in communication with the matter to which they relate. On the contrary Chamærops humilis stands with Attalea, Areca with Acrocomia, Borassus and Corypha with Astrocaryum, and so on; nor is this inconvenience at all remedied by the index; so that, in the case of the Chamærops humilis already mentioned, we are unable to discover either the part of the work to which it belongs, or whence the figure has been borrowed, or what it illustrates. Plates introduced in this manner become mere "gays" to please children, and lose their scientific value.

A Treatise on the Vine Disease, by Mr. James Cuthill, is a great mistake in very small compass. Than the author no one knows better how to deal with a practical subject—if he happens to understand it, which we are obliged to say is not the case in the present instance.

Mr. Stanford of Charing Cross has published (in a thin 4to) *A Statistic View of the Population, the Religions, and Languages of Europe, Transcaucasia, and Turkey in Asia in* 1855, by E. Ravenstein. This is effected by aid of three coloured geographical maps, of which one illustrates population, a second languages, and a third religions. We have no doubt that the information thus conveyed will be duly appreciated by statistical inquirers.

Miscellaneous.

College Botanic Garden, Dublin.—We learn that Dr. Mackay, the venerable curator of this establishment, has resigned his office, and that Mr. John Bain has been appointed his successor. A better choice could not have been made.

Vegetation of Van Diemen's Land.—On Valentine's Day I left Launceston by the afternoon coach for Deloraine, 30 miles distant, where Mr. W. Archer proposed to meet me and take me to his place, "Cheshunt," 10 miles further west, among the mountains. The road to Deloraine is through an open but hilly country, much improved. We left the harvest saved round Launceston, but as we advanced to the westward the season was sensibly later, and after 25 miles the fields of corn were quite green; so great is the influence of the more copious rains of the western districts. The difference in elevation was hardly sufficiently great to cause such a change of climate. They reckon nearly three weeks between the seasons at Deloraine and Launceston. Mr. Archer came for me next day, and I spent the following 10 days very pleasantly in his company, making excursions to all sides round his house. He is one of the most western settlers in this direction, and surrounded on all sides by tiers of mountains at various distances. His farm of 14,000 acres is well situated for cattle, a considerable tract being tolerably level, and capable of being irrigated by a perennial river (the Meander) which winds through it: so he has green Grass at all seasons. Here I saw many interesting things for the first time. Gleichenia dicarpa everywhere in the boggy spots. Dicksonia Antarctica in the wet and shady gullies of the hills (it ought to do well in Kerry and Devonshire); its trunk is sometimes clothed with Hymenopylla and sometimes with pale green Hypna, very beautiful. Mosses are abundant. On the river banks Celery-top Pines, Podocarpus bushes, Fagus Cunninghami, and the noble Waratah (Telopia), with the singularly beautiful Wax Cluster (Gaultheria hispida), were the most striking things. The Waratah was past flowering: its leaves resemble those of one of the American Rhododendra, and its branching is not dissimilar. Under the bushes panicles of the cobalt berries of a Dianella looked like hedge-sparrows' eggs strung on slender wires: I could hardly cease gathering them. We spent two days in an excursion to one of the highest points of the neighbourhood, called "Cuming's Head," between 3000 and 4000 feet. It was a very fatiguing walk of six hours to the summit, the track lying through an excessively thick and entangled bush, among which we had to force our way; sometimes creeping, sometimes edging sideways, and often walking along prostrate logs of gigantic dimensions. In some places the whole undergrowth was made up of Bedfordia, growing close and rod-like. At about half the elevation we came on a dense forest of Beeches, and passed some Fern valleys; and at last emerged above the wood, to scramble up a steep ascent of piled rocks near the summit. On reaching the top we had to descend over the ridge about 100 feet to a table-land, where we encamped near some pools of delicious water, and where we enjoyed a little glimpse of Alpine botany. Two species of Leptospermum were in vast abundance and in full flower on the summit, and many smaller shrubs were interspersed; as several Eurybiæ, a Baccharis, Boronia rhomboidea, &c. Gleichenia alpina, which Mr. Archer thinks is only an Alpine form of G. dicarpa, and I am disposed to agree with him, covered the whole plain. Drosera Arcturi was blossoming by the margins of the pools. Gentiana montana in full flower, and G. Diemenensis going out, and in seed; the former much the handsomest. I found specimens of Dr. Hooker's genus Pozoopsis, but whether a variety or species cannot say; it differs from his description in having hairy leaves. One of the most remarkable things on the table-land was the green cushions of many feet in diameter, and very compact, formed primarily of a Mniarum,* but among which grow a great number of minute things—as Plantago Gunnii, a minute Composita, and Pernettia Tasmanica, the latter completely buried in the cushion, except its berries and the tips of its branches. A very showy Helichrysum with short stems and Crocus-coloured flowers was abundant, and some handsome Senecios. On the whole, the table-land was pretty gay, considering the lateness of the season; a few weeks earlier it must have been quite a garden. We descended a ravine at one side to see the Pines (Arthotaxis lycopodioides and cupressoides) which grow abundantly on the margins of a little stream, the woods round being composed of Beech, Atherospermum, &c., with the usual amount of Gums (Eucalypti), and returned in the evening to our bivouac on the table-land. Next morning we collected seeds, &c., and then retraced our steps through the tangled jungle to Cheshunt. On ascending the day before we had lighted a fire, which by the time we returned had spread over many acres, and had reduced a great part of the Bedfordia obstructions to ashes; while many of the larger trees were still on fire and falling (like the summer avalanches of the Jungfrau) on all sides of us. The fire was still spreading, and by the end of the week, when I left the country, had burned a greater part of the mountain sides, and was still extending! All the result of a lucifer match! Several days while I was at Cheshunt the smoke from bush fires on all sides was so great as to conceal all but the foreground of the landscape; the smoke looking exactly like a London fog. *Harvey in Hooker's Journal of Botany.*

Seed of the Cotton Plant.—The Cotton plant (Gossypium herbaceum), once so largely cultivated in the West Indies, offers this advantage, that it succeeds in poor soils; indeed, it is said to succeed best in the poorest, and without manure. Another advantage is that the old, infirm, and young, can be employed in collecting its produce. The uses of the plant are many. Its cuttings are good for fuel; its seeds contain a good deal of nutritive matter, and are eaten by cattle and sheep, but not, I have been told, by horses, only by ruminating animals, and it is said they are even fatal to hogs; but whether true or not I am ignorant. The plant, as cultivated in Barbadoes, is of three years' duration. One self-own in my garden in that island yielded the first year 192 pods; in each pod or capsule there were 20 seeds, together weighing in their dry

* Probably a Composite plant Scleroleima.—Ed.

state 43·3 grains; the lining wool, the cotton wool, detached weighed 23·7 grains. The shell or epidermis of the seed is black, thin, hard, and tough. The substance of the seed inclosed is of a light yellow colour, of an oily taste followed by a slightly acrid one. Under the microscope it is found to consist of oil globules, which are abundant, and of a fine granular matter. The seeds are broken (for instance when crushed in a mortar) without much difficulty, and with water on trituration yield a yellow emulsion. Thrown in a filter, the liquid which passes through is turbid and yellowish. It is not apparently altered by boiling; but on the addition of acetic acid flocculi separate, and on cooling subside. Now filtered the fluid is clear and colourless. The precipitate, it may be inferred, is in part at least casein. The larger portion of the washed kernel, that which is retained in the filter with the oil, soon acquires an unpleasant smell; kept a fortnight and then mixed with lime, it gave off a distinct odour of ammonia. The oil is of a yellow colour, not volatile, and is fluid at 80° Fahrenheit. The seed incinerated without the pellicle, after burning—it burns with much flame—leaves a coal that is easily reduced to ash, inconsiderable in quantity, composed chiefly of carbonate of potash, phosphate of lime, and magnesia. The same were found in the ash of the epidermis with some silica. Though growing in calcareous marl no carbonate of lime or free lime could be detected in either. *Dr. Davy in the Edin. New Philosophical Journal.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Attend carefully to valuable pot specimens of hard-wooded plants which it may be necessary to winter in this house, for many of these are very impatient of fire-heat and a confined atmosphere, and ought therefore to be kept as much out of the way of its influence as circumstances permit. And such things should be placed near the glass, turning them partly round every week so that all their parts may be equally exposed to light; and admitting fresh air on every favourable opportunity, but carefully avoid cold cutting winds, which if allowed to blow through plants just after they have been kept close with fire-heat for some time are sure to disfigure the foliage. Use no more fire-heat than may be indispensable, and be careful to counteract its drying effect on the atmosphere, either by means of evaporating pans or by sprinkling the borders, &c., as may be necessary to prevent anything like a dry parching state of the atmosphere. It is in many cases a very difficult matter to maintain a sufficiently moist atmosphere without causing drip, as the moisture in the house gets condensed upon the glass, and unless provision is made by means of inside gutters and pipes to catch the condensed moisture and carry it off, it is nearly impossible during frosty weather to preserve the beauty of flowers for any length of time; and in cases where there is no provision made against the condensed moisture falling upon the plants, the temperature should be kept as low as may be consistent with safety, avoiding moisture in the atmosphere as far as possible whenever the glass is affected by frost. Cold Pits.—Plants that have been excluded from the light and air for but a few days must not be too suddenly exposed, especially to cold northerly winds, but should be very gradually inured to free exposure. Take advantage, however, of mild days to give air freely, and keep the plants very sparingly supplied with water at the root, so as to prevent weakly sappy wood. Look frequently over anything subject to the attacks of mildew, apply sulphur the moment this pest is perceived, and see that everything is perfectly free from insects. Stove.—If there is any prospect of a scarcity of bloom next May, a portion of the Achimenes and Gloxinias should be repotted at once and placed in a warm part of the stove, choosing such as have been the longest at rest; and a few Clerodendrons, Allamandas, a plant or two of Echites splendens, and Dipladenia crassinoda, may also be started; but unless plants of these are at command with well ripened wood, and that have been some time at rest, there will be nothing gained by attempting to start them into growth at present, for in most cases it is difficult at this season to maintain a sufficiently warm temperature to secure anything like free growth from these unless the plants have been well prepared for an early start. A gentle bottom-heat of about 80° or 85° will be of great service to such things in inducing a healthy root action, and if this can be secured there will be little difficulty about obtaining free vigorous growth. Let Ixoras and other hard-wooded plants that have made sufficient growth be kept rather dry at the root, in order to check their growth, and induce a tendency to form bloom, but do not let the balls become so dry as to endanger the foliage. Look sharply after insects here, especially mealy bug, and endeavour to get the whole collection clear of this tormenting pest, for if neglected now it will not fail to demand attention in spring and summer, when time with the plant grower will doubtless be fully as precious as now. Be sparing in the use of fire-heat, save in the case of things being forced into flower or growth, and it is in every sense good policy to have a separate house or compartment for these, as it saves fuel, avoids over-driving the whole collection for the sake of a small portion, and ensures a more satisfactory result than can be obtained where there is but one house for the whole collection of what is generally termed stove plants. Let specimens in bloom be placed in the most favourable positions for prolonging their beauty, and be careful to preserve the flowers from damp. Admit a little fresh air on the forenoons of mild days, but do this very carefully, unless it can be made to pass over the heating apparatus, so as to get warmed before it reaches the plants. See to having plenty of soil for potting under cover, so that it may be dry and fit for use at any time it may be wanted. Also get spare pots washed, crocks broken and sorted, stakes made and painted, spare trainers cleaned and repainted, and whatever else can be done now to facilitate operations in spring. Look well to the watering of things standing near the pipes or heat-giving surfaces, and examine these frequently for red spider, and see that they are not allowed to form a nursery for this enemy, as is often the case; and if spider is perceived lay the affected plants on their side, and thoroughly wash the under part of the foliage with the syringe, repeating the dressings as often as may be necessary to perfectly clean them.

FORCING DEPARTMENT.

Pineries.—The supply of ripe fruit from May until August being usually obtained from plants that start into fruit without making growth in spring, a fair proportion of the stock should therefore be in a well matured state by or shortly after this season, and any sudden changes of temperature which might induce too many of them to show fruit at once should be carefully avoided. That portion of the stock expected to furnish the autumn supply of fruit should not be too much checked at present, indeed these may be kept growing slowly all the winter, which is perhaps the most certain method of preventing their fruiting too early in spring. Where the stock of plants likely to fruit without making farther growth is considered insufficient to meet the demand until August, the stronger plants of those for autumn fruiting should be encouraged to make growth as early as can be done without weakening the foliage, with the view of preparing them for showing fruit in April. Examine the soil occasionally about young stock growing in the open bed, and do not allow it to become unhealthily dry, for this would probably result in a great portion of the stock showing fruit prematurely, and it is also a work of some difficulty properly to moisten the bed if it is once allowed to get too much dried up. Use no more fire-heat for the present than will suffice to maintain the requisite temperature, which, for the general stock, need not be high for some time yet Vineries.—As soon as the buds in the early house are fairly started the temperature should be increased to 60° at night and 65° by day, allowing it to rise 10° on bright days. Take every opportunity of admitting a little fresh air, but recollect that the foliage will not bear exposure to cold drying winds, therefore air should be admitted in contact with the heating apparatus, and when it may be necessary to give back air the sashes or ventilators must be opened but very little, and if pieces of netting could be nailed over the openings this would greatly assist in preventing cold currents blowing into the house. If fermenting material has been used inside the house this should be removed as soon as the leaves make their appearance, as it would probably be found to keep the atmosphere too moist; this will however greatly depend upon the facilities which may exist for safe ventilation in all states of the weather, but anything like rank steam must be carefully avoided. If the fermenting materials are removed the evaporating troughs must be regularly supplied with water, and the borders and passages, &c., moistened with the syringe two or three times a day, so as to keep the atmosphere moist, but discontinue syringing the Vines after the foliage begins to expand; attend to starting houses in succession, according to the anticipated demand, and wherever heat can in any way be applied to the border see to this a week or two before attempting to start the Vines, for if the roots can be moved there will be no difficulty about getting the buds to push. Where the border cannot be warmed, see that it is well protected from wet, &c., by a thick covering of dry litter or whatever more efficient covering can be commanded. Look over ripe Grapes often, removing any decaying berries, and aim at securing a dry atmosphere with the least possible application of fire heat. Strawberries.—Where ripe fruit is wanted early, a portion of the most promising plants should now be selected and placed in a pit where they can be afforded a gentle bottom heat; or if this cannot be commanded, a Peach-house or Vinery which has just been closed for forcing will do. They must, however, be kept close to the glass, for they require all the light that can possibly be afforded them at this season, and a free admission of air on mild days, with a low temperature until the fruit is fairly set, and if these conditions can be combined with bottom heat success will be more certain than under any other circumstances, and this will be more easily done in a small pit than in a house the temperature of which must be regulated for other things.

FLOWER GARDEN AND SHRUBBERIES.

The winterly weather which we have lately experienced may have served to remind parties who have neglected to apply protection to tender Roses and other things which are found to require this care that it cannot with safety be delayed any longer. And where this has been neglected so far it should be attended to as quickly as possible. If not already done get shrubbery borders trimmed up for the winter with the least possible delay, and in doing this places intended for Hollyhocks, Dahlias, &c., next summer should be prepared by deep digging and working in plenty of good rotten manure, for there is generally as much time to spare for this kind of work now as at planting out time, and by preparing the spaces now the soil will be in better condition than would be the case if it were delayed until planting out time. Also see that coarse growing things which may be encroaching upon their weaker neighbours are reduced by pruning as may be necessary to prevent their injuring more valuable things. Valuable plants, as variegated Hollies, Rhododendrons, &c., if not growing as freely as it is desirable that they should do, would be benefited by a liberal allowance of rotten manure or well-decayed leaf soil applied as a top-dressing, covering it with a little fine soil, and working it into the ground round the ball towards the extremities of the roots. But Rhododendrons, and what are generally termed American plants, bear removal so well that these where not growing satisfactorily should be taken up, the ground well prepared by a liberal addition of peat or leaf soil, and replanted. Continue to give careful attention to half hardy plants in cold frames, taking advantage of every favourable opportunity to expose them freely to air. Anything of which there is but a spare supply of plants to propagate from should be placed in growing quarters at once, taking care to keep them near the glass and free from insects, mildew, &c., for soft-wooded plants in heat at this season are very subject to the attacks of insects.

HARDY FRUIT AND KITCHEN GARDEN.

Make a point of regularly examining every week all the choicer kinds of fruit that may be approaching ripeness, or are found not to be keeping well, so that everything may be used at the proper time, for the finest Pears are worthless enough if allowed to get over ripe before being used, and the same is the case with many varieties of Apples. Also look over the whole stock as often as time can be spared, removing any fruit that exhibit symptoms of decay, and put them aside for immediate use. Any of the choicer kinds of Pears that do not appear to ripen properly in the fruit-room should be removed to a warm dry room for a few days, which will be found to greatly improve them. Keep the fruit as cool and dry as possible, and if frost is excluded it can hardly be too cool where the object is to preserve the fruit plump and sound as long as possible. Push forward pruning, nailing, tieing espalier trees, and such like tedious operations as fast as the weather and circumstances will admit. Get manure wheeled upon vacant ground when the weather is frosty, and this can be done without injuring the walks, and get all spare ground turned up as soon as possible, so as to expose it to the action of the weather as long as possible. For land that has been long cropped with vegetables a dressing of fresh loam would in many cases be preferable to manure, and where this is wanted and can be obtained it should be got to hand, in order that advantage may be taken of frosty days for wheeling it upon the ground. Where fresh soil cannot be obtained, charred vegetable refuse, such as prunings of shrubberies, edgings of walks, and many things which turn up in course of the season, may be cheaply made to form an excellent substitute.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending Dec. 27, 1855, as observed at the Horticultural Gardens.

Dec.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth. 1 foot deep.	Temperature. Of the Earth. 2 feet deep.	Wind.	Rain.
Friday 21	12	29.803	29.702	26	11	18.5	38	40½	E.	.00

Satur. 5	41.9	30.7	36.3	10	0.40	6	3	5	—	1	11	3	1

The highest temperature during the above period occurred on the 30th, 1832—therm. 56 deg.; and the lowest on the 2d, 1854—therm. 4 deg.

Notices to Correspondents.

Cigars: *Red Hand.* They are bad, bitter, and worthless—or at least as bad as the French ones. Very few smokers know what first-class cigars are, so great is the scarcity of them even in the Havannah. They are, however, to be had without difficulty in Guatemala, where they are made by Don José Maria Samayoa; and, what is not a little important, their price is as low as their quality is high.

Names of Fruits.—*N H.* 1, Winter Nelis; 3, like March Bergamot; 4, Easter Beurré; 5, appears to be Passe Colmar; 7, Hacon's Incomparable; 8, Beurré Rance; 9, Flemish Beauty; 11, Crassane; 13, Beurré Diel; 19, Althorp Crassane.—*C.* 1, Winter Crassane; 2, Forelle or Trout Pear.—*J H.* 2, Glou Morceau; 3, 6, Easter Beurré; 4, Beurré Diel; 5, 10, Passe Colmar; 7, Catillac; 8, Glou Morceau; 9, Old Colmar; 3, Minchall Crab; 4, Court-pendu Plat; 5, King of the Pippins; 6, Dumelow's Seedling.

The Dartford Nursery: *Mr J D Parks* begs us to say that he has quitted this establishment, and now resides at Westhill, near Dartford.

Top Dressing for Orchard House Trees: *Rus in Urbe.* If strong manure is used for this purpose, and its sight and smell are objectionable, the remedy is very simple. Sprinkle some powdered charcoal on the manure, and then cover it with a light covering of mould, say half an inch in thickness, the charcoal will at once absorb any unpleasant odour.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
Wm. Inglis Carne, 10, Mark Lane, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the Importation and Sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves; to our agents, Messrs. Gibbs, Bright, & Co., of Liverpool and Bristol; or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence.—Antony Gibbs & Sons.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*—Office, 1, Adelaide Place, London Bridge.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.
40, Bridge Street, Blackfriars. E. Purser, Sec.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than any other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. Gibbs & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

OWNERS OF SETTLED ESTATES and OTHERS desirous of availing themselves of the various recent Acts of Parliament, by which they may charge their Estates with money expended in the Improvement, Conversion, and Reclamation of Land, by Drainage, Irrigation, Embanking, Inclosing, making Farm-roads, Clearing, the erection of Farm-buildings and Machinery, Planting and other Agricultural Improvements, are respectfully informed that Messrs. Hewitt Davis & Francis Vigers undertake to advise and furnish Plans and Estimates, and if required, will contract to do the works, and dispose of the Rent charges.—3, Frederick's Place, Old Jewry, London.

DRAINING BY STEAM POWER.

JOHN FOWLER is prepared to undertake Contracts for DRAINING LAND by his PATENT STEAM PLOUGH, at prices varying, according to depth and distance, from 3*l.* to 5*l.* 10*s.* per acre, inclusive of tiles, main drains, and all other expenses. Contracts executed with great rapidity, and tiles manufactured on the spot, where suitable clay exists.—Temple Gate, Bristol.

LAND DRAINAGE BY CONTRACT, in Large or Small Quantities, undertaken by Thomas Scott, Land Agent, 5, Charing Cross, London.

IMPROVEMENT OF LAND.
Tenants for Life and Others.

MR. HUMBERT, of Watford, Herts, a Land Agent and Surveyor of more than 20 years' experience, offers advice to Landowners having but limited or life interests, as to the means by which they can effect improvements without an immediate outlay; and his services in Erecting and Improving Farm Buildings, in Draining, Reclaiming, Planting, and Road-making by contract or commission, and the general Improvement of Land; also in Falling and Selling Timber, in the Transfer and Management of Estates, and the Enfranchisement of Copyholds. Mr. Humbert has long been largely interested in Landed Property, and is authorised to refer to his employers.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Offices, 52, Parliament Street, London.
Henry Ker Seymer, Esq. M.P., *Chairman.*

1. This Company is incorporated by Act of Parliament to facilitate the Drainage of Land, the Making of Roads, the Erection of Farm Buildings, and other Improvements on all descriptions of Property, whether held in fee, or under entail, mortgage, in trust, or as ecclesiastical, or Collegiate Property.

2. In no case is any investigation of Title necessary.

3. The Works may be designed and executed by the Landowner or his Agents, independently of the Company's officers, or he may elect whether he will employ their staff. Equal facilities will be afforded in either case.

4. The whole cost of the works and expenses will, in all cases, be charged on the Lands improved, to be repaid by half-yearly instalments.

5. The term of such charge may be fixed by the Landowner, and extended to fifty years for Land Improvements and thirty-one years for Farm Buildings, whereby the instalments will be kept within such a fair percentage as the occupiers of the improved Lands can afford to pay. William Clifford, Sec.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, his Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, late Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
PROTECTION FROM MORNING FROST.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

COLLEGE of AGRICULTURE and CHEMISTRY, and of PRACTICAL and GENERAL SCIENCE, 37 and Lower Kennington Lane, Kennington, near London.
Principal—J. C. Nesbit, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.
Mr. Nesbit is prepared to make engagements to deliver in the country a limited number of Lectures on Agricultural Chemistry during the next twelvemonth.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. White & Brothers Milbank Street, Westminster.

FIRST PRIZE REAPING MACHINE.
NOTICE.

MESSRS. BURGESS and KEY beg respectfully to inform the public, and particularly the noblemen and gentlemen whose orders they were obliged to decline for this season on account of the manufacture not being fully arranged, that the Royal Agricultural Society's First Prize of 30*l.* was awarded to them for M'Cormick's Reaper, with their patent screw platform, at the trial at Leigh Court, near Bristol, upon the 29th of August last. Amongst the competing machines were Bell's, by Crosskill; Forbush's, exhibited by Mr. Palmer; and Hussey's, with tilting platform, by Wm. Dray & Co. The reports of farmers who have worked the machines during this present harvest, show that the average quantity of Wheat, Barley, and Oats which they cut was from 1¼ to 1½ acre per hour. Two horses work the machine with ease, and the only attendant required is a man or a boy to drive. Further particulars and prices sent free on application.—Burgess & Key, 103, Newgate Street; and 52, Little Britain, London.

PURE AND CHEAP BREAD.—Flour Mills for Family Use.—Grind your Wheat.—Pure Bread, and do away with medicine entirely, besides effecting a saving.
Mary Wedlake's FLOUR MILLS, 4*l.* 10*s.* and upwards. Washing Machines, 6*l.* 10*s.*; Mangles, from 50*s.*; Chaff-cutters and Oat-crushers. Book on Feeding Horses, 1*s.*
116, Fenchurch Street, London.

PRESENT PRICES OF FARM SEEDS.

THE CROPS of SWEDE TURNIP, MANGEL, and other FARM SEEDS *being good, prices are much lower this season (at present) as see* Messrs. Sutton's *Priced List*, which may be had, post free, on application, Addressed Sutton & Sons, Seed Growers and Merchants, Reading, Berks. Early orders are requested and recommended.

The Agricultural Gazette.

SATURDAY, DECEMBER 29, 1855.

There are no persons fonder of the rule of proportion than those agricultural teachers who reason from limited experience, or from experiments upon a small scale; and yet as a general rule there are none who more frequently forget what the rule of proportion really is. "The rule of three direct," we quote from an old book of arithmetic, "teaches from three given numbers to find a fourth which shall have the same ratio to the second that the first has to the third." To this end you must first "state the question," that is, "place the numbers so that the first and third may be of the same name and denomination, and the second the same as the fourth number required." Now this is precisely what you cannot do in cases of the kind to which Messrs. Hardy and many other really praiseworthy men are so fond of directing the attention of farmers. And it is what you cannot do even in such cases as agriculturists are themselves liable to quote, when from a measured yard of produce they calculate the yield of a whole field.

It is, however, more erroneous to calculate on the same result following farm management as obtains in garden culture than it is to calculate the produce of a farm from that of a perch or yard, because in the latter case you deal with results already obtained, while in the former you deal with causes whose fruits have yet to be developed. It may be that the yard of produce is not an average one, and then in the acre of produce the deficiency or excess is multiplied 5000 times; but when the yard *cultivated after a certain manner* is made the basis of a calculation which is to show the effects of that culture on an acre, the difference is not one of result but of cause—it is not 5000 times the difference but 5000 times the fruit of that difference which you obtain. The fact is you cannot say that, as a cultivated yard is to the produce of a yard, so is an acre similarly cultivated to the produce that may be expected from 4840 yards; the first and third terms in the question so stated are not of the "same name or denomination." A yard or any limited patch cultivated after a certain manner, with a man to look after it, is not of the same "denomination" as 4840 such yards or patches in one piece with a single cultivator to look after all, and the rule of proportion, therefore, will not apply, and the results of its application are not trustworthy.

Those who are so apt to criticise the results of ordinary agricultural experience on the ground of their own very limited experience, should be especially careful that they do not break the rule which they think leads them to their conclusions. "The rule of three direct" is very rarely capable of use with perfect justice in agricultural calculations, simply because in a business so influenced by the varying circumstances of soil, of climate, and of life, it is not always easy to name three terms, of which the first and third shall be exactly of the same "name or denomination."

Without specifying in detail the produce of the several districts or counties under which Scotland has been divided for the purpose of the statistical inquiry into its agricultural produce, we give in the following figures the main results of the inquiry; and our readers will agree with us that the thanks of the country are justly due to those by whose energy and goodwill so much valuable information has been given at so early a period. We understand that Government has asked the Highland Society to undertake the collection of the agricultural statistics of Scotland in future years. That society has done a most important service by demonstrating the possibility of obtaining early in the season a knowledge of the yield of the past harvest, and nothing could be more consistent with the purposes for which it was instituted than its inquiry into the agricultural produce of the country over whose agricultural interests it has so long presided. Whether it may be for its interests or those of its constituents that it should permanently charge itself with a duty of this kind, bearing the brunt of all those misunderstandings and mistakes which cannot but be expected in the annual prosecution of such a task, and bearing possibly the injury arising from its ordinary duties becoming subordinate to this new employment, will have to be considered by the next general meeting of the society. That the Government should be anxious to leave the task in the same hands which have hitherto so ably performed it, is not to be wondered at. That they appreciate the service which the Highland Society has rendered during the past two years in these matters appears from the following extract of the letter received by the secretary:—

"It is the pleasing duty of my Lords once more to convey to the Directors of the Society their best thanks for their most valuable services, in connection with this important national inquiry, the practicability of conducting which successfully no longer remains a matter of question, but has been satisfactorily established by the complete success of two consecutive experiments. At the same time, they cannot withhold the expression of the high sense entertained by them of the indefatigable and able services rendered by yourself, as the Secretary to the Society, which have rendered it possible for their Lordships to be in possession of so much valuable information at this early date. My Lords also appreciate most highly the assistance rendered with so much diligence and zeal by the district enumerators, and by the intelligent body of farmers composing the Committees, whose services are so appropriately described by you; and they request that the Highland Society will make themselves the channel of conveying to those different gentlemen the expression of my Lords' thanks accordingly."

It is proper in order to the true meaning of the figures that Mr. Maxwell's commentary should be given with them. In the letter accompanying the tables, addressed by him to the Board of Trade on the 11th of December, he remarks on (1) the occupants, (2), the acreage, (3) the stock, and (4) the estimates of produce. On the first point he states that in 1854 in round numbers about 50,000 schedules were issued, and of these about 100 were unaccounted for. "I have this year," he adds, "endeavoured to arrive at more exact results regarding this part of the inquiry, and to restrict the list of occupants to those whose status is purely agricultural, by striking off the names of householders, feuars, owners of villas, &c. The number has further been reduced by scheduling together any number of farms lying in the same parish, and leased by the same individual, thus regulating the roll by the number of occupants and not of tenements. Effect having been given to these modifications, the list contains 4339 occupants rented at and above 20*l.* in the counties of Argyle, Caithness, Inverness, Orkney and Zetland, Ross and Cromarty, and Sutherland, and in the Island of Arran, and 39,123 rented at 10*l.* and upwards in the remaining counties; and I have great pleasure in reporting to my Lords that the returns of acreage and stock may be regarded as complete for the whole number of 43,462, with the exception of one farmer in Argyleshire, and four persons occupying very small portions of land in Aberdeenshire. The former has twice forwarded his schedule, but it has miscarried, and his return could easily be obtained were I to incur the delay

attending a correspondence, at this season, with one in a remote insular locality. The four cases of omission in Aberdeenshire probably do not together involve a difference of 20 acres, and being unimportant, it is not necessary to defer the report on their account."

This is certainly a most extraordinary report to make. Those gentlemen south of the border who see so many obstacles in the way of a statistical inquiry into farm produce will read it with something of astonishment. It is no unintelligent jury whose verdict has thus stamped the inquiry with approval. Scotchmen have not hitherto been supposed blind to the interests either of themselves or of their country, and the whole agricultural body in Scotland declare the inquiry desirable and useful.

On the acreage which the following figures exhibit Mr. Maxwell says: "Only the corresponding columns for the two years are contrasted; but in one important point, even these do not afford data for a fair comparison as regards the gross results. The schedule for 1854 contained a column for '*Grass under rotation*,' and another for '*permanent pasture*;' it is difficult sometimes to draw a line between these, and, consequently, a considerable extent which had been, and again may be, under the plough, was formerly scheduled as 'permanent pasture.' This year the returns of acreage are limited to tillage, the column for 'permanent pasture' having been omitted, and instructions given to schedule as '*Grass and hay under rotation*' all land 'which, in the ordinary rotation or course of cropping of the farm, will sooner or later be again broken up.' The result has been to swell the column for Grass under rotation by the transference to it of much which last year appeared as permanent pasture; the difference thus created amounts to 82,200¼ acres, and will be found to tell more particularly in the dairy districts.

"In other respects, it is conceived that the returns for the two years generally correspond, if allowance be made for such fluctuations in cropping as are fairly attributable to, and must ever occur in consequence of, prices, weather, and other accidental but inevitable influences. The green crops, particularly Turnips, show a large increase, indicating, probably, a greater breadth in preparation for grain; but the extent under cereals is nearly the same, though the distribution of the different crops varies. Wheat has increased by 23,067¼ acres. Barley has decreased by 21,426¾ acres. There is a trifling difference in favour of Oats, and against the other crops, but the gross returns for the two years, as regards the acreage under Wheat, Barley, Oats, Rye, Bere, Beans, and Peas, come within 176 acres of each other. In 1854 there were 1,374,515¼, and in 1855 1,374,691¼ acres thus occupied."

A few words in explanation of the stock returns are also necessary:—"The gross returns of stock at first sight exhibit a startling excess over those of last year, but the difference is almost exclusively confined to horses and sheep, and is easily accounted for. In 1854 there was but one column for horses, under which in general only the animals employed on the farm were returned; now, there are three columns embracing horses of all ages and descriptions, and there is consequently a larger return. The great difference, however, is in the number of sheep. In 1854 there was no column for lambs, which, by the instructions appended to the schedule, should have been returned with ewes and wethers. Many overlooked this direction, and, seeing no mention of lambs in the schedule, omitted them; but, as there is now a special column, the return has been general, reducing to a certain extent the number of ewes and wethers, but adding to the gross amount of sheep stock. The increase on the total stock this year is 937,630—while that on horses and sheep alone is 928,107."

In the estimation of produce there is only one consideration of importance which needs remark. Mr. Maxwell says: "Having ascertained that, in 1854, the light or inferior grain, which is usually consumed on the farm, had in many cases been excluded from the estimates, directions were given to enumerators to include it, by reducing it to its equivalent in good grain, according to marketable value, and by adding it to the average produce per acre. To a certain extent this interferes with a comparison between the averages of the two years. It may be assumed that the light grain was genefally omitted last year, and that a certain deduction must, therefore, on a comparison, be allowed from the averages of 1855."

With these explanatory remarks we give the figures so far as the totals of the several columns in the tables returned by Mr, Maxwell are concerned.

The occupants number 43,462. The total acreage amounts to 3,529,902½ in 1855, 3,431,485½ in 1854. In the following returns the first amount given is the acreage of 1855, the second that of 1854:—Wheat, 191,283½—168,216; Barley, 186,080½—207,507; Oats, 93,364½—923,994; Rye, 3692—3809; Bere, 17,260—18,118; Beans, 37,308½—37,702; Peas, 5456—6169½; Vetches, 15,038¾—13,442½; Turnips, 449,372½—433,915¾; Potatoes, 146,963½—143,032½; Mangel, 2299½—1946¾; Carrots, 1191—1218; Cabbage, 1200½—1395¼; Flax, 3461½—6670½; Turnip seed, 1998½—1429½; Rape, &c., 1223½; bare fallow, 22,462—26,128½; Grass and hay under rotation, 1,509,990½—1,427,790½.

The numbers of stock for 1855 are as follows:—farm horses over three years old, 121,182; farm horses under three years old, 32,099; all other horses, 23,919; milk cows, 298,446; other cattle, 469,242; calves, 207,040; sheep of all ages for breeding, 2,707,847; sheep of all ages for feeding, 1,138.501; lambs of 1855, 1,848,389; swine, 134,349. Total stock 1855, 6,981,014; for 1854, 6,043,384.

And now comes the most important result of this inquiry—the estimated produce of the year. Wheat, 5,062,540—4,848,679 bushels; Barley, 6,092,904—7,645,328 bushels; Oats, 30,079,714—34,093,047 bushels; Bere, 556,876—645,418 bushels; Beans and Peas, 1,183,647—1,081,263; Turnips, 6,461,476—6,411,419 tons; Potatoes, 732,141—529,915 tons.

It will be seen from the above that the diminished produce per acre of the Wheat crop is more than made up by the increased extent grown this year, and that while the loss on the Barley and Oats is considerable, yet taking Wheat and Potatoes and the Turnips into the account there is nearly as much food for man and beast in Scotland this year as there was last year—that is to say, there has been a full average produce.

STEAM CULTIVATION.

It will be noticed in my last (p. 731) I separate the homestead altogether from the field; considering the objects sought to be obtained in each so totally dissimilar, that the only link which binds the two departments together is the receipt of made manure from the one, and unmanufactured crops from the other. In the field the object is to make a crop—a real living crop—which demands more of attention and supervision than of mechanism, but in the homestead the object is to manufacture a dead crop for market in some form or other, which requires (precisely as in other manufactures of dead material) more of mechanism than of attention. In fact, that in this latter department mechanism is more advantageous and necessary than man, and that the more man is superseded in it the better for the farmer, the labourer, and the country; but in the former, the more mechanism can be reduced and man introduced, the better for the farmer and the country.

Since I shall have occasion to make a liberal use of man, as a cheap and convertible species of mechanism, for the composition of a steam-driven tillage machine, allow me to urge a word or two more in his favour. The hand of man is a substitute for manure (as proved at Lois Weedon, Colne Engain, &c.); and manure is the "mother of money" in the rearing of plants. Again, if the working value of a man can be improved he is far more profitable to a farmer than a horse; he requires only 2 acres to pay his year's wages, whereas a horse requires six; and the horse pays nothing back to the farmer, whereas the man returns two-thirds of his wages. A farmer pays a man 9*s*. on a Saturday night, and before the week is past he has paid him back 6*s*. for breadstuff. He also pays the horse 10*s*. on a Saturday night; but this voracious animal pays nothing back save a few barrowsful of manure, not worth a shilling. Besides it is highly desirable (when it can be done) the farmer should grow customers as well as corn. Farmers cannot exist without customers. Neither horses nor mechanism in the field are afterwards profitable customers. If our artificial manufactures were in any way superseded abroad, farmers would have no customers. Still to urge, as some philanthropists do, that it is the duty of a farmer to employ more labourers than he can turn to a useful account, is one of the weakest arguments which can be adduced; to show him how he can usefully employ them—that's the point. To demonstrate the possibility of a solution to a great social problem, in conjunction with steam cultivation, is also one of the main objects of these letters. And from what I know of the general disposition of the farmers of England, they would willingly employ double the number of hands, if such could be done with profit. I hope to be able to prove that if "man," the labourer, be mechanically assisted, and certain (now) latent powers be developed, we shall be able to cause him to perform all the varied operations of the field, reducing the horse-power required, superseding expensive by inexpensive mechanism, rendering "manuring," in every way a most expensive article by cartage and first cost of procuring, whether from at home or abroad, less expensive—in fact make his increased employment in the field pay in every way.

I stated the object of the farmer in the field was to grow a plant—that a plant was a thing of life; and that the element most essential to insure success in "life," or plant production, was "attention," "unremitting attention," and that unremitting attention could only be had from the "head and hand" of man, therefore that "man" was the peculiar mechanism most needed by the farmer in the field. So let us at once proceed to the field and see what is required to be done therein—why it is that man cannot now do it and see what assistance he needs to enable him to do so. We enter the field, and discover that (unlike the gardener) the farmer has only two descriptions of hardy plants to grow—the one a Grass, the other a root—the first requiring a shallow, firm, and not over-rich description of seed-bed to rest upon; the second, a deep "feather-bed" soil to flourish in: hence the latter ought always to prove a sufficient preparation for the former, and be contained therein, without much extra labour. So the preparation of the deep seed-bed is the grand consideration. The next thing noticed is, that seed must be inserted in these prepared beds in drills, or rows, a definite distance apart, that we need not be nice in measuring the quantity, since the sowing scale has been proved to range (in the case of Wheat) from 3 pints to 3 pecks and 3 bushels per acre; hence, with even moderate care we might "broadcast" it down tubes to the soil, the only care needed in the operation being that you do neither over-do it nor under-do it, according to the quality of the soil. The next thing is hoeing between the rows to keep down all weeds, and admit fresh air; this operation does not require work by "measurement"—the only mechanical qualification required being the power to elevate or depress a lever-hoe so as to accommodate its working to the inequality of the surface soil. Harrowing, rolling, or compressing, irrigation, or manuring, require the same lever adaptation.

Now, upon first perusal of this summary of the secondary operations of the field (excluding tillage or first cultivation for the moment), does it strike the mind there is one which the ordinary skill of man could not accomplish? To this question we should all of us say: theoretically viewed there is not. But then things may be true in theory which nevertheless could not be carried out in practice. Here is an illustration. Archimedes is reported to have said: "With a lever he could lift the world!" Now, this was strictly true in theory, nevertheless quite impracticable, unless he was first provided with a lever long enough and strong enough, and could have the planet Mars as a fulcrum. Hence, in our proposals, we must take especial care that theory and practice do not fall out; and the only way to avoid so disagreeable an event is to provide the means beforehand for practically working out that which is proved to be theoretically possible.

By bringing forward these secondary operations of our field practice first, and claiming your assent as to whether men, when mechanically assisted, could not execute the whole of them with sufficient accuracy and efficiency, you will observe I have adopted the same course as they did at Vienna, but unlike them I hope we shall not fall out on the first and most important point, which we are now about to discuss, viz., tillage, or the art of obtaining a well pulverised seed-bed.

Tillage.—We will take a clay soil, because it is the most difficult to render into a fit seed-bed by the present mechanical treatment; and we further select it because if we get through the problem of its cultivation, no farmer would deny but that the same mode of manipulation would readily render a sandy or light soil into a fit seed-bed; in fact that with the same power employed, we should be able to execute twice the quantity of the latter, as of the former, viz., one acre of sand, as easily as half an acre of clay.

The first question put by an inquiring inventor would be this, viz., what principle of mechanical treatment is the best to pursue to reduce a hard body to a pulverised or powdered condition, with the least expenditure of power on the instant? The answer to this is, that method which involves the principle of overcoming the labour by degrees. Now to illustrate this "principle" of operation on hard materials by degrees, we will adduce two well-known examples. The one is the carpenter—the other the sawyer. The carpenter has a hard surface to operate upon, and he desires to remove the surface of a piece of wood to the depth of $\frac{1}{8}$th of an inch. How does he proceed? Does he adjust the share of his ploughing plane to the full depth of the $\frac{1}{8}$th required, and then by an immense expenditure of power on the instant—the sweat bursting from his brow with the effort and the tool struggling beneath his hands to deviate from the path he wishes it to travel in, does he seek by one upheaving stroke to remove the "ribbon" of solid surface? No, he does nothing of the sort; he adjusts his cutting point to a shallow depth, and then by a slight expenditure of power on the instant, he upheaves a thin shaving, and by repeating the stroke over the surface he removes a series of shavings until the required depth be obtained. Again, how does the sawyer proceed? His object is to reduce a certain amount of hard wood to the "dusty" or pulverulent state. Does he adapt his saw so as to break off by a vast expenditure of power on the instant large lumps at one stroke, and then taking up a hammer or "roller" reduce these lumps to powder? No, he does nothing of the sort. He so manages his tool that it takes but slight hold of the material, and then by repeated strokes he cuts his hard material into "sawdust" at once, thus saving the second operation of hammering or rolling. Now although I have selected these two illustrations, they are not exactly in point in one respect, since the "method" of operating I shall propose to you, will be more analogous to grinding by means of a millstone, which, as every farmer knows, consists of a great number of horizontal radii, to which radii our steam-tillage machine (when in operation) will represent one. Still let us see what profitable application we can make of the two above described illustra-

tions in regard to tillage or the art of obtaining a pulverized seed-bed out of a hard or heavy soil. We must see (in the examples adduced) the result is obtained by repeated strokes over the surface; this, in fact, being the "principle" of operating; and we further see the effect desired is obtained by the least expenditure of power on the instant. These are just the principles we are in search of. Hence what is the inference in respect to our tilling land by the power of steam? Why whenever our object is to obtain like results on hard materials, we should apply the same principles to obtain our end with the least expenditure of power. Now arises the question, why is the principle not in use at the present time? Because the farmer uses only a small tool scarce a foot wide, and having a large superficies to operate upon, he cannot afford the time to go twice over a place; he cannot avail himself of the economical mechanical axiom of "repeated strokes;" he is obliged to encounter the labour and rip up the heavy material to the full depth required at one stroke. If he were to attempt to operate with the plough in the manner indicated over half an acre of land, it would be equal to 16 horses trampling the land for four hours, which of course would neutralise the very end he had in view. Therefore, however advantageous the "principle" of operating "by degrees" may be—however economical of power—he has never yet been able to employ it, because he has not a machine through which he could use it without trampling down the seed-bed as fast as he made it.

In a former letter we showed how to economise time in operating, by inscribing the work to be done within the area of a circle; in another, how to obtain the element most necessary to insure success in plant-production by employing the human head and hand as a temporary piece of mechanism; in this we have discovered how to economise "power," and reduce its employment to a minimum by adopting the principle of overcoming labour by degrees. Let us in our next briefly sum up, and proceed to devise a steam-tillage machine according to the evidence, which shall be calculated to fulfil every necessary requirement of the farmer in the field. *C. Burcham, London.*

SALT: ITS AGRICULTURAL PROPERTIES AND USES.

By Mr. Prideaux, of Plymouth.

Of the long list of fertilisers, not one has suffered more from misunderstanding and consequent misapplication than salt, which is nevertheless so active, as well as cheap, that it will do good service to the farmer to give him distinct and definite notions of its true properties, the purposes it is fit for, and the best methods of applying it. The two first of these points will be treated of in this letter; but to give practical directions for all its applications would require much more detail than would suit either your columns or my time. The intelligent and reasoning farmer will be able to modify these, according to the circumstances of his estate, when he clearly understands the properties and modes of action of salt, and the purposes for which it is really fit.

The properties of salt chiefly useful in agriculture are—1. The supply of its constituents, soda and chlorine. 2. Attraction for moisture and resistance of freezing. 3. Sharpness, without being acid or alkaline; solubility and penetration of porous matter. 4. Promotion of putrefaction when used sparingly, though the contrary when used freely. 5. Mutual decomposition with lime and some of its compounds, as well as some other salts, giving rise to other and often more active fertilisers.

Let us next see what are its known effects, and to which of these properties they may be owing; and for our avowed purpose of distinctness we will consider them in three divisions:—A. Effects of salt on the soil. B. Its effects on other manures. C. Its effects on the plant and seed.

A. *Its Effects on the Soil.—a.* Keeps it moist in the heat of summer, and soft in the winter's frost (see above prop. 2); thus suits dry soils and seasons, whilst most other concentrated manures require wet. *b.* By this, and its penetrating quality (3) it keeps everything in the soil in the softest and most soluble state, best fitted to work on each other, and to be acted on by the air and weather. *c.* By its putrefactive power (4), it also promotes these reactions, thus digesting, so to speak, everything in the soil fit for vegetable nutrition, and preparing it to enrich the root-sap. *d.* Kills all vermin, and most weeds also, if used freely enough, by its sharpness and penetration (3).

B. *Its Effects on other Manures.—e.* Dung with salt has been found more effective for Turnips than double the quantity of dung without; and one quarter dung to three quarters salted peat, worked into a rich soapy spit-manure, produced more Turnips and Potatoes than the whole four parts of dung alone. Both these cases appear due to the moistening and digestive actions already explained (*a, b, c*). *f.* Worked with seeds, &c., kills all vermin, seeds, and roots, by its sharpness and penetration (*d*), and rots them (*a*) to a soft smooth paste, fit for the dung-heap, as it does not waste the ammonia like lime. *g.* Undergoes decomposition with lime and its compounds (5); produces soda on its combination with carbonic acid or with humus, all more powerful digestives and feeders than the salt itself: salt and lime work vegetable matters to decay quicker than salt alone. With gypsum it will supply soda and sulphuric acid cheaper than any other material, besides the muriate of lime, so valuable for its moistening quality.

C. *Its Effects on the Plant.—h.* It acts more favourably on some plants than others—those especially which naturally contain much of it. It benefits root and green crops generally, more than those of corn, as might be expected from its moistening and digestive quality in the soil (*a, b, c*). *i.* Pasture is, as well as roots, rendered more palatable and wholesome by its entering into the sap by its solubility (3), and more nutritious by its digestive action in the soil and manures enriching the root-sap. *k.* Low pastures are sweetened by it, though it is not alkaline; but it becomes so by giving out some of its chlorine in the leaf (*m*). *l.* Wheat and Barley have less straw, but more ear and heavier grain. *m.* It does not force the young plant, nor deepen the green (though chlorine is given off by the leaf in sunshine), but strengthens the growth by the enriched sap (*c*). *n.* Germination seems rather to be even retarded by it, and the plant comes up small at first, due to its sharpness (3) and destructive tendency (*d*), but the plant soon fetches up and overpasses those which are not salted; but implying also a stimulating action due to its sharpness (3), exciting to strong plants, but overpowering to weak ones. *o.* Peas and other plants are said to blossom earlier, and grain to come earlier to harvest; here again we recognise the stimulating action above alluded to, which excites vegetation, when used in due proportion, though oppressive to it when in excess (*n*). *p.* Salts are much more abundant in the vital sap before flowering (the chief vital action) than after, and more in the sensitive plant than in others. Hence salts appear connected with vital energy, which may explain the stimulative actions above noticed (*n* and *o*).

This stimulating action is the most important fertilising property of salt, and seems to contrast remarkably with that of ammonia, each supplying the defects of the other. Ammonia forces the young plant, deepens the green of the leaf, produces a luxuriant juicy growth; and in excess runs corn to straw and leaf, and often lays it with but little ear. Salt, on the contrary, rather retards the young plant (*n*); does not deepen the green, but strengthens the after growth (*m*); renders roots and green crops more solid and nutritious (*i*); produces more corn and less straw (*l*), and forwards blossoming and maturity (*o*). Here, then, ammonia seems to give the early vigour and activity, and the luxuriant juicy growth, in which salt is deficient; and salt to supply the strength and nutrition, which ammonia does not always produce, and also to bring the crops earlier to maturity. Hence they would seem practically well suited to act together. Moreover, ammonia was described as acting chiefly in the plant by promoting chemical transformation, and thus lightening the labour, so to speak, of the vital powers, and by encouraging absorption from the air. Salt, on the other hand, appears to act in great part as a digestive in the soil, to enrich the sap by the root, and in the plant as a stimulant to the vital forces. By ammonia the chemical changes in the sap seem liable to overrun the vital appropriation of the materials, and thus produce soft and juicy growth. By salt the vital action seems to be excited to select and arrange all the constituents,, so as to give every part its due solidity.

Hence they appear, theoretically also, just suited to aid and correct each other. It would seem as though three parts salt compost to one of ammoniacal (dung) did better than all dung.

Now, if this be found a general law (and I have hitherto met with few facts opposed to it), how greatly will it add to our resources in manure. If the deficiency of ammonia in the homestead dung-heap can be compensated by so cheap a material as salt, how greatly may the farmer improve his crops at a comparatively trifling expense? And if the concentrated ammoniacal manures, as sulphate of ammonia and guano, may be actually improved by three or four times their weight of salt—thus reducing their cost per cwt. to one-third or one-fourth its present amount—how much more will they be within the means of a small farmer, and enable him to bring heavier crops to the market? To recapitulate what we have said, we may expect from salt—1. In the soil—retention of moisture and softness; general penetration and digestion of all the materials of vegetable food to enrich the root-sap; and destruction of vermin and of seeds when used freely. 2. On other manures—the destruction of all vermin, weeds, roots and seeds; the digestive action just described; mutual decomposition with lime and its compounds, to the advantage of both; and an improvement in the efficacy of ammoniacal manures, whilst it greatly reduces their cost. 3. In the plant—improvement in the taste, wholesomeness, and nutritive power, and earlier maturity.

Home Correspondence.

The Waste Lands of the Highlands.—One writing on the 24th November, calling the attention of agriculturists to the necessity of improving waste land, alludes to two places—the New Forest and the central and eastern highlands of Scotland. As to the land cultivable in the New Forest I can say but little; but I am proud to see one now and then calling our attention to the great necessity of reclaiming waste land. As "A. H. F. C." alludes to the eastern and central highlands of that country being the best parts to improve, I am quite of his opinion, for in many of these vales in the eastern highlands there is little wanted but to plough and sow. Go where you will, on every river and streamlet side, there you see the rich alluvial soil lying along the banks, which has been settling down from the mountains above going on for many centuries back, covered entirely with Heath. And in the central highlands a great extent is covered with water for want of surface drains, which would greatly improve it for pasture alone; indeed, this remark is applicable to the highlands at large. But I am informed if you mention draining to the inhabitants they remark, "it won't pay;" speak of trenching, "it is too far to cart corn such a distance to the sea-shore." I could quote many such remarks; but then how is such a change to be brought about amongst the people? It is my opinion they must have ignorance removed from their door first; by cultivating the inhabitants they will then be in a more fit state to receive instructions how to cultivate the soil. Teach them to be active, sober, and industrious. Instead of noblemen attempting to introduce the games of the dark ages at highland gatherings, let them rather draw their peasants' attention to the games played in the agricultural world. Let man run and leap as he may, he will be outstripped by the horse, or the steam engine. A new system of agriculture is much wanted in those localities to which "A. H. F. C." alludes, and I should be glad to hear his suggestions as to the mode in which it is to be accomplished. He must bear in mind the Highlanders are much enslaved to custom and habit, which are not easy to be taken away from them. My opinion is until landlords take an active interest themselves in improving those portions of the Highlands to which they belong the peasants themselves are of too easy a contented mind to do much. *A Constant Reader.*

Superphosphate of Lime.—My attention has been drawn to the following paragraph in your paper of the 8th instant:—

"*Superphosphate of Lime.*—There has been a lecture delivered by S. Grove Grady, Esq., recorder of Gravesend, upon Agricultural Chemistry. This lecture was delivered at Hatfield. Mr. Grady is one of the directors of the Patent Superphosphate Compost Company. The reporter gives the following:—'He then discussed at length the question as to whether the phosphates, &c., &c., should be in a soluble or insoluble state, and proved by extracts from Dr. C. Remigius Fresenius' chemical analysis, and from Professor Liebig, that the insoluble were as beneficial to the full development of the plant as the soluble; for the ingredients which are soluble serve for immediate use, those which are neutral or semi-soluble exercise a more permanent action, and those which are altogether insoluble afford a prospect of future nourishment for plants, although for the time being they possess no nutritive powers. Those artificial manures, therefore, which are in a highly soluble state, are not so beneficial as when they are soluble, neutral, and insoluble.' I do not remember seeing any thing about semi-soluble phosphate in the writings of Liebig or other writers, neither can I see how any manures can be too soluble provided they are not washed out of the soil by the rains. Will you, Sir, be so kind as to enlighten me on these points? *From a Correspondent.*"

I am at a loss to understand the meaning and object of your correspondent; whether he seeks information, or whether he cavils with the use of a word, or whether he means to say that I have put a word into the mouth of the learned individual referred to, which was not his own, I cannot tell. The last hypothesis would seem to me to point to his object. If so I freely admit that the word "semi-soluble" is not to be met with in Professor Liebig's works, but I must also add that I never used it as the Professor's word. I used it parenthetically, as giving to my audience the closest meaning of the word "neutral" that occurred to me at the moment that I was delivering an extempore address, and the reporter has failed to put it in the way that I used the word, and has left it in my lecture as part of the passage. This, however, must have been apparent to your correspondent if he had been just enough to give himself a moment's thought. If your correspondent seeks information, I say the idea is to be found in Liebig, as I shall presently prove. If he cavils with the use of the word, I say that I was quite justisfied in its use, and that it expressed well to the minds of my hearers the ideas of that great and learned writer whose theories and whose experience we shall every day prove to be more and more correct, and more closely allied to truth than those of any other writer on the great and important subject to which he has addressed himself. In Dr. Liebig's "Chemistry in its application to Agriculture and Physiology," edited by Professor Playfair, 3d edition, p. 155, I find the following passages:—"There are certain ashes of plants wholly soluble in water, others are only partially soluble, whilst certain kinds yield only traces of soluble ingredients when the parts of the ashes insoluble in water are treated with an acid (muriatic acid). This residue in the case of many plants is quite soluble in the acids." "With other plants only half the residue dissolves, the other half resisting the solvent action of the acid, while in the case of certain plants only a third, or even less of the residue is taken up by the acid." If ingredients are wholly, partially, quite soluble; if others are only half soluble and the other half insoluble; if again a third, or even less are soluble, it is manifest there must be different degrees of solubility; if so there is nothing incorrect in the term semi-soluble. Again, in Liebig's "Principles of Agricultural Chemistry, with special reference to the late researches made in England," edited by Professor Gregory, p. 29, I find the following passage:—"The same inequality of increase in mass is observed when the same food is supplied to both plants in great quantity, but in different conditions of solubility." Again, p. 38: "The state of solubility or available form in the mineral constituents has, as I endeavoured to explain in my work, the greatest influence on their efficacy; and this is, for example, the reason why the hard, compact, and not porous apatite in great quantity exerts a far less effect in the same time than burnt bones; and

why the effect of the latter is so greatly increased when they are rendered more soluble by means of sulphuric acid. Again, p. 65: "Silicate of potash, by increasing the proportion of silica, may be obtained of all different degrees of solubility." Again, same page: "All these substances are more or less soluble in rain water, and still more soluble in water containing a larger proportion of carbonic acid." Again, p. 66: "It is necessary, if we would investigate the subject properly, to prepare from the first a whole series of mixtures of different (degrees of, no doubt intended) solubility." Again, p. 69: "As we cannot suppose that the mineral constituents of the same land vary in their solubility in different years from unknown causes; that in one year they are more soluble than in another," &c. If, then, there are different conditions of solubility—if there is a state of solubility—if one ingredient is more soluble than another—if we can obtain different degrees of solubility—if substances are more or less soluble, and still more soluble—if there is different solubility, why should there not be a semi-solubility? I am aware the last passage has a different object in view, but it also conveys the idea in the author's mind of one ingredient being more soluble than another. Now, sir, I trust if your correspondent sought information he has obtained it; if he cavils with the use of a word I have justified it; and if he means to say I have put an improper word into the mouth of a most scientific personage, I say that the word was my own, and that I never intended to use it as that of another. Your correspondent says: "Neither do I see how manures can be too soluble, provided they are not washed out of the soils by the rains." If my lecture had been fully reported, your correpondent would have found that I discussed this question also, and he would have been saved the necessity of displaying that non-acquaintance with the first principles of chemistry which the above remark exhibits. Why, it is because of the great and inevitable tendency of highly soluble manures to be washed beyond the reach of the infant plant that manures so prepared have not been found to be as efficacious as those containing a portion soluble, neutral, and insoluble. A mere tyro in chemistry knows wells that an ingredient in a highly soluble state is immediately taken up by water and must accompany that water wherever it goes; and we all know that the tendency of water is not to remain near the surface of the soil. What is the use, therefore, of a manure that has nothing to recommend it but its high state of solubility? We know that the chief ingredient in the straw of Wheat is silica, of which it contains 70·00 per cent.; we know, also, that the chief ingredient in Wheat is phosphoric acid, of which it contains 50·00 per cent. Whilst the silicates are drawn upon from the very commencement of the growth of the crop, the great body of the phosphates are not required until the development of the ear, when the grain which chiefly feeds upon them first begins to use them. If then your phosphates are highly soluble, and the rain is constantly carrying them into the earth beyond the reach of the plant before it is sufficiently advanced in growth to draw largely on them, are they within reach of the plant at that time when it most requires them for its nourishment? We must not be led astray by mere theorists upon this all important subject; but must, casting aside all prejudices, quietly, coolly, calmly, and dispassionately bring common sense to bear upon its discussion; we shall then find it impossible to maintain the position that soluble manures are as beneficial as those prepared to meet the requirements of vegetation in its different stages of growth. I have to apologise, sir, for the length to which this letter has run; the censure must fall upon your correspondent, who has touched upon so important a subject, but I feel satisfied that you require no apology from one whose chief object is that of investigating a great truth, and that you are always happy in bringing the minds of your agricultural friends to dwell upon both sides of a question in which they are so deeply interested. *Standish Grove Grady.*

Brown Bread.—I beg to inform your correspondent "J. T. B." that brown bread requires the dough to be made moister than white. I have no doubt his cook makes it of the same consistency, whereas brown flour will take half as much more water than white. The best and brownest bread is made from Wheat ground as it comes out of the mill without any bran or stuffs taken out. If "J. T. B." can get such flour, and his cook will put the extra quantity of water, I feel sure he will be satisfied with the bread. *Mary.*

Societies.

Royal Agricultural of Ireland, *Dec.* 21.—The half-yearly meeting of this society took place this day. Our readers are aware that great dissension has been exhibited at meetings of the Council latterly, and that the conduct of the secretary has generally afforded the subject on which these differences have arisen. The report of the Council to the general meeting recommended very considerable modifications of the office of secretary; involving, we suppose it will be generally admitted, a reflection on the manner in which the duties of that office had been hitherto discharged. And at the meeting which has just so happily passed a large gathering of members took place, the question no doubt which had interested them, and on which each came prepared with his opinion, being the merits of Mr. Harkness as the secretary of the Royal Agricultural Improvement Society of Ireland. This personal feeling bade fair to tear the society asunder; and that this has not been the result is due, we think with Mr. D. J. Wilson who spoke well upon the subject, rather to the good sense of a large body of the Society than the angry discussions which have been reported or believed to have existed. "I was asked," said Mr. Wilson, "what party I belonged to—what part I intended to take—with which of the two parties I would be found? 'Two parties!' said I; 'why, there are three parties.' 'Three!' exclaimed the person who addressed me; 'why, I only heard of two—the secretary and his party, and a section of the council.' 'Well,' I said, 'I feel there is another party stronger than either of the two parties, and stronger than both put together, and that is the party of the Royal Agricultural Society. That is the party that I belong to, and, notwithstanding the previous expressions of angry feeling, I do hope that before we leave this room we shall convince the public that that is the stronger party.'" We give below an abridgement of the address of Mr. Gartlan upon the occasion—he having been apparently the spokesman of the general sense of the members. It had been proposed to adopt the report of the Council. Mr. Gartlan moved the following amendment:—

"That the further consideration of the report be adjourned, and a committee of nine members of the society be appointed to inquire into, and report to an adjournment of this meeting, to be held on the last Thursday in January next, on the several matters that have tended to produce dissension and discord in the society, and on certain charges of insubordination and negligence made against the secretary, and on certain allegations of irregularities in the awards of certain of the society's prizes and premiums made against members of the council of the society; and that it be an instruction to such committee to take into its consideration the several laws, bye-laws, rules, and regulations of this society, with a view (if they think fit) to suggest such additions, alterations, and amendments therein as may be necessary for the more harmonious working of the society for the future—this meeting being of opinion that the bickerings and disputes that have latterly taken place have a direct tendency to lessen the influence of the society and to impair its usefulness."

He said:—I deeply feel, and every gentleman who takes an interest in the well-being and well-working of this society must feel, that such scenes as have been enacted in our council-room for the last few months cannot co-exist with the harmonious working of this society. Either the secretary should yield, I respectfully submit, or the council should yield. The documents which have been handed about, the letters which have been written, and the discussions which have taken place, prove as distinctly as possible that there is not harmonious working within our council, and I deeply regret that we cannot shut our eyes to this fact, that our secretary has leagued himself with one section of the council. I don't say the section that have taken the part—if I may use the expression—of the secretary are wrong. Far be it from me to say that. I say that is the matter that is to be inquired into; and I hope and trust that when the heat, and the recriminations, and the party discussions have died away, those highly respectable gentlemen who have banded themselves together, upon the one side and upon the other, will meet together or at least a portion of them, in the council-room, as Irishmen should meet when they discuss the affairs of a society like the present, harmoniously, like educated and enlightened gentlemen. I freely admit that there are matters to be inquired into. I freely admit that irregularities have taken place. I refer to three particular instances. The first is in reference to the secretary. I cannot shut my eyes to this fact, that he and the council have not worked harmoniously together. I hope and trust that the result of that committee which I am about to propose will be this—that whatever differences of opinion have existed between the council, or a section of the council, as Mr. Hamilton suggests, and the secretary, probably by some mutual concession, by some mutual understanding, that disagreement might be put an end to; for I cannot shut my eyes to the fact that there has been an attempt made, it is said, to raise an unworthy cry against Mr. Harkness, because he happens to be a Scotchman. I do not adopt that sentiment. I have stated in private, and I repeat in public, that had I been a member of the society when the secretary was appointed, probably I would have imagined that in Ireland might have been found an Irishman to fill that office; but I say that Mr. Harkness was no party to that resolution. You are purchasers with notice; you selected him knowing where he was from; and the very fact of his not being an Irishman gives him an additional claim upon your fair consideration. The next point, gentlemen, that I think the attention of the committee will be directed to is, the allegation of irregularity in the award of a premium to Captain Ball. I certainly do believe that in the award of that premium there might be pleaded the statute of limitations. I believe it is five years ago. Be it four or five years, I don't care which; but on the face of the proceedings for a month back in the council this is quite apparent, that the award of that premium is an irregularity that did undoubtedly creep in. I don't conceal the fact that there is another award of a premium in dispute. I believe it is a draining cup, but with the details of it I am perfectly ignorant. I am told that the committee of the society has come to a conclusion upon it at a recent meeting; but it has so recently occurred, that the matter is fresh in the minds of all parties, and I think there can be no objection whatever that it, too, should be considered by the committee. Now, the last matter to which I think the attention of the committee should be pointed is this—is it not notorious, is it not too notorious, that the meetings of our council in these latter times have not been conducted with that order, regularity, good feeling, and harmony with which the meetings of a society like this ought to be regulated? If the council is of that nature that the society at large has not sufficient power over them to prevent such proceedings, I think that a committee should be appointed calmly to look at the constitution of the council, and to report whether such a change should not be made in the bye-laws—that if there are men upon it who will not, and are determined not to pull harmoniously with other members of the council some means should be obtained for ejecting them from the council. (Loud cries of hear, hear, and applause.)

Mr. Gartlan's amendment was carried, and a committee of nine members, two gentlemen from each province, with his Grace the President of the Society as chairman, were appointed in accordance with it to report to an adjourned meeting.

Jump, near Plymouth, *Dec.* 5.—A number of agriculturists assembled to take into consideration the propriety of forming an Agricultural Society. Mr. Thompson referred to the history of the Highland Society, to show the effects of combination for the purpose of agricultural improvement. A superior system of farming was introduced, superfluous fences were rooted out, thorough draining put in extensive practice; furzy heaths were cleared away in every direction, and converted into luxuriant pastures and fertile fields; wide and exposed high field lands were surrounded and adorned with thriving plantations, affording shelter, beautifying and improving the scenery; and the miserable mud hovels of a past age were demolished, and superseded by comfortable and well-arranged buildings of a suitable and substantial kind. Implements of the best order, machinery of the choicest construction and on the most improved principles were introduced, and are now universal there. He made these remarks to show what had been accomplished through the aid and direction of an agricultural society in his native country, and he had no doubt whatever that a society of that description, properly managed and spiritedly backed by the nobility and farmers of this district, where so much room for improvement existed, could not fail in doing an incalculable amount of good; therefore he would take the voice of the meeting whether or not they entertained the same view. The meeting were unanimous in opinion with Mr. Thompson, and nominated a committee to carry out the necessary arrangements for the establishment of the society, to be named the "Maristow Agricultural Society," and to report at the next meeting, to be held at Jump on the first Monday of January next. The chairman again addressed the meeting at considerable length. He made numerous remarks upon the practice of agriculture, crops, and rotation of crops, describing and criticising the Lois-Weedon system of cultivation; he thought the Rev. Mr. Smith very fortunate in having a piece of land capable of bearing such treatment, and instanced the failure of the Lois-Weedon system, under the hands of the Rev. Mr. Forester, Vicar of High Ercale, in Shropshire. He then offered some remarks upon soils and their combinations, upon manures and their application, and depreciated the plan of laying small heaps of manure on the land for some time before ploughing it in. Mr. Rowe, Woolwell, thought that a good way of applying farm-yard manure was to plough it into the soil as soon as carted from the farm-yard. He would recommend the utility of covered yards or sheds in which the manure could be made or laid up and fermented before being carried to the field. He considered that the very essence of their farm-yard manures was washed into the water courses by the rains of heaven. Mr. Harris, Phinx Mill, described his practice in preparing manure. He had all the manure of his place collected into one heap in the yard and mixed with salt in the proportion of 3 cwt. of salt to about 20 loads of dung. Salt, he thought, retained the ammonia, accelerated fermentation, and destroyed the larvæ of insects, together with the vitality of many seeds which might be in the manure. He procured, a short time ago, 3 tons of salt, at 15*s.* per ton; from that, he was satisfied the cost could not be any objection to its use. He made some appropriate remarks upon the keeping and trimming of field hedges, and commented upon the expense of cleaning weeds from the crops, where a bad system of cultivation prevailed. He thought that by paying proper attention to the preparation of the farm-yard manure, the trimming of hedges, and deep cultivation, cereal crops would not require any weeding at all. Intelligence, industry, and perseverance were necessary to the proper advancement of agriculture. It was his opinion that the society which they were about to form, if properly conducted, would prove of immense benefit to the district.

Notices of Books.

On the Advantages that would accrue to the Landed and Agricultural Interest of the United Kingdom from a general Act of Parliament to enable Owners of Settled and Encumbered Estates to Borrow Money for their Improvement upon the Security of the Estates themselves. A Letter to the Right Hon. the Earl of Essex. By Chas. F. Humbert, Land agent, Watford, Herts. Piper & Co., 23, Paternoster Row.

"The only means by which the owner of a limited or settled estate can without making an immediate outlay erect farm buildings, engines, or machinery, make roads, reclaim, enclose, and fence uncultivated land, &c., for instance, is through the intervention of one of the four existing private companies known as "The Landowners' Drainage and Inclosure Company," 1847, "The West of England Land Draining Company," 1848, "The General Land Drainage and Improvement Company," 1849, and "The Lands Improvement Company," 1853, each of which exists under a special Act of Parliament, empowering it to effect upon land improvements of the kind above named, as well as drainage; and to charge the cost of the works upon the inheritance, in the form of an annual rent-charge, and to one of these companies a landowner must of necessity appeal if he wish to charge upon those who may come after him their reasonable share of the cost of the improvements he may contemplate."

We quote this passage from the above-named pamphlet. The object of Mr. Humbert is to show that as the sanction of the Inclosure Commissioners is needed before any of these companies can complete the engagement by which it undertakes the drainage or other improvement of an estate in consideration of a rent-charge upon that estate for a certain number of years, this sanction ought to be the only thing needed to enable the owner or tenant for life to borrow money for that purpose in any quarter. Legislation hitherto has certainly been of great service to the owners of settled estates, and through them to the body of consumers, which was

what was intended. Whether the monoply which the companies charged with the execution of that legislation have hitherto enjoyed has been of any value to their shareholders we do not know, but at any rate it has had the effect of conferring privileges on individuals or limited bodies of individuals, which was not the object aimed at. To be sure this latter is a result which follows all such legislation as needs commissioners for its administration; for those to whom the administration is confided enjoy a monopoly under it in the same way as that is enjoyed by these Improvement Companies; but the answer is, that all commissions for the discharge of that which may be left to the operation of unrestricted competition and natural law are at the best a mere impertinence, and that all such salaried commissioners, and this is the class under which Mr. Humbert must place these companies, are mischievous. The question thus arises whether in the case before us any new commission is needed; whether any increased security to the next tenant arises from those only being privileged to act who have a standing before the public as the officers of an incorporated company for agricultural engineering, beyond that which would be conferred by the employment of any individual engineer, or of any one who pretends to act as such, if only his employment be sanctioned by the Inclosure Commissioners. Mr. Humbert draws the attention of Lord Essex to the fact that "As these works can after all only be carried out by the companies, with the sanction of the Inclosure Commissioners, the same inspections are of course necessary (and at the same cost) as if the landowner could make his application direct to the Commissioners; and that besides this, the landowner has to pay to the company, for the use of their act, a heavy percentage, together with some other charges. He incurs, therefore, more expense and also more trouble, inasmuch as there are more persons concerned in the arrangement, than if he could make his application direct to the Commissioners. "I do not wish," he says, "to imply that the charges of these companies are excessive, nor that an employer ought not to expect to pay the company whose services he may engage, for it must be evident to all that it is alone from charges made upon landowners that the shareholders in the company are to be satisfied, and the directors, secretaries, engineers, and other officers are to be remunerated. But I mean that the charges are altogether unnecessary and therefore extravagant; because the employer could effect his object more cheaply, more speedily, and more conveniently, by being placed in direct communication with the Inclosure Commissioners without the assistance or intervention of a company in any stage of the business; and that to bring about this most desirable state of things either a General Act of Parliament, having the provisions of the Lands Improvement Companies' Act (except that the whole sum expended in the erection of buildings should be charged upon the estate), or an extension of the Private Money Drainage Act, is alone necessary; and from this might be securely predicted the most favourable results to the landed and agricultural interests of this kingdom. It will, in effect, empower any owner of a landed estate, under the direction of the Inclosure Commissioners, to lay out his own capital, or money borrowed by him, in its improvement, and to liquidate the debt so incurred by the estate by annual payments, secured as rent-charges upon itself. The powers of the existing companies would still remain, and whoever might find it to his interest to avail himself of their services would, as at present, be enabled to do so."

We believe with the author of this pamphlet that the general intelligence of landowners, backed by the veto of the Inclosure Commissioners, is guarantee enough that land improvement shall be done efficiently, without confining it in its choice of an agency either to the officers of certain privileged companies or to those whose appointment may be sanctioned by these officers. And we believe with the select committee of the House of Lords which sat last May, that it is desirable that the powers now vested "in the Companies be made the subject of a General Regulation and that a General Act be passed without delay, for determining under what provisions owners of limited and settled estates should be permitted to obtain advances of money for their improvement, &c."

Farm Memoranda.

SANDIWAY, NEAR NORTHWICH.—Mr. John Warburton, who occupies a farm chiefly of light soil, sows his Grass seeds with Barley or Oats, and sometimes in the Wheat crop, and says that they will succeed with any of these crops if the land be thoroughly cleaned and managed. To effect this object in clayey loams, he recommends that they should be autumn fallowed. He has also sown Grass seeds after early Potatoes, and found, when the land was thoroughly clean, that the Grass crop succeeded very well, and could be mown three times the following year. In this case the seeds should not be sown later than the middle of September. With reference to the "second and after years' herbage," he says he has a field now that was laid down in the spring of 1853 with a mixture of Grasses recommended by and purchased from Mr. Chivas, of Chester, which were mown twice in 1854, and once in the present year, and the herbage is now equal to any old pasture for cheese-making or feeding. Part of this field was laid down with Wheat after Mangel Wurzel and Potatoes, and part with Barley and Swede Turnips. Eight to 10 cwt. of boiled bones, and 2 to 3 cwt. of guano, were applied to the young Grass root in the spring of 1854. (His usual time is March or April, as the seasons may suit). He considers the guano of most service in forcing the Grass for the first cutting, and the bones afterwards. The following is a list of the seeds usually sown per statute acre, subject to some little variation occasionally made by the seedsman, to adapt them to the different soils, whether light, strong, or peaty:—

½ peck of Pacey's perennial Rye-grass	1 lb. of smooth-stalked meadow Grass
½ peck of Italian Rye-grass	2 lbs. of crested Dog's-tail
½ peck of Cock's-foot	2 lbs. of Welsh Clover
1 peck of meadow Fescue	3 lbs. of Cow-grass
½ peck of hard Fescue	3 lbs. of white or Dutch Clover
2 lbs. of rough-stalked meadow Grass	

Mr. Warburton's rotation of cropping, beginning with the land when in Grass, is—1st, Oats; 2d, Mangel Wurzel, Potatoes, and Carrots; 3d, Wheat; 4th, Swede Turnips (for which the land is autumn fallowed); 5th, Oats or Barley, with Grass seeds sown therein; afterwards in Grass for six or eight years, and in some fields (if the Grass remains good so long) for 10 or 12 years; but in several of the fields the herbage begins to deteriorate at seven or eight years old.

WEAVERHAM, NEAR NORTHWICH.—Mr. Thomas Wild, who also occupies a farm of light soil, states that on such a soil Barley is preferable to any other white crop for laying down land to Grass; and Oats or Barley on clayey loams, if drained. He has also laid down land after early Potatoes, and states that he considers this the best system for getting good herbage for milking or feeding, but it is not so profitable as laying down land with corn. He finds in all instances the second year's lea is the least productive, but considers the aggregate produce of his three first years of Grass of more value than three years of old Grass, if the soil is of a light quality. His Clover or first year's Grass root is always manured with boiled bones as soon as convenient after the corn is removed. The following seeds are sown per statute acre:—12 lbs. of Red and White Clover or Trefoil, varied according to circumstances with carefully selected Grass seeds. He has several times applied permanent Grass seeds from Mr. James Dickson, of Chester, which have cost 10*s.* or 12*s.* per acre (exclusive of the cost of Clover seeds), and they have answered very well. The land intended to be sown with Clover and Grass seeds is worked to a very fine tilth, and rolled before sowing the seeds, otherwise a great portion of the seed would be covered too deep, and be entirely lost. After sowing, the land is bush-harrowed very lightly, and again rolled. This plan has been adopted for many years, and never failed. Has tried seeds with the Wheat crop, but could never succeed in getting such good pasturage. He is aware that many objections are made to new laid down land for cheese-making, but is himself satisfied that on light soils more Grass is obtained, and consequently more stock kept, and more cheese made, than from old pasture.

DUTTON HALL, NEAR PRESTON BROOK.—Mr. J. Taylor, whose farm is composed of both strong and light soils, lays down his sandy loams to Grass with a Barley crop, but the clayey loams with Oats. His second and after years' herbage is of unusually good quality, and considered by him as quite equal to old pasture for cheese-making, but the manufacture of the cheese requires more care, most probably from the fact of the milk being richer. The manure he applies to the young Grass root is bone-dust. The Grass seeds sown by him are obtained from Mr. Chivas, and are for a statute acre as follows:—

3 pecks of perennial Rye-grass	½ peck of meadow Foxtail
½ peck of Cock's-foot	1½ lb. of crested Dog's-tail
½ peck of meadow Fescue	4 lbs. of Red Clover
1½ lbs. of rough and smooth-stalked meadow Grass	2½ lbs. of White Clover
	1½ lbs. of Rib-grass

The cost of the above is about 15*s.* When the seeds are intended for pasture, Cowgrass is substituted for Red Clover. Mr. Taylor's second and third year's herbage is said to be uncommonly good.

DARESBURY, NEAR WARRINGTON.—Mr. William Hall, who occupies a farm of clayey loam under Mr. Chadwick, was allowed a few years ago to break up an old meadow for the purpose of draining it and laying it down in better condition. After going through a short rotation of cropping, the field was laid down to Grass with a Barley crop in April, 1853. In the spring of 1854, the young Grass root was manured with 5 cwt. of boiled bones per statute acre, and was mown once in that year and once in 1855, the crop both times being good. The soil is a strongish clayey loam, and the Grass seeds sown, which were prescribed for by myself, were after the following rate per acre, the cost being 21*s.*:—

3 pecks of perennial Rye-grass	2¼ lbs. of smooth ditto
1½ pecks of Cock's-foot	1½ peck of meadow Foxtail
1½ peck meadow Fescue	2¼ lbs. of Cow Grass
2¼ lbs. of rough stalked meadow Grass	2¼ lbs. of Trefoil
	2¼ lbs. of Timothy Grass

Most of these Grasses have come up, and the herbage is of first-rate quality. When compared with other fields in the same farm laid down without natural Grasses in the ordinary way, the superiority is very apparent. *Mr. White, at Chester.*

Notices to Correspondents.

ADDRESS: Can any one supply us with the address of Mr. Philipps, manufacturer of the horizontal Turnip-cutter, who formerly resided in Bristol?

GAS COKE: *J B R.* If you pay only 20*s.* for as much as would fill 1000 feet of drain, you would yet have a very inferior, and in most districts a more costly material than pipe tiles afford.

LAND AGENCY: *J K.* We should suppose that land agency, or possibly commission agency for the sale of agricultural implements, would be a profitable mode of occupation for the spare time you speak of; but really the subject is hardly proper for our discussion or pages.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1¼ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s.*

1¼-inch Flexible Rubber and Canvas Suction for ditto, 3*s.* 6*d.* per foot.

1¼ Gutta Percha Suction, 1*s.* 6*d.* per foot.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel.	Length of Barrel.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 10 0
2½ „	long 3 „ 3 „		1 14 0
3 „	ditto 3 „ 6 „		2 8 0
3½ „	ditto 3 „ 6 „		2 12 0
4 „	ditto 3 „ 6 „		3 3 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 14 0
2½ in.	long ditto	ditto ditto	2 18 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

OAT-CRUSHING AND BEAN-SPLITTING MILL (TURNER'S No. 5).

This Mill is recommended to the use of every person keeping a Horse, as superior for efficiency, durability, and ease in working to any manufactured. Two bushels of crushed corn afford more nourishment both to old and young horses than three bushels of uncrushed!

Price £5 15*s.* 6*d.*

Made and Sold by E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, London.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

ROBINSON'S PATENT BARLEY, for making superior BARLEY WATER in 15 minutes, has not only obtained the patronage of her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than 30 years have been held in constant and increasing public estimation as the purest farinæ of the Oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and, alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co. Purveyors to the Queen, 64, Red Lion Street, Holborn, London. Sold by all respectable Grocers, Druggists, and others in Town and Country, in packets of 6*d.* and 1*s.*; and Family Canisters, at 2*s.*, 5*s.*, and 10*s.* each.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH

GOOD MATERIALS AND WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

PUBLIC INVITATION.

HEATING EXTENSIVELY BY ONE BOILER.

JOHN WEEKS & Co., King's Road, Chelsea,

HAVE this Season the pleasure of being able to refer to several other extensive Establishments where they have fixed ONE BOILER to do the same work which hitherto has taken from six to twelve boilers.

All the world knows the highly respectable firm of Messrs. Edward Henderson & Co., of the Wellington Nursery, Wellington Road, St. John's Wood, and as that Establishment is open to the public Messrs. JOHN WEEKS & Co.'s Hot-water Apparatus will now have a chance of being fairly tested and impartially represented during this winter. Messrs. Edward Henderson & Co. have now adopted what is called the "ONE BOILER System." At their extensive Nursery any gentleman or horticulturist can see the Hot-water Apparatus of several extensive ranges of Hothouses, all connected to ONE BOILER. We will here quote Mr. Edward Henderson's own words, showing how he approves of Messrs. J. WEEKS & Co.'s system of heating by hot water. He says:

"I am more than satisfied with the extraordinary results of what Messrs. JOHN WEEKS & Co. *have done for me in heating a great number of our hot-houses from* ONE BOILER. *It is almost impossible for me to express my satisfaction sufficiently strongly. The effect and great saving produced is truly wonderful; less than two sacks of coke in 24 hours is all that is used to heat a variety of hothouses, &c., nearly 800 feet in length, and these various houses are to some extent widely separated, as 300 feet stand in one direction, 150 feet in another, 200 feet in another, and so on, including our large newly laid-out winter garden."*

Messrs. JOHN WEEKS & Co. can also refer to several extensive private establishments, where their Hot-water Apparatus can be seen in operation, and in every case with the same favourable results. J. W. & Co. also adhere strictly to all their former statements relating to their ONE BOILER system, and most respectfully solicit a visit to their Garden Establishment at Chelsea, which consists of Hothouses, Greenhouses, Conservatories, Pits, &c., the whole measuring 1000 feet in length, exposing to the atmosphere upwards of 16,000 superficial feet of glass, the whole heated by ONE BOILER, 5 feet high by 3 feet 6 inches in diameter, the water in the various houses circulating through 5000 feet of Hot-water Pipe.

The accompanying sketch represents our improved Upright Tubular Boiler, with hollow furnace bars. The large surface which this Boiler exposes to the immediate action of the fire renders it of such extraordinary power.

JOHN WEEKS & Co., King's Road, Chelsea,
Horticultural Builders and Hot Water Apparatus Manufacturers.

At our two establishments horticultural science is fully carried out in all its branches, combining all the improvements of the day. We have always in stock ready for immediate use a very extensive variety of horticultural erections; also Forcing Pits and Frames of all sizes. See our Illustrated Catalogues on Horticultural Building and Heating by Hot Water; also of all the best Stove and Greenhouse Plants; also of the best Vines, Pines, Peaches, and other Fruit trees.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility Gentry, and the Trade, in most of the counties in England.

COTTAM AND HALLEN, Engineers, Founders, &c.

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

A SHOW ROOM DEVOTED ENTIRELY TO ARTICLES OF HORTICULTURE.

ILLUSTRATED CATALOGUES UPON APPLICATION.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK,

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the framework, but covered with Galvanised Iron Sashes, with excellent strong glass, and all completed for 1*s.* 3*d.* per foot super. Hundreds of references can be given, and Printed Price Lists sent.

C. STEPHENSON, late STEPHENSON AND SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

HOT-WATER APPARATUS.

J. R. PEILL, 17, New Park Street, Southwark, (late Stephenson and Peill), Inventor of the Improved Conical Boilers in Iron and Copper, is now enabled to make considerable reduction in the prices charged by his late firm, and to supply the trade upon very advantageous terms, with materials for Warming Buildings of every description; Iron Conservatories, Roofs, and every description of metal work. Prices, &c., at the Manufactory as above.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. The same prices charged at all the Establishments.

CHRISTMAS PRESENTS.—The most appropriate offerings for this Season of Festivity are those which tend to the promotion of Health and Personal Attraction; none can be more acceptable than ROWLAND'S MACASSAR OIL, for imparting a transcendent lustre to the hair, and sustaining it in decorative charm.

ROWLAND'S KALYDOR imparts a radiant bloom to the cheek, and a delicacy and softness to the hands, arms, and neck; and

ROWLAND'S ODONTO, or PEARL DENTIFRICE,

Bestows on the teeth a pearl-like whiteness, and renders the breath sweet and pure. The patronage of Royalty throughout Europe, their general use by rank and fashion, and the universally-known efficacy of these articles give them a celebrity unparalleled.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

*** BEWARE OF SPURIOUS IMITATIONS!

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

MARK YOUR LINEN.

THE PEN SUPERSEDED.—The most easy, permanent, and best method of marking Linen, Silk, Cotton, Coarse Towels, Stockings, Books, or anything else, is with the PATENT ELECTRO-SILVER PLATES. By means of this novel invention a thousand articles can be marked in ten minutes. Any person can easily use them. Initial Plate, 1*s.*; Name Plate, 2*s.*; Set of Numbers, 2*s.*; Crest Plate, 5*s.* Sent free to any part of the kingdom (on receipt of stamps), by the inventor and sole patentee, T. CULLETON, Heraldic Engraver to the Queen and Royal Family, 2, Long Acre, one door from St. Martin's Lane.

NO MEDICINE FOR THE CURE OF ASTHMA CONSUMPTION, AND COUGHS, was ever attended with such speedy and unfailing success as DR. LOCOCK'S PULMONIC WAFERS. In every newspaper and periodical in the kingdom may be seen testimonials of their wonderful efficacy. To singers and public speakers they are invaluable for clearing and strengthening the voice. They have a pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. Sold by all Medicine Vendors.

TO AGRICULTURISTS.

Just published, in one volume 8vo, 400 pages, cloth, with numerous illustrations, some coloured, 9*s.* 6*d.*; post free by Post-office order for 10*s.*

THE YEAR BOOK OF AGRICULTURE; OR THE ANNUAL OF AGRICULTURAL PROGRESS AND DISCOVERY, FOR 1855. Also, may still be had,

THE ENTOMOLOGIST'S ANNUAL for 1855. Edited by H. T. STAINTON. Second Edition; with Coloured Plates. 12mo. Pp. 153. Price 2*s.* 6*d.*

Lately Published.

THE NATURAL HISTORY OF THE TINEINA. Vol. I. By H. T. STAINTON; assisted by Professor ZELLER and J. W. DOUGLAS. With eight Coloured Plates. Price 12*s.* 6*d.*

"The work is wholly written in four languages—English, French, German, and Latin, which are printed in parallel columns. It is as well done as such a work can be, and it is unnecessary to praise the illustrations when we say that they were drawn by the late Mr. Wing, who was perhaps unequalled in his own department of Art. The descriptions are full and yet precise; the criticism on former authors is just; and the account of the habits of the little animals graphic and amusing."—*Athenæum.* London: JOHN VAN VOORST, Paternoster Row.

Now ready, No. I. of the Second Edition of

THE COTTAGE GARDENERS' DICTIONARY, in Weekly Numbers, 1½*d.*; and Monthly Parts, 7*d.* Edited by GEORGE W. JOHNSON, Esq., Editor of "The Cottage Gardener," "The Gardeners' Almanack," &c.

This Dictionary explains, in Alphabetical Order, the Terms and Operations employed by Gardeners; Descriptions and Histories of all the Species of Fruits, Flowers, and Vegetables worthy of a place in our Gardens, Greenhouses, and Stoves, with their Varieties and appropriate Cultivation; and all its details have been prepared by some of the best practical and Scientific gardeners of England. These characteristics render it the most useful and most reliable, as it is also the cheapest work for general reference that has yet been published on English Gardening.

One very large Edition has been sold, and the present Edition, including all New Plants, with most copious Dictionary of Synonyms, is a still more valuable work of reference, both to the Amateur and Professional Gardener. It will be published in about Sixty Weekly Numbers. Price 1½*d.* each, and in Monthly Parts, price 7*d.*

London: W. KENT & Co., 51, Paternoster Row.

London: W. KENT & Co., 51 and 52, Paternoster Row.

RENDLE'S PRICE CURRENT FOR 1856.

RENDLE'S PRICE CURRENT AND GARDENER'S DIRECTORY FOR 1856, *is just published by Messrs. Simpkin & Marshall and can be obtained through any Bookseller in the United Kingdom, or from the Proprietors,* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth, price Sixpence, or free to purchasers of Seeds.*

THE PRESENT EDITION IS PRINTED THE SAME SIZE AS THE "FLORIST," AND WILL CONTAIN 120 PAGES, AND BE FOUND EVEN MORE COMPLETE THAN THE FORMER EDITIONS.

It contains a valuable Descriptive List of KITCHEN GARDEN SEEDS, with prices affixed to every article, and in addition to these descriptions there are short and concise cultural remarks for every kind of *Vegetable,* pointing out the best varieties for *Early, Medium,* and *General Crops.*

The List of FLOWER SEEDS has been much improved, and contains descriptions of all the leading sorts, with directions for sowing seeds, and other useful practical remarks; and in this department Mr. Errington has written expressly for the work an original article on ANNUAL AND OTHER FLOWER SEEDS, which will be read with much interest.

The CALENDAR OF OPERATIONS for the whole of the year has also been revised, and will be found even more useful than the one in the last edition.

The ALMANACK is now a prominent feature of the "Price Current," and a page is devoted to every month.

Full detailed lists are given of the quantities and descriptions of seeds sent in the "COLLECTIONS OF SEEDS."

The following ORIGINAL ARTICLES *have also been contributed, for which the Proprietors have to return their sincere acknowledgements.*

FLORICULTURE. By Mr. JOHN EDWARDS, the Secretary to the National Floricultural Society, and Editor of the "National Garden Almanack."

VEGETABLE FORCING. By Mr. ROBERT ERRINGTON, Gardener to Sir P. Egerton, Oulton Park, Tarporley.

RENDLE'S TANK SYSTEM OF HEATING. By Mr. JOHN DOBSON, late Gardener to Mr. Edward Beck, Isleworth.

GRAPE DISEASE AND MILDEW. By Mr. JAMES CUTHILL, of Camberwell.

ON NATURAL AND ARTIFICIAL MANURES. By Mr. J. B. LAWES, the celebrated Agricultural Chemist.

ON THE PORTABLE AND MINIATURE FRUIT GARDEN. By Mr. NIVEN, of the Garden Farm, Drumcondra, near Dublin.

ON THE CULTIVATION OF THE CUCUMBER. By Mr. JOSEPH HAMILTON, Author of the "Hamiltonian System of Pine Growing."

LIST OF A FEW OF THE BEST FRUIT TREES GROWN AT WOOLATON, the seat of Lord Middleton. By Mr. J. HAYTHORN.

MIGNONETTE, CULTURE OF. By Mr. WILLIAM MELVILLE, Gardener to the Earl of Roseberry, Dalmeny Park.

NEW AND ECONOMICAL MODE OF HEATING GREENHOUSES, ORCHARD HOUSES, &c. By Mr. NIVEN. Garden Farm, Drumcondra.

ROTATION OF CROPS. By Mr. ROBERT ERRINGTON.

SELECTION OF KITCHEN GARDEN SEEDS. From the "Scottish Gardener and Magazine of Horticulture and Floriculture."

THE OSAGE ORANGE. Introduction and Cultivation of.

In addition to the above will be given short directions for the CULTIVATION of FLOWER SEEDS, with modes of TESTING their GROWING QUALITIES. Also a descriptive list of all the newest introductions for the present year.

A Description of the CEDRUS DEODARA, with an engraving kindly lent by the proprietors of the "Florist;" and a few remarks on the Dioscorea Batatas, by SAMUEL CURTIS, Esq., the proprietor of Curtis's "Botanical Magazine."

Copies of the above edition can now be obtained through any bookseller in town or country, or from the Proprietors, price 6*d.* each, or free to all purchasers of seeds.

WILLIAM E. RENDLE & CO.,
SEED MERCHANTS, Plymouth.
ESTABLISHED 1786.

Proceedings of the Botanical Society, containing Papers by Professor Balfour, Professor Gregory, Dr. Greville, &c., &c.

Edinburgh: D. GUTHRIE, 377, High Street, and J. MENZIES, 63, Princes Street; London: HOULSTON & STONEMAN.

TO MARKET GARDENERS.

DAWLEY WALL, NEAR HARLINGTON, MIDDLESEX.

TO BE LET by Tender, for Terms of Years, about 23 ACRES of excellent GARDEN GROUND, stocked with all kinds of young Fruit Trees and Bushes in full bearing, with nearly 1000 yards run of Wall and Wall Fruit Trees. Shed and Barn room will be provided; there is also a Cottage which may be tendered for separately.—The Ground may be seen on application to Mr. W. THORNTON, at Dawley Wall (West Drayton Station, Great Western line), by whom all necessary information will be given, as well as by Mr. HADRILL, at Messrs. T. and W. RHODES', Ball's Pond, Kingsland. Tenders to be sent to Mr. HADRILL, as above, on or before THURSDAY, January 10, 1856, at 11 o'clock. The advertisers do not guarantee to accept the highest, or any other bidder, unless the respectability of the parties selected shall be satisfactorily established.

TO BE LET, A NURSERY AND SEED BUSINESS.—JOHN YOUNG begs to say that he is desirous of treating with a Tenant for his Nursery Ground, which he is at present occupying himself, and which offers an eligible opportunity to any one wishing to enter on the business. The Stock is light, and the quantity of Land may be made to suit the convenience of the Tenant.—For further particulars, apply to JOHN YOUNG, Elm Cottage, Taunton.

TO NURSERYMEN, GARDENERS, AND OTHERS.

TO BE DISPOSED OF, by Private Contract, the LEASE, GOODWILL, and STOCK of Birch Field Nursery, eligibly situated about two miles from the centre of the town of Birmingham, out of the borough, on the turnpike road to Walsall. It occupies an area of about 2 Acres, the rent is very low, and the Stock of an ordinary and useful character. There is a Cottage, Stable, Greenhouse, and other necessary conveniences for carrying on an extensive and profitable business.—For further particulars, and to treat, apply to MR. JOSEPH JAGGER, Bank, High Street; or to Mr. C. H. JAGGER, Solicitor, Cannon Street, Birmingham.

TO BE SOLD, a handsome CONSERVATORY (at a very low price in consequence of alterations), with amber, blue, and ruby Gothic Margins round each sash, standing in front of E. DENCH'S Patent Hot-house Works, King's Road, Chelsea. Also the Ridge and Furrow one against the Wall, with amber margin.

CANNES, SOUTH OF FRANCE.

TO BE SOLD, completely furnished, in one of the warmest, driest, and most healthy and agreeable localities for invalids in all Europe, that beautiful Marine Residence and Grounds known as the CHATEAU ST. GEORGES, fit for the immediate reception of any nobleman's or gentleman's family, and situate one mile west of the town and port of Cannes, within a few minutes walk of the chateau of the Right Hon. Lord Brougham, and 20 miles south-west of Nice. The property faces the Mediterranean, which forms its southern limit, while its northern boundary is the grande route from Italy to Marseilles, from which latter town it is only 14 hours' by posting, or 11 hours by the steamers, and there are also two diligences daily each way, in connection with the railway from Paris to Marseilles, which is now opened throughout, and the *trajet* is made in 20 hours, thus the total travelling is only 45 to 47 hours from London to Cannes on the south side of the maritime Alps, where the climate is so warm and sheltered from all bad winds that the Aloe, Cactus, and Flowering Myrtle are growing wild on the rocks, and the finest Orange trees of Malta and Sicily, 50 to 60 years old, are covered with their golden fruit in the open gardens all through the winter, within 100 yards of the Mediterranean. The Electric Telegraph communicating with Paris passes the Lodge gates.—For particulars and viewing plans, apply to Messrs. GREEN, Estate Agents and Auctioneers, 28, Old Bond Street, London.

WORKS

PUBLISHED BY

HENRY G. BOHN,

YORK STREET, COVENT GARDEN.
